

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

CHAMBERS'S ENCYCLOPÆDIA

A DICTIONARY OF UNIVERSAL KNOWLEDGE

MALTEBRUN, KONRAD (properly MALTHE CONRAD BRUUN), geographer, born 12th August 1775, at Thisted, in Jutland, studied in Copenhagen, but was banished in 1800 because of his having openly shown his sympathy with the French Revolution. He sought refuge in

Paris, where he supported himself by teaching and literary labours. With Mentelle and Herbin he compiled a *Géographie Mathématique du Monde* (16 vols. 1803-7); and in 1808 he began *Annales des Voyages, de la Géographie, et de l'Histoire* (24 vols.), in 1818 *Nouvelles Annales*. His principal work is a *Précis de la Géographie Universelle* (8 vols. 1810-29; latest ed. 6 vols. 1872). He also contributed to the *Dictionnaire de la Géographie Universelle* (8 vols. 1821), and took an active part in founding the Geographical Society of Paris. He died 14th December 1826.—His son, VICTOR ADOLPHE MALTEBRUN (1816-89), was professor of History and Geography at the college of Pamiers and subsequently at Paris (1848-60); and from 1860 onwards he was secretary of the Geographical Society of Paris. He was the author of numerous geographical works, as *La France Illustrée* (new ed. 1879-84), *L'Allemagne Illustrée* (1884-86), *Histoire Géographique et Historique de l'Allemagne* (1866-68), &c.

Maltese Cross. See CROSS.

Maltese Dog, a small kind of spaniel, with roundish muzzle, and long, silky, generally white hair. It is fit only for a lapdog.

Malthus, THOMAS ROBERT, the expounder of the theory of population, was born 14th February 1766, at the Rookery, near Dorking, in Surrey, where his father owned a small estate. He was ninth wrangler at Cambridge in 1797, was elected Fellow of his college (Jesus), took orders, and was appointed to a parish in his native county. In 1798 he brought out his *Essay on the Principle*

of Population, which attracted great attention and met with no little criticism. During the following years Malthus extended his knowledge of the subject both by travel and by reading, and in 1803 published a greatly enlarged edition of his essay. In 1805 he married happily, and soon after was appointed professor of Political Economy and Modern History in the East India Company's college at Haileybury, a post which he occupied till his death at Bath on 29th December 1834.

Personally Malthus was a kindly and accomplished man, who followed what he believed to be the truth, and who endured without a complaint the abuse and misunderstanding to which his writings exposed him. The aim of the *Essay* was to supply a reasoned corrective to the theories regarding the perfectibility of society, which had been diffused by Rousseau and his school, and which had been advocated in England by Godwin. Malthus maintained that such optimistic hopes are rendered baseless by the natural tendency of population to increase faster than the means of subsistence. He pointed out that both in the animal and vegetable kingdoms life was so prolific that if allowed free room to multiply it would fill millions of worlds in the course of a few thousand years. The only limit to its increase is the want of room and food. With regard to man, the question is complicated by the fact that the instinct of propagation is controlled by reason; but even in his case the ultimate check to population is the want of food, only it seldom operates directly, but takes a variety of forms in accordance with the complexity of human society. The more immediate checks are either preventive or positive. The former appear as moral restraint or vice. The positive checks are exceedingly various, including 'all unwholesome occupations, severe labour and exposure to the seasons, extreme poverty, bad nursing of children, large towns, excesses of all kinds, the whole train of common diseases and epidemics, wars, plague, and famine.' Malthus goes on to illustrate the action of his principle by

a review of the history of the different nations and races, showing what are the actual checks that have limited population—celibacy, wars, infanticide, plagues, vicious practices—and proving that the population difficulty has affected the development of society from the beginning.

It cannot be said that Malthus was original in his exposition of the theory of population. It is a theme of both Plato and Aristotle. Shortly before the time of Malthus the problem had been handled by Benjamin Franklin, Hume, and many other writers. Malthus crystallised the views of those writers, and presented them in systematic form with elaborate proofs derived from history. In certain details and in the form of exposition the *Essay* may be criticised; but the broad principles of it can be doubted only by those who do not understand the question. The enormous increase of the means of subsistence attained by colonisation and modern industrial development has only for a time postponed the population difficulty for the world at large, while its pressure is still felt in the more thickly peopled centres both of Europe and of the East. At the present time the most interesting feature of Malthus is his relation to Darwin. Darwin saw 'on reading Malthus *On Population* that natural selection was the inevitable result of the rapid increase of all organic beings,' for such rapid increase necessarily leads to the struggle for existence. To prevent misunderstanding it should be added that Malthus gives no sanction to the theories and practices currently known as Malthusianism. In this reference Malthus approved only of the principle of moral self-restraint; 'do not marry till you have a fair prospect of supporting a family.' Besides his *Essay on the Principle of Population* Malthus wrote two important works, *An Inquiry into the Nature and Progress of Rent and Principles of Political Economy*. See Memoir by Dr Otter, Bishop of Chichester (prefixed to 2d ed., 1836, of the *Principles of Political Economy*); also Bonar's *Malthus and his Work* (1885).

Malton, a town in the North and East Ridings of Yorkshire, on the Derwent, 22 miles N.E. of York. It consists of New Malton, Norton, and Old Malton. The *Derwent* probably of the Romans, it has the Norman church of a Gilbertine priory (1150), and a free grammar-school, founded in 1545 by Archbishop Holgate; but no trace remains of a Norman castle. Iron and brass founding, tanning, brewing, &c. are carried on; and Norton is famous for its training stables. Till 1868 Malton returned two members, since then one. Pop. (1851) 7661; (1881) 8754; (1891) 4910.

Malvaceæ, a natural order of exogenous plants, of which about 1000 species are known, chiefly tropical and most abundant in America, although the most important species belong to the Old World. They are herbaceous plants, shrubs, and occasionally in tropical countries trees; with alternate entire or lobed leaves; the flowers showy, generally on axillary stalks. The plants of this order have a great general similarity both in appearance and in properties and products. All contain a mucilaginous substance in great quantity, and some are very useful as an emollient and demulcent in medicine. The seeds contain a considerable quantity of bland fixed oil. The inner bark of the stem often yields a useful fibre, for which species of *Hibiscus* and *Sida* are particularly valued; and to this order belong the cotton plants.—See COTTON, HIBISCUS, HOLLYHOCK, MALLOW, MARSH-MALLOW, &c.

Malvern, GREAT, one of the most fashionable watering-places in England, is situated 9 miles SW. of Worcester, and 129 WNW. of London, on the east side of the Malvern Hills, at the foot

of the Worcestershire Beacon, from the summit of which (1444 feet above the sea-level) extensive views are obtained. It is irregularly laid out, and has a fine cruciform church, with a square embattled tower 124 feet high rising from the centre, rebuilt in the reign of Henry VII., and restored in 1860-1. In the centre of the town are large Assembly Rooms (1884) with winter promenade and gardens, and on the outskirts is Malvern College, a handsome building in the Gothic style of the early Decorated period, erected in 1863-65: the present number of boys is nearly 250, and there are several entrance scholarships, tenable during residence, of from £87 to £30 a year, and a leaving scholarship of £50 for three years, tenable at Oxford or Cambridge. Madame Goldschmidt (Jenny Lind) resided near Malvern for many years previous to her death. Pop. (1801) 819; (1881) 5846; (1891) 6107. See *Blackwood's Magazine* for August 1884.

Malwa, a former kingdom of India. See CENTRAL INDIA.

Mamelukes, properly MAMLÜKS, an Arabic word signifying white slaves captured in war or purchased in the market, and especially applied to the slave-kings in Egypt. These had their origin in the importation of a large number of Turkish slaves, from the regions of the Caucasus and Asia Minor, by Es-Salih Ayyub, grand-nephew of Saladin, and sultan of Egypt, in the middle of the 13th century. They were intended to act as a bodyguard and to defend their master against his numerous rivals as well as against the Crusaders, and they fulfilled their duty well, as is shown by the success of their repulse of the French invasion and the capture of St Louis in 1249. In the absence of capable successors to Es-Salih, his Mamelukes set up one of their own number as sultan of Egypt in 1250, and from that year to the Ottoman conquest in 1517 that country and Syria were ruled exclusively by Mameluke sultans. They were forty-eight in number, often retaining the throne but a few years, or even months, in consequence of the intrigues of rival emirs; and they fell into two dynasties, the Bahri or Turkish Mamelukes (1250-1390) and the Burji or Circassian (1390-1517). The sultan was chosen out of the military oligarchy, and owed his throne to personal prowess and the support of the biggest battalions, rarely to hereditary title. The Mamelukes did not readily propagate their race in a foreign country, and fresh importations were necessary to keep up the stock. As a rule the most powerful lord of the day became king, and kept his place just so long as he retained his following. Violent deaths were common; the sultan's bodyguard was the most essential part of the constitution, and held a large portion of the land of Egypt on a species of feudal tenure. Each of the great lords was a Mameluke sultan in miniature, kept a bodyguard, lived in much state, and was generally prepared to fight his way to the throne should occasion favour the attempt. The streets of Cairo were frequently the scenes of sanguinary conflicts, and its citadel is full of the memories of treacherous assassinations. With all their excesses, however, it may be doubted whether Egypt ever since the days of the Pharaohs possessed a more enlightened series of rulers than the Mamelukes. Their system of law and police, their military organisation and naval enterprise, their postal service, their irrigation-works and engineering operations were far in advance of their time; and, rough soldiers as they appear, they were munificent patrons of art and literature. Nearly all the exquisite mosques that still adorn Cairo, essentially the Mameluke city, are of their building, educational institutions met with their unfailing support, and they carried their taste for refinement into the

smallest details of house furniture and decoration. The museums of Europe and Cairo are full of their delicate inlaid and engraved brass-work, wood carvings, ivory reliefs, enamelled glass, tiles and stone and plaster work, mosaic pavements, and silk embroideries. Their court ceremonies were gorgeous with the pomp of heraldry and armour and dazzling robes; their luxury at home was stupendous. Turks as a rule, they had tastes beyond the ken of the Ottoman Turks who dispossessed them in 1517, and Egypt has not yet recovered from their loss. After the Turkish conquest the government was placed in the hands of an Ottoman pasha assisted by a council; whilst twenty-four Mameluke boys were allowed to administer the provinces. The boys retained most of the power, however, and the pasha became a cipher. Their last brilliant achievements were on the occasion of Napoleon's invasion of Egypt in 1798, when they fought the disastrous battle of the Pyramids near Cairo; but after the retirement of the French and British armies Egypt became a prey to disorder, rival Mamelukes fought and intrigued, and order was not restored until Mohammed Ali established his authority as pasha under the Porte, and by two treacherous massacres, in 1805 and 1811, exterminated the Mameluke princes, save a small remnant who took refuge in the Sûdân, where their medieval armour was recently seen by the British forces employed against the Mahdi.

See Quatremère, Makris's *Histoire des Sultans Mamelouks*; S. Lane-Poole, *Art of the Saracens in Egypt*.

Mamers, a town in the French department of Sarthe, on the Dive, 43 miles by rail NNE. of Le Mans. Pop. 6238.

Mamiani della Rovere, COUNT TERENZIO, an Italian scholar and statesman, born in 1800 at Pesaro in the Romagna, took a prominent part in the futile outbreak at the accession of Gregory XVI., and was compelled to flee to Paris, whence he returned to Rome in 1848 after the unconditional amnesty of Pius IX., and actually held office for three months in the papal ministry. He next withdrew to Turin, where he founded, with Gioberti, his famous society for promoting Italian unity. On the flight of Pius IX. from Rome to Gaeta he re-entered the political arena, and was for a short period foreign minister in the revolutionary cabinet of Galetti. On the fall of Rome he retired to Genoa; in 1856 he was returned member of the Sardinian parliament, and in 1860 entered Cavour's ministry as minister of Instruction. He was appointed ambassador to Greece in 1861, to Switzerland in 1865, and died at Rome, 21st May 1885.

Among his writings are *Del Rinascimento della filosofia antica Italiana* (1836), *Poeti dell' Età media* (1842), *Del Papato* (1851), *Confessioni d'un Metafisico* (1865), *Teorica della Religione e dello Stato* (1868), *La Religione dell' Avenir* (1879), besides books on special social and philosophical problems, and treatises on various subjects. See his *Life* by Gaspari (1887).

Mammals (*Mammalia*, Lat. *mamma*, 'a teat') form what is usually considered the highest class of backboned animals, including numerous orders, of which horse, elephant, and whale, dog, beaver, and bat, anthropoid ape, and man himself are in different ways prominent illustrative types. Compared with birds, mammals are most notably characterized by the greater development of their brains, and by the close connection between mother and offspring; but in both these respects there are grades of excellence. Thus, the Monotremes (see ORNITHORHYNCHUS, and ECHIDNA) have simple brains and lay eggs; the Marsupials (q.v.) have also lagged behind in cerebral development and bring forth their young precociously after a short gestation; while in the higher orders there are many steps in the perfecting of brains and wits,

and in the evolution of the organic connection between the unborn young and the mother. The habitats are also very varied, for though the great majority are *terrestrial*—burrowers, runners, leapers, and climbers, a thoroughly *aquatic* habit is exhibited by the cetaceans, the sea-cows, the seals and walruses, and many genera here and there, while the bats have the power of true flight, and many swooping forms, such as the flying opossums, squirrels, and lemurs are more or less *aerial* (see FLYING ANIMALS). Similarly as regards food there is great variety, for fruit and insects, fish and herbs, roots and flesh, are all utilised, and the diversity of diet is associated with marked differences in Dentition (q.v.). About 2300 living species have been recorded, varying in size from the smallest harvest-mouse, which is scarcely the weight of a halfpenny, to the giant whales, which approach 100 feet in length.

General Characters.—It will be useful to refer to the article BIRDS, where the three highest classes of vertebrates are contrasted; but a more detailed summary is now necessary. Female mammals always nourish their young for some time after birth with the milk produced by the mammary glands. Except in the oviparous Monotremes, the young are born viviparously; and in all mammals above Marsupials the embryo in the womb is organically connected with the mother by means of a Placenta (q.v.). The skin always bears at least some hairs, and these usually cover the whole body, so that most mammals may be justly called furred quadrupeds. In body-temperature, which is some index to the pitch of the life, mammals, though inferior to birds, are emphatically warm-blooded; and in this connection we may notice that a complete muscular partition (midriff or diaphragm) separates the breast from the abdominal cavity. The lungs lie freely and are invested by (pleural) sacs; the heart is four-chambered and gives off a single aortic arch to the *left* side (to the *right* in birds); the red blood-corpuscles are non-nucleated when fully formed. The parts of the adult brain show a greater curvature than in lower forms, while the cerebral hemispheres predominate, become more and more convoluted, and are united by an important bridge called the corpus callosum. Except in Monotremes, the rectal and the urogenital apertures are separate; and, with the same exception, the ova are small and poor in yolk, and undergo total segmentation. The skeletal characteristics are necessarily more technical, but it is important to notice that the skull moves not on one condyle as in birds and reptiles, but on two as in amphibians; the lower jaw is a single bone on each side, and articulates not with the quadrate as in Sauropsids but with the squamosal; a chain of three ear-ossicles (malleus, incus, and stapes, probably equivalent to the articular, quadrate, and columella or hyo-mandibular of lower forms) connects the drum with the internal ear; the teeth, rarely quite absent, are set in distinct sockets; the vertebrae of the neck are (with three exceptions) seven in number; the coracoid bone (except in Monotremes) is a mere process of the scapula; and so on. As the various systems are dealt with in special articles (see BRAIN, CIRCULATION, HAIR, SKULL, &c.), it seems unnecessary to expand the above summary.

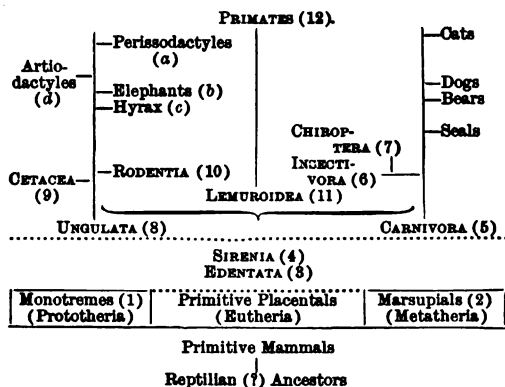

The Sub-classes of Mammals.—In 1816 De Blainville divided mammals into three sub-classes, which subsequent investigation has firmly established. The two orders of Monotremes (duckmole and Echidna) and of Marsupials (kangaroo, opossum, &c.) he raised to the rank of sub-classes under the titles Ornithodelphia (lit. 'bird-wombed') and Didelphia (lit. 'double-wombed'), in contrast to all the other mammals, which he termed Monodelphia.

For these three sub-classes, which are distinct enough to be regarded as separate branches of the primitive mammalian stock, Huxley proposed the less objectionable titles Prototheria, Metatheria, and Eutheria, which are now generally adopted.

The most important contrasts between them may be summarised in the following tabular scheme, which ought to be expanded and vivified by reference to the articles ORNITHORHYNCHUS, ECHIDNA, KANGAROO, MARSUPIAL, &c.

	Prototheria. Ornithodelphia. Monotremes.	Metatheria. Didelphia. Marsupials.	Eutheria. Monodelphia. Placentals.
PARTURITION.....	Oviparous; obviously no placenta; (a temporary pouch in Echidna).	Precociously viviparous; placenta incipient; (a pouch for the young except in some opossums).	Viviparous; placenta established in various forms.
OVA.....	Large, rich in yolk, with a slight shell, with partial segmentation.	Small, with total segmentation and relatively large yolk-sac.	Small, with total segmentation. The yolk-sac is small except in Rodents, Insectivora, and Bats.
MAMMÆ.....	None; the glands open on a bare patch of the skin, whence the secretion is licked off by the young.	Teats lie within the pouch, if that be present, and the milk is forced into the mouth of the young.	The well-developed teats are sucked by the young.
BRAIN.....	Small corpus callosum. Large anterior commissure. Cerebellum uncovered. 25°-28° C.	Small. Large. Uncovered. 32°-36° C.	Large. Small. Increasingly covered. 35°-40° C.
TEMPERATURE.....	The sutures of the skull-bones close, and the surface is polished. The rami of the lower jaw are free and without an ascending process. The three ear-ossicles have primitive characters—e.g. large malleus, small incus, rod-like stapes. The vertebrae have no terminal caps or epiphyses (as also in Sirenia). The pectoral girdle is reptilian-like, with coracoids reaching sternum, with 'interclavicle,' &c. There are marsupial or epipubic bones. No teeth in adults.	The angle of the lower jaw is inflected sharply inwards. There are the usual epiphyses, much reduced coracoids (mere processes of the scapula), and almost always epipubic bones. The dentition is in most cases peculiar.	The typical characters of mammalia already noted. No epipubic bones, or at most slight rudiments of them; no marked inflection of the angle of the lower jaw.
SKELTON.....	Heart somewhat bird-like. Cloaca persists. Oviducts very simple and quite separate. The testes abdominal, and the ureters open into cloaca. Vasa deferentia are not continuous with the penis.	The urinogenital aperture is separate from the rectal, but there is a slight cloaca. Ureters open into bladder. There are two uteri and two vaginæ. The scrotum lies in front of the penis.	Ureters open into bladder; one vagina, and usually one uterus. Scrotum, if present, lies behind the penis.
OTHER PECULIARITIES..			

Orders of Mammals.—Leaving the MONOTREMATA (1)—duckmole and Echidna—and MARSUPIALIA (2)—kangaroo, opossum, &c.—by themselves in marked contrast to one another and to the placental series, we begin the latter with two orders in many ways more primitive than the rest—viz. the EDENTATA (3)—sloths, ant-eaters, armadillos, &c.—and the SIRENIA (4)—dugong and manatee. It seems possible to group the other

orders along three definite lines. One of these is especially marked by the CARNIVORA (5)—cats, dogs, bears, and seals—to which the INSECTIVORA (6)—hedgehogs, moles, shrews—are apparently allied, while these in turn lead to the divergent CHIROPTERA (7) or bats, and to an aberrant genus—the flying lemur or Galeopithecus, for

which some would erect a special order. Another line is especially characterised by the great order UNGULATA (8), including (a) Odd-toed or Perissodactyle forms—horse, rhinoceros, tapir, &c.—(b) Proboscideans or elephants, (c) the unique genus Hyrax, and (d) the Even-toed or Artiodactyle forms—sheep and cattle, chevrotains, camels, hippopotamus, and pigs. But with the Ungulates there are many reasons for connecting two other orders, the CETACEA (9)—whales and dolphins—and the RODENTIA (10)—rats, hares, squirrels, &c. Finally, along a third branch, which probably had its origin in a stock common to the Ungulates on the one hand, to the Carnivores and Insectivores on the other, we have to place the LEMUROIDEA (11)—lemurs—and the PRIMATES (12), the latter including the marmosets, the New-World monkeys, the Old-World monkeys, and man himself.

Extinct Mammals.—(a) The oldest mammalian remains date from the Upper Trias—i.e. from near the beginning of the Mesozoic or Secondary system. Thus, fragments of a small animal known as Dromatherium suggest a primitive type, possibly ancestral to the Monotremes. (b) In Jurassic strata remains of small mammals are locally abundant, and represent more than one type of Marsupial. (c) From the next or Cretaceous period, the beds of which are mostly of marine origin, other small types have recently rewarded the unwearying researches of Professor Marsh. (d) In the beginning of the Tertiary period, however, most of the modern orders of mammals have put in an appearance, and, as one would expect, there are remains of many types which form the common base of branches now widely divergent. Thus, the *Creodonta* (e.g. Hyænodon

and Proviverra) are primitive Carnivora, which show skeletal affinities with Marsupials and Insectivores. Not less remarkably generalised are the *Condylarthra* (e.g. *Phenacodus* and *Peritychus*), primitive Ungulates showing affinities with Artiodactyles and Perissodactyles, with Hyracoidea and (through the Creodonts) with Carnivores, and (according to Cope) even with the Lemurs. In the same way the palæontologists find transitions

Fig. 1.—Slab of Rock showing the left lateral aspect of the skeleton of *Phenacodus primævus*; from the Lower Eocene of North America: actual size of slab, 49 inches in length. (After Cope.)

between Insectivorous, Lemuroid, and Creodont types, between Perissodactyles and Proboscidea (Dinocerata and Coryphodonts), between Rodents and Ungulates (Mesotherium and Toxodon). So, too, a common base has been found for dogs and bears, for pigs and sheep, for deer and chevrotains; but it is enough for our purpose to emphasise the fact, which rapidly progressive research continually corroborates, that in early Tertiary times there persisted numerous generalised mammals which united many of the characteristics of our extant orders.

Distribution in Space.—Referring to the article on GEOGRAPHICAL DISTRIBUTION for the general results reached by the labours of Murray, Wallace, Selater, and others, we shall content ourselves with a few illustrations showing the importance of the inquiry in regard to mammals. Perhaps the most striking of these concerns the great insular region of Australasia, where, with the exception of some bats and marine mammals which transcend the usual limits, of some rats and mice, and of forms introduced by man, the whole mammalian fauna consists of Marsupials and Monotremes. As all extant Marsupials, with the exception of the American opossums, are now Australasian, and as fossil remains of the sub-class are found as far away as Europe, we have here one of the most remarkable cases of gradual restriction and of the saving results of geological changes. For, whatever the precise details may be, there seems no doubt that geological insulation saved the Marsupial immigrants to Australia from the jaws of their pursuers.

In the Lemuroid group, again, we find 'one of the most singular phenomena in geographical distribution.' For out of a total of fifty species thirty are confined to the one island of Madagascar, the remainder occurring through tropical Africa and in restricted portions of India and the Malay Islands—facts from which it is fairly concluded that in the insulated Madagascar 'the lowly organised Lemuroids diverged into specialised forms of their own peculiar type, while on the continents they have to a great extent become exterminated, or have maintained their existence in a few cases in islands or in mountain-ranges.'

The Edentata (sloths and ant-eaters) have also a very restricted distribution in modern times, for, with the exception of the scaly ant-eaters or Manidae

(Ethiopian and oriental in range) and the African aardvark, the home of the order is in South America, where, moreover, in Pliocene times there flourished a giant race 'rivaling in bulk the rhinoceros and hippopotamus.'

Just as naturally as terrestrial mammals are absent from Oceanic islands, so the aquatic Cetaceans have a world-wide distribution, and the Sirenians almost as wide as required conditions of temperature will admit. But it must be clearly noted that when we follow in detail the distribution even of bats, whose great powers of flight free them from the limitations imposed on terrestrial mammals, we find that the inhabitants of special regions are usually marked off with perfect definiteness. The same local definiteness holds true of the world-wide (Australia always excepted) distribution of Ungulates, Rodents, and Carnivores, and is signally illustrated, for instance, in the complete absence of Insectivora from South America alone, or in the striking differences between Old and New World monkeys.

Development.—The ova, which are small and poor in yolk except in Monotremes, burst from the ovaries into the upper ends of the oviducts, may be fertilised by ascending spermatozoa, and with the above exception develop in the lower portion of the female duct known as the uterus. In the oviparous Monotremes the segmentation is partial, like that of birds and reptiles; in all the others the egg segments completely. The development proceeds in a fashion somewhat different in detail from that of the other vertebrates, but it is more important to notice that in the Placentals a close vascular connection is speedily established between the embryo and the wall of the uterus. In the hedgehog, which is a remarkably central type, this connection is first of all maintained simply by the outermost layer of the developing egg; but this is soon abetted by a union between the yolk-sac and the maternal wall, which in turn gives place to the true placenta, mainly due to the Allantois (q.v.). The final result is an interlocking of the maternal tissue with that of the foetal membranes, and the whole life of the embryo depends on the intimacy of this interlocking, by which the blood of the mother is vitally though not directly united with that of the offspring. At birth the union is severed, and the embryonic part of the placenta, with more or less of the associated lining of the uterus, is discharged. The form and structure of the placenta vary considerably in different orders, and have furnished important aid in determining relationship. Of mammals as of other animals it is true that the individual development recapitulates, in general outline, the history of the race, for the life begins at the beginning again in a single cell, divides into a ball of cells, acquires a layered body, and passes from stage to stage presenting successively the general features of a vertebrate, of a reptilian (?), of a simple mammal, of an insectivore, and finally of a young hedgehog. Nursing remains somewhat crude in the oviparous Monotremes, which are destitute of teats, but the embryos have a considerable store of yolk which serves as preliminary capital. The eggs of the duckmole are laid in a nest, those of the Echidna seem to be borne in a temporary pouch suggesting that of Marsupials. In both cases the young lick the bare patch of skin on which the mammary glands open. The non-placental Marsupials are, in a sense, as Professor Flower says, 'the most mammalian of mammals,' since most of them carry their prematurely-born young in an external pouch surrounding the teats, whence the milk is forced into their passive mouths. In the placental mammals the young are born in a more advanced state, though still requiring much care. They are able

to suck the mammae actively, and their hitherto unused food-canals, gently tutored by the readily-digested milk, more or less rapidly acquire what Sollas has happily termed a 'gastric education,' which makes more substantial diet possible.

Origin of Mammals.—Though the duckmole and the Echinida lay eggs, and from the nature of their genital ducts have been termed Ornithodelphia, their affinities are rather with reptiles than with birds. For mammals and birds represent divergent branches, the common stem of which is exceedingly remote. Recognising this, the theories as to the origin of mammals are mainly concerned with the probabilities in favour of a reptilian or of an amphibian ancestry. In support of the latter it has been urged that mammals and amphibia have two skull condyles, while birds and reptiles have one; that the quadrate is small in the amphibians and mammals, large in Sauropsida; that some other parts of the mammalian skeleton (such as the pelvis) suggest affinities with amphibians rather than Sauropsida; and even that the amphibians in their varied reproductive experiments are as likely as reptiles to have originated the characteristic mammalian parturition. On the other hand, the *a priori* probabilities are in favour of the reptilian origin of mammals, for the reptiles are in general differentiation more evolved. Among the numerous extinct Saurians the Theriomorpha distinctly approach mammalia in some of their skeletal characters, the large partially-segmenting ovum of the Monotremes seems much liker that of reptiles than that of amphibians (which exhibits total segmentation), while it is not without interest that two lizards show an incipient form of yolk-sac placenta. A compromise between the rival theories has been proposed by St George Mivart, who suggests a dual origin of mammals, deriving the Monotremes from Anomodont or allied reptilian types, the Marsupials from a distinct and earlier source, perhaps amphibian. Another compromise, equally problematical, would derive mammals from a primitive stock of fingered quadrupeds, the common ancestors of amphibians and reptiles. On the whole, however, the balance of probabilities seems in favour of the origin of mammals from extinct Saurians, such as those which Cope has grouped as Theriomorpha. A few zoologists, who maintain the reptilian ancestry of mammals, and regard Cetaceans as a very primitive order, would derive these from the Ichthyopterygian reptiles; but this view has been received with virtually fatal criticism.

Evolution of Mammals.—Deeper than the problem of determining whether mammals had their origin from amphibians or reptiles is that which inquires into the factors which actually contributed to their rise. That this must have been very gradual both the fossil forms and the grades which still persist plainly show, and it is important to realise what is indeed a general truth in regard to evolution, that many of the characteristic features of mammals are not so much new acquisitions as reconstructions and elaborations of what is old. The all-important mammary glands seem to be but modifications of the sebaceous glands diffused over the skin; the placenta is chiefly composed of the allantois, which all young reptiles and birds possess; the corpus callosum, which forms a bridge between the cerebral hemispheres, is already represented in reptiles and amphibians. So, too, there is ample evidence of the very gradual evolution of special types and structures—witness the long series which connects the Eocene Eohippus, a five-fingered, three-toed ungulate, about the size of a fox, with the modern Horse (q.v.; see also FOOT); or the evolution of brains from the small casts found inside the skulls of some of the early giants

to such types as are exhibited by Monotreme and Marsupial, and from these upwards to the climax in man; or the gradual growth of Antlers (q.v.) from Miocene times onwards, a history rapidly recapitulated in the life of modern stags. But after realising the gradual development of types and structures, and appreciating the influence of natural selection in determining distribution, in eliminating giants, in fostering swiftness and strength, and in justifying big brains, many naturalists still find the problem of the evolution of mammals incompletely solved. It seems necessary to follow the school of Lamarck in recognising the inheritable effects of use and effort, and the influence of a changeful environment on the progressive growth of the organism in definite directions. Furthermore, an account of the evolution of mammals has to take account of one of the most prominent characteristics, the maternal sacrifice expressed in the placental union, in the prolonged gestation (em-

phasised many years ago by Robert Chambers), and in the lacteal nutrition

after birth, a sacrifice which must have been one of the most important factors in the progress of mammals. After a while the mammalian maternity (perhaps pathological at first and always expensive) must have paid or justified itself; but its recognition as 'a subordination of self-preserving to species-maintaining, of nutritive struggle to reproductive sacrifice,' is a necessary corrective to the prevalent theory which tends to emphasise too exclusively the competitive struggle for individual existence.

Intelligence and General Life.—Through the mammalian series, from the 'frog-witted' duckmole to the highest of the Primates, there is a gradual increase in complexity of brains and quickness of wits. The remarkably docile intelligence of the dog, the cleverness of the highly-evolved elephant, the ingenuity of the social beavers, and the 'humanness' of the higher apes are crowning illustrations which become all the more remarkable when we recall the minute brains of early mammals. A contrast between those types which excel and those which lag behind will also illustrate Spencer's

Fig. 2.—Fore and Hind Feet of the Horse and its extinct Ancestors.

Fig. 3.—Skulls and Casts of Brains of Eocene Mammals:

(After Marsh.)

conclusion that the rate of reproduction varies inversely with the degree of individuation, for in the more highly-developed forms the number of offspring tends to diminish, while the parental care and love proportionally increase. The adaptations to diverse habits and diets, the varying length of life and the means of avoiding death, the migrations of some and the hibernations of others, the struggle for mates as well as for food, the evolution of family-life and even of social sympathies are subjects of inquiry which will well repay observation and further study of mammals.

For general works on mammals, see British Museum Catalogues (in progress); Bronn's *Thierreich—Mammalia*, by Giebel and Leche (in progress); Flower's treatise, *Ency. Brit.* (xv.); Bell's *British Quadrupeds* (2d ed. Lond. 1874); Vogt and Specht, *Nat. Hist. of Mammals* (trans. Edin. 1887); Cassell's *Nat. Hist.*, vols. i.-iii., ed. by P. Martin Duncan; *The Riverside or Standard Natural History*, vol. v., ed. by J. S. Kingsley (Lond. and New York, 1888). The last mentioned has a general bibliography. A treasury both of information and illustration is to be found in Brehm's *Thierleben* (new ed. 1890). For general structure, see the text-books of Owen, Huxley, Gegenbaur, Wiedersheim, Rolleston and Hatcher Jackson, and Flower's *Osteology of the Mammalia* (3d ed., along with Gadow, Lond. 1885). For history and evolution of mammals, see W. K. Parker, *Mammalian Descent* (Lond. 1884); O. Schmidt, *Mammalia in relation to Primeval Times* (Inter. Sc. Series, Lond. 1885); the papers of Cope and Marsh in the Reports of the U.S. Geol. Survey; Nicholson and Lydekker, *Manual of Paleontology* (Edin. 1889); the relevant works of Darwin, Wallace, Haeckel, &c.; Huxley, *Proc. Zool. Soc.* (Lond. 1880); Cope's *Origin of the Fittest* (New York, 1887). For distribution, see A. Murray, *Geogr. Dist. of Mammals* (Lond. 1866); A. R. Wallace, *Geogr. Dist. of Animals* (Lond. 1876); Heilprin (Inter. Sc. Series, Lond. 1888).

Mammary Gland. See BREAST.

Mammee Apple (*Mammea americana*), a highly-esteemed fruit of the West Indies (where it is sometimes called the *Wild Apricot*) and tropical America. It is produced by a beautiful tree of the natural order Guttiferæ, 60 to 70 feet high. The fruit is roundish, from the size of a hen's egg to that of a small melon, with a thick, leathery rind, and a very delicate inner rind adhering closely to the pulp, which must be carefully removed on account of its bitter taste. The pulp is firm and bright yellow, with a peculiar sweet and very agreeable taste, and a pleasant aromatic odour.—A similar fruit is produced by *Mammea africana*, an African species.

Mammoth, the name (originally Tartar, through the Russian) for an extinct elephant (*Elephas primigenius*), whose remains are sufficiently common in the recent deposits of northern Europe and Asia to afford a valuable supply of fossil ivory. In geological time, it is only as it were yesterday that the mammoth ceased to live, for its remains are often found along with those of man, and it seems to have persisted in Britain until after the Glacial Period. The cave-dwellers made use of its tusks, and on these too the prehistoric artists—the literal old masters—cut with no tyro hand the outlines of reindeer and various animals, including the mammoth itself. But the comparatively recent decease of this monster elephant has been repeatedly evidenced in a startling way by the discovery in Siberia of almost intact specimens, standing upright in the ice and frozen soil, with hair and skin, muscles and viscera, as well as bones, all well preserved. The first fairly complete mammoth recorded was disinterred from the ice near the mouth of the Lena in 1806; the fisherman who discovered it had overcome his awe to the extent of cutting off the tusks, wild animals had gnawed the muscles, but the hair was still on the uninjured

parts of the skin, the brain in the skull, and the eyes still stared from their sockets. Others have since been disinterred, or washed out in great thaws, notably one in 1846 which was so marvelously preserved that the stomach still showed young shoots of fir and pine, and a quantity of chewed cones. Great numbers that we know

Mammoth.

nothing of must have been similarly thawed out, and their frozen corpses swept seaward to swell the accumulations of their remains found in the Arctic seas. Their disinterment after thaws explains the old Siberian opinion that the mammoths were monster burrowers, which died when they came to the surface, while the upright position in which the intact forms have been found suggests that they had been smothered where they were buried by sinking heavily into the tundra marsh. Though mammoths in complete preservation are rare, their tusks, teeth, and other bones have been found in great abundance from almost every county in England to Behring Strait, and thence into North America.

'The whole appearance of the animal,' one of the discoverers writes, 'was fearfully wild and strange. Our elephant is an awkward animal, but compared with this mammoth it is as an Arabian steed to a coarse ugly dray-horse.' It stood 13 feet high, 15 feet in length, with tusks 8 feet long; but some other specimens seem to have been larger. The dark skin was covered with yellowish to reddish soft wool about an inch long, with interspersed brownish hairs of 4 inches, and much sparser and longer black bristles. 'The giant was thus well protected against the cold.' The mammoth was liker the Indian than the African survivor, but it is only one of a crowd of fossil Proboscidea distributed in Tertiary deposits over all the great continents. Mammoth, Mastodon, and Dinosaurium are the three most prominent types. Most of them were giant animals, but there seem also to have been pigmies no larger than sheep. Once numerous and widespread, the elephants are now represented only by the two modern species of restricted distribution. To this result many factors, such as the voracity of Carnivores, the deforesting of countries, the changes of climate, and the expensiveness of great bulk, have contributed. The ivory exported in large quantities from Siberia is in great part collected from the islands, some of which are almost literally heaps of mammoth bones.

See ELEPHANT; also, for facts, not inferences, H. H. Howorth's *Mammoth and the Flood* (1887); Norden-skiöld's *Voyage of the Vega*; Boyd Dawkins, in *Quart. Journ. Geol. Soc.* XXXV. (1879).

Mammoth Cave, in Kentucky, is 85 miles by rail SSW. of Louisville. The cave is about 10 miles long; but it is said to require upwards of 150 miles of travelling to explore its multitudinous

avenues, chambers, grottoes, rivers, and cataracts. The main cave is only 4 miles long, but it is from 40 to 300 feet wide, and rises in height to 125 feet. Lucy's Dome is 300 feet high, the loftiest of the many vertical shafts that pierce through all the levels. Some avenues are covered with a continuous incrustation of the most beautiful crystals; stalactites and stalagmites abound. There are several lakes or rivers connected with Green River outside the cave, rising with the river, but subsiding more slowly, so that they are generally impassable for more than six months in the year. The largest is Echo River, three-fourths of a mile long, and in some places 200 feet wide. The air of the cave is pure and healthful; the temperature remains constant about 54°. For the fauna, see the articles referred to at CAVE, and A. S. Packard, *The Cave Fauna of North America* (Memoir of the Nat. Acad. of Science, 1888), *Inhabitants of Mammoth Cave* (1872).

Man. As the races of mankind, the structure and functions of the human body, and the higher activities most distinctive of man are discussed in special articles, it is enough here to restrict attention to three problems: (1) the human characteristics, (2) the origin or descent of man, and (3) the antiquity of the race.

(1) *Characteristics.*—Considered like any other organism, man is strictly the highest of the Primates, differing from the anthropoid apes only in degree. In adult life he is unique in his erect posture, and in the freedom of his hands from any direct share in locomotion. His body is unusually naked, his canine teeth are not longer than their neighbours, his thumbs are larger and more opposable than those of monkeys, and his feet are distinguished by the horizontal sole which rests flatly on the ground, by the projecting heel, and by the non-opposable great toe which normally lies quite parallel to the others. His face is notably more vertical than that of apes, lying below rather than in front of the forepart of the brain-case; the jaws, the orbits, and the ridges above them are relatively smaller; the nose-bones project more beyond the upper jaw; and the chin is more prominent than in other Primates. A much more momentous characteristic, however, is involved in the fact that the normal brain of an adult man is more than twice as heavy as that of the nearest monkeys, for this structural advance is an index to that intellectual and emotional development which raises even the savage many degrees above the brute, and which in its highest realisation is still full of promise. Therefore, while all naturalists allow, with Professor Owen, that there is 'an all-pervading similitude of structure' between the human body and that of the anthropoid apes, there is equal agreement that in intelligence, emotions, and controlled conduct man is pre-eminent.

But, apart from these zoological considerations, it is interesting to notice some statistical results in regard to human (and especially British) characteristics derived from the Report (1890) of the Anthropometric Committee of the British Association. Thus, the average height of man is 5 ft. 5½ in., the Polynesians leading the way with an average of 5 ft. 9.33 in., the English professional class following with 5 ft. 9.14 in., and so on, down to the Bushmen, who average 4 ft. 4.78 in. As to the adult population of Britain, in height the Scotch stand first (68.61 in.), the Irish second (67.90 in.), the English third (67.36 in.), and the Welsh last (66.66 in.), the average being 67.66 in. The Scotch are also first in weight (165.3 lb.), the Welsh second (158.3 lb.), the English third (155 lb.), and Irish fourth (154.1 lb.), the average being 158.2 lb. Again, a typical adult Englishman has a stature of 5 ft. 7½ in., a chest girth of 36½ in., a

weight of 10 stone 10 lb., and is able to draw, as in drawing a bow, a weight of 77½ lb. As to the sexes (in England), the average male stature and weight is 67.36 in. and 155 lb., as against 62.65 in. and 122.8 lb. for the women. Moreover, the men are about twice as strong. For further results, many of which are of profound practical suggestiveness, the Report should be consulted.

(2) *Origin or Descent of Man.*—Even when we confine our attention to the opinions of those who accept the theory of evolution as a modal explanation of nature, we are in fairness bound to recognise some diversity of opinion in regard to the origin of man. (a) So unique does he appear to some that his descent from a humbler organism seems incredible—a position in favour of which some arguments will be found in the cited works of A. de Quatrefages. (b) Alfred Russel Wallace and others 'reject the idea of "special creation" for man, as being entirely unsupported by facts, as well as in the highest degree improbable,' yet believe that his progress from the brute was due to introduction of new causes, or 'spiritual influxes,' to which the higher human characteristics owe their origin. (c) The majority of naturalists deem this hypothesis of special spiritual influx inconsistent with the continuity of evolution, which they regard as a 'natural' process, self-sufficient throughout, for the origin of man as for other grand results.

The arguments which go to show that man is descended from a simpler animal are, of course, the same as those which substantiate the general theory. Thus, his structure and functions are not demonstrably different in kind from those of the nearest Primates; he develops from a fertilised egg-cell, and passes through successively higher grades of organisation in a manner which seems only interpretable as the recapitulation of ancestral history; he varies as other animals do, is subject to similar diseases, and exhibits numerous reversionary and rudimentary structures which are enigmas, except on the theory that he had his origin from an ape-like stock. How his evolution was brought about is a problem requiring much elucidation, but among the special factors which conduced to evolve his higher characteristics of wisdom and gentleness it seems reasonable to attach much importance to the necessity for cunning in the struggle with stronger mammals, to the consequences of the prolonged weakness of infancy, to the influences of family life and of the indispensable combination into larger aggregates. As to the future, if we disregard minor changes—e.g. in hair and teeth, for which fashion and 'civilisation' are responsible—it seems almost certain, as Herbert Spencer has emphasised, that the progressive evolution of man must be restricted to intellectual and emotional qualities.

(3) *Antiquity of the Race.*—From the human remains, and far more frequently from the weapons, tools, and other vestiges of human activity, found in the more recent deposits on the earth's surface, it is obviously legitimate, after due caution, to infer the presence of man at the time—certainly not estimable in the years of any chronological system—when these beds were formed. Cuvier and others tried, indeed, to avoid this conclusion—for instance, by exaggerating the power of floods in mixing up recent deposits; while Boucher de Perthes, who in 1836 discovered flint axes along with mammoth bones in undisturbed strata 20–30 feet below the surface, had to wait almost twenty years for a fair hearing, and yet longer for decisive corroboration. Both were gained, however, and the conversion of naturalists may be dated from 1863, when Lyell summarised the existing evidence in his *Antiquity of Man*. Since then the problem has been worked at with ever-increasing energy

and success, and there is now general agreement that man was alive during the later stages of the glacial epoch, while there are indications of his presence in Pliocene and, according to a few, even in Miocene ages (see GEOLOGY).

Older, however, than any indications of his Pliocene presence man must surely be, for zoologists refer his origin not to any of the existing anthropoid apes, as is sometimes popularly supposed, but to the common stock which included their ancestors and his, and which had apparently begun to diverge in Upper Miocene times. In a similar way, our impression of the antiquity of man is increased when we remember that the most ancient human remains, such as the Neanderthal skull, do not take us appreciably nearer any low type of man such as the ancestral forms presumably exhibited. Moreover, the oldest distinct implements and artistic products suggest not the handicraft of beginners, but the work of men behind whom there already lay a long history.

For further discussion of man in various aspects, see the articles on the various continents, countries, and races, as well as the following articles, with the other articles and works cited under them :

Man. ISLE OF, is situated in the Irish Sea, 16 miles S. of Burrow Head in Wigtownshire, 27 miles SW. of St Bees Head, and 27 E. of Strangford Lough. The length of the island is $3\frac{1}{2}$ miles, breadth $1\frac{1}{2}$ miles, and area 145,325 acres (227 sq. m.), of which nearly 100,000 are cultivated. At the south-western extremity is an islet called the Calf of Man, containing 800 acres, a large portion of which is under cultivation. A chain of mountains extends from north-east to south-west, the highest of which is Snaefell (2024 feet). In some of the streams trout abound, though in many the fish have been destroyed by the washings from the lead-mines. The coast-scenery from Maughold Head on the east, passing south to Peel on the west, is bold and picturesque, especially in the neighbourhood of the Calf, where Spanish Head, the southern extremity of the island, presents a sea-front of extreme grandeur.

The greater part of the island consists of clay-slate under various modifications. Through the clay-schist granite has burst in two localities, in the vicinity of which mineral veins have been discovered, and are extensively worked. Nearly 5000 tons of lead are extracted annually, considerable quantities of zinc, and smaller quantities of copper and iron; the lead ore is very rich in quality. The principal mines are at Laxey on the east coast, and Foxdale near the west. The Great Laxey Mine is one of the most important in the United Kingdom.

The climate is remarkable for the limited range of temperature, both annual and diurnal; westerly and south-westerly winds greatly predominate, easterly and north-easterly winds occurring chiefly in the autumn quarter. Myrtles, fuchsias, and other tender exotics flourish throughout the year. The flora of the island is almost identical with that of Cumberland. The Manx cat is tailless (see CAT).

The fisheries afford employment to nearly 4000 men and boys. More than 700 boats are employed in the herring and cod fisheries, the average annual produce being above £60,000. Large numbers of fat cattle are shipped to the English markets, as well as about 20,000 quarters of wheat annually. The manufactures are inconsiderable. The revenue derived from the island amounts to about £50,000 per annum; of this the greater part is received from customs duties, and the whole, except £10,000 a year payable to the imperial treasury, is used for insular purposes.

The Isle of Man possesses much to interest the antiquary. Castle Rushen (see CASTLETOWN), probably the most perfect building of its date extant, was founded by Guthred, son of King Orry, in 947. The ruins of Rushen Abbey (1154) are picturesquely situated at Ballasalla. Peel Castle, with the cathedral of St German, is a very beautiful ruin, dating from the 12th century (see PEEL). There are numerous so-called Druidical remains and Runic monuments throughout the island; the Runic crosses, of which there are some forty in all, are especially numerous at Kirk Michael. The Tynwald Hill at St John's, near the centre of the island, is a perfect relic of Scandinavian antiquity. Once a year new Acts of Tynwald are here proclaimed. The hill is artificial, circular, and arranged in four platforms. Both institution and use should be compared with the Icelandic Tingvall. The island is divided into six *sheadings*; these into seventeen parishes; these, again, were divided into *treens* (now obsolete), and, lastly, into *quarter-lands*. The towns, noticed separately, are Castletown, Douglas, the modern capital, Peel, and Ramsey.

The principal line of communication with the United Kingdom is between Douglas and Liverpool, by means of a fine fleet of swift steamers. There is a submarine telegraphic cable between Maughold Head and St Bees Head. In 1873 a line of railway was opened between Douglas and Peel; in 1874 to Castletown and the south; and in 1879 to Ramsey—all on the single narrow-gauge system. Extensive improvements in the way of harbour-works, piers, and promenades have been carried out at Douglas, Ramsey, and Peel. Pop. (1821) 40,081; (1841) 47,986; (1871) 54,042; (1881) 54,089; (1891) 55,598; the smallness of the increase being attributable to emigration. Visitors number about 130,000 annually.

The Roman *Mona* was not Man, but Anglesey. Previous to the 6th century the history of the Isle of Man is involved in obscurity; from that period it was ruled by a line of Welsh kings, until near the end of the 9th century, when the Norwegian, Harald Haarfager, invaded and took possession of the island. A line of Scandinavian kings succeeded, until Magnus, king of Norway, ceded his right in the island and the Hebrides to Alexander III. of Scotland (1266); this transference of claim being the direct result of the disastrous failure of the expedition of Haco of Norway against the Scots in 1263. On Alexander's death the Manx placed themselves under the protection of Edward I. of England by a formal instrument dated 1290; on the strength of this document the kings of England granted the island to various royal favourites from time

to time until 1406, when it was granted to Sir John Stanley in perpetuity, to be held of the crown of England, by rendering to the king, his heirs, and successors, a cast of falcons at their coronation. The Stanley family continued to rule the island under the title of Kings of Man, until 1651, when the style of Lord was adopted. In the same year the island was surrendered to a parliamentary force by Receiver-general Christian, who had raised an armed body against the government, then in the hands of the Countess of Derby. Parliament granted the island to Lord Fairfax; but on the Restoration the Derby family were again put in possession. On the death of James, tenth Earl of Derby, without issue in 1735, James, second Duke of Athol, descended from the youngest daughter of James, seventh Earl of Derby, became Lord of Man. The Isle of Man having been for a long period the seat of an extensive smuggling trade, to the detriment of the imperial revenue, the sovereignty of it was purchased by the British government, in 1765, for £70,000 and an annuity of £2000 a year, the duke still retaining certain manorial rights, church patronage, &c. The last remaining interest of the Athol family in the island was transferred to the British crown in 1829; the amount paid for the island having amounted in the aggregate to £493,000.

The Isle of Man forms a separate bishopric under the title of Sodor and Man. The bishopric of the Sudoreys—Scandinavian for 'Southern Isles'—was for a time annexed to Man; hence the title of Sodor, which is still retained, the name having been applied to the islet of Holm Peel, on which the cathedral church of the diocese stands. This bishopric is said to have been founded by St Patrick in 447. Among the bishops the most famous was Thomas Wilson (q.v.), the author of *Sacra Privata*. The Manx Church has its own canons, and an independent convocation. The see is, for certain purposes, attached to the province of York; the bishop sits in the House of Lords, but does not vote.

The Isle of Man has a constitution and government of its own, to a certain extent independent of the imperial parliament. It has its own laws, law-officers, and courts of law. The legislative body is styled the Court of Tynwald, consisting of the Lieutenant-governor and Council—the latter being composed of the bishop, attorney-general, two deemsters (or judges), clerk of the rolls, water bailiff, archdeacon, and vicar-general—and the House of twenty-four Keys, or representatives. A bill is separately considered by both branches, and on being passed by them is transmitted for the royal assent; it does not, however, become law until it is promulgated in the English and Manx languages on the Tynwald Hill. The House of Keys was formerly self-elective; but in 1866 an act was passed establishing an election by the people every seven years; and a bill passed in 1880 to amend this act abolished the property qualification for members, granted household suffrage in towns, £4 owner and £6 tenant franchise in the country, and conferred the suffrage on women. The armorial bearings of Man are three legs in armour conjoined at the thighs. The Manx people are of Celtic origin, with a strong dash of the Scandinavian. The language belongs to the Goidelic group of the Celtic languages (see CELTS). It is now but little spoken. Church service in the Manx language has been discontinued since the middle of the 19th century. There is no literature beyond a few songs and carols. The Prayer-book was translated into Manx in 1765, the Bible in 1772. A dictionary was compiled in 1835. Some account of the native superstitions will be found in the notes to *Peveril of the Peak*.

Down to the middle of the 19th century the island was almost exempt from taxation, and consequently looked upon as a cheap place of residence, while its laws were available for the protection of English debtors. All this has long ceased. Taxation, locally imposed, has been introduced for various purposes; and, though there is no poor-law, rates in aid are not unknown. The influx of visitors, and the facilities for exporting native produce, have equalised prices with those obtaining in the surrounding countries, and the social condition has been much modified.

See *The Isle of Man, its History, &c.*, by the Rev. J. G. Cumming, M.A., F.G.S.; *History of the Isle of Man*, by Joseph Train, F.S.A. Scot.; Brown's *Popular Guide*; *Chronica Regum Mannicæ*, edited by Munch (Christiania, 1860); *Surnames and Place Names of the Isle of Man*, by A. W. Moore, preface by Prof. Rhys (1890); and the works published by the Manx Society (19 vols. 1858-68).

Manaar', GULF OF, lies between Ceylon and the Madras coast, and is closed on the north by a low reef of rocks and islands called Adam's Bridge. Its extreme width is nearly 200 miles. The gulf is famous for its pearl-fisheries.

Manacor', a town of Majorca, in a fertile plain, 30 miles E. of Palma by rail. Pop. 14,920.

Managua, the capital of Nicaragua, lies in a fertile district, on the south shore of Lake Managua, 53 miles by rail SE. of Leon, and has perhaps 10,000 inhabitants. For the lake, see LEON.

Manakin, a name applied to various birds of the South American group of Chatterers, amongst others to the Cock of the Rock (q.v.). See also COTINGA.

Manaos, capital of Amazonas province, in the United States of Brazil, is on the Rio Negro, 12 miles above its confluence with the Amazons. An ugly, whitewashed cathedral rises in the centre of the town, which also boasts a custom-house, a tiny fort, and a military hospital. It is a steamboat station, and has a considerable trade in various forest-products, but principally in india-rubber. The population, though often stated at 25,000 to 30,000, is under 12,000.

Manassas, formerly MANASSAS JUNCTION, a village close to Bull Run (q.v.). The Confederates called their two victories here the first and second battles of Manassas.

Manasseh, the name of the eldest son of Joseph. The tribe of Manasseh received land on both sides of the Jordan (see PALESTINE).—MANASSEH was also the name of one of the kings of Judah (the fourteenth), who succeeded his father Hezekiah, 697 or 699 B.C., at the age of twelve, and reigned, according to the narrative, for fifty-five years. He rushed headlong into all manner of idolatry, and seduced the people to follow his example. Carried prisoner to Babylon, he repented, and his prayer was heard (2 Chron. xxxiii.).—The apocryphal composition called the *Prayer of Manasses*, found in some MSS. of the Septuagint, was never positively received as canonical.

Manasseh ben Israel, Jewish scholar, was born at Lisbon in 1604, fled with his father from the Inquisition, and settling at Amsterdam became chief rabbi of the synagogue there. In 1656 he visited England, seeking to secure (see JEWS, Vol. VI. p. 328) from Cromwell the readmission of the Jews. He died at Middelburg in 1659. He published texts of various parts of the Old Testament, with notes; *De Creatione Problemata XXX.* (1635); *De la Resurrección de los Muertos* (1636); *De Termino Vitæ* (1639); *Esperança de Israel* (1650); *Vindicatæ Judæorum, or a Letter in Answer to Questions propounded* (Lond. 1656); and *Humble Address to the Lord Protector on behalf of the Jewish Nation* (1656).

Manatee (*Manatus*), one of the 'sea-cows' or *Sirenia*, allied to the Dugong (q.v.) and to the extinct *Rhytina*. Two species, very like one another in structure and habit, are distinguished, *M. australis*, in the rivers and estuaries of the Atlantic side of tropical South America, and *M. senegalensis*, in the Senegal and other rivers of West Africa. They are gregarious, inoffensive, sluggish mammals, browsing on algae, fresh-water weeds, and even shore-plants. In regard to their breeding and parturition information is still required, but we know that the mothers show much affection for the young, and protect them in danger. In length the manatee measures from 10 to 12 feet; the colour of the thick, wrinkled, hairless hide is dark bluish gray, lighter as usual on the ventral surface. The upper lip bears a rounded knob, and

Manatee.

there are yellow bristles about the mouth; the eyes are small and deeply sunk, and the nostrils are valved slits at the end of the snout. From the dugongs they differ in having a thicker body and a straighter head, with the jaws but slightly curved, in the rounded or shovel-like shape of the tail, and in the presence of rudimentary nails on the fore-limbs, to the hand-like form of which the word Manatee refers. They differ also in more technical characters—e.g. in the very exceptional occurrence of six instead of seven neck vertebrae, and in the Dentition (q.v.), which in the adult manatee is represented by horny pads replacing the front teeth lost in early life, and by $\frac{1}{2}$ ridged molars, of which, however, only $\frac{1}{2}$ are in use at a time. The manatee, though becoming scarcer, is still harpooned or otherwise caught, being valued on account of its palatable flesh, its abundant fat, and its strong skin. Gentle and affectionate, it readily admits of being tamed, and living specimens have been successfully transported to the Zoo in London.

See DUGONG; and also the memoirs by Murie and Garrod in the *Trans. Zool. Soc.*, vols. viii. x. xi.

Manbhum, a district forming the eastern part of Chota Nagpore (q.v.).

Manby, GEORGE WILLIAM, inventor of life-saving apparatus for shipwrecked persons, was born in 1765, at Hilgay, near Downham Market in Norfolk, served in the militia, and became barrack-master at Yarmouth in 1803. In 1808 he succeeded, with apparatus designed by him, in saving the lives of the crew of the brig *Elizabeth*. A career of usefulness was thus commenced, which he followed for the remaining forty-six years of his life. He repeatedly received grants of money from parliament. He died November 18, 1854. It was estimated that, by the time of his death, nearly 1000 persons had been rescued from stranded ships by means of his apparatus. See LIFE-SAVING APPARATUS.

Mancha, LA, a district of Spain, the southernmost part of the old kingdom of New Castile, comprising most of the present province of Ciudad Real, with parts of Albacete, Toledo, and Cuenca (see CASTILE). It is the country of the ever-memorable Don Quixote, his squire Sancho Panza, and of the peerless Dulcinea del Toboso.

Manche ('sleeve'), a maritime department in the north-west of France, formed from the old province of Normandy, derives its name from La Manche (the English Channel), which washes its rocky coasts. Greatest length, 81 miles; average breadth, 28 miles; area, 2289 sq. m. Pop. (1872) 544,776; (1886) 520,865. The climate is mild but humid. Cereals, flax, hemp, beetroot, and fruits are extensively cultivated. Immense quantities of apples are grown, from which 28,000,000 gallons of cider are made annually. Horses of the true Norman breed are reared, and excellent cattle and sheep are fed on the extensive pastures. There are valuable granite quarries. The department is divided into the six arrondissements of St Ló, Coutances, Valognes, Cherbourg, Avranches, and Mortain. Capital, St Ló. The port of Cherbourg and the rock of St Michel (with its celebrated abbey) belong to this department.

Manchester (Sax. *Mancestre*), a corporate and parliamentary borough of Lancashire, was elevated to the dignity of a city in 1847, by being made the see of a bishop, and confirmed by royal charter in 1853. It is situated in the hundred of Salford, on the east bank of the Irwell. Salford is on the opposite bank; and the two boroughs, connected by sixteen bridges (besides railway viaducts), may be considered one city. Manchester is the acknowledged centre of the most extensive manufacturing district in the world, and is remarkable from being surrounded by a ring of populous suburban townships formed from the overflow of its population. Within a few miles there is a second circle of towns, with populations ranging from 10,000 to 50,000. At a radius of 30 miles is another cluster of towns, nearly all of them manufacturing, and to all of which there is easy and frequent access by tramways, canals, and railways. Manchester is 187 miles NNW. of London, 31 E. of Liverpool, 51½ SE. of Lancaster, 84 N. of Birmingham, 68½ NW. of York, 48½ SW. of Leeds, 41½ NW. of Sheffield, and 40 NE. of Chester. The growth of the population of the two boroughs is shown in the following table:

	Manchester.	Salford.	Total.
1801.....	75,275	14,477	89,752
1851.....	303,382	102,449	405,831
1871.....	351,189	124,801	475,990
1881.....	423,801	176,235	600,036
1891.....	505,343	198,136	703,479

By the City Extension Act of 1885 the parliamentary boundaries were greatly extended, and later an agitation was begun in various suburban townships for incorporation. Five of these were already incorporated with Manchester in 1890, when others were applying and expected to become incorporated. The total population then will probably exceed a million, though officially it was estimated in 1890 at 873,000. The area of the parliamentary borough is 20 sq. m., and that of Salford 8 sq. m. Both boroughs were enfranchised by the Reform Bill of 1832, Manchester returning two members and Salford one member to parliament. The Reform Bill of 1867 gave Manchester three and Salford two members. Since 1885 Manchester returns six and Salford three members to parliament.

At present Manchester and Salford, and a large portion of the suburban population, are supplied with water collected on the slopes of Blackstone Edge, distant about 20 miles. The water-works possess a total capacity of 3,828,000,000 gallons, and the average daily supply is about 25,000,000 gallons. In view of the rapid increase of the population the city council purchased Thirlmere Lake, in Cumberland, from which will come a further supply of 50,000,000 gallons daily. The water will be conveyed by means of an aqueduct and tunnels to Bolton, and the remaining 60

miles in large iron pipes laid along the main roads. The first contract of 6 miles' tunnelling and $1\frac{1}{2}$ mile of open cutting was let in 1885. The water-works, along with the gas-works, are the property of the corporation, and Manchester claims to have been the first local authority to obtain powers to supply public light. The profits average £105,480, out of which £25,000 is paid over for city improvements. The market rents amount to £44,000 per annum, and until so late as 1845, being governed by the antiquated machinery of manor courts, borough reeve, constables, and unpaid magistrates, tax and toll were paid on all articles brought into the markets. During that year (1845) these manorial privileges were bought for £200,000. In 1845-46 a public subscription founded three parks of about 30 acres each, and shortly after a fourth of 60 acres was added. There are now in Manchester and Salford eleven parks, giving seven for the former and four for the latter, with eight recreation grounds, covering altogether 300 acres. Manchester was also the first borough to take advantage in 1852 of the

churches, a Greek church, and an Armenian (q.v.) church.

The principal buildings for secular purposes are, first, the town-hall (1868-77), by Waterhouse, completed in 1883. The original estimate for the building was £750,000; it has, however, cost £1,053,000, and occupies an area of 8648 square yards. It is a Gothic structure and triangular in form, built of brick, faced with freestone, and at some parts with granite; and is, it is claimed, the finest building in the world devoted to purely municipal purposes. The great hall is decorated with remarkable pictures illustrating the history of Manchester, by Madox Brown (q.v.). The clock-tower, 286 feet high, contains a fine peal of twenty-one bells. In the Royal Infirmary, first used in 1755, as many as 32,000 patients are treated annually, and there is an average of 25 accident cases admitted daily. The Royal Institution is a noble Doric edifice by Barry, built at a cost of £30,000, and contains a gallery of paintings, a school of design, and a lecture theatre. It was erected in 1825-30, its object being to diffuse a taste for the fine arts by exhibiting works of art of the highest class, and to encourage literary and scientific pursuits by means of popular courses of lectures. The walls of the entrance-hall are decorated with casts of the Elgin Marbles, presented by George IV. A fine statue of Dalton by Chantrey is placed in the hall. The Royal Exchange (1864-74), an imposing building in the Italian style, has a meeting-hall said to be the largest in the United Kingdom—area, 5170 square yards. It is 120 feet wide without intermediate supports. Tuesdays and Fridays are the chief days for business, and on these days its immense area is densely covered. The Free-trade Hall (1856) holds 5000 people, and is a memorial of the agitation which resulted in the repeal of the corn laws. The 'Peterloo Massacre' took place on its site. The Assize Courts (1864), by Waterhouse, are a splendid specimen of Gothic architecture, and cost £100,000. The great hall is a magnificent apartment, being 100 feet long, 48½ broad, and 75 feet high. All the arrangements of the court are considered as nearly perfect as possible.

Free Libraries Act. Perhaps none of the great towns in Britain is better furnished with good libraries and reading-rooms than Manchester, all provided within a few years. There are six branch libraries with reading-rooms, and also additional rooms for boys. The Free Reference Library in King Street has 198,000 volumes. Salford has four branch libraries, with reading-rooms and a museum; while Manchester in 1890 received a park, library, and museum from the Whitworth legatees, to be incorporated with the Technical School and School of Art. There are besides eighteen private libraries, some of which are connected with institutions of various kinds. The Chetham Library, founded by Humphrey Chetham (q.v.) in 1653, contains 30,000 volumes, with many rare and curious books and manuscripts, and was the first free library in England. There is a fine old reading-room, in which the visitor is at once carried back in imagination to medieval times. Mention may be made also of the Athenæum, Royal Exchange, Portico, and Law and Foreign Libraries, &c. The two boroughs have about 162 churches belonging to the Establishment. The Cathedral, formerly known as the Collegiate Church, but now called the 'Old Church' (built in 1422), is a fine Gothic structure, and between 1845 and 1868 underwent complete restoration in its original style. It comprises a perfect stalled choir of exquisite beauty, a retrochoir, lady chapel, lateral chapels, chapter-house, and a tower 139 feet high, with ten bells. There are 23 Roman Catholic and 398 dissenting chapels, some of which are very fine specimens of modern Gothic architecture. There are 5 Jewish synagogues, 5 German

and is a memorial of the agitation which resulted in the repeal of the corn laws. The 'Peterloo Massacre' took place on its site. The Assize Courts (1864), by Waterhouse, are a splendid specimen of Gothic architecture, and cost £100,000. The great hall is a magnificent apartment, being 100 feet long, 48½ broad, and 75 feet high. All the arrangements of the court are considered as nearly perfect as possible.

The Literary and Philosophical Society (1789), in George Street, has a valuable scientific library and a chemical laboratory, and publishes memoirs. On its roll are many distinguished names, including Drs Henry and Percival, Benjamin Franklin, Thomas de Quincey, John Dalton, Eaton Hodgkinson, Sir W. Fairbairn, Sir James Whitworth, James Nasmyth, and Dr Joule. There are about seventy other societies and institutions of various kinds in Manchester, many of them of very high standing.

The statues and monuments in Manchester are numerous, and vary considerably in order of merit. On the Infirmary Esplanade are four statues—the Duke of Wellington, Sir R. Peel, Watt, and Dalton. The Albert Memorial stands in Albert Square, also a statue of Bishop Fraser, and in 1890 it was proposed to erect one of Dr Joule, and another of John Bright. A bronze statue of Cobden is placed in St Anne's Square, Humphrey Chetham in the Cathedral, and Cromwell near the entrance of Victoria Street.

The facilities for education in Manchester have been greatly extended and improved within recent years. The Grammar-school is the most ancient, and

was founded by Hugh Oldham, Bishop of Exeter, in 1515. Its original endowment was £29 per annum, but the possession of certain mills on the Irk—a tributary of the Irwell—soon gave the school a substantial revenue. In 1825 the report of the Charity Commissioners showed that the total income of the Grammar-school Trust had reached a sum exceeding £4000 per annum. In 1868 the original plan of the founder was altered, and the new scheme, as sanctioned by the Court of Chancery, is the admission of 100 boys at twelve guineas a year each, the remainder being on the foundation, and the school is enlarged to accommodate 350 boys. In Brazenose College, Oxford, there are four scholarships belonging to this school, and eighteen others of which it has every third turn. In St John's College, Cambridge, it has, in turn with two other schools, a right to twenty-two scholarships. There is also a hospital school, founded in 1651 by Humphrey Chetham, 'for maintaining, educating, bringing up, and apprenticing forty healthy and poor boys.' By 1845 the revenue had increased sufficiently to justify the feoffers in increasing the number of boys to 100. In 1851 was opened Owens College (q.v.). It is due to the liberality of John Owens, who died in 1846, leaving by will £100,000 to be expended in founding an educational institution of the highest class. In 1870 a further sum of £90,000 was expended on new buildings, &c. In 1880 a royal charter was granted for the founding of Victoria University, of which Owens is one of the colleges, and by an additional charter the university was entitled to confer degrees in surgery and medicine. As an educational institution it has already earned a very high character, and has grown steadily in usefulness and resources. The university contains an excellent library and museum of natural history. The Technical School, with which in 1883 was incorporated the Mechanics' Institute, and in 1890 the Manchester Whitworth Institute, has proved very completely how a school can be organised to give thorough technical training in the principles and processes of great and complicated industries. The course of studies is generally confined to subjects of commercial and mechanical interest—theoretical and practical engineering, designing, spinning and weaving, printing, dyeing, and bleaching, metallurgy and chemistry. It has also several good lecture-rooms. Every facility is afforded the scholars for acquiring thorough knowledge, theoretical and practical, of the various handicrafts, and the expert use of tools. The guarantors of the Manchester Exhibition (1887) have contributed their surplus of £42,000, and the city council has adopted the Technical Instruction Act, and has from 1890 allotted the school the sum of £2000 per annum. In 1889-90 there were 50 board schools and 130 elementary schools, with an attendance of 72,167 scholars. There are evening classes in connection with the board and technical schools at a moderate rate. As regards the education of the poorer children, the persevering endeavours of the wealthy and benevolent in this direction have been very noteworthy.

The great revolution in the industrial life of England began here about the middle of the 18th century—the substitution of the factory system, where large numbers of men work together, for the older method of each working in their homes. New possibilities were also opened up by a series of remarkable inventions which increased production of manufactured goods at a far cheaper and inconceivably more rapid rate, combined with the new application of mechanical power to the service of man in Watt's steam-engine. Manchester has been the pioneer in opening up new means of internal communication, and to meet the rapid increase of

trade and commerce many efforts were made in early times to substitute some better means for the pack-horse mode of carriage and conveyance. In 1720 the Irwell was made navigable. In 1756 the Bridgewater Canal was constructed, which put Manchester in communication with the coalfields of Lancashire and the salt-mines of Cheshire, and made an outlet to the sea. Later it became a highway for passengers as well as goods. In 1830 Manchester had the first perfect railway in full operation. It has been proved that conveyance by water is only one-tenth of the cost of the same distance by land, and, in order to avoid transhipment of goods, and to render Manchester an inland seaport, the gigantic engineering work of making a ship-canal at a cost of £5,750,000 sterling was carried out in 1887-91 (see CANAL, Vol. II. p. 700). A perfect network of railways and canals radiates from Manchester as a centre in all directions. In consequence of all these gradual changes Manchester is losing its character as merely a manufacturing town. A change is gradually developing in the *locale* of the various large industries, and the city may be regarded now as the general market for the whole trade. The principal cotton-mills and other industries are being removed to the suburbs north and east of the city, and in and around Manchester and Salford two-thirds of the entire cotton-manufactures of the United Kingdom are located. There are about 700 different industries in the district. Manchester was the first place to secure the privilege of inland bonding for articles charged with customs duties, and now produces a large and increasing revenue from that source.

The sanitary condition of Manchester is not a satisfactory one, and in consequence the death-rate, averaging 35 per 1000, is abnormally high; but it must be remembered that the corporation had long arrears of neglect and indifference to make up, while a rapid increase of population was going on. Down to 1838 Manchester and Salford were governed by a borough-reeve and constables, and from their abolition only could the real work of improvement begin. As instances of the immense works accomplished by the corporations may be mentioned the gas and water supplies, municipal buildings, widening and draining of the streets, removal of unhealthy courts and dwellings. The sewage main drains made since 1838 are 95 miles in length, cross drains and eyes 148 miles, whilst the area of streets paved equals a million square yards. The smoke nuisance is perhaps more difficult to remove now than when the factories were within the city. The disease and death dealing river, the Irwell, flowing through a dense population, has yet to be dealt with. Besides the pollution from public works of all kinds it is the receptacle of the sewage from more than one million of a population distributed over the watershed of the Irwell, comprising an area of 300 sq. m. Great efforts are constantly being made to remedy this unfortunate state of matters.

Manchester is undoubtedly an ancient city. It is mentioned as a Roman station (*Mancunium*; in A.S. *Manigceaster*), and spoken of at the time of the Norman Conquest in connection with Salford and Rochdale, but the uncertainty of all trustworthy information, especially as regards its origin, renders any account of its early history a matter of doubtful value. We cannot determine when Manchester became a manufacturing district, but it is probable that the introduction of Flemish artificers in the reign of Edward III. is the real starting-point. In the 13th century there was a fulling-mill, and dyeing yarns or cloth was practised. The 14th and 15th centuries are mentioned as periods of great progress. Camden, who visited Manchester in the reign of Queen Elizabeth, describes it as

'surpassing neighbouring towns in elegance and populousness. Here,' he says, 'is a woollen manufacture, church, market, and college. In the last age it was more famous for the manufacture of stuffs called Manchester cottons and the privilege of sanctuary, which the parliament under Henry VIII. removed to Chester.' In 1724 Dr Stukely describes it as 'the largest, most rich, populous, and busy village in England. Here are about 2400 families, and their trade, which is incredibly large, consists of fustians, tickings, girth-webbs, and tapes, which are dispensed all over the kingdom and to foreign parts. They have looms which work 24 laces at a time, stolen from the Dutch, and on the same river for the space of 3 miles there are 60 water-mills.' Another authority of near the same date says 'the inhabitants are not only thrifty and inventive but very industrious and saving—always contriving and inventing something new.'

In the political world Manchester has taken a leading place. The Anti-corn-law League, which after a seven years' struggle caused the repeal of the corn laws, had its origin here; and the *Manchester School* is a term applied to a party of English Radicals, which had its origin in the Anti-corn-law League. It identified itself with the development of free-trade principles, utilitarianism, the resistance to government interference (as with factory labour), supporting a policy of *laissez faire*, and in foreign affairs was a peace party, insisting strongly on non-interference. See articles on Corn Laws, Free Trade, Bright, Cobden, Gibson (Milner).

See Whittaker's *History of Manchester* (1771); Prentice's *History and Sketches of Manchester* (1850-53); Reilly's *History of Manchester* (1861); Baine's *History of Lancashire* (1870); Proctor's *Memorials of Manchester* (1880); Axon's *Annals of Manchester* (1886); Saintsbury's *Manchester* (1887); and M'Culloch's *Dictionary of Commerce* (1887).

Manchester, the largest city of New Hampshire, stands mostly on the east bank of the Merrimac River, 16 miles S. of Concord, 59 miles NNW. of Boston by rail. Its principal streets are wide and shaded with elms, and it has several public parks. The river here falls 54 feet, and affords water-power to numerous factories. The great industry of the place is its manufacture of cottons and woollens; but locomotives, fire-engines, sewing-machines, wagons, edged tools, boots and shoes, paper, &c. are also manufactured. Manchester is the seat of a Roman Catholic bishop, and has a Catholic orphanage and a convent, besides a state reform-school. Pop. (1870) 23,536; (1890) 44,126.

Manchester, EDWARD MONTAGU, second EARL OF, English general and statesman, was the son of the first earl, and was born in 1602. After leaving Cambridge—his college was Sidney Sussex—he accompanied Prince Charles to Spain, and afterwards sat in the House of Lords as Baron Kimbolton. But siding with the popular party, and being an acknowledged leader of the Puritans in the Upper House, he was charged by the king (3d January 1642) with entertaining traitorous designs, along with the five independent members of the House of Commons. He succeeded his father as earl in the same year. On the outbreak of hostilities he of course fought for the parliament. He served under Essex at Edgehill, then held the associated (eastern) counties against Newcastle, took Lincoln (1644), and routed Prince Rupert at Marston Moor—that is to say, he nominally commanded; the real fighting was done by Cromwell and his Ironsides. He then marched to oppose the royalists in the south-west, and defeated them at Newbury (the second battle). But after this battle he again showed slackness in following up the victory, the same fault that had been noticed after Marston

Moor. In consequence Cromwell accused him of military incompetency in the House of Commons, and the two had a downright quarrel. The Self-denying Ordinance deprived Manchester of his command, and this did not allay his bitterness against Cromwell. He opposed the trial of the king, and protested against the Commonwealth. Afterwards, having been active in promoting the Restoration, he was made Lord Chamberlain, a step designed to conciliate the Presbyterians. He died 5th May 1671.

His grandson, CHARLES MONTAGU, fourth EARL, supported William of Orange in Ireland, was sent as ambassador extraordinary to Venice (1696), Paris (1699), and Vienna (1707), and was made Duke of Manchester in 1719 for having favoured the Hanoverian succession. He died 20th January 1722.

Manchineel (*Hippomane mancinella*), a tropical American tree of the natural order Euphorbiaceæ, celebrated for the poisonous properties of the acrid milky juice with which every part of it abounds. A drop of this juice, which is of a pure white colour, burns like fire if it falls upon the skin, and the sore which it produces is very difficult to heal. The Indians of tropical America use it for poisoning their arrows. The fruit is in form, colour, and scent not unlike a small apple. The fruit of manchineel dried and pulverised is diuretic; the seeds are excessively so. The wood is of fine quality, and well suited for cabinet-making.

Manchuria, or the country of the Manchus, called by the Chinese Tung-san-sheng, is the north-easternmost division of the Chinese empire, bounded N. by the river Amur; E. by the Usuri and the Russian Maritime Province; S. by Corea, the Yellow Sea, and the gulf of Liao-Tung; and W. by Mongolia. It embraces three provinces—Moukden (area, 50,000 sq. m.; pop. 12,000,000), in the south, also called Feng-tien and Liao-Tung; Heilung-chiang (area, 140,000 sq. m.; pop. 2,000,000), in the north; and Kirin (area, 90,000 sq. m.; pop. 7,000,000), lying between the other two—total area, 280,000 sq. m.; total pop. 21,000,000. The eastern and most of the central parts are covered with the irregularly-grouped ranges of the Long White Mountains, which in the White Mountain itself reach 8000 feet, whilst the northern province is crossed by the Chingan Mountains. The central parts of the country are watered by the Sungari, which rises in the crater-lake of the Long White Mountains, and after a course of 850 miles joins the Amur in the north of Kirin province. Besides the frontier rivers already mentioned there are the Nonni and the Hurka, affluents of the Sungari; the Tumen, which separates the Maritime Province of Russia from Corea; and the Ya-lu and Liao-Ho, which flow south-westwards into the China Sea. The hills are rich in timber, pines predominating; in minerals, chiefly gold, silver, coal, and iron, of all which little is extracted, though steps were being taken in 1890 to work the gold-mines in the Amur region; and in fur-bearing and other animals, as the sable, foxes, lynx, squirrel, tiger, bear, wolf, deer, &c. The Manchurian lark, a clever mimic, is exported in great numbers to China. The rivers swarm with salmon, and trout are plentiful. The climate is temperate in summer, especially whilst the rains last (May to September), but very severe in winter, the season of traffic, when the streams and extensive marshy tracts are frost-bound; the thermometer frequently falls as low as -25° F. in the northern province in the depth of winter. The soil is extremely fertile, and produces in abundance millet (with vegetables the chief food of the people), maize, hemp, poppy, beans, rice, vegetables, and ginseng. Wild silk is produced. The industry is

confined to the making of furniture, coffins (sent to China), and carts, the tanning of leather, the preparation of furs, and the distilling of spirits. A large amount of trade is carried on at the towns in the interior, and especially at the treaty port of New-chwang (q.v.). Beans, bean cakes and oil, silk, ginseng, skins and furs, &c. are exported to the annual value of 1½ million sterling, and cottons, woollens, metals, sugar, silk, paper, medicines, opium, &c. imported to 1½ million sterling. The native opium is rapidly supplanting the Indian, the import of which fell from 327,067 lb. in 1879 to 12,266 lb. in 1889. Excessive floods in 1888 caused a severe famine. The population does not embrace more than one million Manchus, and most of these dress and speak like Chinese. Yet they are the aristocracy of the country, furnishing its magistrates and soldiers, its police, and its hunters, though many cultivate their own land. Ever since the Manchus conquered China (1644) and founded the present imperial dynasty Manchuria has been the favourite recruiting-ground for the Chinese army; there are stated to be 80,000 drilled men in the country. The rest of the population consists almost entirely of Chinese immigrants, as enterprising, industrious, and prosperous as any people in the empire. The principal towns are Moukden (q.v.), the capital; Kirin (q.v.); Tsitsihar, a convict settlement for the empire; Ying-tzu, commonly called New-chwang (q.v.), the chief port; and some others with populations of about 20,000. All Manchurian towns are indescribably filthy, worse than English towns in the 15th century, and most of them are walled. The religions current are those found in China (q.v.), though the original creed of the Manchus was Shamanism. Early in the 11th century B.C. there existed a native kingdom in the southern of the three provinces, and this was succeeded by other states, until in the beginning of the 17th century Nurhachu, a Manchu chief, founded a powerful sovereignty; in 1644 his grandson ascended the throne of China, and thus founded the reigning Chin dynasty. The conquerors imposed upon the conquered the custom of wearing the pigtail, shaving the forehead, and dressing in narrow-sleeved instead of wide-sleeved coats. Brigandage and gambling are exceedingly rife in the country. The Manchu language is a branch of the Mongol stem, as the people themselves are of the same division of the Ural-Altaic family. The French Roman Catholics have had missionaries in Manchuria since 1838, and the Scottish and Irish Presbyterian churches since about 1861. See James, *The Long White Mountain* (1888), where other books are quoted.

Mancini. See MAZARIN.

Mandæans, an oriental religious sect of great antiquity, formed out of heterogeneous Christian, Jewish, and heathen elements, and still found about the cities of Wāsīt and Basra, and in Khūzistān (*Susiana*) on the eastern shore of the Tigris, working as jewellers, blacksmiths, carpenters, &c. The name is due to the word *Mandā*, 'gnosis' (whence *Mandāyē*, 'gnostics'), but the public name they take is that of Sabians (*Subbā*, 'baptists'), thus professing to identify themselves with the Sabæans tolerated in the Koran. They were formerly called Christians of St John the Baptist from their habit of baptism or ablation. In their religious system the supreme is *Prā rabbā* ('the great glory'), with which is connected the *Mānā rabbā*, which, after calling forth the first life, retired into an obscurity that can be penetrated only by the most holy after death, and that but once. The first life (*Chayē Kadmayē*) is the active deity as revealed, and which alone can be worshipped. From it, besides the 'second life,'

emanated the *Mandā d'hayyē* ('spirit of life'), the mediator and saviour of the Mandæans, from whom they derive their name. He reveals himself to man in his three sons, *Hibil*, *Sitil*, and *Anūs*; of these *Hibil* is the most important. From the second life emanated the *Uthrē* ('angels'), the greatest of whom is *Abātūr*, whose son Gabriel built the earth and formed man, save that his spirit was infused into him by *Mānā rabbā*. There is an elaborate cosmogony extending to the kingdoms of darkness, of hell, the mountains of the blessed, and the planets. The succession of false prophets from Nū were *Abrahīm*, *Mīshā* (Moses), *Shlīmūn* (Solomon), and *Yishu M'shiha* (Jesus), who had been baptised through deceit by the only true prophet, *Yahya*. The last of the false prophets is *M'hamad*.

The Mandæans had three degrees in the priesthood, with a supreme official (*Rīsh ammā*) as the source of both civil and ecclesiastical authority. The priests officiate in white robes, barefooted, and women may be admitted to their order. Their principal rite is the *masbatha* or baptism. Their sacred language is an Aramaic dialect close to the Babylonian Talmud. They have five important sacred books: *Sidrā rabbā* ('the great book'), called also *ginza*, 'treasure'; *Sidrā d'Yahyā* ('book of John'); the *Qolasta*, a collection of hymns; *Diwān*, a ritual; and *Asfar Mahwāsē*, a manual of astrology.

Brandt traces this system of religion back to the period of amalgamation of the Assyro-Babylonian religious spirit with the philosophical speculation of the Greeks.

See Chwolson, *Die Sabier u. der Sabismus* (1856); Siouffi, *Études sur la Religion des Soubbas ou Sabéens* (1880); E. Babelon, *Les Mandéites, leur Histoire et leurs Doctrines religieuses* (1882); and especially Dr Brandt, *Die Mandäische Religion* (1889).

Mandalay, the capital of Upper Burma, stands 2 miles from the left bank of the Irawadi, a little N. of Amarapura (q.v.), the former capital, and 410 miles by rail (1888) N. of Rangoon. Founded in 1860, it was the capital of independent Burma until its capture by the British in the end of 1885, and since the treaty by which (1886) the king lost his throne it has been the capital of Upper Burma. The city forms a square, each side a mile long, and is surrounded by a wide moat, a crenelated brick wall 26 feet high, and an inner earthen parapet. In the centre of the city stand the royal palaces, constructed principally of teak-wood, and enclosed by three stone walls and a teak-wood stockade. There is little of real interest or beauty in them beyond some rich wood-carving. The most famous building in Mandalay is, however, the Aracan Pagoda; it contains a brazen image of Buddha, 12 feet high, an object of veneration to thousands of pilgrims. Outside these enclosures was, until the British conquest, a crowded, dirty native town, now cleared away to make room for a British cantonment. The present native quarters lie outside the fortified city. Beyond them, again, on the slopes of the hills that border the valley of the Irawadi, are numerous fine monasteries. Pop. 65,000. Silk-weaving is the most important of the industries; the others are gold and silver work, ivory and wood carving, bell and gong casting, and knife and sword making. In 1886 one-tenth of the city was burned to the ground, and an inundation of the river caused immense damage. In the same year a meteorological observatory was built.

Manda'mus is a writ, not of right but of prerogative, which issues from the Court of Queen's Bench, commanding some public body, or inferior court, or justices of the peace, to do something which it is their legal duty to do. In the United States the power to issue writs of mandamus is vested in

the Supreme Court, and is also allowed to the circuit courts, subject to considerable restrictions.

Mandarin, a general term applied to Chinese officers of every grade by foreigners, derived from the Portuguese *mandar*, 'to command.' For the Chinese governmental authorities, their rank and distinctive buttons, see CHINA, Vol. III. p. 191.

Mandeville, BERNARD DE, English satirical writer, though born of Dutch parents at Dordrecht in Holland in 1670. He graduated in medicine at Leyden, after six years of study, in 1691, and immediately afterwards settled in London to practise his profession; he died in that city in 1733. He is known as the author of a short work in doggerel verse entitled *The Fable of the Bees*, which, as finally published in 1723, included the fable itself, called *The Grumbling Hive*, first printed in 1705, *Remarks on the Fable*, and *Inquiry into the Origin of Moral Virtue*, both added to the 1714 edition, and *An Essay on Charity Schools and Search into the Origin of Society*, added in 1723. This book was a pothouse fulminant, levelled against the ethical theories of Shaftesbury, who set up as the standard of virtue the ultra-refined tastes of an idealistic aesthete. Mandeville, writing in a vein of extremely coarse and brutal paradox, cynical in its frankness, though frequently of striking acuteness, affirms that 'private vices are public benefits,' and that every species of virtue is at bottom some form of gross selfishness, more or less modified. Thus he over-emphasises the baser elements in human nature, as Shaftesbury does the 'dignified.' The book was condemned by the grand jury of Middlesex as being immoral and pernicious in its teaching. Besides that, it was attacked by Law (q.v.) the nonjuror, by Berkeley, by Brown, Warburton, Hutcheson, and others. Mandeville in his defence states that he wrote in irony for the diversion of people of discernment and knowledge, and his words were not to be taken in literal earnest, as if meant for general readers. Nevertheless, his other works, such as *The Virgin Unmasked*, *Free Thoughts on Religion*, &c., detract greatly from the sincerity of this plea. It is worth while observing that his realistic habits of thought bring him in some respects curiously into touch with the exponents of modern scientific methods of inquiry.

See Leslie Stephen, *Essays on Freethinking* (1873), or the briefer summary in vol. ii. of the same writer's *English Thought in the 18th Century* (1876).

Mandeville, JEHAN DE, the name assumed by the compiler of a famous book of travels, written in French, and published between 1357 and 1371. Versions in Italian, Spanish, Dutch, Walloon, German, Bohemian, Danish, and Irish are found, and the number of MSS. amounts to at least 300. Many have maintained the priority of the Latin text, which exists in as many as five independent versions, but it seems much more probable that the French was the earlier. The earliest edition of the French text was printed at Lyons in 1480. Indeed, it is most probable that the book was written under a feigned name by the physician Jehan de Bourgoigne, otherwise Jehan à la Barbe, who is stated in an early Latin edition to have met Mandeville first at Cairo, and again at Liège, and to have persuaded and helped him to write his travels. There can be little doubt that this statement of Bourgoigne's was merely an ingenious blind, and that he alone was the author of the book. But a statement has been discovered that Bourgoigne revealed on his death-bed his real name of Mandeville to Jean d'Outremeuse, explaining that he had had to flee from his native England for a homicide. We are told further that this physician, who died in 1372, had practised his profession at Liège since 1343. And it is

apparently quite certain that in the 16th and 17th centuries a tomb was shown at Liège, with a Latin inscription stating that Mandeville died there in November 1372. An English version was made from a defective French manuscript at least as early as the beginning of the 15th century, and two extant independent revisions of this followed within a quarter of a century. The original defective form was printed by Pynson and Wynkyn de Worde (1499); the editions of 1725 and the well-known reprints by Halliwell (1839 and 1866) represent one of these later revisions; that first printed for the Roxburghe Club in 1889 is an admirable edition of the other. But the glaring errors of translation render it impossible that either of these forms of the English version can be from the hand which wrote the original work, in spite of the statement in the preface, which has been too easily believed, that it was made by Mandeville himself. None the less it remains an admirable monument of English, but the name of Sir John Mandeville should now disappear from histories of literature as the 'father of English prose.'

In the preface the French compiler describes himself as a knight born at St Albans, who left his native country in 1322, travelled by way of Turkey, Armenia, Tartary, Persia, Syria, Arabia, Egypt, Libya, Ethiopia, Amazonia, and India, often visited Jerusalem, and who wrote in Romance as better understood than Latin. In the course of the book we are told further that he had served the sultan of Egypt against the Bedouins, and the emperor of China against the king of Manzi; that he had seen the glory of Prester John and drunk of the Fountain of Youth at Palombe (Quilon on the Malabar coast), and returned home unwillingly owing to arthritic gout in 1357.

By far the greater part of the book has now been proved to be borrowed, with interpolations, usually extravagant, from the narrative of Friar Odoric (written about 1330); from Hayton, an Armenian who became a Premonstratensian monk, and dictated at Poitiers in 1307 a book about the East in the French tongue; from the work of the Franciscan Carpini; from the well-known *Epistle* of Prester John, widely known in the 13th century; from Albert of Aix, Brunetto Latini, Peter Comestor, Jacques de Vitry, Vincent de Beauvais (*Speculum Historiale* and *Speculum Naturale*); from the 12th-century Latin itineraries of Palestine, and from the work of the German knight William of Boldensele, written in 1336. A small portion of the book may still represent actual travels and personal knowledge, especially in the part relating to the Holy Land; but this does not re-establish the honesty of the writer, who claims himself to have travelled in the remotest regions described, and to have seen with his own eyes the wonders enumerated, while he never mentions Odoric, from whom he conveyed by far the greater part of his book. Among these wonders we find stories of fabulous monsters, such as anthropophagi, and men whose heads grew beneath their shoulders, the phoenix, the vegetable lamb, the weeping crocodile, the garden of transmigrated souls at Cansey (Hang-choo-foo), and the Valley Perilous. Of the Terrestrial Paradise, however, the writer is candid enough to say that he had not been there.

See the article by Colonel Yule and E. B. Nicholson in vol. xv. (1883) of the *Encyclopædia Britannica*, and the latter's letter in the *Academy* for April 12, 1884; Dr Albert Bovenschen, *Quellen für die Reisebeschreibung des Johann von Mandeville* (Berlin, 1888); and the Introduction by G. F. Warner to his edition for the Roxburghe Club (1889), in which the views of Dr Vogels and Dr Carl Schönborn are also discussed.

Mandible, a name applied to various jaw-organs—e.g. the third pair of appendages in Crus-

taceans, the first pair of true appendages in Insects, the lower jaw in Vertebrates.

Mandingoes are a Bantu people of Africa, mainly in Senegambia (q.v.). See AFRICA, Vol. I. p. 85.

Mandogarh, or **MANDU'**, a ruined city of India, formerly capital of the Mohammedan kingdom of Malwa, stands 15 miles N. of the Nerbudda and 38 SW. of Indore. The ruins stretch for 8 miles along the crest of the Vindhya Mountains, and have a circumference of 37 miles. A deep, narrow valley separates them from the adjoining tableland. The least injured of the ruined buildings is the great mosque, which is reached by a handsome flight of stairs; it is said to be 'the finest and largest specimen of Afghan architecture extant in India.' There are also a massive royal palace and the white marble mausoleum of the king who raised the city to the acme of its splendour (early 15th century). According to Malcolm, Mandogarh was founded 313 A.D.

Mandoline, a musical instrument of the lute species. The body of the mandoline is formed of a number of narrow pieces of different kinds of wood, bent into the shape, and glued together. On the open portion of the body is fixed the sounding-board, with a finger-board and neck like a guitar. The Neapolitan mandoline, which is the most perfect, has four double strings, tuned (beginning with the lowest) G, D, A, E. The Milanese mandoline has five double strings, tuned G, C, A, D, E. The sound is produced by a plectrum in the right hand, while the left hand produces the notes on the finger-board. The mandoline is chiefly used for accompaniment.

Mandrake (*Mandragora officinalis*), a Solanaceous plant closely allied to Belladonna (q.v.). There are two varieties, the vernal and the autumnal; both are natives of the Mediterranean region and the East, and especially abound in Greece. The whole plant has a very fetid narcotic smell;

Mandrake (*Mandragora officinalis*).

and all parts have poisonous properties like those of belladonna, but more narcotic, for which reason a dose of the root was formerly sometimes given to patients about to endure surgical operations. The ancients were well acquainted with the narcotic and stupefying properties of mandrake, and it was a common saying of a sleepy or indolent man that he *had eaten mandrake*. The large taproot grows somewhat irregularly, and often seems divided into two, through the development of a branch which attains more or less equal size. Hence arises a rude resemblance to a human figure; and this is easily exaggerated by a little judicious pruning or carving, and by trimming the covering of fine hair-like roots. Hence Pythagoras speaks of the mandrake as *anthropomorphic*. To such mannikin-figures many magical virtues were ascribed: by the ancient Germans they were supposed to bring luck

to their possessors, who accordingly dressed and tended them like dolls, yet kept them reverentially enshrined in caskets, and thus obtained their services for the healing of obstinate diseases of man and beast, for the divination of the future, or the ensuring of supplies of money. From the most ancient times aphrodisiac virtues have been ascribed to mandrake, which was therefore supposed to cure barrenness (see Gen. xxx. 14-16); such repute is hardly borne out by the actual properties of the root (which would, however, relax the womb), but probably more commonly depended on its magical associations as a phallic figure. The extremely narcotic and poisonous properties of the plant could not but invest these figures with a more grim significance, of which the medieval imagination made the most. So large, deep, and well fixed a root needs some labour to dig out, and, if torn up by main force, breaks with more or less noise, hence the ancient legend that the mandrake shrieks when torn out of the ground. The subsequent possibilities of accident (not to speak of misuse) can easily be imagined, not only from the sweet and attractive berries, but the leaves, root, or even juice. On the base of caution there arose a whole fantastic ritual: the plant could only be safely dug up at midnight, and when loosened by careful digging should be dragged out of the ground by a black dog, which served as a vicarious substitute for the herbalist, in dread of the mandrake's vengeance.

Mandrill. See BABOON.

Manduria, a town of Southern Italy, 22 miles E. by S. of Taranto, near the ancient town of Manduria, of which some important relics are still extant. Pop. 8865. In 1790 it exchanged its name of Casalnuovo for Manduria.

Mandvi, the chief seaport of the principality of Cutch, in India, on the north shore of the Gulf of Cutch, 36 miles SW. of Bhuj, the capital. It has a good roadstead and a breakwater, but the harbour is choked with sand. The pilots are in request all through the state. Pop. (1881) 35,980.

Manes. See LARES.

Manet, ÉDOUARD (1832-82), a French painter, the founder of Impressionism (q.v.). See his Life by Bazire (Paris, 1884).

Manetho, a celebrated Egyptian historian, native of Sebennytus, a priest who flourished in the 3d century B.C. See EGYPT, Vol. IV. p. 238.

Manfred, regent and king of Sicily, was a natural son (afterwards legitimised) of the Emperor Frederick II. by Bianca, the daughter of Count Lancia, and was born in 1231. On his father's death in 1250 he received the principality of Tarentum, and in the absence of his half-brother, Conrad IV., acted as regent in Italy. He bravely defended his sovereign's interests against the aggression of Pope Innocent IV.; and after Conrad's death he was acknowledged as regent of Apulia, in name of his nephew Conradin (q.v.). The pope, however, renewed his pretensions to Apulia, and compelled Manfred to flee for shelter to the Saracens, by whose aid he defeated the papal troops, and became, in 1257, master of the whole kingdom of Naples and Sicily. On the rumour of Conradin's death he was crowned king at Palermo, 11th August 1258, and immediately afterwards was excommunicated by Pope Alexander IV. along with his adherents; but Manfred invaded the papal dominions, and made himself master of the whole of Tuscany. His power now seemed secure, and his government was at once mild and vigorous. But this tranquillity was not of long duration. Pope Urban IV. renewed the excommunication

against him and his friends, and bestowed his dominions as a papal fief on Charles of Anjou, the brother of Louis IX. of France. Manfred, though at first successful in the war which ensued, was at last treacherously defeated, and slain in a bloody battle at Benevento, 26th February 1266. His body was interred as that of an excommunicated person. His widow and children were barbarously treated by the French; the widow and three sons died in prison; the daughter was confined for twenty-two years. His history has been made the subject of drama and opera. See Cesare, *Storia di Manfredi* (1837); Schirrmacher, *Geschichte der letzten Hohenstaufen* (1871).

Manfredonia, a walled seaport of Italy, on the Gulf of Manfredonia, a bay of the Adriatic, 23 miles by rail N.E. of Foggia. Founded by Manfred in 1261 from the ruins of ancient Sipontum, it has an old castle and a cathedral. Pop. 8324.

Mangalore, a seaport and military station, and chief town in the district of South Kanara, in the presidency of Madras, India. A clean, picturesque town, embosomed in cocoa-nut palm groves, it ships large quantities of coffee (from Coorg and Mysore) in small Arabian and Indian vessels. The total trade reaches an annual average of nearly £780,000 in value. Pop. (1881) 32,099, including a large body of Roman Catholics, who have here a bishop and a college. Mangalore is also the headquarters in India of the Basel Lutheran Mission, the members of which teach their people to weave cloth, print and bind books, and make roof tiles. The town, which was three times sacked by the Portuguese in the 16th century, was taken by Hyder Ali in 1763, and made the headquarters of his navy. In 1784 its English garrison yielded to Tippoo Sultan after a nine months' siege. It became British in 1799, and was burned by the Coorg rebels in 1837.

Mangan, JAMES CLARENCE, a gifted but hapless Irish poet, who was born in 1803, and employed for many years in the drudgery of copying in an attorney's office. His heart was framed for suffering, and his whole life was a tragedy of hapless love, poverty, and intemperance, until he found rest in death at Meath Hospital, Dublin, 20th June 1849. There is fine quality in his original verse, as well as in his translations from the German, but more especially from the old Irish, as in the impassioned ballad of *Dark Rosaleen*. His *German Anthology* was published in two volumes in 1845, a complete edition of his poems at New York in 1870, with a biographical introduction by John Mitchell.

Manganese (sym. Mn; atomic weight, 55) is one of the heavy metals of which iron may be taken as the representative. It is darker in colour than wrought iron, is capable of a high degree of polish, and is so hard as to scratch glass and steel. It is only feebly attracted by the magnet, and oxidises readily on exposure to the air. The metal occurs in nature in small quantity along with iron in meteoric stones, but may be obtained in large amount by the reduction of its sesquioxide or carbonate by charcoal at an extreme heat.

With oxygen it forms six compounds: manganous oxide, MnO ; manganic oxide, Mn_2O_3 ; manganoso-manganic oxide, Mn_3O_4 ; manganese dioxide, MnO_2 ; manganic anhydride, MnO_3 ; and permanganic anhydride, Mn_2O_7 . Like iron it forms proto-salts, $MnCl_2$, and persalts, Mn_2Cl_8 . It also forms salts derived from an acid, H_2MnO_4 , such as potassium manganate, K_2MnO_4 , and from an acid, $HMnO_4$, as potassium permanganate, $KMnO_4$. The *binovide*, MnO_2 , is the chief form in which manganese is found in nature, and is the general source of the other compounds. It is known to

mineralogists as pyrolusite, and in commerce as black manganese or manganese simply. When heated alone or with sulphuric acid it gives off oxygen, and when heated with hydrochloric acid chlorine is evolved. It is largely used in the manufacture of glass, to which it imparts a purple colour. It is also supposed to colour the amethyst.

Manganous oxide, MnO , is an olive-green powder. Its salts are colourless, or of a pale rose colour. The sulphate, $MnSO_4$, in pink crystals, is largely used by the calico-printer for the production of black and brown colours, by decomposing it with bleaching powder or an alkali.

Manganic oxide, Mn_2O_3 , in octahedral crystals, forms the mineral braunite, and in the hydrated form, $Mn_2O_3 \cdot H_2O$, the mineral manganite.

Red oxide of manganese, Mn_2O_4 , is formed when any of the other oxides are heated in the air. It is found in nature as the mineral hausmannite.

Manganic anhydride, MnO_3 , is not known in the free state. It forms a hydrated acid, H_2MnO_4 , which forms salts. Manganate of potassium, K_2MnO_4 , is the best known of these. It is in green crystals, and on allowing its solution to stand exposed to the air it rapidly becomes blue, violet, purple, and finally red, by the gradual conversion of the manganate into the permanganate of potash; on this account it is sometimes called chameleon mineral.

Permanganic anhydride, Mn_2O_7 , is only known in solution or in a state of combination. Its solution is of a splendid red colour, but appears of a dark violet tint when seen by transmitted light. Permanganate of potash, $KMnO_4$, which crystallises in reddish-purple prisms, is the most important of its salts. It is largely employed in analytical chemistry, and is the basis of Condy's Disinfectant Fluid.

Manganese is a constituent of many mineral waters, and is found in small quantity in the ash of most vegetable and animal substances. It is almost always associated with iron. Various preparations of manganese have been employed in medicine. The binovide has been used as a substitute for bismuth in dyspeptic affections, while various preparations have been tried as substitutes for iron in anæmia, but with disappointing results. The manganate and permanganate of potash readily part with their oxygen, and in weak solution are used as disinfecting and astringent lotions.

Mange, a contagious disease in horses, dogs, and cattle, is, like scab in sheep, very similar to itch in the human subject, resulting from the attacks of minute mites or *acari*. Some of these burrow in the skin, others move about upon the skin, especially if it be dirty or scurfy, and cause much irritation, heat, and itching, and the eruption of minute pimples, with dryness, scurfiness, baldness, and bleaching of the skin. The treatment consists in destroying the *acari*, and insuring the cleanliness and health of the skin, both of which objects are effected by washing the parts thoroughly every second day with soft soap and water, and dressing daily with sulphur or mild mercurial ointments, or with a solution containing four grains either of corrosive sublimate or arsenic to the ounce of water. Castor-oil seeds, bruised and steeped for twelve hours in buttermilk, are very successfully used by the native Indian farriers. Where the heat and itching are great, as is often the case in dogs, a few drops of tincture of belladonna may be used to the usual dressing, or applied along with a little glycerine. Where the general health is indifferent, as in chronic cases, the patient should be liberally fed, kept clean and comfortable, have an occasional alterative dose of any simple saline medicine, such as nitre or common salt, and a course of such tonics as iron or arsenic. Cleanliness and

occasional washing and brushing maintain the skin in a healthy state, and thus prevent its becoming a suitable nidus for the *acari*.—The Sarcotic mange, due to a burrowing mite, besides being highly contagious, is often fatal, and is especially legislated for in the Shetland Islands, where it is very prevalent, under the Contagious Diseases (Animals) Act.

Mangnall, RICHMAL, of Irish extraction, but born in London, was the head-mistress of a ladies' school near Wakefield, and died in 1820. Few particulars of her personal history have been preserved; she survives only in her redoubtable *Questions*, the pride and terror of several generations of school-girls. She was an amiable and excellent woman, but as a writer she has been well called 'the very high-priestess of the great god Cram.' Of the popularity of her schoolroom encyclopædia, compiled entirely by herself, there can, however, be no doubt: an impression, printed in 1857 in America, was taken from the 84th London edition. It has been reprinted in England and in the United States as recently as 1886.

Mango (*Mangifera indica*, natural order Anacardiaceæ), one of the most esteemed fruits of India. The tree grows from 40 to 50 feet high, with spreading top and numerous branches, at the extremities of which are the densely-crowded long lanceolate leaves. When in flower it bears some resemblance to the Sweet Chestnut. The fruit,

Common Mango (*Mangifera indica*).

which is a fleshy drupe, when fully ripe is somewhat kidney-shaped or oval, varying in size from that of a small hen's egg to a large goose's egg, in colour yellow or reddish, speckled with black, and containing a large flattened stone, the kernel of which is nutritious. There are several varieties of mango. Some have the flesh of the fruit full of fibres, and are on that account considered inferior; those that cut like an apple, and have few or no fibres, are the most highly esteemed. The fruit is eaten without any preparation, except peeling the outer rind off. Jellies, preserves, and tarts are made of the unripe fruit, and it is also pickled. Mango was introduced into Jamaica in 1782, and is now very generally cultivated in tropical and subtropical countries. The tree is ordinarily raised from seeds, but, as the finer varieties cannot be depended upon to come true from seeds, they are increased by layering and inarching. *M. sylvatica*, besides being eaten when ripe and fresh by the natives of India, is dried and used medicinally. *M. oppositifolia*, the fruit of which is of the size of a pullet's egg, is much esteemed in Burma.

Mangold-wurzel, or MANGOLD, a German name in general use in Britain and America to designate the varieties of the Common Beet (q.v.) cultivated in fields for the feeding of cattle—*Beta vulgaris* of the natural order Chenopodiaceæ. The field beets differ from the garden beets chiefly in being larger in all their parts, and coarser. They have large roots, which in some of the varieties are red, in others greenish or whitish, in some carrot-shaped, and in others nearly globular. The cultivation of mangold as a field-crop was introduced from France into England in 1786. At first, so little was its value known, that the leaves alone were used as food for cattle. Its importance, however, was soon appreciated, and it rapidly gained favour. It is much more patient of a high temperature than the turnip, liable to fewer diseases, and vastly more productive under favourable conditions. In highly-manured grounds in the south of England as much as from 60 to 70 tons to the acre have been raised; throughout the south of England it is generally admitted that it is as easy to grow 30 tons of mangold to the acre as 20 tons of Swedish turnips. The lower temperature of Scotland, however, does not admit of the crop being raised there to advantage. The mode of culture does not vary materially from that followed in raising turnips. The land in which the crop is to be planted receives a deep furrow in autumn; and, if it is quite free from perennial weeds, it is often previously well manured. Mangolds are sown both in rows on the flat ground and in drills raised by the plough—the former from 18 to 25 inches apart, and the latter from 25 to 28 inches wide. From 12 to 16 tons of dung with from 2 to 3½ cwt. of superphosphate, 2 to 3 cwt. common salt, and 2 to 3 cwt. nitrate of soda per acre are common dressings for mangolds. Indeed, this crop can hardly be over-manured. It requires 6 or 7 lb. of seed to the acre; and, as the grains are enclosed in a hard and rough coat, they are steeped in water for two days previous to their being planted, for the purpose of promoting a quick and regular 'braid.' The long red, the round red, and the orange and yellow globes are all favourite varieties in England. As soon as the plants are about 3 inches above ground, they are singled out by the hand, and their cultivation is afterwards the same in all respects as in the case of Swedish turnips. The crop should always be stored by the end of October, and should not be consumed till the following spring, by which time the roots have lost their tendency to produce scour in animals, and have greatly improved in feeding value. Care has to be taken not to injure the leaves or bulbs, as they are liable to suffer from 'bleeding.' The roots are stored in pits or 'clamps,' covered with straw and a little earth, as a protection in severe weather.

Mangonel. See BALLISTA.

Mangosteen, produced by *Garcinia mangostana* (natural order Clusiaceæ), is considered the most delicious and wholesome of all fruits. The tree, which is a native of the Moluccas, grows about 20 feet high in very regular symmetrical form. The leaves are large, oval, entire, deep dark green above with a dull lustre, olive-green below. The open flowers resemble those of a red rose, but have only four petals. The fruit, in size and shape, resembles a middling-sized orange; it is dark brown, spotted with yellow or gray, has a thick rind, and is divided internally by thin partitions into cells. The pulp is soft and juicy, of a rose colour, refrigerant and slightly laxative, with a mixture of sweetness and acidity, and has an extremely delicate flavour. It may be eaten very freely with perfect safety, and is esteemed very beneficial in fevers. It is cultivated in Java and

in the south-east of Asia; it has recently become common in Ceylon, and has been successfully introduced into other tropical countries.

Mangrove (*Rhizophora*), a genus of calycifloral dicotyledons, including about fifty species, of which the indistinct affinities have constituted a separate order (Rhizophoraceæ). They are trees and shrubs, all tropical (especially South American), and natives of coasts, particularly about the mouths of rivers, where they grow in the mud, and form a close thicket down to and within the margin of the sea, even to low-water mark, forming the characteristic mangrove-swamps so often described

A Mangrove-swamp.

by travellers and naturalists. Most species send down roots from their branches, and thus rapidly extend over large spaces, forming secure retreats for multitudes of aquatic birds, whilst crabs and shell-fish are also to be found in them in vast numbers. Their interlacing roots retain mud, seaweed, &c., and thus rapidly form soil and encroach upon the shallow sea; on the north coast of Java and elsewhere their geological importance is specially marked. The seeds have the peculiarity of germinating before the fruit has fallen, a long thick radicle proceeding from the seed, piercing its covering, and extending rapidly downwards. When the fruit drops, the stout heavy radicle pierces the mud, and the young tree is thus planted in the proper position forthwith. The fruit of the common mangrove (*R. Mangle*) is sweet, eatable; and its juice, when fermented, yields a light wine. The bark is sometimes imported for the sake of its tannin, in which all the species are rich. Mangrove wood is also imported from the West Indies. The Chinese and East Indian species (*R. gymnorhiza*, &c.) are of similar habit and properties; some of the latter are separated as a distinct genus, *Bruguiera*.—The so-called *White Mangrove* is *Avicennia* (q.v.).

Manhattan Island, the island on which the great part of New York city stands.

Mania. See INSANITY.

Manica, a gold-field long worked by the Portuguese, 130 miles NW. of the port of Sofala.

Manichæus, or MANI, the founder of the heretical sect of the Manichæans, of whose life the most legendary and contradictory accounts are given through two distinct sources—the Western or Greek, and the Oriental or Mohammedan—the latter alone being apparently worthy of belief. According to it Mani was a native of Ecbatana, born probably about 215 A.D., and had his education at Ctesiphon under his father Futak, who joined the

sect of the *Moghtasilah* (Baptists) in which his son was brought up. This sect was connected with the Mandæans (q.v.), and most probably also with the Elkesaites and Hemerobaptists, and may also have borrowed something from Christianity. At about the age of thirty Mani began to proclaim his new religion at the court of the Persian king, Sapor I., and then undertook long missionary journeys, returning to the court about 270. Pursued by the enmity of the Magians he was obliged to flee, was protected by the next king, Hormuzd, but under his successor, Bahram I., was abandoned to the hatred of his enemies, who crucified him in 278 and flayed his lifeless body. His numerous epistles and writings are lost, and we know of them only from the Arabic catalogue, the *Fihrist*, and from allusions in Epiphanius, Augustine, and Photius.

MANICHEISM was a great religious system that sprung up in western Asia about the close of the 3d century, and which, although it utterly disclaimed being denominated Christian, yet was reckoned among the heretical bodies of the Church. It was not an offshoot from Christianity, but was based on the ancient Babylonian religion, and was thus really a Semitic religion of nature modified by Christian and Persian elements, systematised and elevated into a gnosis, and made applicable to human life by a deduced system of ethics. But, while it borrowed nothing from Christianity proper, it derived part of its terminology and some of its conceptions from Christianity as developed among the sects of the Basilidians, Marcionites, and Bardesaites. The Western Manichæans adopted many Christian elements which were not present in the original system of its founder nor in its purer Eastern development. It is possible, although it has not yet been satisfactorily proved, that it borrowed some elements from Buddhism. Baur was the first to work out the theory of a Buddhist element, and was followed by Neander, Hilgenfeld, and other scholars; but his argument has been assailed by Le Page Renouf, Zeller, Lightfoot, and Harnack. Manichæism was essentially a complete dualism, materialistic in so far as the physical and ethical were confounded, and its success, says Harnack, was due to the fact that it united an ancient mythology and a thorough-going materialistic dualism with an exceedingly simple spiritual worship and a strict morality. As has been said, it assumed two chief principles, whence had sprung all visible and invisible creation, and which—totally antagonistic in their natures—were respectively styled the Light, the Good, or God, and the Darkness, the Bad, Matter, or Archon. They each inhabited a region akin to their natures, and excluding each other to such a degree that the region of Darkness and its leader never knew of the existence of that of the Light. Twelve æons—corresponding to the twelve signs of the zodiac and the twelve stages of the world—had emanated from the Primeval Light; while Darkness, filled with the eternal fire, which burned but shone not, was peopled by *demons*, who were constantly fighting among themselves. In one of these contests, pressing towards the outer edge, as it were, of their region, they became aware of the neighbouring region, and forthwith united, attacked it, and succeeded in carrying captive the Ray of Light that was sent against them at the head of the hosts of Light, and which was the embodiment of the Ideal or Primal Man. The God of Light himself now hastened to the rescue, and with the help of new æons defeated Darkness and set free the primal man in his greater and better part. The smaller and fainter portion, however—the *Jesus patibilis* of the Western Manichæans—remained in the

hands of the powers of Darkness, and out of this they formed, after the ideal of the Man of Light, mortal man. But even the small fraction of light left in him, broken in two souls, would have prevailed against them, had they not found means to further divide and subdivide it by the propagation of this man. Thus man was originally formed in the image of Satan, but contained within him a spark of the heavenly light, which awaits its final deliverance by separation from the enveloping darkness. The demons sought to obscure it further by sensuality and dark forms of belief and faith, such as Paganism and Judaism; but the spirits of Light are constantly engaged in drawing out the dimmed and buried light hidden in the world, by opening up to men the true *gnosis* of nature, and weaning them away from sensuality and error. Thus there appeared in the world a succession of teachers, as Adam, Noah, Abraham, and probably Zoroaster and Buddha. Jesus also was such a teacher, but he was neither the historical Christ of Christianity, nor the Messiah of the Jews, but a phantasmal Jesus (*Jesus imitabilis*), who did not actually suffer, as he seemed, on the cross, but only allowed himself to become an example of endurance and passive pain for his own, the souls of light. Since even his immediate adherents, the apostles, were not strong enough to suffer as he had commanded them, he promised them a Paraclete, who should complete his own work. This Paraclete was Mani, who surrounded himself, like Christ, with twelve apostles, and sent them into the world to teach and to preach his doctrine of salvation. The end of the world will be fire, in which the region of Darkness will be consumed.

To attain to the region of eternal light, it is necessary that Passion, or rather the Body, should be utterly subdued; hence rigorous abstinence from all sensual pleasures—asceticism, in fact, to the utmost degree—is to be exercised. The believers are divided into two classes—the *Electi* (*Perfecti*) and the *Catechumeni* (*Auditores*). The Elect have to take the oath of abstinence from evil and profane speech (including 'religious terms such as Christians use respecting the Godhead and religion'), and from flesh, eggs, milk, fish, wine, and all intoxicating drinks; from the possession of riches, or, indeed, any property whatsoever; from hurting any being—animal or vegetable; from heeding their own family, or showing any pity to him who is not of the Manichæan creed; and finally, from breaking their chastity by marriage or otherwise. The *Auditores* were comparatively free to partake of the good things of this world, but they had to provide for the subsistence of the *Elect*, and their highest aim also was the attainment of the state of their superior brethren. In this Manichæan worship, the Visible Representatives of the Light (sun and moon) were revered, but only as representatives of the Ideal, of the Good or supreme God. Neither altar nor sacrifice was to be found in their places of religious assemblies, nor did they erect sumptuous temples. Fasts, prayers, occasional readings in the supposed writings of Mani, were all their outer worship. The Old Testament they rejected unconditionally; of the New Testament they adopted certain portions, as revised and redacted by the Paraclete. Sunday, as the day on which the visible universe was to be consumed, the day consecrated to the sun, was kept as a great festival; and the most solemn day in their year was the anniversary of the death of Mani. The later Manichæans celebrated mysteries analogous to the Christian sacraments of Baptism and the Lord's Supper. St Augustine belonged to the sect for about nine years, and is our chief authority on this subject.

The outward history of the sect is one of almost

continuous persecution. Yet it spread rapidly from Persia and Mesopotamia to Syria, northern Africa, and even Constantinople and Rome, drawing adherents from the remnants of the old Gnostic sects, especially from the Marcionites, and on the other hand from men of a rationalistic temperament who were repelled by such dogmas as that of the Incarnation. Both the Roman and Byzantine emperors enacted stringent laws against the Manichæans, the most severe being Valentinian III. and Justinian. Pope Leo the Great persecuted them in Rome, and in northern Africa they were exterminated by the Vandals. But their peculiar doctrines lingered on into the middle ages, and influenced many sects, as the Priscillianists, Paulicians, Bogomiles, Catharists, and Albigenses.

See Beausobre, *Hist. critique de Manichéisme et du Manichéisme* (1734); Baur, *Das Manich. Religionsystem* (1831); Flügel, *Mani* (1862); Kessler's *Untersuchung zur Genesis des Manich. Religionsystems* (1876), and his excellent articles, 'Mani' and 'Manichæer,' in vol. ix. of Herzog-Plitt's *Real-Encyclopädie*; Geayler, *Das System des Manichæismus* (1875); also Harnack's admirable article in the *Encyclopædia Britannica*.

Manihiki Islands, a group of low, wooded atolls, scattered over the central Pacific, between the Marquesas and Union groups, with a total area of some 55 sq. m., and pop. of 1600. Most of these islands, as Caroline, Malden, Starbuck, Penrhyn, Humphrey, Vostok, Flint, and two or three others, belong to Britain.

Manila (by English people often spelt *Manilla*), chief town of the Philippine Islands and capital of the Spanish possessions in eastern Asia, stands on the east side of a wide bay on the south-west coast of Luzon, 650 miles SE. of Hong-kong, with which city it has been connected by telegraph since 1881. It is divided into two portions by the little river Pasig. On the south bank stands the sleepy old town (founded in 1571 by Legazpi), surrounded by crumbling walls, with tolerably wide straight streets crossing each other at right angles. Here are the archbishop's palace, numerous churches and monasteries, the cathedral, mint (closed in 1889), university, Jesuit observatory, arsenal, and the barracks of the Spanish garrison. On the north bank are the modern suburbs, Binondo, &c., the commercial and native quarters, with the palaces of the governor-general and the admiral of the station. The city is liable to visitations of earthquakes, typhoons, and thunderstorms of exceptional violence: for instance, a violent earthquake did great damage in 1880, whilst a hurricane in 1882 ruined half the city. For this reason many of the old stone houses and churches are in ruins, the streets are lighted, not with gas, but with kerosene oil lamps, and most of the newer houses are built of wood. The native houses are generally constructed of bamboo and thatched with the leaves of the nipa palm. Glass is not used in the windows, but the flat shell of a large oyster, and the window-frames all slide horizontally. This is to exclude the great heat, the mean for the year being 82° F.; but during the rainy season (May to November) it ranges from 65° to 68°. The total population is estimated at nearly 300,000, for the most part native Tagals, though there are some 25,000 Chinese, large numbers descended from these two races, and about 5000 Spaniards. The people are fond of dancing and music; but the predominant passions of the native population are cock-fighting, carried on in licensed cockpits, which yield a large revenue to the government, and betting and gambling. Almost the only industry is the manufacture of cigars, which employs 21,000 women and 1500 men. The harbour is not very safe during south-west and north-east winds, although shelter is afforded by a small breakwater, and improvement works were in operation for ten

years until suddenly stopped in 1889. Large ocean-going vessels anchor at the naval station of Cavite, 2 miles to the south-west. A railway was commenced from Manila to Dagupan, a distance of 120 miles, in 1887, and one section was opened in 1890. The principal port of the Philippines, Manila has an export trade valued approximately at £3,400,000 annually, and an import trade that falls but little short of that figure. Sugar, hemp, cigars and tobacco, and coffee account for three-fourths of the exports, and cotton goods, rice, wine, silk, and flour figure most prominently amongst the imports. Nearly one-half of the trade is carried on under the British flag, one-fourth under the Spanish, and one-seventh under that of the United States. The Spanish authorities are very jealous of foreigners settling in Manila, and especially dislike the Chinese. A breach was threatened in 1889 between China and Spain on account of the treatment to which the subjects of the former power were subjected in the Philippines.—For *Manilla Hemp*, see ABACA.

Manin, DANIELE, an Italian patriot of Jewish descent, was born 13th May 1804 at Venice, studied law at Padua, and subsequently practised at the bar. From 1831 he became a recognised leader of liberal opinion in Venice. Previous to the outbreak of 1848 Manin was imprisoned for presenting a somewhat outspoken petition to the authorities; but on the promulgation of the news that Paris, Naples, and Tuscany were in revolution he was released in triumph by the populace, and was at once invested with supreme power. From the period of his election to the presidency of the Venetian republic Manin's energies were devoted to the organisation of the inhabitants for self-defence. During the annexation of Lombardy to Piedmont he laid down his authority; but on the defeat of the Sardinian army at Novara, 23d March 1849, he resumed it, and was the animating spirit of the entire population of Venice during the heroic defence of the city for five months against the besieging Austrian army. On the 24th of August Venice capitulated; but Manin, with forty of the principal citizens, being excluded from the amnesty, quitted the city. He retired to Paris, where he taught Italian, and where he died of heart-disease, 22d September 1857. The bones of this truly great and noble man were brought to free Venice in 1868, and a statue of him was erected in 1875. See Lives by Henri Martin (Paris, 1859), Finzi (1872), and Errera (1875).

Manioc, MANDIOC, or CASSAVA (*Manihot utilisima*), a plant of the natural order Euphorbiaceæ, a native of tropical America, and much cultivated there, in tropical Africa, and in other tropical countries. Manioc, or *Mandioca*, is the Brazilian name, *Cassava* the West Indian; and in Peru and some other parts of South America the name is *Juca* or *Yucca*. The plant is shrubby, with brittle stems 6 to 8 feet high, and crooked branches, at the extremities of which are the large palmate leaves and green flowers. The root is tuberous, of immense size, weighing often as much as 30 lb. The milky, acrid juice which permeates every part of the plant is a deadly poison in its fresh state, owing to the presence of hydrocyanic acid, which is quickly dissipated by heat. The juice, inspissated by boiling, forms the excellent sauce called *Casareep* (q.v.), and fermented with molasses yields an intoxicating beverage called *Ouycou*; whilst the root, grated, dried on hot metal plates, and roughly powdered, becomes an article of food, largely used in South America, and there very generally known as *Farina* (Port., 'meal'). It is made into thin cakes, like the oatmeal-cakes of Scotland, which are formed, however, not by mixing it with

water, but by the action of heat softening and agglutinating the particles of starch. It is also imported into Britain, to be used in manufactures as starch. The true starch of manioc, separated in the ordinary manner from the fibre, is known in commerce as *Brazilian Arrowroot*. From it tapioca is made, by heating it on hot plates, and stirring with an iron rod; the starch-grains burst, some of the starch is converted into dextrine, and the whole agglomerates into small irregular masses. The *Pearl Tapioca* of the shops, consisting of small spherical grains, is not a product of manioc but of potato starch.—Another species or variety of manioc is also cultivated, the roots of which contain a perfectly bland juice, and are eaten raw, roasted, or boiled. This, the Sweet Cassava or Sweet Juca (*M. Aipi*, said to be a native of Africa as well as of America), has the root of longer shape than the common or bitter cassava, and smaller.—The manioc is easily propagated by cuttings of the stem, and is of rapid growth, attaining maturity in six months. The produce is at least six times that of wheat.

Manipur, a native state in the north-east of India, occupying some 8000 sq. m. of for the most part heavily timbered mountain-land between Burma, Assam, Chittagong, and Cachar; pop. (1881) 221,070, collected most thickly in one valley, 650 sq. m., situated 2500 feet above sea-level. Most of the work in the country is performed by women: they do all the buying and selling, and the carrying to and from market, as well as the field labour and the spinning and weaving. The men are incorrigibly lazy, but passionately fond of the game of Polo (q.v.). A British political agent is stationed at the rajah's court; but no tribute is paid to the British government.—The *capital*, called Manipur, also Imphail, is a vast group of suburban residences, those of the rajah and his courtiers, situated in the midst of a large forest. The place has no tradesmen or artisans; its wants are supplied by women hucksters, who bring in food and cloth from their villages. Pop. 30,000 to 40,000.

Manis. See PANGOLIN.

Manissa. See MAGNESIA.

Manistee', capital of Manistee county, Michigan, is on Lake Michigan, at the mouth of the Manistee River, 135 miles NW. of Lansing. It has several foundries, ten salt-works, and a large number of lumber-mills. Pop. (1890) 12,812.

Manitoba, a province of Canada, bounded on the W. by the district of Assiniboia, and on the NW. and N. by the districts of Saskatchewan and Keewatin. Its eastern boundary is the province of Ontario and the unorganised territory east of Keewatin. On the S. the boundary is 49° N. lat. The province is traversed by several rivers, among others the Assiniboine, with its many tributaries, the chief of which are the Souris, the Pembina, and the Red River. The Winnipeg River flows for 60 or 70 miles through the eastern portion of the province into Lake Winnipeg. The principal lakes are Winnipeg, 8500 sq. m.; Manitoba, 1900 sq. m.; and Winnipegosis, 1936 sq. m. The country consists for the most part of a level plain, with occasional undulations. A good deal is said from time to time about the severity of the climate. The summer mean is 65° to 70°—nearly the same as that in the state of New York. In winter the thermometer occasionally sinks to 30°, 40°, and 50° below zero; but these extreme temperatures are very rare. The atmosphere is bright and dry, and the cold is not so much felt as in many countries with a higher temperature and a more humid atmosphere. Warm clothing—especially when driving—and warm houses are necessary to resist the severity of the weather. Very little snow falls on

the prairies, the average depth being about 18 to 24 inches; the native horses graze out of doors all the winter. Ploughing generally begins during April. The harvest takes place in August and September. Trees are found along the rivers and streams, and in greater abundance in the eastern and northern parts of the province; but Manitoba is not well wooded.

The population in 1886 was 108,640—Presbyterians, 28,406; Church of England, 23,206; Methodists, 18,617; Roman Catholics, 14,651; Mennonites, 9,112. Ethnologically they may be classified as follows: of English origin, 25,949; Irish, 21,180; Scotch, 25,676; Indians, 5,575; half-breeds, 7,985; French, 6,821; Germans, 11,082; Icelanders, 2,468. Among the principal cities and towns are Winnipeg, 25,000; Portage-la-Prairie, 4,000; Brandon, 4,000; and Selkirk, 1,000. The chief industry is agriculture; the soil is of remarkable depth and fertility, and in favourable seasons the crops are large, considering the imperfect methods of cultivation practised. Manitoba wheat and flour are regarded as the finest in the continent. Much of it is bought up by American millers, the product being mixed with flours made from grain produced in the United States. Other grains succeed admirably, and an endeavour is being made to encourage the growth of flax. Vegetables and roots are unusually prolific and of great size. Wheat-growing was for some few years the staple industry; but the farmers are now engaged more in mixed farming, including dairy-farming and the raising of cattle and sheep. Fruit-growing is not carried on to any extent, although many of the smaller varieties—such as the strawberry, black and red currant, raspberry, gooseberry, and cranberry—appear to be indigenous. In minerals the province is not very rich, but coal is found in southern Manitoba, although it is not yet worked to any extent. Manufactures of various kinds are increasing; and Winnipeg is to a large extent the distributing centre for the western part of the Dominion. Big game is still found in the less accessible parts of the province—moose, bear, and some kinds of deer. Small game is plentiful—principally prairie chicken and wild duck. Close times are provided for the protection of all the principal wild animals and birds. A considerable fishing industry is carried on in the rivers and lakes, and white-fish and pickerel are caught in large quantities.

Goods to the value of \$2,207,314 were imported in the year ending June 1889. Of this amount \$673,012 came from Great Britain, and \$1,434,749 from the United States; the other countries being in the following order: Japan, France, Germany, China, and Belgium. The exports in the same period were valued at \$1,782,606, consisting chiefly of animals and their produce, and agricultural products, chiefly to Great Britain and the United States. These figures do not include the inter-provincial trade, which is large.

The government is administered by a lieutenant-governor, appointed by the governor-in-council. He is assisted by an Executive Council and a Legislative Assembly of 35 members elected by the people. There is only one House of Parliament in Manitoba. The province is represented by three members in the Dominion Senate and by five in the House of Commons. The revenue of the province in 1888 was \$1,740,448, and the expenditure \$691,221. The subsidies from the Dominion treasury amounted in all to \$426,671.

In Manitoba the Dominion government offers free grants of land—160 acres—to every male settler above eighteen years of age, and to every female who is the head of a family. There is still a considerable quantity of government land undisposed of in the north-western and north-eastern

parts of the province. The Canadian Pacific Railway Company, the Canada North-west Land Company, the Manitoba and North-western Railway Company, and the Hudson Bay Company have a considerable quantity of land for sale in different parts of the province, the price ranging from \$2.50 up to \$7 or \$8 per acre, according to locality and contiguity to railways and settlements. A large land grant has also recently been promised to the Hudson Bay Railway Company. Improved farms are to be had on reasonable terms at moderate prices. The Dominion Lands Commissioner is established in Winnipeg, and there are land and immigration agents in different parts of the province.

Manitoba is in communication by rail with the Atlantic seaboard and the Pacific, and with all parts of Canada and the United States. The construction of the Canadian Pacific Railway—completed in 1885—has naturally been of immense advantage to the province. The first railway to Manitoba was a continuation of the United States system from Pembina to Winnipeg, and was opened in 1879. The Northern Pacific Railway has direct connection with Winnipeg and Brandon; and a railway is projected from Winnipeg to Hudson Bay.

Until 1868 what is now known as Manitoba formed a portion of the territory under the control of the Hudson Bay Company. The first agricultural settlement in the country was formed in 1812, under the auspices of the Earl of Selkirk, who took out a party of Highlanders in that year. They were located at Kildonan and Selkirk, on the Red River, about 20 miles north of the site of the present city of Winnipeg. In 1868 the company gave up their exclusive rights to the government of the territory, on certain conditions—among others a money payment of £300,000 and a considerable grant of land. The province of Manitoba was constituted by an Act passed in 1870. One of the first events of importance that happened in Manitoba was the Riel rebellion in 1869-70. It arose out of a feeling of some of the inhabitants that their position and rights had not been sufficiently considered in the transfer already mentioned. The rebellion collapsed in 1870 on the arrival at Fort Garry, the site of the present city of Winnipeg, of the expedition under Colonel (afterwards Lord) Wolseley. Most of the leaders in the rebellion were subsequently amnestied. The progress of Manitoba from an agricultural point of view has been somewhat remarkable, but its political history has been comparatively uneventful, excepting for the existence of occasional friction between the provincial and Federal authorities since 1880, in connection with railway extension in the province. After protracted negotiations these differences have, however, been disposed of.

Manitou. See ANIMAL-WORSHIP, Vol. I. p. 288.

Manitou, a summer-resort at the base of Pike's Peak, Colorado, 6296 feet above the level of the sea. It is the Saratoga of the west, with soda springs and several large summer hotels. Pop. 422.

Manitoulin Islands, a chain of islands in Lake Huron, separating it from Georgian Bay. The principal are Grand Manitoulin (80 miles long

and 28 wide), Cockburn Isle, and Drummond Isle; the last belongs to the state of Michigan, the rest to Ontario. All are irregular and striking in their natural features, and Grand Manitoulin and Cockburn are covered with large forests of pine. Pop. about 2000.

Manitowoc, capital of Manitowoc county, Wisconsin, lies at the mouth of the Manitowoc River, on Lake Michigan, 77 miles by rail N. of Milwaukee. It has a good harbour, and shipbuilding is actively carried on. Lumber is sawn, and furniture, machinery, castings, and leather are manufactured. Pop. (1885) 6881; (1890) 7525.

Manka'to, capital of Blue Earth county, Minnesota, on the right bank of the Minnesota River, 86 miles SW. of St Paul. Three lines of railway pass, and small steamboats can ascend as far as this point. The town contains a state normal school, Roman Catholic college, &c., and has varied manufactures. Pop. (1885) 7845; (1890) 8838.

Mann, HORACE, American educationist, was born at Franklin, Massachusetts, 4th May 1796, graduated at Brown University in 1819, and commenced the study of law. He was elected to the legislature of Massachusetts in 1827, and succeeded in founding the state lunatic asylum. Removing to Boston, he was elected (1833) to the state senate, of which he became president. After editing the revised statutes of the state, he was for eleven years secretary of the Board of Education. He gave up business and politics, and devoted his whole time to the cause of education, working usually fifteen hours a day. In 1843 he made a visit to educational establishments in Europe, and his Report was reprinted both in England and America. In 1848 he was elected to congress, as the successor of John Quincy Adams, whose example he followed in energetic opposition to the extension of slavery. In 1853 he accepted the presidency of Antioch College, at Yellow Springs, Ohio, established for the education of both sexes, where he laboured with zeal and success until his death, August 2, 1859. See the Life by his wife (1865; new ed. 1882).

Manna, a concrete saccharine exudation obtained by making transverse incisions into the stems of cultivated trees of *Fracinus Ornus*. The manna ash is cultivated chiefly in Sicily and Calabria for the purpose of obtaining manna. In July or August the collectors make deep cuts through the bark to the wood near the base of the tree; and if the weather be warm and favourable, the manna begins to ooze out of the cuts slowly, and hardens in lumps or flakes, which are from time to time removed by the collectors. Manna is a light porous substance, usually in stalactiform pieces, 1 to 6 inches long, crystalline, friable, yellowish in colour, with a honey-like odour and a sweetish, somewhat bitter taste. It is used in medicine as a gentle purgative for young children. It consists of about 60 to 80 per cent. of mannite, about 10 per cent. moisture, a bitter substance, and other less important constituents. There are several other manna-yielding plants besides the ash, especially the manna-bearing Eucalyptus of Australia (*Eucalyptus mannifera*), which is non-purgative, and is a favourite sweetmeat with the children of that country. Small quantities are found on the common larch in some districts; this kind is known under the name of manna of Briançon.

The manna of the Israelites, which they ate during their wanderings in the wilderness, was identified by Ehrenberg with the saccharine substance called *Mount Sinai Manna*, which is produced in that region by a shrub, *Tamarix mannifera*, a species of Tamarisk (q.v.), from the branches of which it falls to the ground. It does not, however, contain any mannite, but consists wholly of

mucilaginous sugar. The exudation which concretes into this manna is caused by the punctures made in the bark by insects of the genus *Coccus* (*C. manniparus*), which sometimes cover the branches. It is a kind of reddish syrup, and is eaten by the Arabs and by the monks of Mount Sinai like honey with their bread. Others have supposed that the manna of the Jews was produced by a species of Camel's Thorn (q.v.).

Manners, a noble family of Northumbrian extraction, their ancestor, Henry de Maners, having in 1178 been lord of the manor of Ethale, or Etal, in that county. His descendant, Sir Robert de Manners, was governor of Norham Castle in 1327. In 1454 another Sir Robert de Manners was sheriff of Northumberland; in 1525 his grandson was raised to the earldom of Rutland; and in 1703 the tenth earl was raised to the dukedom. The eldest son of the third duke was the celebrated Marquis of Granby (q.v.). The chief seat of the family is Belvoir Castle, 7 miles W. by S. of Grantham, a large castellated pile, reconstructed by Wyatt, and commanding a splendid view. Crabbe was chaplain here. See works by Eller (1841) and Allen (1874).

Mannheim, the capital formerly of the Rhenish Palatinate, and now the chief trading-town in Baden, lies low in a fertile plain on the right bank of the Rhine, here 400 yards wide and joined by the Neckar, 53 miles S. of Frankfort and 38 N. of Carlsruhe. The fortifications have been converted into gardens, and the town is remarkable for its cleanliness and regularity, the whole of it being laid out in quadrangular blocks. The palace, built in 1720-29 by the Elector-Palatine Charles Philip, is one of the largest in Germany, covering 15 acres, with a façade 580 yards long, and 1500 windows. The Schillerplatz is adorned with colossal statues of Schiller, Dalberg, and the actor and dramatist Iffland (1759-1814). A great and increasing river-trade is carried on, the harbour having been opened in 1875. The manufactures also are important, of iron, cigars, carpets, india-rubber, &c. Pop. (1875) 46,453; (1885) 61,273, of whom 26,904 were Catholics, and 4249 Jews. Mannheim is heard of as early as 706, but remained a mere village till 1606, when a castle was built by the elector-palatine, around which a town grew up, peopled chiefly by Protestant refugees from the Low Countries. It was several times taken and retaken during the wars of the 17th century, totally destroyed by the French in 1689, rebuilt and strongly fortified, and in 1795 severely bombarded by the Austrians. See works by Fecht (1864) and Feder (1875-77).

Manning, HENRY EDWARD, a cardinal of the Catholic Church, was born 15th July 1808, at Totteridge in Hertfordshire, was educated at Harrow and Balliol College, Oxford, and, after taking a double first in 1830, was made a Fellow of Merton. He soon came to the front as an eloquent preacher and as a leader of the Tractarian party. In 1834 he was appointed to a country rectory in Sussex, and married a lady whose sisters were the wives of Samuel and Henry Wilberforce. Mrs Manning died after a few months of married life. In 1840 her husband became Archdeacon of Chichester. But in 1851, deeply moved by the final decision in the 'Gorham Case' (q.v.), he left the Church of England and joined the Church of Rome. His advancement in that communion was rapid from the first; having been ordained priest, he studied for some years in Rome, and in 1857 he founded the congregation of the Oblates of St Charles Borromeo at Bayswater, London. He was made provost of Westminster, and in 1865, on the death of Cardinal Wiseman, was promoted to be Archbishop of Westminster. At the Ecumenical Council of

1870, Manning was one of the most zealous supporters and promoters of the infallibility dogma; and, named cardinal in 1875, he continued an influential leader of the Ultramontane section of the church. Besides being the foremost spirit in most Catholic movements in England, he took part in many non-sectarian good works designed to better the social life of the people, such as the temperance movement; and he was a member of the Royal Commissions on the Housing of the Poor (1885) and on Education (1886). Thus he was not only a devout prelate and a churchly statesman, he was also a practical reformer; and to these characters he added that of an accomplished man of the world. Before his secession to Rome, he published several volumes of powerful sermons; afterwards his writings were mainly polemical. Amongst his numerous volumes, pamphlets, and articles are discussions of the temporal power of the pope, infallibility, the Vatican Council, Ultramontaniam, the *Four Great Evils of the Day* (2d ed. 1871), *Internal Mission of the Holy Ghost* (1875), *The Catholic Church and Modern Society* (1880), *Eternal Priesthood* (1883), *Characteristics* (ed. by W. S. Lilly, 1885), &c. He died 14th January 1892.

Manning, ROBERT. See BRUNNE, ROBERT DE.

Mannite, $C_6H_8(OH)_6$, is a peculiar saccharine matter which forms the principal constituent of Manna (q.v.); it is also found in several kinds of fungi, in asparagus, celery, onions, &c. It is most readily obtained by digesting manna in hot alcohol.

Manoa. See EL DORADO.

Man-of-war. See NAVY.

Man-of-war Bird. See FRIGATE BIRD.

Manometer (Gr. *manos*, 'thin,' 'rare') is properly an instrument for measuring the rarity of the air or of other gases; but the name is most frequently applied to instruments for indicating the elastic pressure of gases, which is always, for each kind of gas, inversely proportional to its rarity, or directly proportional to its density. The several kinds of Barometers (q.v.) are really manometers, and so is the steam-gauge of a Steam-engine (q.v.).

Manor, in English law, denotes the land held by a body of tenants under one seignory or lordship. Manors were probably formed by the gradual establishment of feudal rights over free townships and subject communities of villeins or serfs; but, according to legal theory, the lord derives his rights from the king or from some superior lord. In a fully-organised manor the local customs are enforced by three courts: a Court Baron for the free tenants, who are emphatically the *barones* or men of the manor; a Customary Court for the copyholders, who hold by base or customary tenure; and a Court Leet, in which officers are elected and minor offences punished. The lord's demesne includes lands occupied by himself and by his tenants-at-will, including customary tenants. Freehold lands do not form part of the lord's demesne; but free tenants are essential to the existence of a manor. Where the services of free tenants have been allowed to pass into desuetude, the manor survives as a 'manor by reputation,' but the Customary Court is kept alive for the purpose of recording acts and events which affect the title to copyhold lands, and of collecting the quitrents, fines, &c., which are payable to the lord. No new free tenure can be created in England since the statute *Quia Emptores*, passed in 1290; all existing manors, therefore, must trace their origin from before that time. The king himself was lord of many manors in right of his crown; and these are called manors of ancient demesne, to distinguish them from lands which fell casually into the king's hands

by forfeiture or otherwise. Manors closely resemble the feudal estates known to the law of Scotland. In the United States there is no institution corresponding to the manor. See FEUDALISM.

Manrent (or properly, MANRED), BONDS OF, agreements which used to be entered into in the Highlands of Scotland between the greater and lesser magnates, where protection on the one hand was stipulated in return for allegiance on the other.

Manresa, a town of Spain, on the Cardoner, 41 miles by rail NW. of Barcelona. It has a fine church (1020-15th century), the cave of Ignatius Loyola, and manufactures of cotton, broadcloths, brandy, &c. In 1811 it was fired by Marshal Macdonald—an outrage avenged by the Catalan knives of the townsfolk. Pop. 16,526.

Mans, LE, a picturesque city of France, the capital formerly of the province of Maine, and now of the department of Sarthe, on the left bank of the river Sarthe, 132 miles SW. of Paris by rail. The cathedral, 390 feet long, has a Romanesque nave of the 11th and 12th centuries, and a matchless Pointed-Gothic choir of the 13th century, 104 feet high, with splendid stained glass. In the right transept is the monument of Berengaria, Cœur-de-Lion's queen. There are two other interesting churches, and both préfecture and seminary occupy old conventual buildings, the former comprising also a museum and a library of 55,000 volumes. Le Mans does a large trade in poultry and cloverseed, and manufactures candles, woollens, lace, soap, &c. Pop. (1872) 42,654; (1886) 53,468. The *Cenomanum* of the Romans, and the birthplace of Henry II. of England, Le Mans witnessed in 1793 the dispersion and massacre of more than 10,000 Vendéans; and in January 1871 the defeat, after a stubborn resistance, of 100,000 Frenchmen under Chanzy by Prince Frederick-Charles. A statue of Chanzy was erected in 1885, and one of Belon (q.v.) in 1887. See Hublin, *Le Mans Pittoresque* (1885).

Mansard Roof, a form of roof invented by François Mansart (1598-1666), a distinguished French architect. It is constructed with a break in the slope of the roof, so that each side has two planes, the lower being steeper than the upper. The framework ought to be arranged so that its parts are in equilibrium. This kind of roof has the advantage over the common form of giving more space in the roof for living-rooms.

Mansard Roof.

Manse, in Scotch law, is the designation of a dwelling-house of the minister of the Established Church, and in popular use the term is often applied generally to the dwelling-house of any minister of a dissenting congregation, though no legal right exists in the latter case. In the Established Church every first minister of a rural parish is entitled to a manse, which the heritors or landed proprietors in the parish are bound to build and uphold; and he is also entitled, as part of the manse or dwelling-house, to a stable, barn, and byre. The manse must, by statute, be near to the church. When a manse has been built or repaired by the heritors it becomes a free manse, and all ordinary repairs have to be done at the charges of the minister. Decree to the effect that a manse is 'free' may be given by the sheriff; and such decree stands good for fifteen years, or until the appointment of a new minister. It has been judicially decided that a minister has a right to let his manse at a rent for two months in summer.

Mansel, HENRY LONGUEVILLE, Dean of St Paul's, was born at Cosgrove rectory, Northamp-

tonshire, October 6, 1820. Educated at Merchant Taylors' School and St John's College, Oxford, he became Reader in Moral and Metaphysical Philosophy in 1855, and Waynflete professor in 1859. Appointed regius professor of Ecclesiastical History, and canon of Christ Church, Oxford, in 1867, he was made Dean of St Paul's in 1869. He died 31st July 1871. The pupil and continuator of Hamilton (q.v.), he differed from him in holding that there is immediate cognition of the conscious ego; and he went beyond his master in emphasising the relativity of knowledge in the province of theology—alleging that we have no positive conception of the attributes of God (see *CONDITION*). The agnostic tendency of this doctrine created violent controversy. His published works are Aldrich's *Logic*, with Notes (1849); *Prolegomena Logica* (1851); article 'Metaphysics' in 8th edition of the *Encyclopædia Britannica* (1857), afterwards published separately; *The Limits of Religious Thought* (Bampton Lectures, 1858); *The Philosophy of the Conditioned* (1866), in reply to Mill's *Review of Hamilton's Philosophy*; and lectures on *The Gnostic Heresies*, edited by Lightfoot in 1874, with Life of Mansel by the Earl of Carnarvon. He was co-editor, with Professor Veitch, of Sir William Hamilton's Lectures. See Dean Burgon's *Lives of Twelve Good Men* (1888).

Mansfeld, COUNTS OF, an old German noble family (founded circa 1060), whose ancestral castle stood at the east end of the Harz Mountains, 14 miles NW. of Halle. Two members of the family have acquired historical reputation. COUNT PETER ERNEST I., afterwards elevated to the rank of a prince, was born on 15th July 1517. Having taken part in Charles V.'s expedition against Tunis, and distinguished himself afterwards at the siege of Landrecies, he was made by the emperor governor of the duchy of Luxemburg. But in 1552, whilst raiding in Champagne, he was taken prisoner by the French, and not ransomed until 1557. He fought against them again at St Quentin. On the outbreak of the revolt in the Low Countries he made a name as one of the cleverest generals in the Spanish service. Having been sent by Alva to the assistance of the French king against the Protestants, he covered himself with glory at Montcontour (1569). He subsequently took part in many sieges and military operations in the Netherlands, and acted for a while as governor of the Spanish Low Countries. In 1597 he retired to Luxemburg, where he had gathered a valuable collection of antique art, and died there on 22d May 1604.

His illegitimate son, PETER ERNEST II., usually called Count Ernest von Mansfeld, was one of the most prominent military leaders during the Thirty Years' War (q.v.). Born at Luxemburg in 1580, he served his apprenticeship to war in the Austrian service in Hungary and in the Juliers dispute. As part of his reward he was promised his father's possessions; but when it came to the pinch, they were refused to him. This converted Mansfeld into an implacable enemy, and he went over to the side of the Protestant princes. He assisted the Duke of Savoy against the Spaniards (1613–17), and in 1618 was despatched to Bohemia, to aid the Count-Palatine Frederick, and captured Pilsen and other strongholds. But the disaster of the Weissenberg compelled him to retreat to the Palatinate, from which he carried on for nearly two years a semi-predatory war on the imperialists, defeating Tilly at Wiesloch (April 1622). When Frederick abandoned the struggle, Mansfeld, with his chosen ally Christian of Brunswick, a swashbuckling adventurer like himself, fought his way through the

Spanish-Austrian forces to take service for the United Netherlands, beating Cordova at Fleurus (29th August). At the bidding of his new masters Mansfeld chastised the Count of East Friesland, and then, dismissing his army, retired into private life at The Hague. But in 1624 he resumed active work again at the solicitation of Richelieu. With an army of 12,000 men, raised mostly in England, he renewed the struggle on the Lower Elbe, till on 25th April 1626 he was crushingly defeated by Wallenstein at the bridge at Dessau. Once more raising a force of 12,000 in Brandenburg, with these and 6000 Danes he marched by way of Silesia to join hands in Moravia and Hungary with Bethlen Gabor of Transylvania. But the French and English subsidies failing, on which he relied for pay for his men, he was making his way to Venice with a few officers to raise fresh moneys when he fell sick and died, standing, clad in full panoply and supported by two attendants, at Racowitza, near Serajevo in Bosnia, on 29th November 1626. Count Ernest, a soldier of fortune, was the idol of his lawless soldiery, whom he frequently allowed to plunder and raid to their heart's content, so that they were a terror to friends as well as foes.

Mansfield, a market-town of Nottinghamshire, in Sherwood Forest, 17 miles N. of Nottingham. Its grammar-school (1561) has been rebuilt at a cost of £10,000; and there are a memorial cross (1850) to Lord George Bentinck, a town-hall (1836), an interesting parish church, &c. Mansfield stands in the centre of a manufacturing and mining district, and has manufactures of lace-thread and iron. Pop. (1881) 13,651; (1891) 15,925. See Harrod's *History of Mansfield* (1801).

Mansfield, capital of Richland county, Ohio, stands on an elevated site, 179 miles by rail N.E. of Cincinnati, and contains iron-foundries and manufacturing of flour, agricultural implements, stoves, tiles, &c. Pop. (1880) 9859; (1890) 13,473.

Mansfield, WILLIAM MURRAY, EARL OF, Lord-chief-justice of the King's Bench, was the fourth son of Andrew, Viscount Stormont, and was born at Perth, 2d March 1704. From Westminster he passed to Christ Church, Oxford, graduated M.A. in 1730, and was called to the bar the following year. He soon acquired an extensive practice—mainly, it would seem, on account of his facility and force as a speaker, for neither then nor at any subsequent period of his career was he reckoned a very erudite lawyer—and was often employed on appeal cases before the House of Lords. In 1743 he was appointed Solicitor-general, entered the House of Commons as member for Boroughbridge, and at once took a high position. In 1746 he acted, *ex officio*, as counsel against the rebel lords, Lovat, Balmerino, and Kilmarnock; was appointed Attorney-general in 1754; and at this time stood so high that, had not the keenness of his ambition been mitigated by a well-founded distrust of his fitness for leading the House, he might have aspired to the highest political honours. He became Chief-justice of the King's Bench in 1756, and, contrary to usage, also a member of the cabinet; and entered the House of Lords under the title of Baron Mansfield of Mansfield, in the county of Nottingham. Although he was impartial and tolerant as a judge, his opinions were not those of the popular side, and accordingly he was exposed to much abuse and party hatred. Junius bitterly attacked him, and during the Gordon riots of 1780 his house, with all his books and papers, was burned. The aged judge declined with much dignity to be indemnified by parliament. In 1776 Murray was made Earl of Mansfield. Age and ill-health forced him to resign the Chief-justiceship in 1788. He died,

20th March 1793, when the title devolved upon his nephew, Viscount Stormont.

Mansion House, the official residence of the Lord Mayor of London, was built on the site of the Old Stocks Market in 1739, at a cost of £42,638. It is an oblong building, and at its farthest end is the Egyptian Hall. Four hundred guests can dine in this grand banqueting-room, which was designed by the Earl of Burlington from the description of an Egyptian chamber given by Vitruvius. All the great banquets, public and private, given by the Lord Mayor take place here, and there are also fine ball and reception rooms. At the close of the exhibition of 1851 the Corporation of London voted £10,000 to be expended on statuary for the adornment of the Mansion House; and there is also a fine gallery of portraits and other pictures. Among its curiosities may be mentioned a state bed, which cost 3000 guineas, and a kitchen and culinary utensils extraordinary for their vast size. The Lord Mayor's jewelled collar of gold and diamonds, his silver-gilt mace, his sword, and his seal are described, together with his coach and ancient barge, in Thornbury's *Old and New London*, vol. i. pp. 436, 443. The establishment and expenses connected with the office cost an annual sum of £25,000; and it is said that only one Lord Mayor ever saved anything out of his salary. The Mansion House is too modern to possess much historical interest; but the Wilkes riots frequently took place in its neighbourhood during the mayoralty of Wilkes' friend, Brass Crosby. The Mansion House is often a centre of benevolent enterprise in the collection of money for sufferers by war, famine, flood, pestilence, and earthquake abroad, or by colliery explosions, shipwrecks, and lack of employment at home; and Mansion House Funds are also raised for memorials to heroic worth.

Manslaughter is the crime of unlawful homicide without malice aforethought. Homicide, or the infliction of death, is not a crime when it is done in self-defence against unlawful violence, or when it is done in the execution of the sentence of a court of justice. Thus one whose life is endangered by the violent attack of a madman, and kills the madman, commits homicide, but is innocent of manslaughter. So, too, is the executioner who hangs a convicted murderer. Homicide is unlawful, and amounts to manslaughter when, without being justified in any such manner as has been exemplified above, it is committed with the intention to cause physical injury; or is the result of culpable negligence or omission to perform some legal duty; or is the result of an accident occasioned by some unlawful act. Thus, if one man strike another without intending to kill him, and the blow prove fatal, the striker is guilty of manslaughter; or if, where it is the duty of the master of a ship to keep a lookout for small boats in the ship's way, a boat is run down and its occupants drowned in consequence of the absence of a lookout upon the ship, the master of the vessel is guilty of manslaughter; or if a man is engaged in an unlicensed manufacture of dynamite, and by an accidental explosion of the dynamite another is killed, the manufacturer is guilty of manslaughter. When manslaughter is accompanied by malice aforethought, it becomes murder. See Sir James Stephen's *Digest of the Criminal Law*.

Manson, GEORGE, a Scottish water-colour painter, was born in Edinburgh on 3d December 1850. He served five years as a wood-engraver in the establishment of Messrs W. & R. Chambers, studying art in his spare hours morning and evening. His first picture which attracted attention, 'Milking Time,' was painted at Craigmillar Castle

near Edinburgh, between four and eight o'clock of the mornings of a whole summer. In 1871 he devoted himself to painting altogether, but his youthful hard study had permanently injured his health, and he died at Lymington, Devonshire, 27th February 1876. His pictures, which have increased largely in value since his death, are mostly from humble life; beauty and refinement of drawing and colour are their great charm. A memoir of him, with photographs of his principal pictures, was published in 1880. See also P. G. Hamerton's *Graphic Arts*, p. 311.

Mansourah, a town of Lower Egypt, on the Damietta branch of the Nile, 30 miles SW. of Damietta by rail. Pop. (1882) 26,942. The place was founded in 1220, and here St Louis of France was imprisoned in 1250.

Mant, RICHARD (1776-1848), divine, was born in Southampton, educated at Oxford, and after holding cures in England, became successively Bishop of Killaloe (1820) and of Down and Connor (1828), with Dromore attached (1842). He wrote with D'Oyly a famous annotated Bible (1814), an annotated *Book of Common Prayer* (1825), and a *History of the Church of Ireland* (1841). See his *Memoirs* by Berens (1849) and W. Mant (1857).

Mantchuria. See MANCHURIA.

Mantegna, ANDREA, Italian painter, born in or near Padua in 1431, was the favourite pupil and adopted son of that tailor Mæcenas of painters, Squarcione. By studying the antique collections gathered together by his patron, especially from the study of the sculpture, Mantegna became imbued with the spirit of ancient art, and all his works bear the impress of the severe dignity and precision of his models. Grace and beauty were not the ideals that he aimed at; some of his pictures are positively ugly. A precocious genius, Mantegna set up an independent atelier when only seventeen years of age. Amongst his earliest works, done at Padua, are frescoes of saints in the church of St Antony, an altarpiece for St Justina, and most of the frescoes of St Christopher, and some of those of St James, in the church of the Hermits. Having married the sister of Giovanni and Gentile Bellini, he seems to have become estranged from Squarcione, and left Padua (1459). He painted an altarpiece, the 'Madonna and Angels,' for St Zeno's church at Verona, and was induced by Lodovico Gonzaga, Duke of Mantua, to settle in his city. There he remained, with the exception of a visit to Rome (1488-90) to paint a series of frescoes (now destroyed) for Pope Innocent VIII., until his death on 13th September 1506. His greatest works at Mantua were nine tempera pictures representing the 'Triumph of Cæsar' (his masterpiece). 'The Madonna of Victory with Gonzaga,' 'Parnassus,' 'Defeat of the Vices,' 'Triumph of Scipio,' and 'Madonna between St John the Baptist and St Magdalene.' Like Leonardo da Vinci, Mantegna was something of a universal genius. He was an engraver and an architect, as well as a painter, and is said to have written poems and wielded the sculptor's chisel. He introduced into North Italy, though he can hardly have invented, the art of engraving with the burin on copper. His best plates bear the titles 'A Bacchanal Feast,' 'Descent from the Cross,' 'Entombment,' 'Resurrection,' 'Battle of the Titans,' and 'Roman Triumphs.' Mantegna's technical excellencies, his skilful foreshortening, masterly perspective, and austerity of form exercised a great influence upon subsequent Italian art.

Mantell, GIDEON ALGERNON, an eminent British paleontologist and geologist, was born at Lewes, in Sussex, in 1790; studied medicine, and practised successively at Lewes, Brighton, and

Clapham, London, where he died in 1852. Though long suffering from a distressing spinal disease, the result of an accident, he pursued his studies with unabated zeal. He bequeathed his geological drawings to Yale College. His collections he sold to the British Museum in 1839 for £5000. Mantell's principal works are *Fossils of the South Downs* (1822); *The Fossils of Tilgate Forest* (1826); *Wonders of Geology* (1833), perhaps the most popular geological work ever written by an Englishman; and *Medals of Creation, or First Lessons in Geology* (1844). He was a very voluminous writer, no less than sixty-seven works and memoirs of his being enumerated in Agassiz and Strickland's *Bibliotheca Zoologica et Geologica*. His claims to a permanent place in the history of science rest mainly on his laborious investigations into the fossils of the Wealden beds. To him we owe the discovery and description of the four great Dinosaurian reptiles, the *Iguanodon*, *Hylæosaurus*, *Pelorosaurus*, and *Regnosaurus*.

Mantes, a town in the French department of Seine-et-Oise, on the left bank of the Seine, 36 miles by rail WNW. of Paris. It has a striking tower (1344) and a beautiful church, a reduced copy of Notre Dame at Paris. The ancient *Medunta*, a town of the Celts, Mantes in 1083 was sacked by William the Conqueror, who here received the injury that caused his death; and here too Henry IV. was converted from Protestantism. Pop. 6607.

Manteuffel, EDWIN HANS KARL, FREIHERR VON, Prussian general and administrator, was born, of an old Pomeranian noble family, at Dresden on 24th February 1809. Entering the Prussian guards in 1827, he rose to be colonel by 1854, and three years later was nominated head of the military bureau at Berlin, a post which he held until 1865. Having been appointed commander of the Prussian troops in Sleswick, he protested against the summoning of the Holstein estates by marching his men into that duchy (June 7, 1866). On the outbreak of hostilities Manteuffel commanded a division of the army of the Main, which was destined to act against the south German allies of Austria. He took part in the battle of Langensalza (27th June), which brought about the capitulation of the Hanoverian army, and on 19th July succeeded Von Falckenstein as commander-in-chief of the Main army, and by winning the battles of Werbach, Tauberbischofsheim, Helmstädt, and Rossbrunn over the Bavarians and others he brought that part of the campaign to a successful issue. He entered the war of 1870 as commander of the First Corps, but was soon promoted to the command of the First army, which fought successfully at Amiens and other places. Transferred in January 1871 to the command of the army of the south, operating against Bourbaki, Manteuffel assailed the enemy's rear near Belfort, and drove 80,000 men across the frontier into Switzerland. When peace was proclaimed he was placed at the head of the army of occupation in France, and in 1879 was appointed imperial viceroy of the newly-organised provinces, Alsace-Lorraine. His administration was not a happy one: his endeavours to help on the process of Germanisation by direct efforts only incensed the clergy and upper classes, both French and German. He died at Carlsbad, 17th June 1885. See *Life* by Keck (Bielef. 1889).

Mantineia, an ancient city of Arcadia, in the Peloponnese, situated on the river Ophis, in the midst of a broad plain. Here Epaminondas fell in the moment of a great victory over the Spartans, 362 B.C.

Mantis. This name is commonly applied to the various genera which constitute the family Mantidae of the insect order Orthoptera. They are chiefly to

be distinguished by the long prothorax and the enlarged front legs, which are fitted for grasping. They are entirely carnivorous in habit, but do not actively pursue their prey; the insect waits patiently until a fly comes within reach, and then rapidly seizes it with its fore-limbs (see the illustration).

Mantis religiosa.

The attitude adopted while waiting for insects to come within reach has given to one species, plentiful in the south of Europe, the name of 'praying mantis' (*M. religiosa*). This creature, invested with supernatural attributes, figures prominently in Bushman mythology and folklore. One of the most remarkable forms of mantis is the Indian *Hymenopus bicornis*; it has a flower-like shape and a pink colour. The apparent petals are the much-flattened joints of some of the limbs as it rests quietly among foliage. It is supposed that the resemblance to an orchid-like flower may delude smaller insects into approaching near enough for the mantis to take advantage of its 'alluring' colours and shape.

Mantling. See HERALDRY.

Man-traps, engines for the terrifying of trespassers and poachers (formerly often indicated by the warning notice 'man-traps and spring-guns set here'), resembled gigantic rat-traps four feet long. They may be seen in museums; it is, since 1827, illegal to set them save indoors between sunset and sunrise, as a defence against burglars.

Mantua (Ital. *Man'tova*), a fortified city of Northern Italy, formerly capital of the duchy of the same name, 38 miles by rail N. of Modena and 25 S. by W. of Verona, occupies two islands formed by the Mincio, and stands in the midst of a marshy district, which, combined with its artificial fortifications, make it perhaps the strongest fortress in Italy. But at the same time its situation makes it liable to malaria. It forms one of the four fortresses of the Quadrilateral (q.v.). The streets are spacious, the squares numerous, and the population comparatively small, 28,048 in 1881; so that for this reason, and because of the numerous massive medieval buildings, the town has a lifeless and gloomy appearance. Chief amongst the buildings are the fortress of the Gonzagas, erected in 1393-1406, and adorned with paintings by Mantegna; it forms the oldest part of the ducal palace, built in 1302, which contains 500 rooms ornamented with paintings and designs of Giulio Romano; the Palazzo Te, outside the city walls on the south, the greatest monument to the skill of Giulio Romano as architect, painter, and sculptor; the cathedral of San Pietro, restored from designs by G. Romano; and the church of San Andrea, one of the finest Renaissance churches in Italy, containing the tomb of Mantegna, whose pupils

adorned the walls with frescoes. The public institutions include an academy of arts and sciences, a library with 80,000 vols. and 1000 MSS., a museum of antiquities, an observatory, archives, a botanical garden, a large military hospital, &c. Virgil was born at Pietole (anc. *Andes*), now a suburb of Mantua. The industries include weaving, tanning, and saltpetre-refining. Some 3000 Jews live in Mantua. Mantua, an Etruscan town, was successively in the possession of the Romans, Ostrogoths, and Lombards before falling into the hands of the emperors, who gave it to the Marquis of Canossa. From him it passed to the Countess Matilda of Tuscany in 1052. After her death it was a free imperial city and joined the Lombard leagues against the Hohenstaufen emperors. The Buonacolsi made themselves masters of the city in 1247, but were ousted from power by the head of the Gonzaga (q.v.) family in 1328. This dynasty, the head of which was created duke by Charles V. in 1530, not only maintained themselves against their great rivals, the Visconti of Milan, but raised the city to the height of its splendour and renown. The last duke died childless in 1708, and his duchy was confiscated by Austria, who kept her hold of it down to 1866, except for two short periods (1797-99 and 1801-14), when it was in the possession of France. Mantua has endured at least three great sieges, by the Emperor Ferdinand II. in 1630, by the French in 1797, and by the Austrians in 1799. During the years 1830-59 it was the headquarters of much political persecution by the Austrian government. See Arco's History, in Italian (7 vols. 1871-74). The province has an area of 911 sq. m., and a pop. (1889) of 321,872.

Manu (from the Sanskrit *man*, 'to think,' lit. 'the thinking being') is the reputed author of the most renowned law-book of the ancient Hindus, and likewise of an ancient Kalpa work on Vedic rites. It is matter, however, of considerable doubt whether both works belong to the same individual, and whether the name Mann, especially in the case of the author of the law-book, was intended to designate an historical personage; for, in several passages of the Vedas (q.v.), as well as the Mahābhārata (q.v.), Manu is mentioned as the progenitor of the human race; and, in the first chapter of the law-book ascribed to him, he declares himself to have been produced by Virāj, an offspring of the Supreme Being, and to have created all this universe. Hindu mythology knows, moreover, a succession of Manus, each of whom created, in his own period, the world anew after it had perished at the end of a mundane age. The word Manu—akin to our 'man'—belongs therefore, properly speaking, to ancient Hindu mythology, and it was connected with the renowned law-book in order to impart to the latter the sanctity on which its authority rests. This work is not merely a law-book in the European sense of the word, it is likewise a system of cosmogony; it propounds metaphysical doctrines, teaches the art of government, and, amongst other things, treats of the state of the soul after death. The chief topics of its twelve books are the following: (1) creation; (2) education and the duties of a pupil, or the first order; (3) marriage and the duties of a householder, or the second order; (4) means of subsistence and private morals; (5) diet, purification, and the duties of women; (6) the duties of an anchorite and an ascetic, or the duties of the third and fourth orders; (7) government and the duties of a king and the military caste; (8) judicature and law, private and criminal; (9) continuation of the former and the duties of the commercial and servile castes; (10) mixed castes and the duties of the castes in time of distress; (11) penance and expiation; (12) transmigration and final beatitude. Bühler has proved that Max

Müller was right in regarding the extant work as a versified recast of an ancient law-book, the manual of a particular Vedic school, the Mānavas; and holds that the work, the date of which used to be given at 1200 B.C., was certainly extant in the 2d century A.D., and seems to have been composed between that date and the 2d century B.C. There are many remarkable correspondences between this work and the Mahābhārata, suggesting the use in both of common materials.

The laws of Manu were translated by Sir William Jones (1794). See also *The Ordinances of Manu*, translated from the Sanskrit, with introduction by Burnell, completed by Hopkins (1886); *The Laws of Manu*, translated with extracts from seven commentaries by G. Bühler (in 'Sacred Books of the East,' 1888).

Manure. Any material, whether of animal, vegetable, or mineral origin, which adds to the fertility of the soil has been generally regarded as manure. The application of stable and farmyard manure, as also the ashes of plants, &c., to the soil has been practised probably in all ages; but the scientific principles involved in this ancient practice were but little understood until more recent times, when chemists, botanists, and physiologists set themselves the task of explaining to the agriculturist the changes which are ever taking place in the soil and in the plant itself. On virgin soils crops may be grown for years without much evident diminution in quantity or quality; but a period must come when there will be an exhaustion of one or more of the constituents of plants, and the soil can then be no longer regarded as fertile. That is to say, soils contain certain proportions of certain ingredients; and when these are abstracted by the plant and carried away in the form of crops, the soil must in time become exhausted. It then becomes necessary to add to the soil in the form of manure such constituents as the crops have removed in order that the land may regain fertility. When we consider that Soils (q.v.) are formed mainly from the weathering of rocks, it will at once be understood how it is generally unnecessary that manures should contain such things as magnesia, iron, alumina, &c. Speaking generally, the constituents which are removed by plants from soils, the loss of which brings about that condition of 'exhaustion,' are compounds of nitrogen, phosphoric acid, and potash; and hence it is, in part at least, that farmyard manure is so universally regarded as the 'stand-by' of the agriculturist, for that material contains all those ingredients, and in a form easily assimilated by plants. It must not be overlooked, however, that possibly the chief advantages derived from the use of farmyard manure are that it makes the soil porous, and that the conditions which result from the decomposition of the organic matter are favourable to the development of those micro-organisms which bacteriologists are endeavouring to prove are of as much importance as the manure itself (see NITRIFICATION). Manures containing large proportions of organic matter, such as stable manure, wrack or seaweed, fish offal, &c., have value as plant-food; but the heat developed during their decomposition, or rotting, and the fact that the carbonic acid resulting from that change acts as a solvent on the mineral constituents of the soil and otherwise, are of still greater moment.

The first artificial manure systematically used was probably bones, applied in the earlier periods, either in an unground condition or simply bruised. About the beginning of the 19th century, however, it was proved that fineness of division rendered bone more easily assimilated by plants; and further progress still was made when Liebig introduced the treatment of bone with sulphuric acid, whereby chemical division was realised. There are about 50,000 tons of bone imported into Britain annually,

while of home-collected bone not less than 60,000 tons are employed in the manufacture of manure, and of this latter quantity London alone produces fully 23,000 tons annually.

Guano.—Peruvian guano was at one time imported from the Chincha Islands in enormous quantities; but the old deposits are practically exhausted, and the quality of the now available supply is comparatively poor (see GUANO). Ichaboe (off south-west Africa) guano is still imported, though in somewhat limited quantity; but it is much the richest available guano. The value of these guanoes lies in the percentages of nitrogenous organic matter, ammonia salts, phosphates of the alkalies and of lime, and the potash salts which they contain. Some of the islands in the South Pacific yield supplies of guano, but these are almost purely phosphatic, owing to the abundant rainfall of that region having washed out all the ammoniacal salts. Liebig's Guano and Liebig's Meat Meal are by-products from the preparation of Liebig's extract of meat. They are in a fine state of mechanical division, and are valuable sources of nitrogen and phosphates. Fish-guano is largely produced in Norway and the north of Scotland from fish offal (see GUANO). The process employed is essentially steaming to remove the oil, which is run off with the water; the solid residue is pressed and dried. The manurial constituents of this material are nitrogen and phosphates.

Dried Blood is another valuable source of nitrogen. Horn powder, shoddy and wool waste, leather raspings, &c. are also employed for the same purpose, but they are of much less value.

Phosphatic Substances.—The coprolites of Cambridge, Norfolk, and Suffolk come under this classification, as does also the land phosphate from the Ashley Basin of South Carolina, and the dredged phosphate from the Ashley and Cooper rivers. In addition to these we have Canadian apatite, Sombbrero, Navassa, Somme, Belgian, Florida, Spanish, Curaçao, and numerous other phosphates. These are of little value as manure in their natural and ground state, and are almost wholly converted into superphosphate by the action of sulphuric acid, whereby the natural or tricalcic phosphate—which is insoluble in water—is converted into the monocalcic phosphate, which is soluble, and therefore readily available to plants.

Sulphate of Ammonia is principally derived from the destructive distillation of coal and shale (see GAS, Vol. V. p. 215, and PARAFFIN). Its value depends upon the percentage of ammonia which it contains. This salt sometimes contains sulphocyanide of ammonium, a substance which is inimical to plant-life. Some experimentalists assert with all confidence that ammonia salts must undergo nitrification before they can enter the plant; but that contention is scarcely now tenable, because nitrification is possible in some cases within the plant itself.

Nitrate of Soda or Chili Saltpetre is very extensively imported, and is sold on a basis of 95 per cent. nitrate, or '5 per cent. refraction'—i.e. not more than 5 per cent. of impurities. It is found native in several districts of South America in an impure state, and is rendered marketable by a process of solution and re-crystallising. Its action as a manure is comparable to that of nitrate of lime, nitrate of potash, or sulphate of ammonia. Its only valuable constituent is nitric acid, while in the other nitrates mentioned the base is also serviceable.

Potash Salts are of the utmost service to plants. Carse or clay lands generally contain a sufficiency of potash, while medium and light soils require it to be added. Nitrate, sulphate, and muriate are all more or less employed in compounding potash

manures (i.e. manures containing potash as one of their constituents), but kainit—an impure potash salt largely imported from Germany—is perhaps the most generally used when a dressing of potash only is desired.

Liquid Manure may be classed with farmyard manure, as it is now very commonly absorbed in the 'courts' by the straw, &c. Occasionally it is used in the liquid form on grass or stubble land.

Lime is one of the most necessary constituents of soils and manures. It is generally applied 'fresh burned' to newly-broken land, or where there is an excessive amount of peat or similar material. Lime is the great carrier into plants of other 'stuffs' which go to form their organic compounds, and during this elaboration organic acids are formed, many, if not all, of which would poison the plants themselves but for the presence of lime, with which these organic acids combine to form insoluble non-poisonous compounds.

The study of the subject—manures and manuring—can be most profitably followed in the works of Lawes and Gilbert. Yet most of our manurial—or agricultural—experiments are but gropings in the dark; they are most misleading and inconclusive, mainly because the experimentalists have known little or nothing of the changes going on in the plant itself, or of the variations in those changes caused by the amount and intensity of light and heat. Until we know more about the micro-organisms in the soil, their life-history and functions, but little progress can be made; and until we have experimentalists capable of demonstrating the functions, chemical and physical, of plants, and the variations in those functions with the ever-varying climatic conditions, so-called agricultural research must lead to disappointment. See AGRICULTURE, COMPOSTS, ROTATION, and SEWAGE.

Manzanilla. (1) a port of Mexico, on a fine bay opening to the Pacific, 31 miles by rail WSW. of Colima. The country around is equally fertile and unhealthy, and the trade is largely in the hands of Germans. Pop. 4000.—(2) A port on the south coast of Cuba, with a good harbour and export trade in valuable woods, sugar, &c. Its climate also is unhealthy. Pop. 8000.

Manzoni, ALESSANDRO, a great Italian writer, was born at Milan, March 7, 1785, of noble parents, and through his mother grandson of the celebrated Marquis Beccaria. He published his first poems in 1806, married happily in 1810, and spent the next few years in the composition of the *Inni Sacri*, sacred lyrics, and a treatise on the religious basis of morality, by way of reparation for the unbelief of early youth. In 1819 he published his first tragedy, *Il Conte di Carmagnola*, a trumpet-blast of romanticism; the second, *Adelchi*, followed in 1822. Manzoni's first tragedy had the honour to be defended by Goethe, 'one genius having divined the other.' But the work which gave Manzoni European fame is his historical novel, *I Promessi Sposi*, a Milanese story of the 17th century (3 vols. Milan, 1825-6-7). The tale abounds in interesting sketches of national and local Italian customs and modes of life, portrayed with unflinching spirit and humour, while various grave historical events are narrated with force and grandeur of style, especially the episode of the plague in Milan. Manzoni's noble ode, *Il Cinque Maggio*, was inspired by the death of the great Napoleon. His last years were darkened by the frequent shadow of death within his

household. He himself died at Milan, 23d May 1873, leaving to posterity the memory not alone of a great writer, but of a singularly noble and sincere man.

A complete edition of his works, in 5 vols., was published by Nicolò Tommaseo (Florence, 1828-29). His Letters were collected by Sforza (1875); and a posthumous work on the French and Italian revolutions of 1789 and 1869 was edited by Bonghi (Milan, 1889). Bismara's *Bibliografia Manzoni* (Turin, 1875) will be found useful. There are Lives (Italian) by Balbiani (1873), Bersezio (1873), Prina (1874), and Pugni (1876).

Ma'oris, the native inhabitants of New Zealand (q.v.).

Maormor. See EARL.

Map (Lat. *mappa*, 'a towel'). A map is a delineation on a plane of the surface of the earth or of a portion thereof, exhibiting the lines of latitude and longitude, &c., and the forms and relative positions of the countries, mountain-ranges, rivers, towns, &c.; or it may be of the starry heavens, or of stars and constellations. As it is manifestly impossible correctly to represent a spherical upon a plane surface, geographers are consequently necessitated to resort to expedients in order to minimise or distribute the unavoidable distortion and disproportion. Hence the use of the various map projections or arrangements of the lines of latitude and longitude. The only true representation of the earth's surface, it is clear, is to be found on the *terrestrial globe*. This is inconvenient in form and necessarily too small in scale to serve the purposes effected by maps proper, which are usually produced on paper or other convenient plane surfaces, and a series of which, conjoined, form an *atlas*. A *hydrographical* map, specially representing oceans, seas, or navigable waters with their coasts, sandbanks, currents, lighthouses, depths, and other objects and information of importance to seamen, is usually constructed on Mercator's projection, and is called a *Chart* (q.v.). A special *topographical* map represents the details minutely and on a considerable scale. The Ordnance Survey of Great Britain and Ireland is a good example of such, and is produced on various scales—viz. 6 inches and 1 inch to a mile respectively. Some counties are also published on a scale of 1 square inch to an acre. Similar products, the result of exact trigonometrical work, are extant of the continent of Europe from the Bay of Biscay to the Lower Volga, and from Sicily to St Petersburg. Portugal also is thus represented, and considerable parts of Sweden and Norway, but not of Turkey or Greece, and but little of Spain. Similarly advantaged are considerable portions of the United States, Algeria, the Nile Delta, Sinai, Palestine, India, Ceylon, and Java. The results of general but not detailed survey exist of the remaining portions of Europe, United States, Canada, Argentina, Cape Colony, eastern and southern Australia, New Zealand, Japan, China proper, and parts of central Asia, Persia, and Asia Minor. Much of the chartography of the rest of the known world is compiled from numerous observations and itineraries, and is fairly reliable. Extensive tracts of North and South America, north Asia, Australia, and most of Africa are only approximately correct. Maps are also constructed for special purposes, and are distinguished as physical, political, military, statistical, historical, &c.

Within the last half-century great improvement has been made in the art of map production or *chartography*, resulting in great clearness and the combination of a mass of information with artistic beauty. This is attained in some cases partly by the use of conventional signs or arrangements, such as the adoption of blue colour for coasts and water-courses, brown for mountain-ranges, and various

tintings for the divisions, political or otherwise, and to distinguish the various natures of the surface, such as forest, arable, prairie, desert, elevation, &c. The art of lithography has been an invaluable aid in all such cases. In Germany especially has this science-art been carried to the greatest perfection.

The *scale* or definite relation of a map to the actual size of nature is indicated by a graduated line, showing by its divisions the number of miles or yards corresponding to any space measured on the map. In comparing various maps by their scales, it is convenient to refer to the *scale of nature*, frequently indicated in proportional figures, thus—1 : 3,700,000 ; 1 : 500,000, &c.

The lines of *projection* on a map are essential for determining the positions of the parts, and indicate latitude, or distance north or south from the equator, and longitude, or distance east or west from any given line. These lines are called *meridians*, and are usually numbered from the meridian of Greenwich on English maps, and indeed on nearly all maps. Other first meridians in common use are those of Paris, Washington, and Ferro (see LATITUDE AND LONGITUDE). These distances are given in degrees, minutes, and seconds, as in other circle measurements. In choosing a projection, regard must be had to the purpose for which it is intended, and to the area to be represented. The errors inherent in a projection nearly imperceptible in a map of England might be fatal to its use in a map of Asia. In a map of the world equivalence of area is of less importance than freedom from distortion and correctness of relative position. There have been numerous forms of projection devised, including perspectives and approximative developments. Of these only the more familiar can be described here.

The plane on which the perspective map is drawn is supposed to pass through the centre of the earth, and, according to the distance of the eye, the projection is either of the first, second, or third of the following. (1) In the *orthographic* the eye is assumed to be at an infinite distance from the centre of the earth, so that all rays of light proceeding from every point in its surface are parallel and perpendicular. From the nature of this projection, it is evident that, while

Fig. 1.

Globular, or Equidistant Projection of a Hemisphere.

the central parts of the hemisphere are fairly accurately represented, the parts towards the circumference are crowded together and diminished in size. On this account it is of little use for geographical purposes, but most suitable for maps of the moon. (2) In the *stereographic* the eye or point of projection is assumed to be placed on

the surface of the sphere opposite the one to be delineated. If the globe were transparent, the eye would then see the opposite concave surface. Contrary to the orthographic, this method contracts the centre of the map, and enlarges it towards the circumference. Owing to the unequal area of the divisions, and the difficulty of finding the true latitude and longitude of places, this projection is not much employed. (3) In order to rectify the opposite effects of the two preceding, the *globular* projection, a modification of the two, is generally adopted. If we suppose the eye to be removed from the surface to a distance equal to the sine of 45° of the circumscribing circle, the projection is called globular. In other words, if the diameter of the sphere be 200 parts, it must be produced 70 of these parts in order to give the point of projection. All meridians and parallels in this projection are in reality elliptical curves; but as they approach so nearly to circular arcs, they are very rarely shown otherwise.

The construction of the globular or equidistant projection is as follows (fig. 1): Describe a circle, NESW, to represent a meridian, and draw two diameters, NCS and WCE, perpendicular to each other, the one for a central meridian, the other for the equator. Then N and S will represent the north and south poles. Divide each of the quadrants into nine equal parts, and each of the radii, CN, CE, CS, and CW, also into nine equal parts. Produce NS both ways, and find on it the centres of circles which will pass through the three points 80×80 , 70×70 , &c., and these arcs described on both sides of the equator will be the parallels of latitude. In like manner, find on WE produced the centres of circles which must pass through a, b , &c., and the poles. Having selected the first meridian, number the others successively to the east and west of it. A map may in this way be constructed on the rational horizon of any place.

The impossibility of getting a satisfactory representation of special parts of the sphere by any of the previous methods leads to the desire for others less defective. Of all solid bodies whose surfaces can be accurately developed or rolled out upon a plane without alteration, the cone and cylinder approach nearest to the character of the sphere. A portion of the sphere between two parallels not far distant from each other corresponds very nearly to a like conical zone; whence it is that conical developments make the best projections for limited portions of the earth's surface, and even with some modifications for more extensive portions.

A conical projection of Europe (fig. 2) is constructed thus: Draw a base-line, AB; bisect it in E, and at that point erect a perpendicular, ED, to form the central meridian of the map. Take a space for 5° of latitude, and, since Europe lies between the 35th and 75th parallels of latitude, mark off eight of these spaces along ED for the points through which the parallels must pass. The centre from which to describe the parallels will be the point in ED where the top of a cone, cutting the globe at the 45th and 65th parallels, would meet the axis of the sphere. This point will be found to be beyond the North Pole at C. On the parallels of 45° and 65° , where the cone cuts the sphere, mark off equivalents to 5° of longitude, in proportion to the degrees of latitude in those parallels, and if straight lines be drawn through these points from C they will represent the meridians for every 5° . A modification of the conic projection, suitable for more extensive portions of the sphere, such as of Asia, is obtained by giving on each parallel of latitude the true meridional proportional distances, which results in a curving of the meridian lines outward from the centre of the map.

In all the projections hitherto described the

direction either of the north and south, or of the east and west, is represented by a curved line, so

Fig. 2.—Conical Projection of Europe.

that on such a map the course of a vessel would almost always be laid down in a curve, which could only be described by continually laying off from the meridian a line at an angle equal to that made with the meridian by the point of the compass at which the ship was sailing. If the vessel were to steer in a direct north-east course by one of the previous projections, she would, if land did not intervene, describe a spiral. The mariner, however, requires a chart which will enable him to steer his course by compass in straight lines only. This valuable instrument is supplied by Mercator's chart, a cylindrical projection in which all the meridians are straight lines *perpendicular* to the equator, and all the parallels straight lines *parallel* to the equator. It is constructed thus (fig. 3): A

Fig. 3.—Mercator's Projection.

line, AB, is drawn of the required length for the equator. This line is divided into 36, 24, or 18 equal parts, for meridians at 10° , 15° , or 20° apart, and the meridians are then drawn through these perpendicular to AB. From a table of meridional parts (a table of the number of minutes of a degree of longitude at the equator comprised between that and every parallel of latitude up to 89°) take the distances of the parallels, tropics, and arctic circles from the equator, and mark them off to north and south of it. Join these points, and the projection is made.

This projection, of course, does not give a natural representation of the earth, its effect being to exaggerate the polar regions immensely. The distortion in the form of countries and relative direction of places is rectified by the degrees of latitude being made to increase proportionably to those of longitude. There are other cylindrical projections of the sphere, but this is the most generally valuable and best known. It gives an unbroken view of the earth's surface with the exception of the poles, which are infinitely remote.

Historical.—The ancient Greeks considered Anaximander (560 B.C.) as the inventor of cartography; but there is evidence that about 1000 years earlier some attempts in that direction had been made amongst the Egyptians. Necessarily these efforts were of the crudest, and were made upon the supposition that the earth was a plane. After Aristotle the spherical theory was adopted, and the application of astronomical observations to

geography was first made by Pytheas of Massilia (326 B.C.), and the first attempts at projections by Dicæarchus of Messana (310 B.C.). Ptolemy's (150 A.D.) rational teaching had an ultimate valuable influence in the treatment of cartography, although the Romans made little progress in the art, which during the middle ages also showed almost no advance. In the 14th and 15th centuries a gratifying improvement is observable in Italian nautical charts. In the 15th century the revivals of Ptolemy's teaching produced a revolution in the construction of maps, and laid the foundation of modern cartography. There was great increase in the number and importance of maps. The first attempts to improve and increase the methods of projection known to the Greeks were made by Germans, viz. Johann Stöfler (1452-1536), and Peter Apianus (1495-1552), &c. In the same period that Mercator (Gerhard Kremer, 1512-1594) made his invaluable contributions, the Italians,

Map of British Islands, reduced from the Latin Ptolemy of 1478.

Germans, and Dutch were active competitors in geographical work. Amongst the increasing host of names connected with the subject are found that of Sebastian Cabot (1544), who produced his map of the world. In Germany, Johann Baptist Homann (1644-1724) and Tobias Mayer (1723-86) occur; in France, Nicolas Sanson (1600-87), Guillaume de l'Isle (1675-1726), and Jean Baptiste Bouignonn d'Anville (1697-1782); and in Italy, P. Vincent Cornelli (d. 1718). In the 18th century France led the way in cartography by state survey resulting in the *Carte Géométrique de la France*. The British Ordnance Survey was begun in 1784.

In our own times excellent maps are produced by the million accessible to all classes, and are of great account for educational purposes. The most prominent names of recent cartographers are—German: Kiepert, Berghaus, Petermann, Hassenstein, Habenicht, Justus Perthes, &c.; Italian: Guido; Coro; British: Arrowsmith, Hughes (*educational*), Ravenstein, and the geographical firms of W. & A. K. Johnston, E. Stanford, and Bartholo-

mew & Co. See also the articles CONTOUR LINES, DEGREE, EARTH, LATITUDE AND LONGITUDE, MERIDIAN, ORDNANCE SURVEY.

Map (less correctly, MAPES), WALTER, a great 12th-century writer, was born on the Welsh marches, perhaps in Herefordshire, about 1137. He studied at the university of Paris, became an intimate friend of Becket, was a justice-in-eyre at Gloucester assize in 1173, attended the king the same year to Limoges, and for many years later, probably as chaplain, and was sent on missions to Paris and to Rome. He enjoyed the living of Westbury in Gloucestershire, where he had a long feud for his rights with the monks of a neighbouring Cistercian convent, and became canon of St Paul's and precentor of Lincoln, but still continued his attendance on the king. In 1196, under Richard I., he became archdeacon of Oxford, and so passes from recorded history. Map was a frank, open-hearted man, with a quick wit, bold humour, and an indignant contempt for hypocrisy. All these qualities

are revealed in a number of Latin satirical poems long connected (and apparently on good grounds) with his name. Of these the chief are the *Golias* series (*Apocalypsis Goliae*, *Predicatio*, *Confessio*, &c.). In the latter occurs the famous 'Meum est propositum in taberna mori,' which is far more a stern satire by self-revelation than a jovial drinking-song, as often understood. In Bishop Golias the writer has realised by creative imagination a type of the ribald priest, and upon his head he pours out the vials of his wrath and scorn, with humour rich, bold, sometimes coarse, but always honest. Map seems to have kept well the secret of his authorship, for even his friend Giraldus Cambrensis did not know their origin, as we find him, with the churchman's proverbial dislike to see the humorist point out the stains upon his cloth, denouncing Golias as a foul-mouthed scoffer.

Sir Galahad, the stainless knight, was Map's creation, and there is the best reason, with M. Paulin Paris, to count him the heart and soul of that contemporary work of Christian spiritualisation which systematised and gave a meaning to the detached Arthurian romances. He wrote most probably the Latin original of Robert Borron's introductory romance of the *Saint Graal*, and certainly *Lancelot of the Lake*, the *Quest of the Saint Graal*, and the *Mort Artus*. M. Paris confines his direct work to the two Graal romances and the opening of Merlin.

Thomas Wright edited for the Camden Society Map's *Latin Poems* (1841) and the *De Nugis Curialium* (1850), an interesting kind of note-book of the court-gossip and events of the day, interspersed with theological polemics, anecdotes, and accounts of miracles, fairy legends, or *apparitiones fantasticæ*, and the dissuasion against marriage sent by Valerius to the philosopher Rufinus.

Maple (*Acer*), the typical and the principal genus of the natural order Aceraceæ. The species are numerous, all are deciduous trees, and natives of the temperate parts of the northern hemisphere, and particularly numerous in North America and the north of India. They have opposite leaves without stipules, usually lobed or palmate. The flowers are in axillary corymbs or racemes of no beauty, but abound in honey, and are very attractive to bees. The fruit is formed of two small winged nuts, each with one or two seeds.—The

America, where it often forms great part of the undergrowth in woods, is so named because the smooth bark of the two-year-old branches are beautifully varied with green and white stripes; its wood, which is very white, is used for inlaying in cabinet-work.—The Greater Maple or Sycamore (*A. pseudo-platanus*), commonly called

Fig. 2.—Greater Maple (*Acer pseudo-platanus*):
a, fruit.

Plane-tree in Scotland, is a native of various parts of Europe, but a doubtful native of Britain, in which, however, it has long been common. It attains a height of 70 to 90 feet, has a spreading umbrageous head, and large, palmate, coarsely-serrated leaves on long stalks. It is of quick growth, and succeeds well near the sea and in other exposed situations. The wood is white, compact, and firm, though not hard; it is capable of a fine polish, and is used by wheelwrights, turners, &c. It is not apt to warp. Stair-rails are often made of it, and pattern-blocks for manufactories, as well as bowls, bread-plates, &c. Sugar is sometimes made from the sap of this tree, as from that of several other maples; but the species which yields it most abundantly is the Sugar Maple (*A. saccharinum*) of North America, a species which much resembles the sycamore, and abounds in the northern parts of the United States and in the British possessions, where large quantities of sugar are made from it, although only for domestic use. To obtain the sap, the trees are tapped in February, March, and April, according to the locality and the season, and when warm days and frosty nights occur, which favour its flow. An incision is made in the trunk with an auger or axe, at first half an inch deep, and is increased by degrees to two inches. A spout of sumach or elder is then inserted, through which the sap flows into a trough, whence it is conveyed daily to a larger receiver; from this, after being strained, it is carried to the boiler. Being liable to ferment, it cannot be kept long after being collected. The boiling and refining processes are the same as those in the manufacture of cane-sugar. A single tree yields from two to six pounds in a season. Good vinegar is made from it, and a kind of molasses much superior to that from the sugar-cane, and much used in America with buckwheat cakes, &c. The wood of the Sugar Maple has a satiny appearance, and is used for cabinet-making; it is sometimes finely marked with undulations of fibre, and is then known as *Bird's-eye Maple*, and is used for veneers. The Sugar Maple is not so hardy in the climate of Britain as the sycamore, and seems to

Fig. 1.—a, Common Maple (*Acer campestre*);
b, Japan Maple (*Acer palmatum*).

Common Maple (*A. campestre*), a small tree, is a native of Britain, and of many parts of Europe and Asia. The wood is compact, fine grained, and takes a high polish; hence it is much used by turners and for carved work, being frequently substituted for the wood of the Holly and Box by mathematical instrument makers. Several nearly-allied species are found in the south of Europe.—The Striped Bark Maple (*A. striatum*) of North

require a dry and sheltered situation.—The Norway Maple (*A. platanoides*), a native of the north of Europe, although not of Britain, is also found in North America; it much resembles the sycamore.—A Himalayan species (*A. villosum*), a noble tree, found with pines and birches at great elevations, is sometimes grown in Britain. A large number of interesting and remarkably beautiful forms of several Japan species of Acer, such as *A. dissectum* and *A. palmatum*, have been introduced within the last few years; they have proved hardy in many favoured districts of England and Ireland, but are unsuited to Scotland generally, though they are occasionally seen there in conservatories cultivated in pots.

Maqui (*Aristotelia Maqui*), the only known species of the genus, which belongs to the natural order Tiliaceæ, and has been made the type of a proposed order. It is an evergreen or sub-evergreen shrub, of considerable size, a native of Chili. The Chilians make a wine from its berry, which they administer in malignant fevers. The wood is used for making musical instruments, and the tough bark for their strings. The Maqui sometimes ripens fruit against a wall in England, and is frequently cultivated as an ornamental shrub.

Mar, an ancient district of Scotland between the Dee and the Don, comprising nearly the south half of Aberdeenshire, and subdivided into Braemar, Midmar, and Cromar. In 1014 a Mormaer of Mar was present at the battle of Clontarf; and in 1115 another figures in the foundation charter of Scone priory as 'comes' or earl. The male line of these Celtic Earls of Mar expired in 1377 with Thomas, thirteenth earl, whose sister Margaret married William, first Earl of Douglas. Their daughter, Isabella, in 1404 married Alexander Stewart, the 'Wolfe of Badenoch,' who, after her death in 1419, was designated Earl of Mar. The earldom by right should have gone to Janet Keith, great-granddaughter of Grathney, eleventh Celtic earl, and wife to Sir Thomas Erskine; but it was not till 1565 that it was either restored, or else granted by a new creation with limitation to heirs male, to their sixth descendant, John, sixth Lord Erskine, who at his death in 1572 had been for a twelvemonth regent of Scotland. John, Earl of Mar (1675–1732), who began life as a Whig, and by his frequent change of sides earned the nickname of 'Bobbing Joan,' headed the rebellion of 1715 (see JACOBITES), and died in exile at Aix-la-Chapelle. In 1824 the reversion of his attainder was procured by his grandson, John Francis Erskine, but his grandson dying without issue in 1866, the question arose whether the earldom of Mar could pass through his sister to her son, John Francis Good-eve-Erskine (né Goodeve), or must go to his first cousin, Walter Coningsby Erskine, Earl of Kellie. And the strange solution of that question has been that in 1875 Walter Henry Erskine, thirteenth Earl of Kellie, was declared by the Committee of Privileges also eleventh Earl of Mar, and that in 1885 the Earldom of Mar Restitution Bill declared Mr Goodeve-Erskine twenty-sixth Earl of Mar, claiming creation before 1014, but allowed precedence 1404. See the Earl of Crawford's *Earldom of Mar in Sunshine and Shade* (2 vols. Edin. 1882).

Marabon Feathers. See ADJUTANT.

Marabouts, a name derived from the Arabic word *morabit*, and used to designate a religious devotee or ascetic. They have always been found chiefly in north Africa, and have at times exercised considerable political influence, as in encouraging opposition to the French conquests in Algeria and Tunis in the 19th century, and in former centuries as the origin and mainstay of the Almoravid dynasty, which held Morocco and Spain for a

long period. These devotees are held in great veneration by the Berbers; they frequently officiate at mosques and chapels, and are believed to possess the power to prophesy and work miracles. The dignity is generally hereditary. The name is also applied to the tombs of the devotees.

Maracaybo, a fortified city of Venezuela, is situated on the west shore of the strait which connects the lake and gulf of Maracaybo. It is a handsome town, with many gardens and squares, a college, hospitals, a theatre, a German clubhouse, the usual government buildings, a custom-house, wharves, and a number of manufactories. The climate is hot, the soil sandy, and the place unhealthy, owing mainly to the unsanitary domestic arrangements. The trade is chiefly in the hands of Germans, Danes, and North Americans. The staple export is coffee (£1,367,291 in 1889); box-wood, *lignum vitæ*, cedar, and other woods, besides divi-divi, hides and skins, and some cocoa, gums, and fish sounds, are the other exports, the value of which (including coffee) in 1889 reached about £1,500,000. Fully seven-eighths of these go to the United States, although most of the merchandise imported comes from Great Britain, Germany, and France. Pop. (1888) 34,284.

The *Gulf of Maracaybo* is a wide inlet of the Caribbean Sea, extending from the peninsulas of Paraguana and Guajira to the strait by which it is connected with the lake. The latter forms the floor of a great valley, shut in by lofty mountains. Its waters are sweet, and deep enough for the largest vessels; but the bar at the mouth, where a swift current runs, makes entrance difficult. The gulf and lake were discovered in 1499 by Ojeda, who found here houses built on piles, and so gave the district the name Venezuela ('Little Venice'), which was afterwards extended to the entire country.

Maragha, a town of western Persia, 55 miles S. of Tabriz and 20 miles E. of Lake Urmia. It is celebrated as the capital of Hulagu Khan, grandson of Genghis Khan, and as the site of the observatory which Hulagu built for the astronomer Nasr ed-Din. Pop. 13,260.

Marajó, an island situated between the estuaries of the Amazon and Para, with an area of nearly 18,000 sq. m. It is for the most part low and covered with grass and bush, but in the east and south with dense forest. The soil is fertile, and large herds of cattle are reared in the north-east.

Maranhão, or **MARANHAM**, a maritime state of Brazil, bounded on the north by the Atlantic Ocean, with an area of 177,566 sq. m. and a pop. (1888) of 488,443. The surface is uneven, but there is no range of mountains. There are numerous rivers falling into the Atlantic, large forests, extensive plains where cattle are reared; the climate is fine, the soil fertile. Agriculture, however, has not prospered here, and the emancipation of the slaves, on whose labour it had depended, was followed by a period of great depression. Cotton and sugar are the principal products.—The chief city is *Maranhão*, or *San Luiz de Maranhão*, on an island between the mouths of the Mearim and the Itapicuré. It is a well-built town, clean, gay, hospitable, and has a pop. of 35,000. It contains a cathedral and bishop's palace, a hospital, a technical school, some sugar and spinning and weaving factories, and docks that admit ships drawing 14 feet. The chief exports (£420,656 in the year 1887–88, £282,004 in 1888–89) are cotton and sugar; then come hides and goat and deer skins, gum, balsam, cotton-seed, india-rubber, &c. Portugal is the largest customer, followed by Britain, which sends three-fourths of the total imports (about £520,000 annually).

Marañon. See AMAZON.

Maraschi'no. See LIQUEUR.

Marat, JEAN PAUL, one of the most prominent figures in the French Revolution, was born at Boudry in Neuchâtel, May 24, 1743, eldest child of Jean Paul Mara, a physician and native of Cagliari, who had married Louise Cabrol, a Genevan Protestant. He studied medicine at Bordeaux, next went to Paris, to Holland, and to London, where for some time he practised his profession with success, and published a materialistic *Philosophical Essay on Man* (1773), sharply attacking Helvétius, and anonymously a political essay, *The Chains of Slavery* (1774). In 1775 he paid a visit to Edinburgh, and was made on June 30, on the recommendation of certain Edinburgh physicians, M.D. of St Andrews University; and it hardly admits of doubt that he was not the John Peter le Maître, *alias* Maire, *alias* Mara, who got five years at Oxford assizes in March 1777 for stealing coins and medals. For in June 1777 his character and reputation as a physician and oculist stood so high that he was made brevet-physician to his guards by the Comte d'Artois, afterwards King Charles X.—an office which he held till 1786. Meantime he continued his scientific work in optics and electricity, attracting the attention of Franklin and Goethe, but the Académie des Sciences refused him admission on account of his attack on Newton. Further writings were his anonymous *Plan de Législation Criminelle* (1780), a translation of Newton's *Optics* (1787), and *Mémoires Académiques, ou Nouvelles Découvertes sur la Lumière* (1788).

But all Paris was now infected with the fever of revolution, and Marat flung himself with characteristic ardour into the war of pamphlets, and at length in September 1788 established his famous and infamous paper, *L'Ami du Peuple*. Throughout he fought ever for his own hand, with bleary-eyed honesty and indomitable persistence, constantly croaking of treachery in high places, and denouncing with feverish suspiciousness in turn Necker, Bailly, Lafayette, the king, Dumouriez, and the Girondins. His virulence provoked the most vehement hatred, and covered his own head with calumnies which survived for generations; but it made him the darling of the scum of Paris, and placed great power in his hands at some of the most momentous crises of the Revolution. His printing-press had to be cunningly concealed from Lafayette's police, twice at least he had to flee to London, and once he was forced to hide for a time in the sewers of Paris, where he contracted a loathsome skin disease, yet was tended with affectionate faithfulness by Simonne Evrard, whom he had married 'one fine day in presence of the sun.' His sufferings deepened his frenzied hatred and suspicion of constituted authority, and there can be no doubt that on his head rests in great measure the guilt of the infamous September massacres. He was elected to the Convention as one of the deputies for Paris, and was perhaps the most unpopular man within the house, where indeed his influence never became more than contemptible. On the declaration of the republic he started his paper anew under the title *Journal de la République Française*. After the king's death his last energies were spent in a mortal struggle with the Girondins, who subscribed their own downfall when their formal accusation of Marat failed before the tribunal. But it was the tribune's last triumph. He was dying fast of the disease he had contracted in the sewers, and could only write sitting in his bath. There his destiny reached him through the knife of Charlotte Corday (q.v.), in the evening of the 13th July 1793. His body was committed to the Panthéon with the greatest public honours, to be

cast out but fifteen months later amid popular execration.

See the *Histories of the French Revolution* by Mignet, Thiers, Michelet, Louis Blanc, Carlyle, Von Sybel, and H. Morse Stephens; A. Bougeart, *Marat, l'Ami du Peuple* (2 vols. 1864); but especially the works by F. Chevrement, *Marat, Index du Bibliophile* (1876); *Placards de Marat* (1877); and his exhaustive *Jean Paul Marat, esprit politique, accompagné de sa vie scientifique, politique, et privée* (2 vols. 1881).

Marathi. See MAHRATTAS, INDIA.

Marathon, a village on the east coast of ancient Attica, 22 miles N.E. of Athens, long supposed to be the modern *Marathona*. It stood in a plain 6 miles long and from 3 to 1½ miles broad, with a background of mountains in the west, and a marsh both on the north and south; eastward it reached the sea—'The mountains look on Marathon, and Marathon looks on the sea.' Recent investigations by Prussian officers identify the historic village with that of Brana, nearly 2½ miles to the south, and locate the battle in the plain between the mountain Stavrokoraki and the sea, nearly 3 miles north-east of Brana. The name of Marathon is gloriously memorable as the scene of the great defeat of the Persian hordes of Darius by the Greeks under Miltiades (490 B.C.)—one of the decisive battles of the world.

Marave'di, an old Spanish copper coin in use from 1474 to 1848, was worth about ⅓th of a penny. There were also, at an earlier period, *maravedis* of gold and of silver.

Marbeck, or MERBECKE, JOHN, organist of St George's Chapel, Windsor, was condemned to the stake about 1544 for favouring the Reformation, but pardoned by favour of Bishop Gardiner. In 1550 he published his famous *Booke of Common Praier Noted*, an adaptation of the plain chant of the earlier rituals to the first liturgy of Edward VI. He wrote several theological and controversial works; and a hymn for three voices and parts of a mass by him are extant. He died about 1585.

Marble, in its strict and proper sense, is a rock crystallised in a saccharoidal manner, having the fracture of loaf-sugar, and composed of carbonate of lime, either almost pure when the colour is white, or combined with oxide of iron or other impurities which give various colours to it. But many other kinds of stone are popularly included under this title. Indeed any limestone rock sufficiently compact to admit of a polish is called marble. It is only in this vague sense that the indurated amorphous rocks used in Britain can receive this name. Such are the black, red, gray, and variegated limestones of the Devonian system, which are very beautiful from the numbers of exquisitely-preserved corals which abound in them; the marbles of the Carboniferous series from Flintshire, Derbyshire, and Yorkshire, so full of encrinites; the shell marbles from the Oolitic rocks at Rance, Stamford, and Yeovil; and the dark Purbeck and Petworth marbles, beautifully 'figured' with shells, from the Wealden strata, which were so much used by the architects of the middle ages.

Saccharine or statuary marble is a white fine-grained rock, resembling loaf-sugar in colour and texture, working freely in every direction, not liable to splinter, and taking a fine polish. Of the marbles used by the ancients, the most famous was Parian marble, a finely granular and very durable stone, with a waxy appearance when polished. Some of the finest Grecian sculptures were formed of this marble, among others, the famous *Venus de Medici*. The marble of Pentelicus was at one time preferred by the Greeks to Parian, because it was whiter and finer grained. The Parthenon was entirely built of it, and many

famous statues still remain which were executed in this marble, but they are always more or less weathered, never retaining the beautiful finish of the Parian statues. The quarries at Carrara (q.v.) were known to the ancients, but they have been more extensively wrought for modern sculptors, who use this marble chiefly. It is a fine-grained, pure white marble, but is so often traversed by gray veins that it is difficult to get large blocks free from these. Of coloured marbles, the best known are the Rosso Antico, a deep blood-red, sprinkled with minute white dots; Verde Antico, a clouded green produced by a mixture of white marble and green serpentine; Giallo Antico, a deep yellow, with black or yellow rings; and Nero Antico, a deep black marble.

A true marble is a crystalline granular aggregate of calcite, the granules being of remarkably uniform size. Not infrequently scales of mica or talc occur scattered through the rock. Such a rock is of metamorphic origin: it is simply a limestone which has been rendered entirely crystalline from the effects of heat under pressure, as in the vicinity of large intrusions of igneous rock. Marble may therefore be of any geological age. Many crystalline limestones, which are sometimes entitled to the name of marble, occur associated with gneiss and mica-schist, and are often rich in such minerals as garnet, actinolite, zoisite, mica, &c.

Marblehead, a seaport town of Massachusetts, on a rocky promontory, 18 miles N.E. of Boston. Its share in the fisheries is no longer important, and the manufacture of boots and shoes is the chief industry. Pop. (1885) 7518; (1890) 8203.

Marburg, a quaint old town in the Prussian province of Hesse-Nassau, on the Lahn, 59 miles by rail N. of Frankfurt and 64 SW. of Cassel. It is built on a terraced hill, whose summit is crowned by a stately castle, dating from 1065. In its Rittersaal (1277-1312) was held in 1529 the conference between the Wittenberg and the Swiss reformers regarding the Lord's Supper. The fine Gothic church of Elizabeth with two towers 243 feet high, was built in 1235-83 by the Teutonic Knights over the splendid shrine of St Elizabeth (q.v.), and was thoroughly restored in 1850-67. The university occupies new Gothic buildings of 1879. It was founded in 1527 in the Reformed interest by Philip the Magnanimous, Landgrave of Hesse; and among its earliest students were Patrick Hamilton and William Tyndale. It has about 80 professors and teachers, 800 to 1000 students in philosophy, medicine, theology, and jurisprudence, and a library of 120,000 volumes. Pop. (1875) 9600; (1885) 12,668. See three works by Kolbe (Marburg, 1871-84).

Marcantonio, or in full, M. RAIMONDI, an Italian engraver, born at Bologna late in the 15th century. A goldsmith by trade, he early turned to engraving, and received his first great stimulus from woodcuts of Albrecht Dürer, which he saw at Venice about 1505. He copied on copper two sets of plates from the German master's designs for the 'Life of the Virgin' and the 'Passion of Christ' (see DÜRER). At Rome, where he worked from 1510, he was chiefly engaged in engraving Raphael's works, as 'Lucretia,' the 'Massacre of the Innocents,' the 'Three Doctors of the Church,' 'Adam and Eve,' 'Dido,' 'Poetry,' the 'Judgment of Paris,' &c., and subsequently those of Raphael's pupil, Giulio Romano. On account of the power of his drawing and the purity of his expression, he is accounted the best amongst the engravers of the great painter. The capture of Rome by the Constable Bourbon in 1527 drove Marcantonio back to Bologna, where he probably remained until he died, some time before 1534

came to an end. See the essay by Fisher prefixed to the catalogue of his engraved works exhibited in London in 1868, and Delaborde's monograph (Paris, 1887).

Marcasite, an iron ore, a variety of Pyrites (q.v.).

Marceau, FRANÇOIS SÉVERIN DESGRAVIERS, French general, was born at Chartres on 1st March 1769. On the outbreak of the Revolution he was appointed inspector of the national guard in his native town, and in 1792 helped to defend Verdun with a body of volunteers till its surrender. His brilliant military career was ended in four years from this time; but they were four years of stirring activity. Sent in the following year to join the republican army in La Vendée, he was, for his services in the engagements before Saumur and Le Mans, promoted to the rank of general of division. Then, proceeding to the north-east frontier, he commanded the right wing at Fleurus, and after the allies retreated occupied Coblenz. During the campaign of 1796 he was given command of the first division of Jourdan's army, and sat down to invest Mainz, Mannheim, and Coblenz. But whilst covering the retreat of the French at Altenkirchen he was shot, on 19th September, and died four days later. His body was buried in the entrenched camp at Coblenz, but was transferred to the Panthéon in Paris in 1889. He ranks next after Hoche amongst the French generals of the early years of the Revolution, not only for military genius, but also on account of the nobility and uprightness of his personal character. See Lives by Doublet de Boisthibault (Chartres, 1851) and Maze (Paris, 1888).

Marcello, BENEDETTO, musical composer, born in Venice on 1st August 1686, was a judge of the republic, and a member of the Council of Forty, and afterwards held important administrative offices at Pola and Brescia, where he died on 24th July 1739. He had a passion for music, and is remembered as the composer of music for Giustiniani's version of the Psalms (8 vols. 1724-27), of numerous concertos, canzonis, cantatas, a pastoral, an oratorio, and other pieces, distinguished for their simple yet elevated style, and as the author of a satirical work, *Il Teatro alla Moda* (1720).

Marcellus, the name of two popes, of whom the second deserves special notice, as having, when Cardinal Marcello Cervini, taken a very prominent part in the discussions of the Council of Trent, over which he was appointed to preside as legate of Julius III. He was elected pope 10th April 1555, and survived his elevation but twenty-two days. He did not follow the usual custom of laying aside his baptismal name and assuming a new one.

Marcellus, M. CLAUDIUS, a famous Roman general, of one of the most eminent plebeian families. In his first consulship (222 B.C.) he defeated the Insubrian Gauls, and slew with his own hand their king, Britomartus or Viridomarus, whose spoils he dedicated as *spolia opima* to Jupiter—the third and last occasion in Roman history. In the second Punic war Marcellus took command after the disaster of Cannæ, and put a check upon the victorious Hannibal at Nola, in Campania (216 B.C.). Again consul in 214 B.C., he gave a fresh impulse to the war in Sicily, but all his efforts to take Syracuse were rendered unavailing by the skill of Archimedes, and he was compelled to regularly blockade the city. Famine, pestilence, and ultimately treachery on the part of the Spanish auxiliaries of the Syracusans, opened its gates (212 B.C.), after which the remainder of Sicily was soon brought under the dominion of the Romans.

In his fifth consulship, 208 B.C., he fell in a skirmish against Hannibal.

Marcet, JANE, known as MRS MARCET, the author of a very popular elementary introduction to chemistry entitled *Conversations on Chemistry*, through which Faraday made his first acquaintance with the subject. She was the daughter of a rich London merchant, a Swiss by birth, and was herself born at Geneva in 1769. She married Alexander Mercet, a Genevan, who settled in London as a doctor in the last years of the 18th century, and later in life devoted himself to experimental chemistry. Besides the book on chemistry, which reached the 16th ed. in 1853, she wrote *Conversations on Political Economy* (1817; 7th ed. 1839), which was warmly praised by J. B. Say, by McCulloch, and by Lord Macaulay; *Conversations on Natural Philosophy* (1819; 13th ed. 1858), and similar books on Botany (9th ed. 1840), Vegetable Physiology, &c., besides numerous charming *Stories for very Little Children*, in the estimation of many her best work. She died in London on 28th June 1858. See Harriet Martineau's *Biographical Sketches* (1869).

March (Slav. *Morava*), the principal river of Moravia, rises on the boundary between that country and Prussian Silesia, and flows 214 miles south to the Danube, which it joins 6 miles above Presburg. It receives on the right the Thaya. In its lower course it forms the boundary between Austria and Hungary. It is navigable for small boats from Göding, 50 miles from its mouth.

March, a market-town of Cambridgeshire, on the Nen, 14 miles E. of Peterborough and 16 NW. of Ely. Its church has a fine Perpendicular clerestory, with splendid roof. Pop. of parish (1851) 6241; (1881) 6190.

March, the first month of the Roman year, and the third according to our present calendar, consists of thirty-one days. It was considered as the first month of the year in England until the change of style in 1752, and the legal year was reckoned from the 25th March. Its last three days (old style) were once popularly supposed to have been *borrowed* by March from April, and are proverbially stormy.

March, a musical composition, chiefly for military bands, with wind-instruments, intended to accompany the marching of troops. There are slow and quick marches, and marches peculiar to different countries. Marches are also introduced into oratorios, the best-known examples being the 'Dead March' from the oratorio of *Saul*, and Mendelssohn's 'Wedding March.'

Marchantia. See LIVERWORT.

Marchena, a town of Spain, 47 miles by rail E. by S. of Seville, with a ducal (Arcos) palace, and sulphur-baths. Pop. 13,768.

Marches, the border districts that run contiguous on each side of the boundary line between England and Scotland, and between England and Wales. The Lords of the Marches were the nobles to whom estates on the borders were given, on condition that they defended the country against the aggressions of the people on the other side. Under the Norman and Plantagenet kings of England there was almost chronic war between the English Lords of the Marches and the Welsh. For the Scottish-English Marches, see BORDERS.—The Mortimers, Earls of March, took their title from March in Cambridgeshire.—The corresponding German word *Mark* was in like manner applied to the border countries or districts of the German empire, conquered from neighbouring nations—the marks of Austria, of Brandenburg, Altmark, Steiermark, &c. The governors entrusted with the charge of these marks were called mark-grafs or margraves,

corresponding to the English and Scottish Wardens of the Marches (see MARQUIS). The ancient German tribe of *Marcomanni* were 'Marchmen.' In Italy *The Marches* include the march of Ancona (q.v.) and three other provinces (see ITALY).

Marchetti, FILIPPO, an operatic composer, born at Rome in 1835, became in 1881 president of a musical college in Rome. His best-known operas are *Romeo e Giulietta* (1865) and *Ruy Blas* (1869).

Marcianisi, an agricultural town of Italy, situated in a marshy district, 12 miles by rail N. of Naples. Pop. 11,083.

Marcion, the founder of the Marcionites, a rigorously ascetic sect which attained a great importance between the years 150 and 250 A.D. He was a native of Sinope in Pontus, became wealthy as a shipowner, and about 140 repaired to Rome. There he laboured to correct the prevailing views of Christianity, which he considered to be a corruption of Jewish errors with the gospel of Christ as expounded by Paul, its best interpreter. The opposition which he encountered drove him to found a new community about 144, and he laboured earnestly propagating his theology until his death about 165. Marcion was hardly a Gnostic, although he had been intimate with Cerdo, and Gnostic speculations certainly influenced the development of the Marcionite theology. Failing to recognise the New Testament God of love in the Old Testament, and profoundly influenced by the radical Pauline antithesis of law and gospel, he constructed an ethico-dualistic philosophy of religion, and proceeded to cosmological speculations which are not free from contradictions. He set aside as spurious all the gospels save Luke, and it, as well as the Pauline epistles, he purged of Judaizing interpolations. He was thus the earliest to make a canonical collection of New Testament writings. From about the beginning of the 4th century the Marcionites began to be absorbed in the Manichæans. Marcion's doctrines can be discovered from the controversial writings of Fathers, as Tertullian, Hippolytus, Epiphanius, &c. See works of Baur, Möller, Lipsius, and Harnack quoted under GNOSTICISM.

Marco Polo. See POLO.

Mardi Gras. See SHROVE-TIDE.

Mardin, a town of Asiatic Turkey, is strikingly situated on the southern slopes of the Mardin Hills, 60 miles SE. of Diarbekir. Pop. 12,000, of whom half are Moslem Kurds.

Maree, LOCH, a beautiful lake of Ross-shire, 40 miles W. of Dingwall. Lying 32 feet above sea-level, it is 12½ miles long, 3 furlongs to 2½ miles broad, 360 feet deep, and 11 sq. m. in area. It is overhung by mountains, 3000 feet high; sends off the Ewe, 3 miles long, to the sea; and contains twenty-seven islets, one with remains of an ancient chapel and a graveyard. Queen Victoria's residence at Loch Maree in 1877 is described in her *More Leaves* (1884).

Maremma (corrupted from *Marittima*, 'situated on the sea'), a marshy region of Italy, extending along the sea-coast of Tuscany from the river Cecina to Orbitello, and embracing an area of about 1000 sq. m. The Pontine Marshes and the Campagna of Rome are similar districts. In Roman times and earlier the Maremma was a fruitful and populous plain; but the decay of agriculture, consequent upon unsettled political history, fostered the encroachments of malaria, which now reigns supreme in great part of these stricken districts. Leopold II. of Tuscany directed especial attention (1824-44) to the drainage and amelioration of the Maremma, and his efforts and subsequent measures

have been attended with considerable success. Crops are now grown in the summer on the fertile soil of the infected area by the inhabitants of the adjoining hill-country, who go down only to sow and to reap their crops. During winter the Maremma is healthier and yields good pasture.

Marengo, a village of Northern Italy, in a marshy district near the Bormida, 3 miles SE. of Alessandria. Here on 14th June 1800 Napoleon, with 33,000 French, defeated 30,500 Austrians under Melas. It was the cavalry charge of the younger Kellermann that turned what looked like certain defeat into a decisive victory, though the French lost 7000 in killed and wounded, the Austrians only 6400 (besides 3000 prisoners).

Mareotis, or **MAREIA, LAKE**, the modern *El Mariût*, a salt lake or marsh in the north of Egypt, extends southward from Alexandria, and is separated from the Mediterranean, on its north-west side, by a narrow isthmus of sand. In the 15th and 16th centuries it was a navigable lake; in 1798 it was found by the French to be a dry sandy plain; but in 1801 the English army cut the dikes of the canal that separated the Lake of Aboukir from Mareotis, to cut off the water-supply of the French, and Mareotis became once more a marsh. The like happened again in 1803, in 1807, and in 1882; on the last occasion the sea was introduced directly through a cutting 15 feet wide and half a mile long.

Mare's Milk. See **KOUMISS**.

Mare's Tail (*Hippuris vulgaris*), a tall erect marsh-plant, with whorls of narrow leaves and inconspicuous flowers.

Margaret, **ST.** Scottish queen, was born about 1047 in Hungary, and from 1057 was brought up at the court of her great-uncle, Edward the Confessor, with Lanfranc for her spiritual instructor. In 1068, with her mother and sister and her boy brother, Edgar the Atheling (q.v.), she fled from Northumberland to Scotland. Young, lovely, learned, and pious, she won the heart of the rude Scottish king, Malcolm Canmore (q.v.), who next year wedded her at Dunfermline. 'Perhaps,' says Skene, 'there is no more beautiful character recorded in history than that of Margaret. For purity of motives, for an earnest desire to benefit the people among whom her lot was cast, for a deep sense of religion and great personal piety, for the unselfish performance of whatever duty lay before her, and for entire self-abnegation she is unsurpassed.' She did much to civilise the northern realm, and still more to assimilate the old Celtic church to the rest of Christendom on such points as the due commencement of Lent, the Easter communion, the observance of Sunday, and marriage within the prohibited degrees. She built, too, a stately church at Dunfermline, and re-founded Iona. She bore her husband six sons and two daughters, and died three days after him, in Edinburgh Castle, on 16th November 1093. Innocent IV. canonised her in 1250. Her head, which had found its way from Dunfermline to Douay, was lost in the French Revolution; but her remaining relics are said to have been enshrined by Philip II. in the Escorial.

See the *Latin Life* by her confessor Turgot, Bishop of St Andrews (Eng. trans. by Fr. Forbes-Leith, 1884); Skene's *Celtic Scotland* (vol. ii. 1877); and Bellesheim's *History of the Catholic Church of Scotland* (Eng. trans. 1887).

Margaret, the 'Semiramis of the North,' queen of Denmark, Norway, and Sweden, was the second daughter of Waldemar IV. of Denmark, and wife of Hacon VIII. of Norway, and was born in 1353. On the death of her father without male heirs in 1375, the Danish nobles offered her the crown in trust for her infant son Olaf. By the

death of Hacon in 1380 Margaret became ruler of Norway as well as of Denmark. When Olaf died in 1387 Margaret nominated her grand-nephew, Eric of Pomerania, as her successor. The Swedish king, Albert of Mecklenburg, having so thoroughly alienated the affections of his subjects that the nobles, declaring the throne vacant, offered in 1388 to acknowledge Margaret as their ruler, she sent an army into Sweden, which defeated the king's German troops, near Falköping, and took Albert and his son prisoners. Albert remained in prison seven years, during which time Margaret, in spite of the efforts of the Hanseatic League and its allies, wholly subjugated Sweden. In the following year (1396) Eric of Pomerania was crowned king of the three Scandinavian kingdoms, and though he was proclaimed king *de facto* next year, the power still remained in the hands of Margaret. In May 1397 was signed the celebrated Union of Calmar, by which it was stipulated that the three kingdoms should remain for ever at peace under one king, though each should retain its own laws and customs. Before her death at Flensburg, on 28th October 1412, Margaret had enlarged the territories she held for her grand-nephew by the acquisition of Lapland and part of Finland. She was a woman of masculine energy and strong will, and ruled her subjects with a firm hand.

Margaret of Anjou, the queen of Henry VI. of England, was daughter of René of Anjou, the titular king of Sicily, and of Isabella of Lorraine, and was born at Pont-à-Mousson, in Lorraine, 24th March 1429. She was married to Henry VI. of England in 1445; and her husband being a person whose naturally weak intellect was sometimes darkened by complete imbecility, she exercised an almost unlimited authority over him, and was the virtual sovereign of the realm. A secret contract at her marriage, by which Maine and Anjou were relinquished to the French, excited great dissatisfaction in England, and the war with the French which broke out anew in 1449, in the course of which all Normandy was lost, was laid by the English to the charge of the already unpopular queen. In 1450 occurred the insurrection of Jack Cade, and soon after the country was plunged in the horrors of that bloody civil war known as the Wars of the Roses. Margaret took an active part in the contest, braving disaster and defeat with the most heroic courage. At length, after a struggle of nearly twenty years, Margaret was finally defeated at Tewkesbury, and flung into the Tower, where she remained four years, till Louis XI. redeemed her for fifty thousand crowns. She then retired to France, and died at the château of Dampierre, near Saumur, in Anjou, 25th August 1482. Mrs Hookham's *Life* (1872) is not altogether satisfactory as history.

Margaret of Navarre, in her youth known as Marguerite d'Angoulême, sister of Francis I. of France, and daughter of Charles of Orleans, Comte d'Angoulême, was born at Angoulême, 11th April 1492. She was carefully educated, and early showed remarkable sweetness and charm added to unusual strength of mind. In 1509 she was married to Charles, Duke of Alençon, who died in 1525; and in 1527 she was married to Henri d'Albret, titular king of Navarre, to whom she bore Jeanne d'Albret, mother of the great French monarch, Henry IV. She encouraged agriculture, the arts, and learning, and sheltered with a courageous generosity such advocates of freer thought in religion as Marot and Bonaventure des Périers. Accusations entirely unfounded have been brought by interested bigotry against her morals. She died 21st December 1549. Her writings include a series of remarkably interesting Letters (ed. by Génin,

2 vols. 1842-43), a miscellaneous collection of poems gracefully entitled *Les Marguerites de la Marguerite* (ed. by Frank, 4 vols. 1873), and especially the famous *Heptaméron des Nouvelles* (1558; ed. by Leroux de Lincy, 3 vols. 1855), modelled on the *Decameron* of Boccaccio, but worked out in an original manner. A company of ladies and gentlemen returning from Caunterets are detained by bad weather, and beguile the time by telling stories, seventy-two in number, which are separated by interludes introducing the persons. The subjects of the stories are similar to those of the *Decameron*, but the manners delineated are more refined; and they reflect closely the strange combination of religious fervour with religious free-thinking and refined voluptuousness so characteristic of the time. Most critics believe the work to be the joint-production of the queen, of Des Périers, and other men. See *Lives* by Durand (Paris, 1848), Miss Freer (London, 1854), and Lotheisen (Berlin, 1885).

Margaric Acid was formerly thought to be a separate body, but is now known to be a mixture of palmitic and stearic acids. It is obtained from fats.

Margarine, or OLEO-MARGARINE. See the paragraph on Butterine in the article BUTTER.

Margarita, an island in the Caribbean Sea, belonging to Venezuela. Area, 380 sq. m. Discovered by Columbus in 1498, Margarita was long famous for its pearl-fisheries, but now its chief export is salted fish. The island forms the great part (the small Blanquilla, Los Hermanos, &c. make the rest) of the *Nueva Esparta* section of Guzman Blanco state, of which the pop. in 1886 was 41,893.

Margary, AUGUSTUS RAYMOND, traveller, was born 26th May 1846, at Belgaum, in the presidency of Bombay, the son of an English officer. Educated in England at Brighton College and University College, London, he qualified for a student-interpretship in China, and went out in 1867. During the next six years he served at Peking, in Formosa, at Chefoo, and at Shanghai. In August 1874 he was ordered to cross south-west China to Burma to meet a British mission under Colonel Browne, the object of which was to open the overland route between Burma and China. Margary was to act as interpreter and guide to the mission. He successfully accomplished the perilous journey, and set out back again with Colonel Browne, but was murdered by the Chinese at a place called Manwyne on 21st February 1875. The *Journals and Letters* of his journey, together with a biographical preface, and a concluding chapter by Sir Rutherford Alcock, were published in 1876.

Margate, a seaport and municipal borough of England, in the Isle of Thanet, Kent, 3 miles W. of the North Foreland and 74 E. by S. of London, has for many years been the favourite seaside resort of cockney holiday-makers, who, during the season, by rail and by steamer, pour into the town in their thousands. Possessed of many natural advantages in its bracing air, good bathing, and excellent firm sands, Margate offers besides all the customary attractions of a watering-place, with its pier (900 feet long), jetty (upwards of a quarter of a mile in length), theatre, assembly-rooms, baths, zoological gardens, &c. It contains also two interesting churches—one exhibiting traces of Norman and Early English work, and the other with a tower of 135 feet, forming a conspicuous landmark; the Royal Sea-bathing Infirmary, founded 1792 and enlarged 1882; a town-hall (1820); and an extensive deaf and dumb asylum (1875-80-86). Formerly the port was the scene of the embarkation or landing of many royal and other persons, amongst the latter being the wounded brought back from

the field of Waterloo. Queen Victoria visited the town in 1835, where too for a short time Turner the painter (one of whose earliest known sketches is a view of Margate church) was at school. Pop. (1801) 4766; (1881) 18,226; (1891) 21,369.

Margaux, a village 15 miles by rail NNW. of Bordeaux, near the left bank of the Gironde, with a number of white villas, half-hidden amidst trellised vines. The château (a handsome Italian villa) and its celebrated vineyards are half a mile distant. Pop. 1619.

Margay (*Felis tigrina*), a species of cat or tiger-cat, a native of the forests of Brazil and Guiana, smaller and less handsome than the ocelot, which in general appearance it much resembles, though its spots are smaller. It is little larger than the domestic cat. It is capable of domestication, and of being made very useful in rat-killing.

Marghilan, capital of Ferghana (q.v.).

Marginal Credits, a term applied to business operations, in which bankers lend the credit of their names, as it were, to their customers, and thus enable them to carry out important commercial transactions which otherwise could not be so conveniently undertaken. A merchant in England, for instance, desires to import tea or silk, but his name is not so well known on the Chinese Exchanges that bills drawn upon him by a merchant in China can be sold there at a reasonable rate of exchange. The tea or silk cannot be purchased without the money being on the spot to buy it with, and were the merchant to send out specie for that purpose he would involve himself in heavy charges for freight and insurance, and lose the interest of his money while on the voyage. Moreover, before the remittance (silver probably) could arrive, the market prices of tea and silk might have so altered that a purchase might not be desirable, and the money would thus be placed where it was not wanted. But, while drafts by the merchant in China on the merchant in England would not sell, or only at a heavy sacrifice, the drafts by the merchant in China on a banker in England will sell at the best price. The merchant in this country therefore deposits with his banker cash or securities equal to the amount to which he desires to use the banker's name, and receives from him *Marginal Credits* for the amount. These are bill-forms drawn upon the banker, but neither dated nor signed, with a margin containing the banker's obligation to accept the bills when presented. The bills are dated, drawn, and endorsed by the merchant abroad before being sold, so that the obligation runs from the date on which the money was actually paid; and the tea or silk is most likely in the merchant's warehouse before the bill is payable. For the transaction, the banker charges the merchant a commission to remunerate himself for the risk involved. In recent years the use of marginal bills has largely fallen off in consequence of the development of electrical communication. Merchants now prefer to arrange with their bankers for a 'telegraphic transfer,' by which an immediate cash payment is effected through a foreign bank.

Many transactions between merchants abroad and in England can only be carried through by the acceptances of a London banker being tendered in payment, but the transactions are intrinsically the same as when Marginal Credits are used. Bankers in the country obtain the acceptance of a London banker for bills to be drawn against goods their customers are importing. Bankers—usually in London—also accept bills to a great amount for the exchange operations of foreign banks. A banker in, say Canton, buys from his customers bills drawn upon merchants in England for a given amount, and sends them to his corre-

spondent in London, who holds them for him and grants a credit in his favour on the security of them. The Canton banker operates upon this credit by drawing upon the London banker, and sells his drafts at the most favourable exchange. With the money received he purchases other bills, and remits them also, to be again drawn against. When these operations are made with caution and sound judgment they are beneficial to all concerned; but when engaged in without sufficient knowledge or recklessly they involve most disastrous consequences.

Margrave. See MARCHES, MARQUIS.

Marguerite. See MARGARET.

Marguerite. See CHRYSANTHEMUM.

Marheineke, PHILIPP CONRAD, Protestant theologian, born at Hildesheim on 1st May 1780, began to teach at Göttingen in 1804, was appointed a theological professor and university preacher at Erlangen in 1805, and subsequently held theological chairs at Heidelberg (from 1807) and Berlin (from 1811). He died on 31st May 1846. After Hegel's death Marheineke was the chief figure among the right wing of that philosopher's disciples. His Hegelian views found expression in *Grundlehren der Dogmatik* (2d ed. 1827) and *Vorlesungen über die Christliche Moral, Dogmatik, &c.* (4 vols. 1847-49). He also wrote *Geschichte der deutschen Reformation* (4 vols. 2d ed. 1831-34), *Institutiones Symbolicæ* (3d ed. 1830), *System des Katholizismus in seiner symbolischen Entwicklung* (3 vols. 1810-13), and other works.

Maria Christina, queen of Spain, born at Naples, 27th April 1806, was a daughter of Francis I., king of the Two Sicilies. In 1829 she became the fourth wife of Ferdinand VII. of Spain, and in October of that year gave birth to a daughter, Isabella II. Ferdinand died 29th September 1833, and by his testament his widow was appointed guardian of her children—the young Queen Isabella and the Infanta Maria Louisa, Duchess de Montpensier—and also regent. A civil war broke out (see CARLISTS); but the queen-mother seemed indifferent to everything except the company of Don Fernando Muñoz, whom she made her chamberlain, and with whom she was united, in December 1833, in a morganatic marriage. She had ten children by him. A conspiracy, which broke out on the night of the 13th August 1836, led the queen-mother to concede a constitution to Spain. In 1840 a popular commotion ensued, and she gave to the new prime-minister, Espartero, a renunciation of the regency, and retired to France, whence she returned in 1843. Her participation in the schemes of Louis-Philippe as to the marriage of her daughters in 1846, and the continual exercise of her influence in a manner unfavourable to constitutional liberty, made her hateful to the patriotic party in Spain. At length, in July 1854, a revolution expelled her from the country, and she again took refuge in France, but returned to Spain in 1864, only to retire again in 1868. She died at Le Havre, August 1878. See CARLISTS, and SPAIN.

Maria Louisa, the second wife of Napoleon I., born 12th December 1791, was the daughter of the Emperor Francis I. of Austria. She was married to Napoleon after the divorce of Josephine, 2d April 1810. On 20th March following she bore a son, who was called King of Rome. At the beginning of the campaign of 1813 Napoleon appointed her regent in his absence, but under many limitations. On the abdication of Napoleon, not being permitted to follow him into exile, she went with her son to Schönbrunn, where she remained till 1816, when she received the duchies of Parma, Piacenza, and Guastalla. In 1822 she contracted

a morganatic marriage with Count von Neipperg. She died at Vienna, 17th December 1847.

See *Lives* by Helfert (1873) and Imbert de Saint-Amand (Eng. trans. 1886), her *Correspondance* (1887), and the *Mémoires* of Mme. Durand, her maid of honour (1885).

Mariana, JUAN, a Spanish historian, was born at Talavera in 1536, entered at eighteen the then rising order of the Jesuits, and afterwards taught in the Jesuit colleges at Rome (where Bellarmine was one of his scholars), in Sicily, and finally in Paris. After seven years of labour in Paris he was driven by ill-health to Toledo, and there he lived in unbroken literary labours till his death, at an extreme old age, in 1624. His *Historia de Rebus Hispaniæ* first appeared in 20 books in 1592, and was supplemented by 10 additional books, carrying the narrative down to the accession of Charles V., in 1605. Its admirable Latinity and undoubted historical merits give it an abiding value. Mariana himself published a Spanish translation (1601-9), which still remains one of the classics of the language. His *Tractatus VII. Theologici et Historici* (1609) roused the suspicion of the Inquisition. But the most celebrated of the works of Mariana is his well-known treatise *De Rege et Regis Institutione* (1599), which raises the question whether it be lawful to overthrow a tyrant, and answers it in the affirmative, even where the tyrant is not a usurper but a lawful king. This tyrannicide doctrine drew much odium upon the entire order of Jesuits, especially after the murder of Henry IV. of France by Ravaillac in 1610; but it is only just to observe that, while, upon the one hand, precisely the same doctrines were taught in almost the same words by several of the Protestant contemporaries of Mariana, on the other, Mariana's book itself was formally condemned by the general Acquaviva, and the doctrine forbidden to be taught by members of the order.

Mariana Islands. See LADRONES.

Marianna, an episcopal city of Brazil, 3 miles E. of Ouro Preto. The neighbouring gold-mines are exhausted. Pop. 5000.

Marianus Scotus, an early Irish or Scottish chronicler, who, quitting his country in 1052, took the monastic vows as a Benedictine at Cologne in 1058, and then settled in the monastery at Fulda. Ten years later he removed to Mainz, where, and also at Ratisbon, he taught mathematics and theology. He died at Mainz in 1086, leaving a *Chronicon Universale*, which began at the creation and came down to the year 1083. It was published at Basel in 1559 and at Frankfurt in 1613.

Maria Theresa, empress, the daughter of the Emperor Charles VI., was born at Vienna, 13th May 1717. By the Pragmatic Sanction (q.v.), for the fulfilment of which the principal European powers became sureties, her father appointed her heir to his hereditary thrones. In 1736 she married Francis of Lorraine, afterwards Grand-duke of Tuscany, to whom she gave an equal share in the government when, on the death of her father, 21st October 1740, she became queen of Hungary and of Bohemia, and Archduchess of Austria. At her accession the monarchy was exhausted, the finances embarrassed, the people discontented, and the army weak; whilst Prussia, Bavaria, Saxony, and Sardinia, abetted by France, put forward claims to the whole or to portions of her dominions. Frederick II. of Prussia claimed Silesia, and poured his armies into it; Spain laid hands on the Austrian dominions in Italy; and the Bavarians, assisted by the French, invaded Bohemia, and, passing on into the archduchy of Austria, threatened Vienna, the Elector of Bavaria

being crowned king of Bohemia and emperor as Charles VII. (1742). The young queen was saved by the chivalrous fidelity of the Hungarians, to whose loyalty she appealed, with her infant son in her arms, in a stirring speech at the diet held in Presburg, and she was supported by the assistance of Britain, but most of all by her own resolute spirit. The war of the Austrian succession, after lasting more than seven years, was terminated by the peace of Aix-la-Chapelle in 1748. The empress-queen lost Silesia and Glatz to Prussia, the duchies of Parma, Piacenza, and Guastalla to Spain, and some Milanese districts to Sardinia. On the other hand, her titles were fully recognised, as well as that of her husband, who had been nominated emperor (1745), Charles of Bavaria having in the meantime died. During the years of peace that ensued Maria Theresa instituted important financial reforms, did her utmost to foster agriculture, manufactures, and commerce, and improved and nearly doubled the national revenues, whilst the burdens were diminished. At the same time she charged Marshal Daun to reorganise and rediscipline her armies. In Kaunitz (q.v.) she had a minister possessed of wisdom and energy, and in his hands she left for the most part the management of the foreign relations of the empire. But the loss of Silesia, especially the conduct of Frederick the Great, which had brought upon her that loss, rankled deeply in her mind; and, France having been gained as an ally through the address of Kaunitz, she renewed the contest with the Prussian king. But the issue of the Seven Years' War (q.v.) was to confirm Frederick in the possession of Silesia. On the conclusion of hostilities the empress renewed her efforts to promote the national prosperity, ameliorating the condition of the peasantry, mitigating the penal code, founding schools, organising great charitable societies, in short promoting the welfare of her subjects by all the wise arts of peaceful progress. Her son Joseph, elected king of the Romans in 1764, she associated, after the death of her husband (1765), with herself in the government of her hereditary states, but in reality committed to him the charge only of military affairs. She joined with Russia and Prussia in the first partition of Poland (1772), whereby Galicia and Lodomeria were added to her dominions. She also obtained from the Porte Bukovina (1777). On the death of the childless Elector of Bavaria Austria successfully asserted her claim to the 'quarter of the Inn' and one or two other districts. Maria Theresa died 29th November 1780. Personally a woman of majestic and winning appearance, she was animated by truly regal sentiments and an undaunted spirit; and by this rare union of feminine tact with masculine energy and restless activity, she not only won the affection and even enthusiastic admiration of her subjects, but she raised Austria from a most wretched condition to a position of assured power. Her reign marks the transition of Austria from a medieval to a modern state; and by her efforts the beginning was successfully made of fusing into one sovereignty the heterogeneous lands ruled over by the House of Hapsburg. Although a zealous Roman Catholic, Maria Theresa maintained the rights of her own crown against the court of Rome, and endeavoured to correct some of the worst abuses in the church. Of her ten surviving children, the eldest son, Joseph II., succeeded her; Leopold, Grand-duke of Tuscany, followed his brother on the imperial throne as Leopold II.; Ferdinand became Duke of Modena; and Marie Antoinette was married to Louis XVI. of France. See *History by Arneth* (10 vols. 1863-79, an Austrian version), other works by the same writer, by Duller, Ramshorn, and A. Wolf, the

series begun by Duc de Broglie in 1882 (Eng. trans. 1883), and the works quoted under FREDERICK II.

Mariazell, the most famous place of pilgrimage in Austria, is situated in the extreme north of Styria, 25 miles N. of Bruck and 60 SW. of Vienna. It is visited by thousands of pilgrims annually, besides numerous visitors attracted by its romantic scenery. The image of the Virgin (brought here in 1157), the object of the pilgrimages, is enshrined in a magnificent church, built in 1644 on the site of an older one. Pop. 1065. Four miles from the village are important ironworks. *Guide* by Fruhwirth (1882).

Marie Am'elie, queen of Louis-Philippe (q.v.).

Marie Antoinette, JOSEPHE JEANNE, the most ill-fated among the queens of France, was born on the day of the great earthquake at Lisbon, 2d November 1755, the fourth daughter of Maria Theresa and the Emperor Francis I. From her cradle she was destined by her ambitious mother to be queen of France, and to that end was educated, although but indifferently, by the Abbé de Vermond. The marriage was negotiated by the Duc de Choiseul early in 1770, and took place on May 16, but was darkened a fortnight later by an ill-omened panic during the great fête of fireworks given in its honour by the city of Paris, in which some hundreds of people perished. The beautiful young dauphiness soon found her position full of difficulties, and the stiff and stately etiquette of the old French court wearied her to death. A mere child in years, married to a dull, decorous, and heavy husband, who was, moreover, for some years indifferent to her person, she found relief in a capricious recklessness of conduct and a disregard for conventions, and so from the commencement laid herself open to serious scandals for which there never was any real ground but her own indiscretion. Her night drives to Paris, her appearance at masked balls, her extravagance and undisguised love for the card-table, and her open favour to handsome and profligate young men, were misread into shameless immoralities, and she had lost her reputation long before she awoke to a sense of her responsibilities. In May 1774 the death of Louis XV. made her actual queen of France, and she soon deepened the distrust and dislike of her subjects by her undisguised devotion to the interests of Austria, as well as her thoughtless opposition to all the measures devised by Turgot and Necker for relieving the financial distress of the country. The miseries of France became in the popular imagination identified with the extravagant pleasures of the queen, and in the miserable affair of the Diamond Necklace her guilt was at once taken for granted, not only by Paris but the whole country, and 'the Austrian' became the object of the frenzied hatred of a starving people. The act of accusation against Calonne was in the eyes of the mob that of the court and of the queen. Showers of virulent pamphlets rained from all sides, and 'Madame Déficit' and 'Madame Veto' were some of the names in which a maddened people shrieked their hatred against their sovereign.

Meantime the joyous frivolity of the girl had changed into the courage and obstinacy of the woman who made herself a centre of opposition to all new ideas, and prompted the poor vacillating king into a retrograde policy to his own undoing. She was capable of strength rising to the heroic—as Mirabeau once said, the only man the king had about him was his wife. And she possessed the power of inspiring enthusiasm in all noble souls with whom she came into contact, as is evidenced by the personal influence she exercised over Fersen, Mirabeau, and Barnave. Amid the horrors of the march of women to Versailles (Octo-

ber 5-6, 1789) she alone maintained her courage, and she showed herself on the balcony to the raging mob with a serene heroism that for a moment over-awed the fiercest into respect. That same day the royal family and the Assembly left Versailles for Paris amid the plaudits of all the rascaldom of both sexes within the city. But Marie Antoinette lacked consistency even in the part she essayed to play, and to the last she failed to understand the nature of the troublous times into which she had been flung. She had an instinctive abhorrence of the liberal nobles like Lafayette and Mirabeau, and, if she professed to consult them, she also consulted with other men, and refused to trust them altogether. Again the indecision of Louis and his dread of civil war hampered her plans, and the intrigues of the emigrés did her cause more harm than all her domestic enemies together.

The queen was at length prevailed on by Count de Mercy-Argenteau, at the instigation of Count de la Marck, to make terms with Mirabeau, and she gave the great tribune an interview at Saint-Cloud, July 3, 1790. But she was too self-willed and independent frankly to follow his advice, for she abhorred his dream of a constitutional monarchy based on the free consent of an enfranchised people. His death in April 1791 removed the last hope of saving the monarchy, and less than three months later occurred the fatal flight to Bouillé at the frontier, intercepted at Varennes, against which Mirabeau had ever pleaded as a fatal step. The storming of the Tuileries and slaughter of the brave Swiss guards (10th August 1792), the transference to the Temple, the trial and execution of the king (21st January 1793), quickly followed, and ere long her son was torn from her arms, and she herself sent to the Conciergerie like a common criminal (2d August 1793). After eight weeks more of sickening insult and brutality, the 'Widow Capet' was herself arraigned in her ragged dress and gray hair before the Revolutionary Tribunal. Under the torture of her trial she bore herself with the calm dignity and resignation of the martyr: one truthful touch stands out with infinite pathos across the century between—'she was sometimes observed moving her fingers, as when one plays on the piano. Her answers were short with the simplicity of truth: 'You persist, then, in denial?'—'My plan is not denial: it is the truth I have said, and I persist in that.' One charge unspeakable in its infamy was tendered by Hébert, which he had got her wretched son aged eight years to sign. 'A mother can make no answer to such questions; I appeal to every mother here present,' was her only reply. A deep murmur ran through the court—'Miserable fool,' said Robespierre, 'he will make our enemies objects of compassion.' After two days and nights of questioning came the inevitable sentence, and on the same day, October 16, 1793, she left the world and all its madness behind her, under the axe of the guillotine. It was just three-and-twenty years since she had left Vienna amid universal grief, in all the brightness of beauty and hope.

See the Histories of the French Revolution by Thiers, Mignet, Michelet, Louis Blanc, Carlyle, Von Sybel, and H. Morre Stephens *passim*; also Madame Campan's *Mémoires sur la Vie privée de Marie Antoinette* (1823); De Lescaure's *La vraie Marie Antoinette* (1863); D'Hunolstein's *Correspondance inédite de Marie Antoinette* (1864); and Feuillet des Conches' *Louis XVI., Marie Antoinette, et Madame Elizabeth, Lettres et Documents inédites* (1865). These, while valuable, all contain many unauthentic letters: the most reliable work is that by Arneth and Geoffroy, *Marie Antoinette: Correspondance secrète entre Marie-Thérèse et le Comte de Mercy-Argenteau* (3 vols. 1874). Good books are also the elaborate studies by M. P. de Nolhac (1890) and M. de

la Rocheterie (2 vols. 1890); and for the affair of the Diamond Necklace, G. C. D'Est Ange's *Marie Antoinette et le Procès du Collier* (1889). For an account of her portraits, about 500 in number, see Lord Ronald Gower's *Iconographie de Marie Antoinette* (Paris, 1883); and for the closing scenes in her life, Campardon's *Tribunal Révolutionnaire* (vol. i.) and *Marie Antoinette à la Conciergerie* (1863), Lord Ronald Gower's *Last Days of Marie Antoinette* (1885), and L. de Saint-Amand, *Les derniers Années de Marie Antoinette* (1889).

Marie de France, a poetess of whom but little is known with any degree of certainty, save that she lived in England under Henry III., and translated into French from an English version of a Latin translation of the Greek the *Ysopet*, a collection of 103 moralised fables, in octosyllabic couplets, 'for the love of Count William' (supposed to be William Longsword of Salisbury). These fables are natural and happy, as well as graceful in versification, and give their authoress a place in that line of descent which ended with La Fontaine. But her greatest work was the twelve (or fourteen) *Lais*, delightful and genuinely poetic narrative poems, mostly amatory in character, in octosyllabic verse, the longest nearly twelve hundred lines, the shortest just over a hundred. The word *Lai* is of Breton origin, and most probably referred originally to the style of music with which the harper accompanied his verse. The titles of Marie's *lais* are *Guigemar*, *Equitan*, *Le Fraigne*, *Bisclavret*, *Lanval*, *Les Dous Amanz*, *Yonec*, *Laustic*, *Milun*, *Chaitivel*, *Chievrefoil*, *Eliduc*; and to these most add *Graelent* and *L'Espine*. Of the *lais* the best edition is that of Karl Warnke (Halle, 1885), forming vol. iii. of Suchier's *Bibliotheca Normannica*, enriched with invaluable comparative notes by Reinhold Köhler. They were paraphrased rather than translated by the late Mr O'Shaughnessy as *Lays of France* (1872). A third work sometimes ascribed to Marie is a poem of 2300 verses on the purgatory of St Patrick. The best edition of the *lais* and fables together is that of Roquefort (2 vols. 1820).

Marie de' Medici, wife of Henry IV. of France, was the daughter of Francis I., Grand-duke of Tuscany, and was born at Florence, 26th April 1573. She was married to Henry, 16th December 1600, and in the following September gave birth to a son, afterwards Louis XIII. The union, however, did not prove happy. Marie was an obstinate and passionate woman, and her quarrels with the king soon became the talk of Paris. She was wholly under the influence of her favourites, Leonore Galigai and her husband Concini, and was by them encouraged in her dislike to her husband. The murder of Henry (May 14, 1610) did not greatly grieve her, although it is not true that she was privy to the plot. For the next seven years she governed as regent, but proved as worthless a ruler as she had been a wife. After the murder of Concini (24th April 1617), whom she had created Marquis d'Ancre, a domestic revolution took place, and the young Louis XIII. assumed royal power. The queen was confined to her own house, and her son refused to see her. Her partisans tried to bring about a civil war, but their attempts proved futile; and by the advice of Richelieu, then Bishop of Luçon, she made her submission to her son in 1619, and took her place at court. Marie hoped to win over Richelieu to her party, but she soon found out that he had no mind to be ruled by her, whereupon she tried to undermine his influence with the king. Her intrigues for this purpose failed; she was imprisoned in Compiègne, whence she escaped and fled to Brussels in 1631. Her last years were spent in utter destitution, and she is said to have died in a hayloft at Cologne, 3d July 1642. She loved the

fine arts, and Paris owes to her the Luxembourg. See the Life by Miss Pardoe (2d ed. 3 vols. 1852).

Marie Galante, a French island in the West Indies, discovered by Columbus in 1493, lies 17 miles SE. of Guadeloupe. Area, 58 sq. m. It is covered for the most part with wood, and surrounded by coral reefs. Sugar, coffee, cocoa, and cotton are exported. Pop. 15,000. Chief town, Grandbourg, or Marigot, on the south-west coast.

Marienbad, one of the most frequented of the Bohemian spas, 47 miles by rail NW. of Pilsen, at an elevation of 2057 feet above sea-level. The springs have long been used by the people of the vicinity, but it is only since 1807-8 that it has become a place of resort for persons from distant parts of the world. The springs are numerous, varying in temperature from 48° to 54° F. They are saline, containing sulphate of soda and various alkaline ingredients, but differing considerably in their composition and qualities. They are used both internally and in the form of baths. Great quantities of the waters of some of the springs are exported to distant places. Marienbad is surrounded by wooded heights, has a population of 2009, and is visited every season by upwards of 14,000 patients. See Fraser Rae's *Austrian Health Resorts* (1888).

Marienberg, a mining town of Saxony, 38 miles SW. of Dresden. Pop. 6139.

Marienburg, an old town of Prussia, on the Nogat, 30 miles by rail SSE. of Danzig. It was long the seat of the Grand Masters of the Teutonic Order (q.v.), who removed from Venice hither in 1309. The fortress of the Knights, however, was founded here about 1274. Marienburg remained in their hands till 1457, when it was taken by the Poles, and by them it was held till 1772. The castle, in which seventeen Grand Masters resided, a noble edifice in a style of Gothic peculiar to the vicinity of the Baltic, was thoroughly restored in 1817-42. Pop. (1875) 8538; (1885) 10,136. See works by Witt (1854) and Bergau (1871).

Marienwerder, a town of West Prussia, is picturesquely situated 3 miles E. of the Vistula and 55 by rail S. of Danzig. It was founded in 1233 by the Teutonic Knights, and has an old castle and a domkirche (1384). Pop. 8079.

Marietta, capital of Washington county, Ohio, on the Ohio River, 105 miles SE. of Columbus. Founded in 1788, it is the oldest town in the state, is the seat of Marietta College (1835), and has varied manufactures and a trade in the petroleum found near by. Remarkable traces of the earth-builders are visible here. Pop. (1890) 8273.

Mariette Pasha, FRANÇOIS AUGUSTE FERDINAND, Egyptian explorer, was born at Boulogne, 11th February 1821, and was educated at the municipal college of the town. He became French master at a school at Stratford-on-Avon in 1839, and in 1840 a pattern-designer at Coventry. But he soon returned to Boulogne, and after taking his degree at Douay (1841) was appointed professor at his native college. His connection with Nestor l'Hôte, the companion of Champollion, directed Mariette's attention to the hieroglyphic monuments; in 1849 he entered the Egyptian department of the Louvre, and in 1850 was despatched to Egypt in search of Coptic MSS. Whilst there he made his famous discovery of the Serapeum, the long-buried cemetery of the Apis bulls, and brought to light a host of important monuments and inscriptions in Memphis, Sakkara, Gizah, and the neighbourhood. In 1858 he was appointed Keeper of Monuments to the Egyptian government, and thenceforward his life was devoted to archaeological exploration in the Nile valley. With indefatigable

industry he dug out the Sphinx and the temples of Dendera and Edfu, revealed the marvellous sculptures of Meydûm and Gizah, and the courts and inscriptions of Medinet Habu, Deyr-el-Bahri, Karnak, and Abydos, and began the excavation of Tanis, since pursued by the Egypt Exploration Fund. Nor was he less active with pen and pencil. In 1856-57 appeared his *Serapeum et Memphis* (also ed. Maspéro, 1882); four editions of his *Aperçu de l'Histoire d'Égypte* came out between 1864 and 1874, and six of the *Catalogue du Musée de Boulak* (which he founded in 1863, and which is full of the results of his labours) from 1864 to 1876; he published sumptuous descriptions in many volumes, with folio plates of the chief temples—*Dendérah* (1870-75), *Abydos* (1869-80), *Karnak* (1875), *Deir-el-Bahari* (1877), *Monuments Divers* (1872, ff.); while his *Itinéraire de la Haute Égypte* has been translated by his brother (*Monuments of Upper Egypt*, 1877), and his *Mastabas* edited by Maspéro (1882). Besides the Boulak (now Gizah) Museum, which owes its existence to its first director, Mariette founded the French School of Egyptology and the Egyptian Institute. He was raised to the rank of a pasha in 1879; he died at Cairo, 19th January 1881, and was buried in the garden of his museum.

See E. Desceille, *Aug. Mariette* (1882); H. A. Wallon, *Notice*, Inst. de France (1883); A. B. Edwards, *Academy* (January 1881).

Marignano. See MELEGNANO.

Marigold, a name given to certain plants of the natural order Composite, chiefly of the genera *Calendula* and *Tagetes*. Pot Marigold (*Calendula officinalis*) is an annual, a native of France and the more southern parts of Europe, with an erect stem, 1 to 2 feet high, the lower leaves obovate on long stalks, and large, deep yellow flowers. It has long been very common in British gardens; there are varieties with double flowers. The whole plant has a slight aromatic odour and a bitter taste. It was formerly in great repute as a carminative, and was regarded also as an aperient and sudorific. The florets were the part used, and they were dried in autumn to be preserved for use. They are often employed to adulterate saffron, and sometimes for colouring cheese. They were formerly a frequent ingredient in soups, and are still so used in some parts of England. The genus *Tagetes* consists of annual and perennial herbaceous plants, natives of the warmer parts of America, although *T. erecta*, one of those most frequently cultivated in Britain, bears the name of African Marigold; and *T. patula*, another annual well known in British flower-borders, is called French Marigold. Both species are Mexican. They have been long in cultivation, are much admired, and require the assistance of a hotbed in spring in the colder parts of Britain. Corn Marigold is a *Chrysanthemum* (q.v.). Marsh Marigold (q.v.) has no botanical affinity with the true marigolds.

Marine Engine. See STEAM-ENGINE.

Marines, or the Royal Marine Forces, are that body of the military forces of the crown which is under the control of the Admiralty, for service in the navy. They were first raised in 1664, the original aim, since modified, being to form a nursery whence to obtain seamen to man the fleet. The commerce of England was then too limited to procure from out of the merchant fleet sufficient seamen for the public service; and, as those obtained by the system of impress were not easily amenable to discipline, the presence of some marines as disciplined troops had to be relied on to check or suppress the frequent tendency to mutiny. The force is now composed of two branches, with separate lists for the promotion of officers, styled respec-

tively the Royal Marine Artillery and the Royal Marine Light Infantry. The artillery consists of one division quartered at Eastney, near Portsmouth; the uniform, blue with red facings, is almost identical with that of the land artillery. The infantry consists of three divisions, quartered at Portsmouth, Plymouth, and Chatham; their uniform, scarlet with blue facings, is much the same as that of the line regiments. The officers rank according to seniority with officers of like rank in the army, and are promoted by seniority up to the rank of major, beyond which promotion is governed by selection. The strength of the marine forces is now about 14,000. When serving on board ship they are employed as sentries, and keep regular watch like the blue-jackets when not on guard, assisting in all the duties of the ship, except going aloft; in action both the men of the marine artillery and of the light infantry are now stationed at the guns conjointly with the blue-jackets, those not employed at the guns being used as a rifle party on deck; they always form part of all naval brigades landed for service on shore. With a view to their efficient training in gunnery, batteries with heavy guns mounted as on board ship have been constructed at all the marine barracks, where the men are regularly drilled by qualified officers and instructors. All the marine artillery officers have to undergo a special course of training, and since 1887 probationary lieutenants for the light infantry have to pass through a course at Greenwich similar to those for the marine artillery, and after joining headquarters undergo a course of instruction in gunnery. Combining the handiness of the sailor with the training of the soldier, the marines are justly regarded as a most valuable body of men. Their officers can be called upon to sit on garrison courts-martial and to perform general garrison duties, such as field-officer of the day, &c.; but they mount no garrison guards, and, although they may be called upon by the general in command to take part in field-days and reviews, yet, being entirely under the Admiralty, they occupy a position quite distinct from the regular troops in garrison with them. Marines, like blue-jackets, have the privilege, which the army does not enjoy, of wearing their beards, in barracks as well as when afloat; and, like the blue-jackets, but again unlike the army, they remain a long-service corps. Under the short-service system, which obtains in the army, it would be impossible to give marines the necessary training; they are therefore engaged to serve for fourteen years, with the option of re-engaging for another seven years, when they obtain a pension. One result of this is that the Admiralty can always obtain an unlimited supply of recruits; they are thus able to carefully pick their men, and their standard is much higher than that of the line. For physique, soldierly training, and efficiency no regiment in the army, not even the Guards, can approach the Marine Light Infantry. The marine artillery are even more a picked corps than their brothers of the light infantry, and they require a higher educational standard; it is admitted that no other army in the world can put on parade so magnificent a body of men as the Marine Artillery Division. One of their battalions in line covers a third more ground than a corresponding line battalion. The bands of the Marine Artillery and Infantry Divisions are among the best military bands in the kingdom, being only, perhaps, surpassed by the bands of the Guards. The Marine Light Infantry takes precedence in the army immediately after the 50th regiment of foot.

The original number of marines was 1200. The third regiment of the line was called the Maritime Regiment, also the Admiral's Regiment. In 1702

the force of marines had increased to six regiments; from 1714 to 1739 no marine force existed; in the latter year it was reconstituted in six regiments, and in 1741 numbered ten. Once more disbanded in 1748, it was in 1755 placed wholly under the Admiralty. Subsequently, however, on the sudden expansion of the fleet for the wars with France, several line regiments were at times called upon to serve as marines. The land artillery was also represented in the bomb-vessels, and were so serving in 1804, when their duties were taken over by the Royal Marine Artillery, then first formed. This branch, more than once disbanded since then, according to the views of the Admiralty of the time, and even since 1870 again threatened with disbandment, is now recognised as a cheap, reliable, and most valuable reserve of specially-trained gunners. In the United States the marines serve five years, receiving \$13 a month; if they serve beyond the five years they are paid \$18 a month. See the *Historical Record of Royal Marine Forces*, by P. H. Nicolas (1845).

Marini, GIAMBATTISTA, an Italian poet, born at Naples in 1569. Abandoning jurisprudence for poetry against his father's will, he was befriended by various noble patrons, and was carried by Cardinal Pietro Aldobrandini to Turin, where a poem, *Il Ritratto*, procured him the office of ducal secretary. At Paris he enjoyed the patronage of Catharine of Valois, and after her death of Marie de' Medici. Here he wrote his best work, the *Adone* (1622), and after its publication revisited Italy, and died at Naples in 1625. The licentiousness that mars his verse was but an echo of his life. His imitators form the so-called Marinist school, of which the essential features are florid hyperbole and false overstrained imagery. See GONGORA, and LYL. Y.

Marino, a town on the Alban Hills, 12 miles SE. of Rome, has a castle belonging to the Colonnas, who took it from their rivals, the Orsinis, in 1424, and a cathedral and churches with pictures by Guido, Domenichino, and Guercino. It grows wine and manufactures soap, leather, &c. Pop. 6071.

Mario, GIUSEPPE, the famous tenor, was by birth the Cavaliere di Candia and son of General di Candia. He was born at Cagliari in 1808 (not at Genoa or Turin in 1812), and served in the army for some years. But a youthful escapade led to his forsaking Italy for Paris, where he quickly won his way into the most exclusive circles both by the charm of his manners and his exquisite voice. Having contracted debts, however, he accepted the appointment of first tenor of the Opera, with a salary of 1500 francs per month, changing his name at the same time from De Candia to Mario. After two years' study at the Conservatoire Mario made his debut, on the 2d December 1838, as Robert in *Robert le Diable*, and achieved the first of a long series of operatic triumphs in Paris, London, St Petersburg, and America. His repertoire embraced all the great works of Rossini, Bellini, Donizetti, and Verdi. By the famous singer Giulia Grisi (q.v.) he was the father of six daughters. In private he was esteemed for his large-handed liberality and for his noble assistance to struggling artists. In his later years after his retirement from the stage he lost his fortune through disastrous speculations. In May 1878 a benefit concert in London yielded him as much as £1000. He died at Rome, 11th December 1883. See Engel's *Musical Celebrities* (1886).

Mariolatry. See MARY.

Marion, capital of Marion county, Ohio, 46 miles by rail N. of Columbus, with manufactures of machinery, farming implements, and wooden wares. Pop. (1890) 8327.

Marionettes, little jointed puppets of wood or cardboard, representing men, women, and animals, and moved by means of cords or springs by a concealed agent. They are exhibited in what are called marionette theatres, the exhibitor varying his voice, so that a sort of dramatic performance is accomplished. This entertainment was known to the Greeks, and from them passed to the Romans. In modern times it has chiefly prevailed in Italy, where it was known as *Fantoccino*, and has there reached a very respectable degree of artistic perfection. It was carried to France under Charles IX. by an Italian named Marion, whence it passed quickly to England, where it became known as a *motion*, or *motion of puppets*, or *puppets* only. The favourite resort of puppet-plays in London seems to have been Bartholomew Fair, and in Elizabethan times they appear to have played set pieces. We find allusions so frequent as to prove wide popularity in Shakespeare, Ben Jonson, Pepys's *Diary*, Pope, Swift, and the Essayists. Marionettes are still exhibited occasionally, but the only very familiar marionette-play we have is the Punch and Judy of our streets. A marionette *Faust* had for many generations been played in Germany, and Goethe tells us that it gave him the first suggestion of his greatest work. In the East the players are very frequently Gypsies, and it is a striking fact that Gypsies still show marionettes in Germany, and already are spoken of as actors in Scotland in the 16th century.

Mariotte, EDME, a French physicist, born in Burgundy during the first half of the 17th century—the year is not known—was prior of St Martin-sous-Beaune, and died at Paris, 12th May 1684. He was one of the earliest members of the Academy of Sciences at Paris, and wrote original papers on percussion, the nature of air and its pressure, the movements of fluid bodies and of pendulums, on colours, &c. What is on the Continent called Mariotte's Law is rather Boyle's Law, and is an empirical law stated by Boyle (q.v.) in his *Defence of the Doctrine touching the Spring and Weight of the Air* (1662), and by Mariotte in his *Discours sur la Nature de l'Air* (1676). It is generally expressed as follows: *The temperature remaining the same, the volume of a given mass of gas is in inverse ratio to the pressure which it sustains*. This law may be held to be substantially correct within a considerable range of pressure; but see GASES. Mariotte's collected works were published at Leyden in 1717, and at The Hague (2 vols.) in 1740.

Mariposa, a central county of California, with the Sierra Nevada on its north-east border. It contains the Yosemite Valley (q.v.), besides a grove of giant trees (see SEQUOIA). Area, about 1600 sq. m.; pop. 4339.

Marischal. See MARSHAL, KEITH.

Marists, a modern French Catholic Congregation (q.v.). The Marist Fathers date from 1815; the Marist Brothers from 1817; and the Marist Sisters from 1834.

Maritime Province (*Primorskaya*), part of eastern Siberia, extending along the Pacific coast from the frontiers of Corea to the Arctic Ocean, and including Kamchatka and Saghalien. It has a length of 2300 miles, a very varying breadth, and the enormous area of 730,000 sq. m. (more than $3\frac{1}{2}$ times the size of Germany). The variety of climate and productions is of course great. See AMUR, SIBERIA, KAMCHATKA, SAGHALIEN. The Maritime and Amur provinces are under one governor-general, whose headquarters are at Khabarovka.

Maritza (anc. *Hebrus*), a river of European Turkey, rises in the Balkans, and flows E. by S. past Philippopolis to Adrianople, where it bends

and flows S. by W. to the Gulf of Enos in the Ægean. It is 270 miles long, and is navigable for small boats to Adrianople.

Mariupol, or MARIAMPOL, the seaport for the south Russian coalfield, stands on the Sea of Azov, 65 miles W. of Taganrog. It was founded in 1779 by Greek emigrants from the Crimea, and exports coal, wheat, linseed, &c. to the annual value of £425,000. Fish-curing, soap-boiling, and tanning are carried on. Pop. (1882) 14,980.

Marius, CAIUS, a famous Roman general who was seven times consul, was born of an obscure family at the village of Cereatæ, near Arpinum, 157 B.C. He served with great distinction at the siege of Numantia (134) under the younger Scipio Africanus, who is said to have hinted that in him the Romans would find a successor to himself. In 119 he was elected tribune of the plebs, and already he had made himself a great popular leader by his vigorous opposition to the nobles. In 114 he went to Spain as proprætor, and cleared the country of the robbers who infested it. He now married Julia, the sister of the father of the great Cæsar. He served in Africa as legate to Q. Cæcilius Metellus during the war against Jugurtha, and was elected consul two years after. He took for his province Numidia, and closed the Jugurthine war in the beginning of 106. The honour of capturing the beaten king fell to his quæstor L. Sulla, and from this period dates the birth of that jealousy out of which were to flow so many horrors. Meanwhile, an immense horde of Cimbri, Teutones, and other northern barbarians had burst into Gaul, and repeatedly defeated the Roman forces with great slaughter. Marius was again called to the consulate for the year 104, and for the third, fourth, and fifth time in the following years, 103–101, for it was felt that he alone could save the republic. The war against the Teutones in Transalpine Gaul occupied him for more than two years; but he finally annihilated them in a terrible battle of two days' duration at Aquæ Sextiæ, now Aix, in Provence, where 200,000—according to others, 100,000—Teutones were slain. After this he turned to the Cimbri in the north of Italy, and then he also overthrew at Campi Raudii near Vercellæ, with a like destruction (101). The people of Rome knew no bounds to their joy. Marius was declared the saviour of the state, the third founder of Rome, and was made consul for the sixth time in 100. It has often been remarked that, had he died at this period, he would have left behind him one of the greatest reputations in Roman history. But to perpetuate his power he stooped to the basest arts of the unprincipled demagogue.

When Sulla as consul was entrusted with the conduct of the Mithridatic war, Marius, who had long manifested an insane jealousy of his patrician rival, attempted to deprive him of the command, and a civil war began (88). Marius was soon forced to flee, and, after the most frightful hardships, and numerous hairbreadth escapes, he made his way to Africa. Two romantic incidents stand out among these days of peril. His place of hiding in the marshes of Liris had been discovered, and he had been flung into prison at Minturnæ, when a Cimbrian slave was sent to despatch him, 'Wretch, darest thou slay Caius Marius?' said the old hero as he glared upon him out of the gloom. The slave fled in terror saying, 'I cannot kill Marius,' and the citizens recognising the omen allowed the exile to escape. Scarcely had he reached the shore of Africa, when the Roman governor sent him a summons to leave the country. Said Marius, 'Go, tell the prætor that you have seen Caius Marius a

fugitive, sitting on the ruins of Carthage.' Here he remained until a rising of his friends took place under Cinna. He then hurried back to Italy, and, along with Cinna, marched against Rome, which was obliged to yield. Marius was delicious in his revenge upon the aristocracy; a band of 4000 slaves carried on the work of murder for five days and nights. Marius and Cinna were elected consuls together for the year 86, but the former died after he had held the office seventeen days. On the triumph of Sulla his body, which had been buried, not burned, was torn from its grave on the banks of the Anio, and cast into the stream. Lucan tells us how the troubled ghost haunted the spot and scared the peasants from the plough on the eve of impending revolutions.

Marivaux, PIERRE CARLET DE CHAMBLAIN DE, was born at Paris, February 4, 1688. He belonged to a good Norman family and devoted himself to letters. He received but a slight education and in his early writings affected a disdain of the Greek and Latin authors, declaring, for example, that he preferred Gregory of Tours to Tacitus and Vincent Ferrier to Demosthenes. He published *L'Homère Travesti*, a burlesque of the *Iliad*, in 1716, and brought out his best comedy, *Le Jeu de l'Amour et du Hasard* in 1730. He received a pension from Helvétius, and another, of 1000 crowns a year, from Madame de Pompadour. His romance of *Marianne* came out in 11 parts between 1731 and 1741, but was never concluded by him, the twelfth part being added by Madame Riccoboni. He followed up his first dramatic success by numerous comedies: *L'Épreuve*, *Les Fausses Confidences*, *Le Legs*, *Les Sincères*, *La Méprise*, *Le Triomphe de l'Amour*, &c. They are the work of a clever analyst rather than a dramatist; the dialogue, says Sainte-Beuve, is a perpetual 'moral skirmish'; the writer sacrifices character and situation to an ingenious playing with words. Marivaux, said Voltaire, knew all the bypaths in the human heart, but he did not know the highway. He died at Paris, February 12, 1763. His title to fame rests on *Marianne*, one of the best novels of the 18th century. Its interest does not lie in exciting adventures, but in the subtle analysis of character and the delicate picturing of contemporary manners. From the peculiarities of Marivaux's finicking style the term *Marivaudage* was at one time current as a synonym for affected or 'precious' writing. His other romances, *Pharamond* and *Le Paysan parvenu*, are greatly inferior to *Marianne*. See Sainte-Beuve's *Causeries du Lundi* IX., and Arsène Houssaye's *Galerie de Portraits du dix-huitième Siècle*.

Common Marjoram
(*Origanum vulgare*).

Marjoram
(*Origanum*), a
genus of plants of

the natural order Labiatae. Several of the species are familiar as pot and sweet herbs in gardens. *O. vulgare* is the Common Marjoram, a native of

Britain, and is aromatic with a bitter and slightly acrid taste. The dry leaves have been used instead of tea, and they are also used in fomentations. The tops of the plant have been used to dye woollen cloth purple; and, by a process of macerating the material first in alum water and then in a decoction of crab-tree bark, they also dye cotton cloth a reddish brown. *Oil of Marjoram* is obtained from this and other species by distillation. The oil of marjoram is so caustic as to be used by farriers as a stimulating liniment. A little cotton moistened with it placed in the hollow of an aching tooth relieves pain. *O. heracleoticum* is the Winter Sweet Marjoram of gardeners; *O. onites* is the Pot Marjoram; and the Knotted Marjoram is *O. Marjorana*. The dittany of Crete, a plant with round leaves clothed with thick white down and purple trailing stems, which is frequently cultivated as a window-plant in Britain, is *O. Dictamnus*.

Mark, the standard weight of the money system in various countries of Europe, especially in Germany, where in the middle of the 11th century the Cologne mark = half a Cologne pound, or 233·812 grammes, was adopted as the standard, and as such continued in use till 1857. The mark gradually acquired a monetary value as well; as such it has been since 1875 the standard of currency in the German empire, being equivalent to $\frac{1}{100}$ of a pound (500 grammes) of fine gold, and equal to 11 $\frac{1}{2}$ d. English and 24 cents United States currency. But there are only 5, 10, and 20 mark pieces in gold. The silver mark (= $\frac{1}{3}$ thaler) is divided into 100 pfennigs. The Lübeck mark or mark current, a coin formerly in use at Hamburg, was worth 1s. 2d.; the mark banco there, a money of account, was worth 1s. 6d. In England marks are first heard of in the treaty between Alfred and Guthrum the Dane, and are supposed to have been then a Danish reckoning. But these marks were not coins, only money of account, or rather a weight. In 1194 the coined mark had the nominal value it ever after retained, 160 pennies or 13s. 4d., two-thirds of the nominal 'pound.' The gold noble, first struck by Edward III., was worth half a mark—6s. 8d. As late as 1703 Defoe was fined 200 marks. In Scotland the mark or merk was a weight for gold and silver, or common money reckoning, and also a coin. The coin, like the other Scotch coins, had only one-twelfth of the English value: nominally 13s. 4d., it was worth 1s. 1 $\frac{1}{2}$ d. English. There were two-merk, one-merk ($\frac{1}{4}$ to the oz.), half, and quarter merk pieces. The French standard weight mark weighed 244·75 grammes and the Dutch mark 246·08 grammes.

Mark, a signature. See DEED, ILLITERATES.

Mark. See MARCHES.

Mark, also called JOHN (Acts, xiii. 5, 13), or, more fully, 'John, whose surname was Mark' (Acts, xii. 12, 25), is named by unvarying tradition from the close of the 2d century as the author of the second canonical gospel. Of Mary, his mother, nothing is known except that her house in Jerusalem was visited by Peter and the other disciples. Barnabas the Levite was his cousin (Col. iv. 10, R.V.). By some Mark has been supposed to be the young man mentioned in Mark, xiv. 51, 52, and it has also been conjectured that Mary's house may have been the place where the Lord's Supper was instituted. Mark accompanied Paul and Barnabas on their first missionary journey from Antioch in Syria as far as to Perga in Pamphylia (Acts, xii. 25; xiii. 13); here he quitted them on grounds which, whatever they may have been, did not approve themselves to Paul, who at a later date peremptorily declined to have him as a companion on his second journey, even though this involved his parting company with Barnabas also. That a reconciliation afterwards

took place appears from Col. iv. 10; Phil. 24; 2 Tim. iv. 11, where Mark is referred to by the apostle as a useful fellow-worker. Another chapter in Mark's life is indicated in 1 Peter, v. 13, where he is mentioned as a companion of the apostle Peter in Babylon, unless indeed, as has been done by some interpreters, we take 'Marcus my son' in a literal sense, in which case, of course, a different person is referred to. We should not naturally think of interpreting Babylon here as meaning Rome, were it not for subsequent ecclesiastical tradition which usually speaks of Mark as the 'disciple and interpreter' of Peter, and mentions Rome as the scene of their labours till the martyrdom of the latter about 64 A.D. This tradition, in turn, is not easily brought into agreement with the very generally accepted statement of Eusebius, that Mark from Rome went to Alexandria, where, after proclaiming the gospel he had written, he was succeeded in the pastoral office by Ammianus in the eighth year of Nero (62 A.D.). This last date is given as his death year in the Roman breviary. A further tradition speaks of Mark as having preached in other parts of Italy besides Rome, and especially at Aquileia. On the strength of this tradition the Emperor Heraclius in 629 A.D. sent the patriarchal chair from Alexandria to Grado, whither the Aquileian patriarchate had previously been removed. The Venetian legend of the translation of the relics of St Mark from Alexandria to Venice (q.v.) in the 9th century is denied by Tillemont, and rests on very inadequate evidence. He is sometimes spoken of as having suffered martyrdom, but by none of the older authorities nor by the Roman breviary. His feast day is April 25. In medieval art Mark is symbolised by the lion. Various New Testament books have been attributed to him by individual modern critics (Epistle to Hebrews, Epistle of Jude, and, more recently, the Apocalypse, in whole or in part). For the traditions, both earlier and later, regarding Mark, see Molinus, *De Vita et Lipsanis S. Marci Evangelistae* (Rome, 1864).

THE GOSPEL ACCORDING TO MARK.—Two distinct accounts of the origin of this gospel, both of them developments from earlier tradition, were formulated respectively by Augustine and by Jerome; both gained general currency throughout the Western Church, and no difficulty with regard to either of them was expressed for many centuries. Augustine's view (see GOSPELS) was that Mark merely followed and abridged Matthew, Jerome's that he wrote at the direct dictation of Peter. Modern criticism accepts neither. (1) The germs of Augustine's account are found in Irenæus (end of 2d century), who says that Matthew had already written his gospel before Mark began his, and in Clement of Alexandria (*circa* 210 A.D.), who has it that the two gospels containing the genealogies were composed first, and implies that Mark had seen them both. Mark's dependence on Matthew was first controverted towards the end of the 18th century (Koppe, Storr), and his priority to both Matthew and Luke was argued for and illustrated with much cogent detail by Wilke and Weiss in two independent works in 1838. Baur and his school continued to defend the traditional view so far at least as to maintain that the second gospel was a late conciliatory combination of Matthew and Luke, with the Ebionitism of the one and the Paulinism of the other left out. But Ewald again claimed priority for Mark, and his view, supported at the time by Ritschl and by many others since, may now be regarded as, subject to certain qualifications, generally accepted on all hands. Among the considerations that have led to this conclusion are certain peculiarities of language and phraseology in which Mark is confessedly less refined and classical than Luke or even Matthew. It is held

to be unlikely that in course of borrowing the more vulgar style of expression should be substituted for the more polite. Again, the graphic, vivid, and abrupt style of Mark (characterised by use of the historical present and by other features) is not that of a mere abbreviator or copyist. Further, the progress of the narrative, which materially differs from that in Matthew and in Luke, is now held to represent, probably, the actual order of the facts more nearly. The natural course of a gradual development in the life and work of Jesus, in his own self-consciousness, and in the estimation of others, can be traced more clearly in Mark than in any of the other gospels. The manner and degree in which the supernatural element is presented are also held to betoken the earlier narrative. Certain expressions too, which might be supposed stumbling to faith, are present in Mark, but absent from the others, having either been struck out altogether or modified so as to bring them more into accordance with accepted views. (Compare, e.g., Mark, vi. 5 with Matt. xiii. 58; also Mark, i. 32-34 with Matt. viii. 16 and Luke, iv. 40, 41.) In short, its naiveté, directness, and simplicity prove the comparative originality of Mark. (2) Jerome's account can be traced back in its beginnings to Papias (*circa* 140 A.D.), who we learn from Eusebius was once told by John 'the presbyter' (not the apostle John), perhaps about 90 A.D., that 'Mark, having become the interpreter of Peter, wrote down accurately everything he remembered of the things that were either said or done by Christ, not, however, in order. For neither did he hear the Lord, nor did he follow Him; but afterwards, as I said, [followed] Peter, who adapted his instructions to the needs [of his hearers], but had no design of giving a connected account of the oracles of the Lord.' 'So then,' adds Papias, 'Mark made no mistake, while he thus wrote down some things as he remembered them; for he made it his one care not to omit anything he had heard, or to set down any false statement therein.' It is here clearly implied that Mark had only his memory to rely on at the time of his writing, Peter being no longer within reach. Clement of Alexandria (quoted by Eusebius) is the first who knows that Mark wrote before Peter's death, but also informs us that he wrote without Peter's knowledge. Eusebius in another place, probably by a lapse of memory, seems to make Clement say that Peter afterwards gave the work his sanction. Origen states that Mark wrote, 'Peter showing him the way,' but the phrase does not necessarily imply dictation.

Modern critics readily recognise a certain basis of truth in the ecclesiastical tradition as to Peter's connection with Mark's gospel. Clearly all that makes for its first-hand character makes also for its Petrine origin. Much of what it contains, both in substance and in manner, betokens the eye-witness, and such an eye-witness as Peter, or at least one of the three most intimate disciples. The earlier part of the narrative centres mainly round Capernaum and Peter's house there. Among the most important turning-points in it are Peter's call and Peter's confession. But the gospel is not all equally primary. A large portion of what seems in it to be secondary might indeed be explained in some degree were it permissible to hold that Peter's own recollections had been modified in the course of thirty years' brooding reflection on the real significance of the great personality he had followed during those brief months of earthly discipleship, and (as he would in later years feel) had at first so imperfectly understood. The history when looked back upon might well assume to him a different aspect in memory and imagination from that which it had worn while he was actually passing through the scenes with mind and heart only half-opened to

its ideal and figurative elements and its deepest religious meanings. That such was the case with his early companion John at least is a theory that has found considerable acceptance with Christian apologists (see JOHN, GOSPEL ACCORDING TO). But even so, there are passages in Mark in which the narrative is so brief and vague as to make it difficult to believe that they rest on the authority of an eye-witness only once removed. This is confessedly the case with Mark, xvi. 9-20, and partly also with the history of the closing days in Jerusalem, though even this abounds with many picturesque touches, such as that in xi. 4. Instances are frequent in which the exegete feels constrained to suppose some dislocation or derangement of a context, or misunderstanding, perhaps mistranslation, of a saying. See, in particular, chap. xiii.

The general conclusion of the critical discussion is that in the second gospel on the whole we hear the language of a reporter who had often listened to one who claimed to have been present at the scenes he described. The weight of traditional as well as of internal evidence goes to show that it was produced in Rome about 70 A.D., perhaps rather after than before that date. Apart from what he had heard in Petrine circles, the author doubtless felt himself at liberty to make use of whatever he may have gleaned elsewhere from what he deemed trustworthy sources for the Galilean and Jerusalem tradition. It is even a question whether he may not actually have seen or heard read, in whole or in part, the 'logia' of Matthew. That the second gospel was used by the authors both of the first and of the third may be regarded as now made out. On the assumption that the 'logia' of Matthew contained absolutely no narrative material, it used to be argued that the second gospel must originally have been somewhat fuller than it now is ('original' Mark, 'Ur-Marcus'). But this theory is now very generally given up. A more likely supposition is that the original form was shorter than the present. Mark, xvi. 9-20, is confessedly late. It is not improbable that the preface, i. 1-3, was at one time absent. Some have thought that vii. 24-viii. 26 did not occur in the copy of Mark used by Luke. Reuss has long held that the original Mark consisted only of i. 21-vi. 48 and viii. 27-xiii. 37. It is not unlikely that editorial insertions and alterations have been made throughout. Critical investigation into the genesis of the synoptical gospels, though far advanced, cannot be said to have reached completion, and there is good reason to hope that scholarship may yet succeed in reaching still more definite results.

See the works enumerated under GOSPELS, especially the introductions of Holtzmann and Weiss, and also the commentaries by these authors (Weiss, 7th ed. of Meyer, 1886; Holtzmann, 1889). Compare also P. Ewald, *Das Hauptproblem der Evangelienfrage* (1890). The English text of Mark is printed, and its relations to Matthew and Luke graphically exhibited, in Abbott and Rushbrooke's *Common Tradition of the Synoptic Gospels* (1884). A suggestive reconstruction of the supposed first redaction of Mark is given in Solger's *Urevangelium* (1890).

Mark Antony. See ANTONIUS.

Market-Drayton, or DRAYTON-IN-HALES, a town of Shropshire, on the Tern, 18 miles N.E. of Shrewsbury. It has a grammar-school (1554) and a church dating from the 12th century, up whose spire Clive (q.v.) clambered as a boy. At Bloreheath, 3 miles to the east, the Yorkists won a victory in 1459. Pop. of parish, 5188. See two works by J. R. Lee (1861) and T. P. Marshall (1884).

Market-Harborough, a market-town of Leicestershire, on the river Welland and the Union Canal, 16 miles S.E. of Leicester, 18 N. of Northampton, and 84 NNW. of London. It has traces of

a Roman camp; a fine Perpendicular church, built by John of Gaunt as an atonement for his intrigue with Catharine Swynford, with a broach spire 154 feet high; a corn exchange (1858); and a grammar-school (1614; restored 1869). Charles I. slept here before Naseby. Situated in a rich grazing country, it is a famous hunting-centre, and gives title to one of Whyte-Melville's novels. Pop. (1851) 2325; (1881) 5351. See works by John H. Hill (Leicester, 1875) and J. E. Stocks (Lond. 1890).

Markets. See FAIRS.

Markham, CLEMENTS ROBERT, C.B., F.R.S., F.S.A., geographer and author, son of the Rev. D. Markham, canon of Windsor. He was born 1830 at Stillingfleet, near York, educated at Westminster, from which school he entered the navy in 1844. Immediately on passing as lieutenant in 1851 he left the navy, and in 1855 became a clerk in the Board of Control. In 1863 he was elected secretary to the Royal Geographical Society, and in 1867 became assistant-secretary in the India Office. In 1868 he was placed in charge of the geographical department in that office. He served in the Arctic expedition (1850-51) in search of Sir John Franklin. He explored (1852-54) Peru and the forests of the Eastern Andes; he introduced (1860) the cultivation of the cinchona plant from South America into India; served as geographer (1867-68) in the Abyssinian expedition, and was present at the storming of Magdala. Of his numerous publications, which include many translations from the Spanish, and several antiquarian and genealogical works, mention can only here be made of his *Grammar and Dictionary of the Ynca Language* (1863-64); *The Threshold of the Unknown Region* (1874; 4 eds.); *The War between Chili and Peru* (1879; 3 eds.); *Missions to Tibet* (1877; 2 eds.); his *Reports on the Moral and National Progress of India for 1871-73*; and his *Life of John Davis*, in the 'Explorers' series (1889). He edited the *Geographical Magazine* from 1872 to 1878.

Marking Ink. See INK.

Markirch (Fr. *Ste-Marie-aux-Mines*), a town of Upper Alsace, on the Leber, 40 miles SW. of Strasburg by rail, with important cotton and woollen mills. Pop. 11,421.

Marl, a mixture, naturally existing, of clay and carbonate of lime. Marls are found in very different geological formations, but everywhere seem to owe their origin to deposition by water. The name is sometimes applied to friable clays, or mixtures of clay and sand, in which there is almost no trace of lime; but the presence of a notable proportion of carbonate of lime is essential to marls, properly so called. This proportion varies from 6 to 20 per cent. Marly soils are in general of great natural fertility. Marl is very advantageously used as a manure, acting both chemically and mechanically; but different kinds of marl are of very different value in this respect. The use of marl as a manure has been practised from ancient times. An English statute of 1225 (10 Henry III.) gave every man a right to sink a marl-pit on his own ground, and there is other evidence that the application of marl to land was common in England in the 13th century. The quicker action and greater efficiency of lime have led to its use in many cases instead of marl, although some kinds of marl are extremely useful in some soils. The bulkiness of marl confines its use to the neighbourhood in which it is found. Marl is sometimes indurated into a rock; a slaty variety, containing much bitumen, is found in Germany. See also LIAS.

Marlborough, an old and interesting market-town of Wiltshire, pleasantly situated in the valley

of the Kennet, near Savernake Forest, 75 miles W. of London and 11 SSE. of Swindon. Its broad High Street contains some picturesque houses, and at the east end is St Mary's Church with the town-hall (1790); at the west St Peter's with the college. Near the latter is a British mound, on which early in the 12th century Bishop Roger of Salisbury built a castle. This afterwards became a royal residence; and here in 1267 Henry III. held the parliament which enacted the 'Statutes of Marleberge' for restoring good government after the Barons' wars. An ancient municipal borough, Marlborough, till 1867, returned two members to parliament, and till 1885 one. Pop. (1851) 3460; (1881) 3343.—Marlborough College was incorporated in 1845, and obtained an additional charter in 1853; the number of pupils is between 600 and 600, of whom about 70, sons of clergymen, are on the foundation. There are some thirty scholarships worth from £15 to £80 annually, and fourteen leaving exhibitions for Oxford, Cambridge, and Woolwich. The nucleus of the college buildings was formerly a famous coaching-house; and their special glory is the new chapel, an Early Decorated nave with apsidal chancel, completed in 1886, at a cost of £30,000. See local histories by Waylen (1854) and Hulme (1881).

Marlborough, a provincial district of New Zealand, in the north-east corner of the South Island, 130 miles long by 30 broad; area, 3,000,000 acres, of which 200,000 are agricultural land and 1,300,000 suitable for pastoral occupation. Amongst the minerals are gold, antimony, copper, and coal. See NEW ZEALAND.

Marlborough, JOHN CHURCHILL, DUKE OF, the ablest general and diplomatist of his time, was born on the 24th June 1650, at Ashe, in Devonshire, an old manor-house, which can still be seen between Axminster and Seaton. His father, Sir Winston Churchill, had been an enthusiastic adherent of the Stuarts, and on the accession of Cromwell to power his estates had been consequently sequestered. At the Restoration, however, Winston recovered possession of his lands, but his poverty prevented him from giving his children an education befitting their position, so that young Churchill and his brother George had to face the world with little Latin and less Greek, and a knowledge of English history gathered from the plays of Shakespeare. During his engagement as a page to the Duke of York, John was fortunate enough to secure a commission as ensign in the Guards, and at the age of sixteen, in the year 1667, he was sent to Tangiers, then besieged by the Moors. It is said that he was sent to Tangiers on account of the king's jealousy of his favour with the Duchess of Cleveland; and the story is told that on one occasion, being nearly surprised by the king, he leapt out of a window and was presented by the duchess with £5000, £4500 of which he invested in an annuity of £500 a year. The papers with regard to the annuity transaction are still in existence. At Tangiers Churchill had little opportunity of distinguishing himself. Recalled to England by the Duke of York, he was promoted to a captaincy, and in command of a grenadier company he was despatched to join Turenne, to assist Louis XIV. in the reduction of the fortresses on the Dutch frontier. Here his brilliant courage and ability at once gained him a colonelcy, although his promotion would not have been so rapid had he not called into requisition the influence of his sister, Arabella, mistress of the Duke of York. His prosperity was further advanced by his marriage with Sarah Jennings, a lady as remarkable for her talents and imperious disposition as for her beauty. In 1682 he was created Baron Churchill of Eyemouth, in Scotland. On the accession of the Duke of York to the throne

as James II., the services of Colonel Churchill to his master were not forgotten, as he was raised to the English peerage under the title of Baron Churchill of Sandridge, in Hertfordshire. Promoted to be general, Churchill took an active part in quelling the rebellion of Monmouth; but, on the landing of the Prince of Orange, he stole away to the side of the invader, leaving a letter in which he endeavoured to explain away his treachery by saying that only the inviolable dictates of his conscience and a necessary concern for his religion could have induced him to desert his master. James's daughter, the Princess Anne, accompanied by Lady Churchill, also fled to join the rebels in the north. William, on his accession, showed his gratitude for the assistance given him by Churchill by creating him Earl of Marlborough. Notwithstanding the conspicuous service rendered by Marlborough in reducing Ireland to subjection, and as commander of the troops employed against the French in the Netherlands, in 1689–91, William III. could not rid himself of a certain not altogether ungrounded suspicion of his new earl, till in 1692 he fell into disfavour, and was dismissed from all his offices. As the result of the discovery of a plot with which a clever forger named Young associated the name of Marlborough, the earl was arrested and lodged in the Tower. In ten days he was released, however, but for five years he was without any public employment, till the death of Mary, when he was restored to the favour of the king, and he retained it till the death of William in 1702.

At the accession of Queen Anne he was entrusted with the command of the British army in the Netherlands on the declaration of the war of the Spanish succession, in which he was to show his unrivalled strategical genius during one of the greatest series of military operations in which England has ever been engaged. Anne showered honours on the head of the fortunate earl and his wife, her closest friend. Marlborough was made a knight of the Garter, Commander-in-chief, and Master General of the Ordnance, while his lady was appointed Groom of the Stole, Mistress of the Robes, and Keeper of the Privy Purse. Marlborough, in fact, became regent in all but name. His wife governed the queen, and he himself directed Godolphin, the Lord High Treasurer, whose son had married his daughter. At the opening of the campaign, Marlborough, on his arrival at The Hague, was named commander-in-chief of the combined English and Dutch forces, with a salary of £10,000. The campaign was one long series of triumphs for the allies. In 1702, for driving the French out of Spanish Guelders, the reward was a dukedom and £5000 per annum 'from the post-office.' The year 1703 was made memorable to the duke by the death of his only surviving son, the Marquis of Blandford, who succumbed to an attack of smallpox. Marlborough had little time to grieve over his loss, as he was summoned at once to the campaign in the Low Countries, in which he was so much disgusted with the Dutch that he returned to England, seriously thinking of throwing up his command. Next year, however, we see him supporting the Emperor of Germany, and joining Prince Eugene of Savoy, in July of that year storming successfully the French and Bavarian lines at Donauwörth, and on the 13th August gaining a glorious but bloody victory over the enemy at Blenheim. Of 56,000 men, the French and Bavarians lost 40,000, and the victors killed and wounded numbered fully 12,000. The result of this decisive battle stamped Marlborough as the first general in Europe. Parliament bestowed upon him the estate of Woodstock, the queen caused Blenheim Park (q.v.) to be built for him, and the emperor

created him a prince of the Holy Roman Empire. Diplomatic negotiations occupied the principal part of Marlborough's time and attention in 1705, but in 1706 he resumed that career of victory which broke the force of the spell surrounding the great power of France under Louis XIV., who gloried in calling himself the 'Invincible.' On the 23d May 1706 the battle of Ramillies was fought, when the French were obliged to desert the line of the Scheldt and evacuate the whole of Spanish Flanders. The campaign of 1707 was an almost wholly inactive one; but in 1708 the attempt by the French under Vendôme to recover Flanders led to the battle of Oudenarde—the only battle of Marlborough's engaged in front of a fortified town—fought on July 11, and resulting in the total defeat of the French forces. Marlborough then laid siege to Lille and Ghent, and the surrender of these two towns ended the long and arduous campaign. The year 1709 was distinguished by the battle of 'Malplaquet'—in Marlborough's words, 'a very murdering battle.' The numbers were practically equal, but the French had an infinite superiority of position. There are few battles in history of which it can so certainly be said that the best men won. The carnage was tremendous—20,000 on the side of the allies and 8000 on that of the French. The blood of Malplaquet—the last of the four engagements which gave Marlborough's name a unique position in the roll of generals—did not bring about peace; and in 1711 he was afield again, taking town after town from the French. This eventually led to the treaty of Utrecht, which gave thirty years of peace to Europe.

Meanwhile important events were taking place in Britain. The queen, tired of the tyranny exercised by the Duchess of Marlborough, shook off the yoke, dismissed her ministers, Godolphin and Sunderland, paving the way for the elevation to power of the Earl of Oxford and the Tories. Thereupon a charge was preferred against Marlborough of having embezzled public money, and he was deprived of his offices, till the accession of George I., when, in a day, he was restored to the position in which he stood after the battle of Blenheim. A stroke of apoplexy on 28th May 1716, although it impaired his speech, did not preclude his attendance in parliament till within six months of his death, which occurred on 16th June 1722. His funeral obsequies in Westminster Abbey were celebrated with great magnificence, and all ranks and all parties in the state joined in doing him honour. Charges of avarice and speculation have been brought against Marlborough—among others, by Hallam, Mahon, Macaulay, and Thackeray. Despite this, and the certainty that he thought more of his own interest than the cause in which he was engaged, his character had many elements of excellence. He was generous in action, gentle in temper, a devoted husband, and a man of religious fervour.

His wife, SARAH JENNINGS, was born on 29th May 1660, and when about twelve years of age entered the service of the Duchess of York, and became the chosen and most intimate friend of her step-daughter the Princess Anne. Like Marlborough himself, Sarah came of an ancient but ruined royalist family. On the accession of Anne to the throne, the duchess exercised over the young queen the influence due to a superior and singularly active mind. Her power was almost boundless; the Whig ministry relied upon her support, and she disposed of places and offices at her pleasure, and is said to have accumulated money by the transactions. Her fair fame, however, apart from this, was never, even in those days of scurrilous lampoon, tarnished by the breath of scandal. Her rule,

which lasted for a considerable time, at last became unbearable, and she was supplanted in the favour of the queen by her own cousin, Mrs Masham, whom she herself had introduced to court. She retired from the queen's service in January 1711; and for nearly a quarter of a century she survived her husband, living in complete retirement. She was of a very pugnacious disposition, only happy when quarrelling with her friends or engaged in lawsuits, such as those arising out of the completion of Blenheim. She died on 29th October 1744, leaving a fortune of three millions sterling, of which she bequeathed £10,000 to William Pitt. As the Marquis of Blandford, the only son of the Duke and Duchess of Marlborough, died young, the title was inherited by the descendants of one of their daughters, the Countess of Sunderland.

See the *Memoirs* by Coxe (1819), the short Life by Saintsbury (1885), and the article by Lealie Stephen in *Dict. Nat. Biog.* (vol. x. 1887).

Marlinespike, an iron pin, with a large head and taper point, used on shipboard for separating the strands of rope preparatory to splicing or marling; also employed as a lever in tightening rigging, &c. See **KNOTS AND SPLICES**.

Marlitt, EUGENIE, the pseudonym of E. JOHN, a German novelist, born at Arnstadt in Thuringia, on 5th December 1825. Her beautiful voice and musical talent gained her the favour of the Princess of Schwarzburg-Sondershausen, who sent her to Vienna, where, after three years of study, she appeared on the stage. But a successfully-begun career was cut short by an affection of the ear, and Fräulein John acted as reader to her patroness till 1863. Retiring in that year into private life, she spent her time in writing romances, interesting enough, but with strong didactic tendencies and somewhat unreal. Of these the most successful was *Goldelse* (1866; 18th ed. 1885); others, such as *The Old Maid's Secret* (1867), *Princess of the Moor* (1871), *Second Wife* (1873), *Countess Gisela* (1869), and *Thuringian Stories* (1869)—all except the last translated into English, 1870 to 1873—have also passed through many editions. She died at Arnstadt on 22d June 1887. A collected edition of her *Romanzen und Novellen* was issued in 5 vols. in 1889.

Marlow, GREAT, a town of Buckinghamshire, on the Thames, 29 miles W. of London by rail, has manufactures of lace and paper, an iron suspension bridge, a house where Shelley lived in 1817, and a grammar-school (formerly a blue-coat school). It sent two members to parliament down to 1867, and one till 1885. Pop. (1881) 5580; (1891) 6097.

Marlowe, CHRISTOPHER, Shakespeare's greatest predecessor in the English drama, a shoemaker's son, was baptised at Canterbury, 26th February 1563-64. From the King's School, Canterbury, he was sent to Benet College (now Corpus Christi), Cambridge; proceeded B.A., 1583, and commenced M.A., 1587. How he employed himself after taking his bachelor's degree is not known. A ballad printed from MS. by J. P. Collier asserts that he was an actor at the Curtain Theatre, and 'brake his leg in one lewd scene when in his early age'; but the ballad is evidently spurious. Colonel Cunningham suggests that he may have served as a soldier in the Low Countries.

The earliest of Marlowe's extant plays is *Tamburlaine the Great*, in two parts, first printed in 1590, and probably produced in 1587. In spite of its bombast and violence it is infinitely superior to any tragedy that had yet appeared on the English stage. By his energy and fervour, his aspiring imagination and majestic utterance, he confounded his rivals and won immediate supremacy. Very

noticeable is the proud self-confidence displayed by the young poet in the prologue :

From jiggling veins of rhyming mother-wits,
And such conceits as clownage keeps in pay,
We'll lead you to the stately tent of war,
Where you shall hear the Scythian Tamburlaine
Threatening the world with high astounding terms.

Earlier dramatists had employed blank verse, but it had been stiff and ungainly: Marlowe was the first to discover its strength and variety. The popularity of *Tamburlaine* was extraordinary. A ludicrous line in the Scythian conqueror's address to the captive monarchs whom he has harnessed to his chariot—'Holla, ye pampered jades of Asia!'—was constantly parodied for half a century. Doubtless the extravaganzas of the play contributed to its success. The part of Tamburlaine was originally taken by the famous actor, Edward Alleyn, who afterwards personated Faustus and Barabas.

The Tragical History of Dr Faustus was probably produced soon after *Tamburlaine*. The earliest edition is dated 1604; in the edition of 1616 additional comic matter is inserted by an inferior hand, but it also appears to preserve some genuine passages that were dropped from the earlier edition. *Faustus*, as it has come down, is rather a series of detached scenes than a finished drama; and some of these scenes are evidently not by Marlowe. One playwright after another was employed to furnish 'additions.' But the nobler scenes are marvellously impressive; nowhere is Marlowe's genius shown more vividly than in *Faustus*'s glorious description of Helen's beauty and in the terrible soliloquies that prepare us for the catastrophes. *Faustus* held the stage, and was revived at the Restoration. Edward Phillips, Milton's nephew, quaintly remarks that 'Of all that Marlowe hath written to the stage his *Dr Faustus* hath made the greatest noise, with his devils and such like tragical sport.' A German version was acted by English players at Gratz during the carnival in 1606, and at Dresden in 1626. Goethe expressed his admiration for Marlowe's work.

The Jew of Malta, produced after December 1588, was first published in 1633, with a prologue by Thomas Heywood. It is a very unequal play. The first two acts are conducted with masterly skill and vigour; but the last three are absurdly extravagant, degenerating into vulgar caricature. If Marlowe's hand had not faltered, if the later part had been equal to the earlier, Barabas would have been worthy to stand alongside of Shylock.

Edward II., produced about 1590, is the maturest of Marlowe's plays. It has not the magnificent poetry that we find in *Faustus* and in the first two acts of *The Jew of Malta*, but it is planned and executed with more firmness and solidity—in a more temperate and patient spirit. The various characters are skillfully discriminated, and the action is never allowed to flag. Many critics have preferred it to Shakespeare's *Richard II.*; it is certainly no whit inferior. Charles Lamb declared that 'the reluctant pangs of abdicating royalty in Edward furnished hints which Shakespeare scarce improved in his *Richard II.* ; and the death-scene of Marlowe's king moves pity and terror beyond any scene, ancient or modern, with which I am acquainted.'

The Massacre at Paris is the weakest of Marlowe's plays, and has descended in a mutilated state. It was written after the assassination of Henry III. of France (2d August 1589), and was probably one of the latest plays. An early MS., a fragment of an original playhouse transcript, preserves part of scene xix.; and a comparison of the MS. text with the text of the printed copy shows that the play was mangled in passing through the press.

The Tragedy of Dido is stated on the title-page of the first edition (1594) to have been written by 'Christopher Marlowe and Thomas Nash, Gent.' Probably it was left in a fragmentary state by Marlowe and was finished by Nash. It is of slight value; but contains some fanciful poetry (and extraordinary bombast). There can be little doubt that Marlowe had a hand in the three parts of *Henry VI.* ; and it is probable that he was concerned in the authorship of *Titus Andronicus*. A wild, shapeless tragedy, *Lust's Dominion*, was published in 1657 as the work of Marlowe. It deals with historical events that happened after Marlowe's death, but may nevertheless have been adapted from one of Marlowe's lost plays.

The unfinished poem, *Hero and Leander*, composed in heroic couplets of consummate beauty, was first published in 1598; a second edition, with Chapman's continuation, followed in the same year. Ben Jonson is reported to have said that Marlowe's verses were examples fitter for admiration than for parallel. From a passage in the Third Sestiad it appears that Marlowe had enjoined upon Chapman the task of finishing the poem; but neither Chapman nor any other poet could have taken up the story with any hope of success. *Hero and Leander* passed through numerous editions, and won universal applause. Shakespeare quoted in *As You Like It* the line, 'Who ever loved that loved not at first sight?' and feelingly apostrophised the poet as 'Dead Shepherd.' Nash, in *Lenten Stuffs*, speaks of 'divine Museus, and a diviner poet than him, Kit Marlowe.' The watermen sang couplets from it as they plied their sculls on the Thames. Henry Petowe, a poor versifier but enthusiastic admirer of Marlowe, tells how

Men would shun their sleep in still dark night
To meditate upon his golden lines.

Marlowe's translations of Ovid's *Amores* and of the first book of Lucan's *Pharsalia* add nothing to his fame. The pastoral ditty 'Come, live with me and be my love,' to which Sir Walter Raleigh wrote an Answer, was imitated, but not equalled, by Herrick, Donne, and others. Izaak Walton pronounced it to be 'choicely good.' It was first printed in *The Passionate Pilgrim* (1599), without the fourth and sixth stanzas. In *England's Helicon* (1600) it appeared complete, with the author's name, 'C. Marlowe,' subscribed. Another anthology, Allot's *England's Parnassus* (1600), preserves a fragment by Marlowe, beginning 'I walked along a stream for pureness rare.'

In May 1593, at the age of twenty-nine, Marlowe met a violent death in a quarrel (about a courtesan, it is stated) with one Francis Archer, a serving-man. The burial-register of the parish church of St Nicholas, Deptford, has the entry: 'Christopher Marlow, slain by Francis Archer [the name is not quite clear in the register], the 1 of June 1593.' Highly-coloured accounts of his death were given by Puritanical writers. Thomas Beard, in the *Theatre of God's Judgement*, declares that 'hee even cursed and blasphemed to his last gaspe, and together with his breath an oath flew out of his mouth.' There can be no doubt that Marlowe had led an irregular life. In Harleian MS. 6853 is a note 'contayninge the opinion of one Cristofer Marlye concerning his damnable opinions and judgment of Relygion and scorne of Gods worde,' drawn up (shortly before Marlowe's death) by a certain Richard Baine, who was hanged at Tyburn, 6th December 1594. This scandalous document, which in parts is quite unfit for publication, was printed in full by Ritson. There is evidence that Sir Walter Raleigh and Thomas Kyd the dramatist were accused of sharing Marlowe's views.

Had his life been lengthened, Marlowe would doubtless have written more perfect tragedies, but

he could hardly have left a better poem than *Hero and Leander*. Comedy he would never have attempted; he had no humour. In tragedy he prepared the way for Shakespeare, on whose early work his influence is firmly stamped.

Dyce's scholarly edition of Marlowe's works has not been superseded. It was issued in 1850, 3 vols., by Pickering; revised edition, 1 vol. 1858. Cunningham's edition (1 vol.) is useful but inaccurate. In 1885 the present writer brought out an edition (3 vols.). Marlowe's best plays are included in the 'Mermaid' series, ably edited by Mr Havelock Ellis. *Dr Faustus* has been elaborately edited by Professor A. W. Ward. In Germany Messrs Hermann, Breymann, and Albrecht Wagner are engaged in reproducing the old texts, with the original orthography and exhaustive lists of *variae lectiones*. In 1888 it was resolved to erect a monument to Marlowe's memory on the Dane John, Canterbury. No authentic portrait is extant.

Marmalade (Port. *marmelada*, from *marmelo*, 'a quince'; which, again, is from Mid. Lat. *malomellum*, Gr. *melimēlon*, 'honey-apple' or 'sweet apple') is a semi-liquid preserve, made by boiling the pulp of thick-rinded fruits, such as oranges, pine-apples, quinces, &c., with portions of the rind. The most common kind of marmalade is made from the bitter or Seville oranges, the common or sweet sorts being considered inferior for this purpose, though also occasionally used. The woolly coating on the interior being removed, the rind is cut up into thin strips, and boiled along with the expressed juice of the pulp and a quantity of sugar equal in weight to the other ingredients. The preserve is now made on a commercial scale in factories at London, Dundee, Paisley, and elsewhere.

Marmion, SHACKERLEY, minor dramatist, was born in Northamptonshire, January 1602, studied at Wadham College, Oxford, and took the degree of M.A. in 1624. He squandered his fortune, fought in the Low Countries, and joined Sir John Suckling's troop for the expedition against the Scots, but fell sick at York and returned to London, where he died early in 1639. He left behind an epic, *Cupid and Psyche* (reprinted by Singer 1820), and three comedies, *Holland's Leaguer*, *A Fine Companion*, and *The Antiquary*. The last form a volume (1875) in Maidment and Logan's *Dramatists of the Restoration*. The ancient family of the Marmions of Scrivelsby were the former hereditary champions at English coronations. They came in with the Conqueror and settled at Tamworth, but became extinct with the fifth baron under Edward I. Scott says of the hero of his poem, 'I have not created a new family, but only revived the titles of an old one in an imaginary personage.'

Marmont, AUGUSTE FRÉDÉRIC LOUIS VIESSE DE, Duke of Ragusa and Marshal of France, was born 20th July 1774 at Châtillon-sur-Seine, entered the army at an early age, and made the acquaintance of Napoleon at Toulon. He accompanied him to Italy, where his courage at Lodi, Castiglione, and San Giorgio, earned him the rank of general of brigade in the campaign of Egypt. He returned with Bonaparte to France, supported him in the revolution of the 18th Brumaire, and commanded his artillery at Marengo, after which he became general of division. He was sent to Dalmatia in 1805 to defend the Ragusan territory against the Russians, defeated them at Castelnuovo, and was made Duke of Ragusa. Hence he was summoned to join the great army in 1809, the day before the battle of Wagram, was entrusted with the pursuit of the enemy, won the battle of Znaïm, and earned a marshal's baton. He was thereafter for eighteen months governor of the Illyrian provinces; and in 1811 succeeded Massena

in the chief command in Portugal, where he showed skilful strategy in the presence of Wellington. A severe wound, received at the defeat of Salamanca, compelled him to retire to France. In 1813 he commanded a *corps d'armée*, fought at Lützen, Bautzen, and Dresden, and maintained the contest with great spirit in France in the beginning of 1814, till further resistance was hopeless, when he concluded a truce with Barclay de Tolly, which compelled Napoleon to abdicate, and earned himself from the Bonapartists the title of the traitor. The Bourbons loaded Marmont with honours. On the return of Napoleon from Elba he was obliged to flee. After the second restoration he lived in retirement till the revolution of 1830, when, at the head of a body of troops, he endeavoured to reduce Paris to submission, and finally retreating with 6000 Swiss, and a few battalions that had continued faithful to Charles X., conducted him across the frontier. From that time he travelled much and resided chiefly in Vienna and Venice, where he died, 2d March 1852. He was the last survivor of the marshals of the first French Empire. His chief work is his *Esprit des Institutions Militaires* (1845). His *Mémoires* fill nine volumes (1856-57). See Sainte-Beuve, *Causeries du Lundi*, vol. vi.

Marmontel, JEAN FRANÇOIS, a famous but hardly a great French writer, was born of an obscure family at Bort, in the Limousin, 11th July 1723. He made his studies in a Jesuit college, and found employment in a seminary at Toulouse, but early turned to literature, and went to Paris in 1745 by advice of Voltaire. Here he wrote successful tragedies and operas, and was fortunate enough in 1753 to get a secretaryship at Versailles through the influence of Madame Pompadour. Soon after he received a more lucrative appointment, the official journal, *Le Mercure*, being entrusted to his charge. In its columns he commenced the publication of his finished and oft-translated *Contes Moraux* (1761). Marmontel was elected to the Academy in 1763, and became its secretary in 1783, as well as Historiographer of France. After the Revolution he retired to the village of Abbeville, near Evreux, where he died, 31st December 1799. His most celebrated work was the well-known *Bélisaire*, a dull and wordy political romance, containing a chapter on toleration which excited the most furious hostility on the part of the theologians of the Sorbonne, to which Marmontel replied in *Les Incas* by ascribing the cruelties in Spanish America to religious fanaticism. In 1787 appeared his interesting and valuable, but completely uncritical, *Éléments de Littérature*, consisting of his contributions to the *Encyclopédie*. His *Mémoires* is an interesting survey of his whole life, brightened by glimpses of all the great figures he had seen cross the stage from Massillon to Mirabeau.

His own edition of his complete works fills 17 volumes (1786-87), to which must be added 14 volumes published posthumously. Good editions are those of Villeneuve (1819-20) and Saint-Surin (1824-27). See Sainte-Beuve's *Causeries du Lundi*, vol. iv.

Marmora, LA. See LA MARMORA.

Marmora, SEA OF, the *Propontis* of the ancients, separating Europe from Asiatic Turkey, and connecting the Ægean Sea by the Dardanelles (anc. *Hellespont*) with the Black Sea by the Strait of Constantinople (anc. *Bosporus*). It is of an oval form, is 175 miles in length by 50 in breadth, has an area of 4499 sq. m., and a maximum depth of 4250 feet. The Gulf of Ismid extends about 30 miles eastwards into Asia. The sea contains several islands, the largest of which is Marmora or Marmara (area, 50 sq. m.), famous for its quarries of marble and alabaster.

Marmoset, a name given to a group of American monkeys which are always of small size, and which differ in various particulars from other American monkeys (see MONKEY). The popular name of *Ouistiti* has been given to these monkeys on account of the sharp whistling sound which they make when frightened or irritated.

Marmoset (*Hapale jacchus*).

There are a good many species of marmosets which are placed in two genera, *Midas* and *Hapale*, both confined to Central and South America. These creatures are easily kept in captivity, and are usually of an affectionate disposition.

Marmot (*Arctomys*), a genus of rodents, belonging to the family *Sciuridae*, resemble squirrels in their dentition, although in form and habits they more closely resemble rats and mice. They have two incisors and two premolars in each jaw, four molars on each side above, and three below.—The Common Marmot, or Alpine Marmot (*A. marmotta*), is a native of the Alps, the Pyrenees, and the more northern mountains of Europe, up to the limits of perpetual snow, and is found also in Asia. It is about the size of a rabbit, grayish yellow, brown

The Alpine Marmot (*Arctomys marmotta*).

towards the head; feeds on roots, leaves, insects, &c.; and is gregarious, often living in large societies. Marmots spend the winter in their burrows, in one chamber of which is a store of dried grass; but the greater part of the winter is passed in a torpid condition. The Alpine Marmot is easily tamed. There are three kinds of marmots in North America, all popularly termed 'Woodchucks.' The 'Prairie Marmot' (see PRAIRIE

DOG) is nearly allied, but does not belong to the same genus.

Marne, a river of France, the most considerable tributary of the Seine, rises in the plateau of Langres, flows north-west past Châlons to Épernay, and thence west, joining the Seine at Charenton, a few miles above Paris. Its length is 326 miles, and it is navigable for 126 miles up to St Dizier. Its stream is rather rapid, and in most places has a wide bed. It is connected by canals with the Rhine, the Aisne, and the Seine.

Marne, a department in the north-east of France, formed out of the old province of Champagne, is traversed by the river Marne, and to a less extent by the Seine and the Aisne. Area, 3159 sq. m.; pop. (1886) 429,494. It is in the dry and chalky soil of the north that the best varieties of Champagne Wine (q.v.) are grown, of which two-fifths are exported. The rearing of sheep is an important industry, and extensive woollen manufactures are carried on. Cereals, beetroot, and potatoes are grown; honey and wax are produced; building stone is quarried; and metal works, tanneries, &c., are in operation. Marne is divided into the five arrondissements of Châlons-sur-Marne (the capital), Épernay, Reims, Sainte-Ménéhould, and Vitry-le-François.

Marne, HAUTE, a department in the north-east of France, formed chiefly out of the old province of Champagne, and embracing the land in the upper basins of the Marne and the Meuse. It rises in the south into the plateau of Langres and the Monts Faucilles (1500 to 1600 feet). Area, 2402 sq. m.; pop. (1886) 247,781, a decrease of 7095 since 1881. Cereals, wine (12 million gallons annually), fruits, and potatoes are the principal products. The department yields 200,000 tons of iron ore annually, and there are numerous furnaces. The cutlery is in high repute. There are three arrondissements of Chaumont, Langres, and Vassy; capital, Chaumont.

Marnix, PHILIP VAN, Lord of St Aldegonde, Dutch writer and patriot, was born at Brussels in 1538. A pupil of Calvin and Beza at Geneva, on his return home he took an active part in promoting the Reformation, and in 1566 a no less active part in the revolt of the Netherlands against Spain. An intimate friend of William of Orange, he was appointed by this great man to be his representative at the first meeting of the Estates of the United Provinces, held at Dort in 1572, and on subsequent occasions was sent on special missions to the courts of France and England. After helping to cement the Union of Utrecht and visiting the diet at Worms, he was nominated in 1583 burgomaster of Antwerp. This city he defended thirteen months against the Spaniards; but, having then capitulated, he incurred so much ill-will that he retired from public life. The leisure of his retirement he utilised for literary work, besides taking an active interest in the newly-founded university of Leyden. From his pen came the *Wilhelmus* song, the hymn of Dutch liberty and Protestantism; the epoch-making prose satire on the Roman Catholic Church, entitled *The Roman Bee-hive* (1569); a metrical translation of the Psalms from the Hebrew (1590); and the beginning of a prose translation of the Bible. Marnix died at Leyden, 15th December 1598. His works were edited in 7 vols. (Brussels, 1855-59); his religious works in 2 vols. (1871-73). See *Lives in Dutch* by Broes (1840) and Frédéricq (1882), and the French monograph by Juste (1858).

Marocco. See MOROCCO.

Marochetti, CARLO, BARON, an Italian sculptor of respectable talent, was born at Turin in 1805, and trained in Bosio's studio. Settling

at Paris in 1827, he produced 'Young Girl sporting with a Dog,' 'Fallen Angel,' relief on the Arc d'Etoile, an altarpiece for the Madeleine, a memorial work for Bellini's tomb, a statue of Latour d'Auvergne, &c. On the outbreak of the revolution in 1848 he repaired to London. In Britain his best works were statues of Queen Victoria for Glasgow, of Richard Cœur-de-Lion, and of Lord Clyde in Waterloo Place, London. Mounted figures of Emmanuel Philibert and Charles Albert of Savoy were chiselled by him for North Italy. He died at Paris on 4th January 1868.

Maronites, a Christian sect of Syria, generally regarded as the descendants of a remnant of the Monothelite sect (see MONOTHEISM), who settled on the slopes of Lebanon in the 7th century. They take their name from a monk Maro, who lived in the 5th century, or more probably from their first patriarch Moro (701). These people maintained their independence against the followers of Islam; but in the 12th century, on the establishment of the Latin kingdom of Jerusalem, they abandoned their distinctive monothelite opinions, and recognised the authority of the Roman Church. In 1445 they entered into a formal act of union with the Roman Church; in 1584 a college was founded in Rome by Pope Gregory XIII. for the education of the Maronite clergy; and in 1736 they formally subscribed the decrees of the Council of Trent. Nevertheless, they retain their distinctive national rites and usages, and use the ancient Syriac language in their liturgy; their clergy, if married before ordination, are permitted to keep their wives; and they have many festivals and saints not recognised in the Roman calendar. The Maronites, a sturdy, warlike race of mountaineers (see LEBANON), number about 250,000. Their patriarch, who is elected by their bishops, subject to the approval of Rome, resides in the convent of Kanobin on Lebanon. Many convents for both sexes are spread over the country, especially in the neighbourhood of Beherreh, above Tripoli; the inmates follow the rule of St Anthony. The relations of the Maronites with their implacable foes, the Druses, have been already detailed under DRUSES and LEBANON. See Baedeker's *Palestine*, by Socin (2d ed. 1880).

Maroons, the name (derived from the Span. *cimarron*, from *cima*, 'a mountain top') given in Jamaica and Guiana to fugitive negro slaves. When the British conquered Jamaica from the Spaniards in 1655, numbers of slaves took refuge in the uplands. They and their descendants, called Maroons, maintained a constant warfare with the colonists for 140 years; but in 1795 they were subdued, and a portion of them removed to Nova Scotia, and afterwards to Sierra Leone. The remnant fraternised with their manumitted brethren in 1834-35. The Maroons of Guiana, who are generally called Bush Negroes, about 4000 altogether, form a number of independent communities. See Dallas, *History of the Maroons* (1803).

Maros-Vasarhely, capital of the Szekler districts in Transylvania, stands on the Maros, 28 miles SE. of Klausenburg. It contains a fortified castle, an old Gothic church (Reformed), a library of 70,000 volumes, and a collection of minerals and antiquities, and has a trade in timber, tobacco, wine, corn, and fruits (particularly melons). Pop. (1881) 12,883.

Marot, CLÉMENT, a distinguished French poet of the time of Francis I., was born at Cahors in 1496 (?). Largely owing to the influence of his father, who was both poet and courtier, he began at an early age to write verses, and, abandoning his legal studies, entered the service of Margaret,

Duchess of Alençon, afterwards Queen of Navarre, to whom many of his poems are addressed. He was wounded at the battle of Pavia in 1525, and at the end of the year was imprisoned on a charge of heresy, but was liberated in the spring of 1526. Having a witty pen and a satiric turn, and not being particularly prudent either in speech or conduct, he made many enemies and gave his royal patrons considerable trouble. During his absence from Paris in 1535 his house was searched, and compromising literature was found in his library. His claim that a poet should be permitted to read everything being disallowed, he fled, first to the court of the Queen of Navarre, and later found refuge with the Duchess of Ferrara. He returned to Paris in 1536, and in 1538 began to translate the Psalms, which in their French dress became very popular, especially at the court, where they were sung to favourite secular airs, and helped to make the new views fashionable at least. He was encouraged by the king to continue his translation, but the part published in 1541 having been condemned by the Sorbonne, he had again to flee in 1543. He made his way to Geneva, but, finding Calvin's company uncongenial, he went to Turin, where he died in 1544. His poems consist of elegies, epistles, rondeaus, ballads, songs, sonnets, madrigals, epigrams, nonsense verses, and longer pieces of a general character; and, though he himself tells us that love was above all his master, his special gift lay in the direction of badinage and graceful satire. Marot has a singularly light touch, and a great power of simple natural expression, and in all his poems—if we except some early rhetorical exercises—there is the distinctive *style Marotique* which has had an important influence on French literary language. Though he was persecuted for his religious views, he expressly declares that he was not a Lutheran, and probably like many of his friends—Dolet for instance—he had no very definite theological beliefs.

See *Œuvres Complètes* (4 vols. Paris, 1873-75); *Œuvres Choieses*, an admirable selection (Paris, 1826); *Life by Vitet* (1868); Douen, *Clément Marot et le Psautier Huguenot* (2 vols. 1879). Of Guiffrey's costly edition only two volumes had appeared in 1890.

Marozia, a Roman lady of noble birth, but of infamous reputation in the scandalous chronicles of her age, daughter of the equally notorious Theodora, was born in the close of the 9th century. As the mistress of Pope Sergius III., and mother and grandmother of three popes (John XI., John XII., and Leo VII.), she exercised the greatest influence on the political affairs of her time in Italy. She was married three times, and, if we may credit the narrative of Luitprand, had skill and address enough to procure the deposition and death of Pope John X., and subsequently the elevation of her son as John XI. Marozia's later years brought on her the punishment of her crimes. She died in prison at Rome in 938.

Marprelate Controversy, a bitter war of vigorous and often homely pamphlets, waged against official Episcopacy by the Elizabethan Puritans. Many of these were written by deprived ministers, but were published under the comprehensive name of Martin Marprelate. The time of greatest activity was about 1589, and the books were printed in spite of severe government repression, successively at Moulsey near Kingston-on-Thames, Fawsley in Northamptonshire, Norton, Coventry, Welstone in Warwickshire, and in or near Manchester. The names of the chief writers were John Penry (hanged), John Udall (left to rot in jail), Fenner, John Field, and Job Throckmorton who wrote *Hae ye any Work for Cooper?* One of the best attempts to answer the Marprelate writers was Bishop Cooper of Winchester's *Admoni-*

tion to the People of England. Other writers on the same side were John Lilly and Thomas Nash. Bacon presented to the ministry in 1590 his wise paper entitled *An Advertisement touching the Controversie of the Church of England*, an admirable argument for moderation and mutual concession in things indifferent. 'First of all,' he says, 'it is more than time that there were an end and surcease made of this immodest and deformed manner of writing lately entertained, whereby matters of religion are handled in the style of the stage.' Professor Arber has included a reprint of the Marprelate tracts in his 'English Scholar's Library.' See the Rev. W. Maskell's *History of the Marprelate Controversy* (1845).

Marque, LETTER OF. See **LETTER OF MARQUE.**

Marquesas Islands, or MENDANAS, are a group in Polynesia, N. of Tuamotu or Low Archipelago, between 8° and 11° S. lat. and 138° and 141° W. long. The name strictly applies to four or five islands discovered by Mendaña in 1595, but usually includes now the Washington group of seven islands, to the north-west, which were discovered by the American Ingraham in 1797. Total area, 492 sq. m. The whole archipelago is volcanic. Hiva-oa and Nuka-hiva are the largest islands. Nearly all are shaped into several narrow valleys, in which the bulk of the population, 5216 in 1885, live. In Cook's time there were 100,000 inhabitants, but in 1838 they had decreased to 20,000. They are perhaps the finest race of the brown Polynesian stock, and, though courteous, are cruel and revengeful. Since 1842 the islands have been a French protectorate. A little cotton is grown by Chinese immigrants.

Marquette. See **INLAYING.**

Marquette, capital of Marquette county, Michigan, is on the southern shore of Lake Superior, 430 miles by rail N. of Chicago. It has foundries, blast-furnaces, &c., besides sawmills and machine-shops, and a slate-quarry. Iron ore in very large quantities is mined in the county and shipped from here. Marquette is the seat of a Roman Catholic bishop. Pop. (1890) 9093.

Marquis, or MARQUESS, the degree of nobility which in the peerage of England ranks next to duke. Marquises were originally commanders on the borders or frontiers of countries, or on the sea-coast, which they were bound to protect. In England there were marquises or lords-marchers of the borders of Scotland and Wales in the reign of Henry III., and the foreign equivalent *Markgraf* was common on the Continent; but the first English marquis in the modern sense was Robert de Vere, Earl of Oxford, who was created Marquis of Dublin by Richard II. in 1385. The title was first introduced into Scotland in 1599, when the Marquises of Huntly and Hamilton were created. For the coronet of a marquis, see **CORONET.** The mantle is scarlet, with three and a half doublings of ermine. A marquis is styled 'The Most Honourable'; his wife is a marchioness; his eldest son takes by courtesy the next lower title in the peerage, except where that is identical with the title of the marquise, in which case he must take the next lower still. The younger sons of a marquis are styled 'Lord,' and daughters 'Lady,' with the addition of Christian name and surname.

Marr. See **MAR.**

Marriage denotes the union of man and woman in the legal relation of husband and wife as the same may be defined by local law or custom. The term may be properly applied to connections between the sexes which to civilised people seem exceedingly slight and loose, provided that they

are founded on contract, are intended to endure, and are approved of, or at least permitted, by public or group opinion; but these are conditions essential to marriage. It is not strictly applicable to cases in which the wife is got by capture; for no relations or consequences that can be called legal can arise out of an act of violence which arouses resentment and provokes to retaliation; but, if the captor's tribe approve, there may be *de facto* marriage in such cases, and true marriage if, in addition, the tribe of the woman acquiesces in the capture when effected, in which case an approach is made to marriage with the form of capture—i.e. marriage proceeding upon a contract, but carried out through a form or pretence of capturing the bride.

Many nations have had traditions of a time when marriage was unknown among their own predecessors, and of some lawgiver to whom its institution was ascribed, who was, for example, among the Egyptians, Menes; among the Chinese, Fo-hi; among the Greeks, Cecrops; among the Hindus, Svetaketu. And (if man had to work out his own institutions) it is plain that societies everywhere would need time for arriving at those regulative customs, in the absence of which there would be no marriage, and neither right nor wrong in matters of sex; much time, indeed, wherever there prevailed that law of incest (exogamy) which cut off men from marrying all women of their own kindred, however remote the relationship, the women among whom their connections must have been made at first. Darwin, founding upon observation of the higher animals, was of opinion that, before the springing up of marriage custom, the jealous rage of the male would determine that there would be no general promiscuity of the women, and that there would at first be a prevalence of polygyny. It should, however, be remembered that among early peoples and backward peoples, with marriage fully defined, jealousy has often been practically unknown. Observation of men, savage and civilised, would perhaps suggest that, before some notion of right in matters of sex had sprung up, there would be no uniform behaviour in those matters, that men would do as they could, as passion prompted and opportunity offered, and that they would not be over-scrupulous in their connections—i.e. that they might be polygamists, polyandrists, or monogamists according to circumstances, and that there would be as much promiscuity as there was opportunity for.

An attempt to show in outline the history of marriage and of kinship has necessarily been made under the head of Family (q.v.), and to that reference must here be made. In that account the beginnings of marriage are traced to the predominance of a modification of promiscuity, to Nair polyandry, or something equivalent to it, which could yield a system of kinship through females only—a limitation of kinship which can only have become established when there was usually no father in the household, and fatherhood was uncertain, not thought of, or not claimed. Ultimately, in advanced societies everywhere, marriage came to be regarded as not to be duly constituted without a religious sanction.

While the law of exogamy forbids a man to marry any woman of his own kindred, a law which has been named endogamy forbids a man (where it prevails) to marry any woman who is not of his kindred. Endogamy has been widely prevalent, and not among rather advanced populations only, but among many which are decidedly backward; but there are indications, often conclusive, of its having been preceded by exogamy, and it may be taken to have been preceded by it at least in most cases. Exogamy, if this be conceded, has

prevailed at one time or another nearly everywhere. The known cases in which peoples have depended for their wives upon capture, or have, after a contract for marriage, gone through the form of capturing the bride (which undoubtedly is a relic of capture), are a most extensive class; and exogamy gives the explanation of all such cases. Exogamous men having unfriendly neighbours might have to go without wives if they did not capture women from their neighbours; and when these also were exogamous, we may believe that in time captures would be made easy—that reciprocal captures would be more or less arranged, until at length there were contracts made for exchange or purchase of women, and the capture became a form only. As a form capture has in fact lingered on, in shapes more or less distinct, in the marriage ceremonies of many modern peoples. For an attempt to show the origin of the law, which had the remarkable effect of interdicting marriage between all men and women of the same blood or kindred, see *The English Historical Review*, No. 9, January 1888; and *The Origin of Exogamy*, by J. F. McLennan.

This account of exogamy takes it to have been in the first instance an interdict upon wiving only; but the difficulty is rather to see how men came to abstain from marrying their own women than how, that point reached, they afterwards went on to abstaining from them altogether. Of course, it had to be kept in view that the law of exogamy must have been, in fact, a practice which became prevalent and then obligatory, and that, while it was growing up, the practice must have been the same that it was after it had got the force of law, so that, if exogamy at first necessitated a practice of capturing wives, it must have been a practice of capturing wives that became consolidated as exogamy. Groups composed of a single totem kindred, when exogamous (see *FAMILY*), could only get wives by capture. And thus it was a practice (1) of capturing women of stranger groups for wives, and (2) of taking for wives only stranger or foreign—i.e. captured—women that had to be accounted for. A long-continued scarcity of women (which infanticide might account for) is suggested as the explanation of a systematic practice of capture, and the position of men relatively to captured women on the one hand, and their own women (these being scarce) on the other, as the explanation of marriage being ultimately confined to captured or foreign women. What is scarce is of importance, and the position of women among their own kinsmen must have tended to be high, so that something like the Nair relation only could be formed with women by their kinsmen, and that it may be without any contract, practically, at any rate, at the woman's mere choice. The captured woman, on the other hand, would be a slave; the captors could have her as a subject wife, absolutely on their own terms. It is this sort of connection that was destined to prevail, to become the type of marriage, and it was the lot of the captive, not of the kinswoman. To subject the latter to it would have been an outrage, an offence against her and the kin, indeed, even at first what we call a sin; and the practice which at first exempted her, when it became consolidated as custom, excluded her from the condition of wife to any of her kinsmen, with the feeling remaining, and grown intense, that it would be a shocking and sinful thing for them to have her in that condition. The passage from this to the disuse of the Nair or quasi-Nair connections between men and their own women which would have continued while marriage was growing up—and probably until after convenience had made capture easy, i.e. more or less of a form, when there would be practically exchange

of women—and then to the interdiction of such connections, time being given, does not appear to present much difficulty. Moreover there are a few cases known in which all marriage between relatives being forbidden, other connections seem not to be excluded. This account of exogamy is, at any rate, founded at every point upon human nature and its observed tendencies. The scarcity of women which is the basis of it is also the basis of the history of marriage which traces that institution back to polyandrous beginnings.

See works cited at *FAMILY*, and in addition, Darwin, *Descent of Man* (1870); Fison and Howitt, *Kamilaroi and Kurnai* (1880); A. Lang, *Custom and Myth* (1884); Max Kovalovsky, *De l'Origine de la Famille et de la Propriété* (1890).

The solemn and binding nature of marriage is recognised by all civilised peoples; and, although in various countries there is vast difference in details, both as to legal obligations and public ceremonies, there is much substantial agreement. Thus the restrictions as to age, consanguinity, &c. which prevail in England and other modern countries were nearly the same in the Roman law, where, however, the consent of the *paterfamilias* was an essential. The canon law regards marriage as a sacrament and not as a contract; but it recognises the validity of marriage by mere consent, and without ecclesiastical sanction, in countries where such marriages are treated as valid.

England.—A promise of marriage, given in exchange for the promise of the other party, is binding in English law. Performance is not enforced, but damages may be recovered for breach of promise. It is not necessary that the promise should be proved by writing. The parties may give evidence, but the plaintiff cannot recover unless his or her testimony is corroborated by some other material evidence. If either party discovers that the other has been guilty of gross misconduct, or of serious misrepresentation in regard to his or her circumstances and previous life, breach of promise may be justified. It has been held that a bodily infirmity, rendering it dangerous for the defendant to marry, is no defence to an action.

Males of fourteen and females of twelve, not subject to any physical or mental incapacity, are permitted to contract marriage; but for the marriage of a minor the consent of parents or guardians ought previously to be obtained (see *INFANT*). Persons already married are, of course, incapable of marrying again, unless set free by death or by Divorce (q.v.). A man may not marry his mother or other ascendant, his daughter or other descendant, or any woman within the third degree of consanguinity. He is also precluded, by reason of affinity, from marrying any woman related as ascendant, descendant, or blood-relation within the third degree to a deceased wife. Since 1835 marriages within the prohibited degrees are wholly void; it is not necessary that proceedings should be taken to annul any such union. The policy of the law which forbids a man to marry his Deceased Wife's Sister (q.v.) has been much questioned; and bills for legalising such marriages have several times been passed by the House of Commons.

Persons intending to marry are required to give notice of their intention; the forms commonly used for this purpose are banns, and the certificate of a superintendent-registrar. Banns (q.v.) are the subject of a separate article. Instead of giving notice to the parish minister, the parties may apply to a registrar or superintendent-registrar of the district in which they have resided seven days: if they reside in different districts application must be made in both. After twenty-one days the superintendent-registrar issues a certificate for the marriage: one shilling is paid

for entry of notice, and one shilling for certificate. Parties desiring to be married without delay must obtain a license dispensing with the ordinary forms. The Archbishop of Canterbury may grant a special license (which is issued by his vicar-general) for marriage at any time or place. License for a marriage in church is obtained from a surrogate on an affidavit as to residence, absence of lawful impediment, and (if either party be a minor) consent of parents or guardians. A license may also be obtained on giving one day's notice to the superintendent-registrar, and making a declaration as to residence, &c. The fees payable for licenses are considerably higher than those paid for banns and for the ordinary certificate. It is to be observed that the registrar cannot give a license for marriage in church. His ordinary certificate is usually accepted in lieu of banns; but a clergyman may insist on banns or episcopal license when the marriage is in church.

In the actual celebration of marriage the law requires that the ceremony take place between 8 A.M. and 3 P.M. (12 A.M. until 1886), that the parties declare that they know of no impediment to their marriage, that formal words of consent be used in the presence of witnesses, and that the marriage be duly registered. If the marriage is in church, the prayer-book service is used, and the minister enters the marriage in the register. If it is in a Nonconformist chapel or other registered building, a registrar must be in attendance. Persons who wish to be married according to a secular form may be married at a register office, in presence of a superintendent-registrar, and of a registrar and two other witnesses. Persons so married may afterwards go through a religious ceremony, but such ceremony is not a marriage, in the legal sense of the word, and therefore must not be registered. In 1868 a Royal Commission reported on the marriage laws of the United Kingdom, pointing out the grave inconveniences resulting from the maintenance of different laws in England, Scotland, and Ireland, and from the uncertainty of the English law. The excessive formality of the statute law is in some degree neutralised by the rule that a marriage is not avoided unless for some fraud or irregularity of which both parties are cognisant. Thus, a man who is married in a false name is duly married, unless the wife is a party to the deception; and it has been held that a marriage in church, without banns or license, is valid, if the wife is under the belief that the husband has complied with the necessary legal forms. For further particulars in regard to forms, see Hammick's *Marriage Law of England*; and for the legal effects of marriage, see the article HUSBAND AND WIFE.

A marriage celebrated in church by a person professing to be in holy orders, and not known by both parties to be an impostor, is valid. If both parties acquiesce in the celebration of marriage by a pretended clergyman, the marriage is void. Marriage by proxy is not known to English law, and if it were thought desirable to permit such a marriage in the case of a sovereign or other person of exalted rank, a special act of parliament would probably be passed for the purpose. When one party is a Protestant and the other a Roman Catholic, it was formerly not unusual to arrange for two religious ceremonies; but the Roman Catholic clergy now decline to officiate in such cases, unless the parties promise that there shall be no Protestant ceremony. The Anglican clergy being no longer the sole authoritative registrars, the repetition of the Catholic marriage in an Established church is not now tolerated. For papal dispensations granted to Catholics, see DISPENSATION.

In regard to marriages celebrated abroad, and

marriages in England where the parties, or one of them, may be of foreign nationality, it is important to observe that the law of the parties' domicile governs the essentials of the marriage (capacity of the parties to contract marriage, &c.), and that the law of the place of celebration governs the forms with which the marriage must be solemnised, except in the case of a marriage celebrated in an ambassador's house, or other place enjoying the privilege of ex-territoriality. It is not always easy to say what are the essentials of a marriage, and what rules and ceremonies are to be considered merely formal. French law, for example, requires persons about to marry to obtain, or at least to apply for, the consent of their parents. A Frenchman is married in England without asking his parents' consent. It may be said that he has only omitted a formality not required by English law; but the French courts hold in such cases that an essential requisite of valid marriage is wanting. It is obviously most inconvenient that persons deemed to be married in one country should be considered unmarried in another; the 'conflict of laws' as to marriage and divorce is the cause of much hardship and injustice.

Scotland.—The law of Scotland regards marriage as a contract constituted by the consent of the parties alone. In its effects it differs from other contracts in respect that it confers upon the parties a certain distinct status, and inasmuch as its duration and legal consequences cannot be changed at the will of the parties. This is what is referred to when marriage is said to be an institute or something more than a contract. As the free consent of the parties is necessary, marriage is impossible when those elements are present which the law regards as involving incapacity to give consent. Thus idiots and mad persons cannot marry, and a marriage to which the assent of one or other of the parties has been gained by fraud, force, or fear, or error as to some essential matter, will be void. Intoxication, if the person is so drunk as not to know what is being done, also invalidates a marriage. Pupils—i.e. females under twelve and males under fourteen—cannot marry; but, if the parties are of marriageable age, the consent of their parents or guardians is not necessary. Besides these incapacities, specially affecting the nature of the consent given, and attaching to marriage in common with all other contracts, there are others peculiar to marriage only. Thus, impotency renders a marriage void, and a previous marriage, while it subsists, prevents either of the parties from lawfully contracting another; marriage between adulterers is forbidden by an old statute (regarding which, however, doubts have been expressed as to whether its force is not gone by desuetude), and relationship within certain degrees prevents the relations from marrying. The forbidden degrees, as in England, are drawn from the Jewish law as set forth in the Book of Leviticus (see above). A further preliminary requisite to a valid marriage is that one or other of the parties shall have resided in Scotland for a term immediately preceding the marriage. This term varies according to the form which the marriage takes. An irregular marriage is not good unless one of the parties either had his or her usual residence in Scotland, or lived there for twenty-one days before the marriage. In the case of a marriage after proclamation of Banns (q.v.) the session-clerk cannot proclaim banns until the parties have resided in his parish for six weeks. Where publication of notice by the registrar takes the place of banns parties must reside for fifteen days in the district before intimating to the registrar their intention to marry, and seven further days must elapse before the marriage takes place.

As regards the manner of contracting marriage the law of Scotland is peculiar among those of

other nations for the freedom which it allows to the contracting parties. If their present consent to marry is proved, the law requires no special form of proof, imposes no restrictions as to time and place, and enjoins no special mode of celebration. The blessing of the church is not required by the law of the land to make a marriage good; although all marriages celebrated without the assistance of a clergyman are called irregular marriages. It is enough that the parties give their free consent to marry each other. If a man and woman have lived together as husband and wife, and have had the reputation among their neighbours of being married to one another, and this reputation is general in the neighbourhood, uncontradicted by any one and of considerable duration in point of time, these parties will be held to have exchanged a consent to marry, and the courts will declare them to be married. This is called marriage by habit and repute. Where a promise to marry has been given and sexual intercourse between the parties has followed in Scotland, upon the faith of the promise, the court, upon proof of the promise by the writing or the oath of a defender, will declare the parties to have been married, the presumption of the law being that the intercourse has taken place only on an interchange of consent to marry. This is called marriage by promise *subsequente copula*. Cases of marriage by habit and repute or by promise *sub. cop.* are very rare. In the general case, the fact of the interchange of consent to marry is not left to be presumed by law, but is proved in the most unequivocal way either by writing or witnesses. These cases are distinguished as marriages by words of present consent *per verba de presenti*. According to this form persons may marry by declaring, with or without witnesses, that they then consent to marry and do marry, or by making a written declaration to that effect, and acting upon their declaration. This method of interchange of words of present consent was the one followed in the Gretna Green (q.v.) or 'over the border' marriages by runaways from England. They were checked by Lord Brougham's Act of 1856, requiring residence in Scotland for twenty-one days as a pre-requisite to the validity of an irregular marriage. But if this condition be fulfilled they are still possible. Persons who marry in this way may be convicted before a magistrate or justice of the peace of having contracted an irregular marriage; and, as the conviction is recorded in the books of the court and stands as evidence of the marriage, this way of getting married—by declaration and a police-court conviction—has been thought to be the cheapest known way of securely tying the bonds of wedlock, since it entails no necessary fees to any functionary. But persons convicted of an irregular marriage are required to register their marriage, and the registrar is entitled to a fee of twenty shillings. Parties to an irregular marriage may apply within three months after its date to the sheriff for a warrant to register their marriage. The sheriff grants warrant upon proof of the marriage by written declaration; and a certified copy of the entry in the register is declared by statute to be evidence of the marriage. The proceeding of applying to the sheriff for warrant to register is often believed by the parties to be a civil ceremony of marriage, and popular language speaks of couples having been married by the sheriff. By a mistaken notion and confusion with the English forms of marriage this 'marriage by the sheriff' is sometimes referred to as 'marriage by special license,' sometimes as 'marriage before the registrar,' while the truth is that the parties have married themselves, and only apply to the public

functionaries to make their marriage a matter of public record.

Cases of irregular marriage by interchange of words of consent, though much more common than those of marriage by habit and repute or by promise and *copula*, are rare in comparison with marriages celebrated by clergymen. These are forms of marriage by the interchange of words of consent; the law not regarding the presence of a clergyman or the sanction of the church as necessary to marriage. If a clergyman officiates at a marriage he may do so only after the publication of Banns (q.v.) or publication of notice by a registrar as in England. If he do so without these preliminaries the marriage becomes a clandestine marriage, and the clergyman and the parties are subject to penalties. When notice to the registrar of an intention to marry takes the place of banns, the notice is entered in a Marriage Notice Book, and publicly posted on the registrar's office for seven days, after which time, if no objections are taken, the registrar issues a certificate of publication of notice which authorises a clergyman to marry the parties producing it. There is now no provision of law restraining clergymen of other churches than the Established Church of Scotland from celebrating regular marriages. While regular marriages are always treated in law as marriages 'in the face of the church,' it is not the practice to solemnise Presbyterian marriages in church, nor is such a solemnisation necessary to make a marriage regular and lawful. The ceremony is usually conducted by a clergyman at the house of the bride's father; although of late years there have been signs that Presbyterians may come to adopt the custom of marrying within the church walls. The proceedings ought to include, and usually do include, an express inquiry whether the parties consent to marry; a declaration by them, given generally by a nod or a curtsy, that they do consent; a solemn admonition by the clergyman; a declaration by him that the parties are married; and the nuptial benediction. The ceremony should take place in the presence of witnesses who know the parties, and who are capable of giving evidence. After the marriage is solemnised (which may take place any hour of the day), a schedule, which is given out to the parties along with the certificate of publication of banns, or of publication of notice by a registrar, has to be presented, filled up, to the clergyman; signed by the parties, the clergyman, and at least two witnesses, and delivered to the parties, who must transmit it within three days, under penalties, to the registrar of the parish in which the marriage is solemnised. See HUSBAND AND WIFE, DIVORCE.

Ireland.—The law of Ireland as to the constitution of marriage is substantially the same as that of England. The form of celebration may differ according as the marriage is solemnised in the Disestablished Church of Ireland, the Roman Catholic, or the Presbyterian Church; or between persons of different religious persuasions; but the legal rights and duties of the several churches with regard to marriages are now practically the same—to provide for publication of a marriage and for its solemnisation between certain hours in a building set apart for divine service.

United States.—In the United States the general rule in almost all the states is that no specific form is necessary to the constitution of marriage if the consent of the spouses is proved. But marriage differs from contract in that it cannot be modified or dissolved by consent, nor rescinded on proof of fraud. The law in some states requires that marriages be authorised by taking out a license, and solemnised before a magistrate or a clergyman. Pennsylvania provides that marriages must be

solemnised before twelve witnesses. But a marriage good at common law is good notwithstanding any statute on the subject, unless the statute contain express words of nullity. The original law of the prohibited degrees has been modified; and the prohibition of marriage with a deceased wife's sister is all but unknown.

Marrow is a substance of low specific gravity filling the cells and cavities of the bones of mammals. There are two varieties, which are known as *red* or *watery marrow* and *yellow* or *oily marrow*. In some of the short bones, as the bodies of the vertebræ and the sternum, the marrow has a reddish colour, due to the presence of cells which have this colour and are supposed to be transition forms between the proper marrow cells and red blood-corpuscles. On analysis it is found to contain 75 per cent. of water, the remainder consisting of albuminous and fibrinous matter, with salts and a trace of oil. In the long bones of a healthy adult mammal the marrow occurs as a yellow, oily fluid, contained in vesicles like those of common fat, which are imbedded in the inter-spaces of the medullary membrane—i.e. a highly vascular membrane lining the interior of the bones. This marrow consists of 96 per cent. of oil and 4 of water, connective tissue, and vessels.

Marrow Controversy, one of the most strenuous and memorable struggles in the religious history of Scotland, took its name from a book entitled the *Marrow of Modern Divinity*, written by a Puritan soldier in the time of the Commonwealth. The highly evangelical character of this work, and especially its doctrine of the free grace of God in the redemption of sinners, had made it a great favourite with the few zealous and pious ministers then to be found in the Church of Scotland, and in 1718 an edition was published by the Rev. James Hog of Carnock. A committee of the General Assembly reported against the work as too free in its offer of salvation, and the Assembly formally condemned the book. Twelve ministers, amongst whom were Thomas Boston (q.v.) and the Erskines (q.v.), protested against this decision, and were ultimately rebuked by the Assembly, the national sympathy being on the whole with the 'Representers' or 'Marrow-men.' The controversy was substantially the same that, in 1733, resulted in the deposition of Ebenezer Erskine, and the origination of the 'Secession' body.

Marrum. See REED.

Marryat, FREDERICK, was born in Westminster on July 10, 1792. He was the second son of Joseph Marryat, M.P. for Sandwich and colonial agent for the island of Grenada. In 1806 he went to sea as a midshipman under Captain Lord Cochrane on board the *Impérieuse* frigate. He spent some years of active and dangerous service under his famous captain on the north-west coasts of France, on the north coast of Spain, and in the Mediterranean, taking part in many of the incidents which he afterwards described in *Frank Mildmay* and *Mr Midshipman Easy*. 'The cruises of the *Impérieuse*,' he wrote in his private log, 'were periods of continued excitement from the hour in which she hove up her anchor till she dropped it again in port; the day that passed without a shot being fired in anger was with us a blank day; the boats were hardly secured on the booms than they were cast loose and out again.' After visiting West Indian waters in the *Æolus* and *Spartan*

frigates he received a lieutenant's commission in 1812, and was soon after appointed to the sloop *Espiegle*, in which he cruised on the north coast of South America. He was twice invalided home, but was appointed commander at the age of twenty-three, in 1815, at the close of the great war. In 1819 he married Miss Shairp, the daughter of a Scotch gentleman, and was then appointed to the *Beaver* sloop, which was kept cruising off St Helena to guard against the escape of Napoleon. After doing good work in suppressing the channel smugglers in the *Rosario* he was sent out in command of the *Larne* to Burma, where his men suffered severely in river-work and stockade-fighting. On his return to England his services were rewarded by the Companionship of the Bath and the command of the *Ariadne*, of twenty-eight guns. He resigned in 1830 and never afterwards applied for a ship, but settled in Sussex House, Hammer-smith, and thenceforth led the life of a man of letters. *Frank Mildmay*, his first novel, appeared in 1829, and the *King's Own* in 1830. In 1832 he became editor of the *Metropolitan Magazine*, to which he contributed *Newton Forster* (1832), *Peter Simple* (1833), *Jacob Faithful*, *Japhet in Search of a Father*, and *Mr Midshipman Easy* (1834). After living for some time abroad he severed his connection with the *Metropolitan Magazine*, and wrote for the *New Monthly* at the rate of £20 a sheet. *Snarley Yow* and *The Pasha of Many Tales* came out in 1836, and in 1837 Marryat set out for a tour through the United States, where he remained for two years, and where he wrote *The Phantom Ship* (1839) and a drama, *The Ocean Waif*, which was produced at a New York theatre. His literary work was fairly remunerative: he received £1400 for *Mr Midshipman Easy*, £1600 for his *Diary in America*, and similar sums for his other books. But he was extravagant and unlucky in his speculations, and he lost heavily through his estate of Langham in Norfolk. During his later years his means were greatly narrowed, and his life seems to have been shortened by overwork. His *Diary in America* was issued in 1839, and was followed before the close of 1842 by *Poor Jack*, *Masterman Ready*, *The Poacher*, and *Percival Keene*. In 1843 he settled on his Norfolk property, where he spent his days in farming and in writing stories for children. He published *Settlers in Canada* in 1844, *The Mission* in 1846, *The Privateer's Man* in 1846, and the *Children of the New Forest* in 1847. *Valerie* was only partly Marryat's; and *Rattlin the Reefer*, though included in the list of his novels, was written by E. Howard, his sub-editor on the *Metropolitan Magazine*. His health broke down in 1847, and, after rupturing several blood-vessels, he died at Langham on August 9, 1848. He was an excellent officer and a generous man, though quick-tempered, extravagant, and over-eager in the pursuit of enjoyment.

As a writer of sea-stories Marryat has no superior. He cannot, it may be, bring fully home to his readers the beauty and the terror of the deep. But for invention, narrative skill, and grasp of character, and especially for richness of humour, he stands first of all those who have dealt with the sea and sailors in prose fiction. No doubt his fun often descends to farce; still, setting Dickens aside, there is no English novelist who has awakened heartier and honest laughter. His happiest creations, Mr Chucks, for example, and Terence O'Brien, and Mr Easy and Mesty and Equality Jack would not unworthily fill places in the gallery of the greatest novelist. His best books are thoroughly sound in workmanship. They betray no sign of straining after effect; the prose is direct, clear, and vigorous, an ideal, in its way, of the narrative of adventure. Nothing, for example, could well be

more vivid, yet nothing could well be simpler and more reserved in style, than such a passage as the club-hauling of the *Diomedé* (in *Peter Simple*), where—as is usual in Marryat—the excitement and peril of the moment are brought home to you in the tersest phrase, by dramatic flashes and apt touches of dialogue. His sea-fights, his chases and cutting-out expeditions, are told with irresistible gusto. The writing is as unpretentious as it is spirited and truth-like. You have only to compare the action between the *Rattlesnake* and the three schooners (in *Peter Simple*), or the fight between the *Aurora* and the *Trident* (in *Midshipman Easy*), with Fenimore Cooper's attempts in the same line to be convinced of Marryat's immense superiority as an artist. His books have been the delight of boyhood since they first appeared; and you can turn to them in after years confident of a renewal of past enjoyment. The sailors of the Great War live in his pages as vividly as certain ranks and classes of Londoners live in the pages of Dickens.

See *Life and Letters of Captain Marryat* (1872), by his daughter Florence Marryat, herself a prolific novelist; and the *Life of Captain Marryat*, by David Hannay ('Great Writers' series, 1889).

Mars (archaic and poetic *Mavors*; in the song of the Arval Brothers, *Marmar*; the Oscan form is *Mamers*), an ancient Italian divinity of war and of husbandry, identified by the Grecising Romans with Ares (q.v.). As the father of Romulus he was specially the progenitor of the Roman race, and he shared with Jupiter the honour of being styled *Pater*, the forms *Marspiter* and *Maspiter* being common for *Mars Pater*. Other titles were *Mars Gradivus*, as the warlike god; *Silvanus*, as the rustic god; and *Quirinus*, from his relation to the state, and his especial care for Roman citizens in their civil capacity as *Quirites*. His priests, the *Salii*, danced in complete armour. The wolf and the woodpecker were sacred to him. He had many temples at Rome, the most celebrated of which was that outside the *Porta Capena*, on the Appian Road, and that of Mars Ultor built by Augustus in the forum. The *Campus Martius*, where the Romans practised athletic and military exercises, was named in honour of Mars; so was the month of March (*Martius*), the first month of the Roman year. The *Ludi Martiales* were celebrated every year in the circus on 1st August. See PLANETS.

Mars, MADEMOISELLE. Anne Françoise Boutet-Mouvel, a great favourite at the Théâtre Français during the first forty years of the 19th century, was born in Paris on 5th February 1779, the illegitimate daughter of an actor Moutet and an actress Mars. She began to act before she was thirteen, joined the Théâtre Français in 1799, and died at Paris on 20th March 1847. She was equally mistress of naïve parts as of those of the coquette, and was especially successful in Molière's masterpieces. Her *Mémoires* were published in 2 vols. in 1849, and her *Confidences* in 3 vols. in 1855.

Marsala, a seaport on the westernmost point of Sicily, 102 miles by rail and 55 as the crow flies SW. of Palermo. Pop. of town (1881) 19,750; of commune, 40,250 (34,200 in 1871). It is defended by a citadel, has a cathedral and an academy of sciences, and carries on a large trade in wine, the well-known Marsala, which became popular from having been supplied to the British fleet in 1802. It resembles sherry, and is exported principally to England and the West Indies. The town occupies the site of Lilybæum, the ancient capital of the Carthaginian settlements in Sicily, and was selected by Garibaldi as his landing-point for the Sicilian campaign of 1860. It obtained its present name from the Saracens, who occupied it in the 9th century, but were driven out by the Normans in the

11th. The harbour was filled up by Charles V. in 1567 to prevent a Turkish attack; it was reconstructed during the 19th century. On an average some 1960 vessels of 165,300 tons burden (one-fifth British) enter every year, bringing chiefly staves, grain, and spirits to the annual value of £58,960. The total exports reach an annual value of £434,750, of which £431,720 is for wine.

Marseillaise, the stirring song or hymn of the French republicans, was composed, six-sevenths of it, in 1792, by a young officer, Rouget de Lisle (q.v.), then stationed at Strasburg. He composed both words and music under one inspiration one night in April after dining with the mayor of the city; *Chant de l'Armée du Rhin* was the name he gave it. The song was speedily carried by enthusiastic revolutionists to the chief cities of France. It was brought to Paris by the volunteers of Marseilles, who sang it as they entered the capital (30th July) and when they marched to the storming of the Tuileries. Hence the Parisians called it *La Marseillaise*, and as such it has become the official hymn of the republicans of France. More than one writer has called in question Rouget de Lisle's claim to have composed the music; but his originality seems to have been proved. Interdicted under the Restoration and the Second Empire, the Marseillaise became again the national song on the outbreak of the Franco-German war. See Le Roy de Sainte-Croix's monograph (1880) and Loth's inquiry into its real author (Paris, 1886).

Marseilles, in point of population the third city of France, being surpassed by Paris and Lyons only, is the chief town of the department Bouches-du-Rhône, and is situated on the south coast, about 27 miles E. of the mouth of the Rhone. The principal commercial port of France, if not of the entire Mediterranean, Marseilles is entered annually by 8247 vessels (average for five years ending 1889) of 4,633,052 tons burden; of this commerce nearly three-fourths is French, the British being more than one-seventh. The total tonnage of Spain, Italy, Greece, and Holland together is only a little more than the British. The imports and exports together reach an annual value of 65 to 70 millions sterling, three-fifths being for imports. Wheat, oil-seeds, coal (300,000 to 345,000 tons), wine, spirits, and beer, sugar, maize, oats, barley, coffee, olive, palm, and cotton oils, pepper, flour, and tallow figure most prominently, in the order named, amongst the imports; whilst the exports consist chiefly of clay tiles, wheat, oil-cakes, flour, sugar, oil, wine and spirits, soap, and candles. Marseilles is the headquarters of the Messageries Maritimes, Générale Transatlantique, Marseillaise, and other great French commercial companies. An average of 29,790 emigrants, of whom only 1500 are French, embark from this port every year. The harbour accommodation consists of the old harbour, a natural basin of nearly 70 acres, running into the heart of the city; a series of new docks, quays, and warehouses (La Joliette, &c.) extending fully a mile along the shore to the west of the old harbour, and covering about a hundred acres; and an outer roadstead between the dams to these docks and a breakwater constructed in deeper water; besides dry-docks, wet-docks, slips, &c. The industry of the place is very considerable, the first place being taken by soap, vegetable oils, and oil-cake; soda, sugar, macaroni, iron, lead, zinc, tiles, and leather are manufactured. Several hundreds of men are employed in the flour-mills and in the wine-vaults. There is a prosperous fishing fleet.

The city of Marseilles is built on the slopes that overlook the old harbour, and at the foot, and has of late years extended to the south-east. Although greatly improved since 1853, the sanitary condition

still leaves something to be desired. Its memorable buildings include the new Byzantine basilica, which serves as a cathedral; the pilgrimage church, Notre Dame de la Garde, with an image of the Virgin greatly venerated by sailors and fishermen, and with innumerable ex-voto offerings, built in 1864 on the site of an old chapel of 1214; the church of St Victor (1200), with subterranean chapel and catacombs of the 11th century; the health office of the port, with fine paintings by Vernet, David, Gérard, and Guérin; the museum of antiquities, in the Château Borély; the Longchamp palace, a very fine Renaissance building (1870), which shelters in one wing the picture-gallery, and in the other the natural history museum; the public library, with 95,000 volumes and 1530 MSS. The public institutions embrace a botanical and a zoological garden, a marine and an astronomical observatory, a faculty of sciences, and schools of medicine, fine arts, Oriental languages, music, commerce, hydrography. Pop. (1861) 260,910; (1881) 360,099; (1886) 376,143, including a colony of 40,000 Italians. Marseilles was the birthplace of Pytheas, Petronius, Thiers, and Puget.

One of the oldest towns in France, Marseilles was founded by Phœceans from Asia Minor six hundred years before Christ. It was for many centuries, down to 300 A.D., a centre of Greek civilisation. The Greeks called it *Massalia*, the Romans *Massilia*. As the rival of Carthage it sided with Rome. It supported Pompey against Cæsar, but was taken by the latter in 49 B.C., after an obstinate defence. During subsequent ages it fell into the hands of the Saracens (9th century), Charles of Anjou and Provence (13th century), Alphonso V. of Aragon (1423), and Henry III. of France (1575). In 1112 it had become a republic; but in 1660 it was deprived by Louis XIV. of the privileges it had enjoyed as a free port almost from its foundation. The years 1720 and 1721 are memorable for the devastations of the plague in the port, when nearly half the population of 100,000 perished, and for the splendid heroism of Bishop Belzunce and the Chevalier Rose. It was the scene of stirring events in 1792 and 1793, and sent large bands of cut-throats to Paris, besides keeping sufficient at home to carry on wholesale murders. In 1871 Marseilles, always notorious for its extreme republicanism and lawlessness, proclaimed the commune. Its commerce has grown rapidly since the conquest of Algiers and the opening of the Suez Canal.

See the statistical and historical works of Favre, of Boudin, and of Mathieu (1879), and the topographical account of Saurel (1884).

Marsh, GEORGE PERKINS, an American philologist, was born at Woodstock, Vermont, March 15, 1801; graduated at Dartmouth College, New Hampshire, in 1820; studied law in Burlington, Vermont; was elected to the Supreme Executive Council of the state in 1835, and to congress in 1842 to 1849. Whilst United States minister at Constantinople from 1849 to 1853 he was charged with a special mission to Greece (1852); in 1861 he was appointed the first United States minister to the newly-formed kingdom of Italy. He was made LL.D. by Harvard in 1859, and delivered courses of lectures on English philology at Columbia and at the Lowell Institute in Boston. He died at Vallombrosa in Italy, July 23, 1882. Marsh had a sound knowledge of English philology, and his chief works are valued equally on both sides of the Atlantic. These are his *Lectures on the English Language* (1861) and *The Origin and History of the English Language* (1862). Other works are *The Camel, his Organisation, Habits, and Uses* (1856), and *Man and Nature* (1864; largely rewritten, 1874). See *Life and Letters* by his widow (New York, 1888).

Marsh, MRS (*née* Anne Caldwell), was born about 1799 at Lindley Wood, Staffordshire; married the junior partner of the forger Fauntleroy; and between 1834 and 1857 produced a score of novels, of which the best were *Two Old Men's Tales*, *Emilia Wyndham* (1846; new ed. 1888), and *Norman's Bridge*. In 1858 she came into the Lindley Wood property, where she died in October 1874.

Marsh, OTHNIEL CHARLES, palæontologist, was born at Lockport, New York, 29th October 1831, graduated at Yale in 1860, and studied zoology, geology, and mineralogy for two years further at New Haven, and for other three years in Germany. He became the first professor of Palæontology at Yale in 1866, and thenceforward devoted himself to the investigation of extinct American vertebrates, of which in various expeditions to the Rocky Mountains he has discovered over a thousand new species, some representing wholly new orders. They include a new sub-class of odontornithes, a new order of pterodactyles (pteranodontia), the tillodontia and dinocerata, fossil monkeys from the Eocene of Wyoming, and several new families of Dinosauria (q.v.). Professor Marsh has described many of his discoveries in the *American Journal of Science*, and has issued a series of valuable monographs (published by government) on *Odontornithes* (1880), *Dinocerata* (1884), *Sauropoda* (1888), &c. He is LL.D. of Harvard, Ph.D. of Heidelberg, and in 1877 received the Bigsby medal of the Geological Society, London.

Marshal (Fr. *maréchal*; Old High Ger. *marah*, 'a battle-horse,' and *schalh*, 'a servant'), a term meaning originally a groom or manager of the horse, though eventually the king's marshal became one of the principal officers of state. The royal farrier rose in dignity with the increasing importance of the *chevalerie*, till he became, conjointly with the Constable (q.v.), the judge in courts of chivalry. When the king headed his army in feudal times, the assembled troops were inspected by the constable and marshal, who fixed the spot for the encampment of each noble, and examined the number, arms, and condition of his retainers. With these duties was naturally combined the regulation of all matters connected with armorial bearings, standards, and ensigns. In England the earl-marshal is now head of the Heralds' College (see HERALD), and the dignity is hereditary in the family of the Duke of Norfolk. In Scotland the office of marischal was hereditary in the family of Keith (q.v.). In 1716 George, tenth Earl Marischal, was attainted in consequence of his share in the rebellion of the previous year, and the office has since been in abeyance. In France the highest military officer is called a marshal, a dignity which originated early in the 13th century. There was at first only one *Maréchal de France*, and there were but two till the time of Francis I. Their number afterwards became unlimited. Napoleon's marshals are celebrated. From the title of this class of general officers the Germans have borrowed their Feld-marshal, and the British (since 1736) their Field-marshal (q.v.).

Marshall, capital of Harrison county, Texas, stands at the junction of three railways, 40 miles W. of Shreveport, Louisiana. It contains a ladies' college, and has railway machine-shops, foundries, and a trade in cotton. Pop. (1890) 7196.

Marshall, JOHN, chief-justice of the United States, was born in Fauquier county, Virginia, 24th September 1755, and was studying law when the Revolution began. He served as an officer—for a time under his father, Colonel Thomas Marshall (1730–1802)—from 1775 to 1779; in 1780 he received, while in Richmond, a license to practise

law; and in 1781, after a final campaign, he settled down to his profession. He quickly gained distinction, and eventually rose to be head of the Virginia bar. From 1782 he sat in the Virginia House of Burgesses, the state council, the legislature; in 1788 he was elected to the state convention, which ultimately—mainly owing to his and Madison's (q.v.) arguments—adopted the new United States constitution. In 1797 he was appointed joint envoy, with Pinckney and Gerry (q.v.) to France, where he and Pinckney, as Federalists, were ordered to leave the republic, after the envoys had indignantly declined Talleyrand's overtures for a personal and a public loan. His conduct in this matter only made Marshall more respected and popular at home, and in 1799 he was elected to congress; on 12th May 1800 he was appointed secretary of state, which office he held till March 1801. In January 1801 he was appointed chief-justice of the United States, and in this position he occupied until his death, at Philadelphia, 6th July 1835. Chief-justice Marshall's long series of important decisions are recognised as standard authority on questions of constitutional law; a selection was published at Boston in 1839. He prepared a *Life of Washington* (5 vols. 1804-7; revised ed. 2 vols. 1832) from papers placed at his disposal by the president's family. See *John Marshall*, by A. B. Magruder ('American Statesmen' series, Boston, 1885).

Marshalling of Arms. See HERALDRY.

Marshall Islands, a group in the western Pacific, bisected by 10° N. lat., and having the Caroline group to the west, consists of two parallel chains of low coral-reefs—one, the Ratak group, consisting of fifteen islands, and measuring in all 48 sq. m.; the other, the Ralik group, eighteen islands, with a total area of 107 sq. m. The coconut and pandanus palms and the bread-fruit tree are the principal sources of food, besides fish. Coprah is the only export (2800 tons annually). The inhabitants, 11,600 in number, belong to the Micronesian division, and are an ugly but good-natured and hospitable race, fond of song and dance, and skilful weavers of bast mats. The Boston (U.S.) Mission Society have a branch here. These islands were annexed by Germany in 1885. See Hager, *Die Marshallinseln* (Leip. 1886).

Marshalltown, capital of Marshall county, Iowa, near the Iowa River, 50 miles N.E. of Des Moines, at the crossing of two railways. It has a large trade in wheat, &c., has foundries and machine-shops, and manufactures flour, oil, soap, and fencing-wire. Pop. (1885) 8298; (1890) 8914.

Marshalsea, the jail attached to the Marshalsea Court, originally established under the earl-marshal of England for the trial of servants of the royal household. Later on it came to be used as a prison for debtors and defaulters, as well as persons convicted of piracy or other offences on the high seas. It stood near the church of St George, Southwark, and existed in the reign of Edward III. It was abolished as the Palace Court in 1849. Bishop Bonner was confined here for nearly ten years, till his death in 1569, and George Wither in 1613; he obtained his release by his *Satyre to the King's most excellent Majesty*. But the Marshalsea will be longest remembered as the home of Dickens's *Little Dorrit*.

Marsh-gas. See CARBURETTED HYDROGEN.

Marsh-mallow (*Althæa*), a genus of plants of the natural order Malvaceæ. The species, which are not numerous, are annual and perennial plants, with showy flowers, natives of Europe and

Asia. Only one, the Common Marsh-mallow (*A. officinalis*), is an undoubted native of Britain, and is common only in the south, growing in meadows and marshes, especially near the sea. The whole plant is wholesome, abounding in fibre, mucilage, starch, and saccharine matter. It is in the roots chiefly that the mucilage abounds. The emollient and demulcent qualities of marsh-mallow are well known in medicine, and in seasons of scarcity the inhabitants of some eastern countries often have recourse to it as a principal article of food. Lozenges made from it (*Pâtes de Guimauve*) are in use. It is said to be palatable when boiled, and afterwards fried with onions and butter. The Hollyhock (q.v.) is commonly referred to this genus.

Marsh-marigold (*Caltha*), a genus of plants of the natural order Ranunculaceæ, having about five petal-like sepals, but no petals; the fruit consists of several spreading, compressed, many-seeded follicles. *C. palustris* is a very common

Common Marsh-mallow
(*Althæa officinalis*):
a, a flower; b, fruit.

Marsh-marigold (*Caltha*), a genus of plants of the natural order Ranunculaceæ, having about five petal-like sepals, but no petals; the fruit consists of several spreading, compressed, many-seeded follicles. *C. palustris* is a very common

Marsh-marigold (*Caltha palustris*).

British plant, with kidney-shaped, shining leaves, and large yellow flowers, a principal ornament of wet meadows and the sides of streams in spring. It partakes of the acidity common in the order; but the flower-buds, preserved in vinegar and salt, are said to be a good substitute for capers. It is often called Cowslip in the United States.

Marsilio. See FICINO.

Marsivan, a town of Asia Minor, in the vilayet of Sivas, 23 miles NW. of Amasia, with a silver-mine and a pop. of 11,000.

Marston, JAMES WESTLAND, LL.D., dramatic poet, was born at Boston, Lincolnshire, on 30th January 1820. He was articled to his uncle, a London solicitor, but soon gave up law for literature; and in 1842 his *Patrician's Daughter*, a

blank-verse tragedy of the day, was brought out at Drury Lane by Macready. It was the first, and also the most successful, of more than a dozen plays (*Strathmore*, *Philip of France*, &c.), all Sheridan-Knowlesian, and all forgotten, though a collective edition of them and his poetic works appeared in 2 volumes in 1876. Besides these, he wrote a novel (1860), a good book on *Our Recent Actors* (1888), and a mass of poetic criticism. Although his house had once been the gathering-place of several of the most prominent literary men in London, Marston died in that city alone (wife, children, grandchildren, all dead before him) on 5th January 1890.—His son, PHILIP BOURKE MARSTON, the blind poet, was born in London, 13th August 1850, and died there on 14th February 1887. His life was a series of losses—of eyesight at three, and afterwards of his sister, his promised bride, and his two dear friends, Oliver Madox Brown and Rossetti. His memory will survive through his friendships—with the last and with Watts and Swinburne—rather than through his sonnets and lyrics. They are exquisite some of them, but too sad for a world that sees. *Songtide*, *All in All*, and *Wind Voices* were the three volumes of poetry that he published in his lifetime, between 1870 and 1883; to a posthumous collection of his stories is prefixed a memoir by Mr W. Sharp.

Marston, JOHN, dramatist and satirist, a son of John Marston, of Gayton (or Heyton), County Salop, by his wife Maria, daughter of Andrew Guarsi, an Italian surgeon, who had settled in London, was born about 1575, probably at Coventry. He matriculated at Brasenose College, Oxford, 4th February 1591-92, and was admitted B.A. 6th February 1593-94. From the elder Marston's will (dated 24th October 1599) it may be gathered that, after adopting the profession of the law, he abandoned it against his father's wish. He married (but the date of his marriage cannot be fixed) Mary, daughter of Rev. William Wilkes, chaplain to James I. and rector of St Martin's, County Wilts. Ben Jonson wittily observed to Drummond of Hawthornden that 'Marston wrote his father-in-law's preachings, and his father-in-law his comedies,' contrasting the asperity of Marston's comedies with the blandness of the chaplain's sermons. With the exception of *The Insatiate Countess* (which is of doubtful authorship), all Marston's plays were published between 1602 and 1607. He gave up play-writing about 1607, but the date at which he entered the church has not been ascertained. In 1616 he was presented to the living of Christ Church, Hampshire, which he resigned in 1631. He died 25th June 1634 in Aldermanbury parish, London, and was buried beside his father in the Temple Church, 'under the stone which hath written on it *Oblivioni Sacrum*.' His widow was buried by his side, 4th July 1657.

Marston's first work was *The Metamorphosis of Pygmalion's Image: and Certain Satires* (1598). Another series of satires, *The Scourge of Villany*, appeared later in the same year, a second edition (with an additional tenth satire) following in 1599. *Pygmalion*, a somewhat licentious poem, may have owed its inspiration to Shakespeare's *Venus and Adonis*. Marston pretends that it was written with the object of bringing discredit on amatory poetry; but the apology cannot be accepted. Archbishop Whitgift condemned it to the flames with other works of a similar tendency. The satires, which were published under the *nom de plume* of 'William Kinsayder,' are uncouth and obscure. There was a feud between Marston and the satirist Joseph Hall (the future bishop of Norwich), and many hard knocks were dealt on either side. A

Cambridge man, one 'W. J.', intervened with his *Whipping of the Satire*, in which he handled Marston roughly; and he was answered, not very effectively, by one of Marston's friends in the anonymous *Whipper of the Satire*. The controversy raged hotly and excited lively interest, but the allusions in these various satirical pieces are not very intelligible to-day.

In September 1599 Henslow records in his *Diary* that he advanced forty shillings to 'Mr Maxtone, the new poete (Mr Mastone),' in part payment for an unnamed play. This 'new poete' was Marston; but there is no other mention of him in the *Diary*. Two gloomy and ill-constructed tragedies, *Antonio and Mellida* and *Antonio's Revenge*, were entered in the Stationers' Register, 24th October 1601, and were published in the following year. They contain passages of striking power, and a deal of intolerable fustian. In 1604 was published *The Malcontent*, a second edition, augmented by Webster, appearing in the same year. It is more skilfully constructed than the two parts of *Antonio and Mellida*. Marston's command of bold and vivid imagery is effectively displayed in the description of the hermit's cell, iv. 2. He dedicated *The Malcontent* in very cordial terms to Ben Jonson, and in 1605 prefixed some complimentary verses to *Sejanus*. There seem to have been many quarrels and reconciliations between Jonson and Marston. Jonson told Drummond that 'he had many quarrels with Marston, beat him and took his pistol from him, wrote his *Poetaster* on him; the beginning of them were that Marston represented him on the stage in his youth given to venery.' The original quarrel began in or about 1598.

The Dutch Courtesan (1605) is full of life and spirit, the character of the vengeful courtesan Franceschina being drawn with masterly ability. *Eastward Ho* (1605), from which Hogarth is said to have taken the plan of his prints 'The Industrious and Idle Prentices,' was written in conjunction with Chapman and Jonson. It is far more genial than any comedy which Marston wrote single-handed. Some satirical reflections on the Scots were introduced, for which offence the authors were committed to prison at the instance of Sir James Murray, and the report went that their ears were to be cut and their noses slit. *Parasitaster, or the Fawn* (1606), in spite of occasional tediousness, is an attractive comedy; but the tragedy of *Sophonisba* (1606) appeals us with its horrors, the description of the witch Erichtho and her cave being gruesome to the last degree. *What You Will*, published in 1607, but probably written some years earlier, has many flings at Ben Jonson. *The Insatiate Countess* was published in 1613 with Marston's name on the title-page, but in a copy (belonging to the Duke of Devonshire) of the 1631 edition the author's name is given as William Barksteed, a poet of some ability and an actor. The rich and graceful poetry scattered through *The Insatiate Countess* is unlike anything that we find in Marston's undoubted works. Probably Marston left the play unfinished when he entered the church, and Barksteed took it in hand. An indifferent anonymous comedy, *Jack Drum's Entertainment*, written about 1600, may be safely assigned to Marston from internal evidence; and he appears to have had some share in another poor play, *Histrionastice*. In 1633 William Sheares, the publisher, issued 1 vol. sm. 8vo, *The Works of Mr John Marston*, comprising the two parts of *Antonio and Mellida*, *Sophonisba*, *What You Will*, *The Fawn*, and *The Dutch Courtesan*. Marston's works were edited by the late Mr Halliwell-Phillips (then Mr Halliwell) in 1856, 3 vols., and by the present writer in 1887, 3 vols.

Marston Moor, in the West Riding of Yorkshire, 7 miles W. of York, the scene of a great parliamentary victory, 2d July 1644. The royalist army, about 22,000 strong, was led by Prince Rupert; the parliamentary troops numbered 15,000 foot and 9000 horse, consisting of a Scotch army under the Earl of Leven, a Yorkshire army under Fairfax, and one from the eastern counties under the Earl of Manchester, with Cromwell and Crawford. The battle began about seven o'clock in the evening. On the king's left flank the horse under Goring scattered the forces of Fairfax; on his right the troopers of the fiery Rupert were broken for the first time by Cromwell's 'Ironsides.' Hastily recalling his men from the chase, Cromwell saved the day by supporting Manchester and the Scotch infantry against the king's foot under Newcastle, and routing Goring's horse flushed with their victory. Before nightfall the success was complete, and the king's army fled in utter rout to York, leaving 4000 men dead on the field; among them all Newcastle's 'Whitecoats.' This victory gave the whole north to the Parliament, and first brought into prominence Cromwell's military genius. See S. R. Gardiner's *History of the Civil War* (1886), and Edward Lamplough's *Yorkshire Battles* (1891).

Marsupials, lit. 'pouched animals' (*Marsupialia*, *Didelphia*, or *Metatheria*), a sub-class of mammals, the members of which, with the exception of the American opossums, are now restricted to the Australian and Austro-Malayan regions. They are in many ways simpler than the higher mammals, notably in the structure of the brain and in the absence of a close connection between the unborn young and the womb of the mother. The young are born very helpless, after a short gestation, and are usually stowed away in an external pouch or *marsupium*, where they are fed from the enclosed teats. From the wide occurrence of fragmentary marsupial remains in Triassic and Jurassic strata both in the Old and the New World, it seems that the pouch-bearers have been once widely distributed. Before the stronger mammals which rose up after them they have, however, succumbed, except in the case of the above-mentioned refugees in neo-tropical forests, and those saved by the insulation of the Australasian regions before any higher mammals gained a foothold. In the retreat thus afforded the marsupials have developed along numerous lines, as it were prophesying the carnivores, insectivores, rodents, and herbivores among the placental mammalia. Thus, apart from the carnivorous and insectivorous American opossums (*Didelphyidae*), of which one is strictly North American and the rest neo-tropical, there are five Australasian families: the *Dasyuridae* or 'native cats,' carnivorous and insectivorous marsupials as large as wolves and as small as mice, of which very pronounced types are the Tasmanian 'tiger' (*Thylacinus*) and the native ant-eater (*Myrmecobius*); the rodent-like *Peramelidae* or bandicoots; the herbivorous kangaroos and kangaroo-rats (*Macropodidae*); the very varied family of arboreal Phalangiers (*Phalangistidae*), including the flying opossums (*Petaurista*, &c.), the native sloth or koala, the honey-sucking *Tarsipes*, and other curious forms; and finally the *Phascologyidae* or wombats, rodent-like root-eating forms about the size of badgers.

See MAMMALS; also the well-known works of Owen, Huxley, and others on Vertebrates; the relevant parts of Cassell's and the *Standard Natural History*; Chisholm's trans. of Vogt and Specht's *Mammals* (1887); Waterhouse, *Natural History of Mammalia*, i. (1846); and Gould's *Mammals of Australia* (3 vols. 1845-63).

Marsyas, a Phrygian satyr, who, having found a flute that played of itself, which Athena had thrown away, was rash enough to challenge Apollo

to a musical contest, subject to the condition that the victor should do what he liked to the vanquished. Apollo played upon the cithara, Marsyas upon the flute, and the Muses decided in favour of the god, who punished his rival's temerity by binding him to a tree and flaying him alive. From his blood sprang the river Marsyas; his statue stood in many ancient cities, a monument of the folly of presumption.

Martaban, a town in Burma, on the right bank of the Salween, opposite to Maulmain (Moulmein). It is reputed to have been built in 576 by the first king of Pegu, and was down to the end of the first quarter of the 14th century the capital of the kingdom. It was taken by the king of Siam two centuries and a half later, and has been twice captured by the British, in 1824 and in 1852. Pop. 1781. The Bay of Martaban receives the rivers Irawadi and Salween.

Martel, CHARLES. See CHARLES MARTEL.

Martello Towers are round towers for coast defence, about 40 feet high, built most solidly, and situated on the beach. They were so called because at Mortella Point in Corsica a small round tower stood admirably an immense cannonade from an English fleet under Lord Hood in 1794. They were mostly erected at the end of the 18th century as a defence against French invasion, and are now regarded as obsolete.

Marten (*Mustela*), a genus of digitigrade carnivorous quadrupeds of the family *Mustelidae*, differing from weasels in having an additional false molar on each side above and below, a small tubercle on the inner side of the lower carnivorous cheek-teeth, and the tongue not rough—characters which are regarded as indicating a somewhat less extreme carnivorous propensity. The body is elongated and supple, as in weasels, the legs short, and the toes separate, with sharp long claws; the palms and soles are generally, but not always, furry. The ears are larger than in weasels, and the tail is bushy. The martens exhibit great agility and gracefulness in their movements, and are very expert in climbing trees, among which they generally live. There are nine or ten species in this genus, which are distributed over Europe, Asia,

The Pine Marten (*Mustela martes*).

Malaya, and North America. The American 'Pekan' (*M. pennanti*) is the largest species, measuring as much as 46 inches from the snout to the tip of the tail. The most valuable species of marten is the European Sable (*M. zibellina*). Two species of marten, closely resembling one another, occur in Great Britain—the Common or Beech Marten (*M. foina*) and the Pine Marten (*M. martes*). They are often hunted with foxhounds; for this and other reasons they are getting much less plentiful, though still to be frequently met with in certain localities.

Martensen, HANS LASSEN, metropolitan bishop of Denmark and her most prominent theologian in the 19th century, was born at Flensborg on 19th August 1808, and studied at the university of Copenhagen. After shaking off the influence of Grundtvigianism, by which he was dominated in his student days, he stepped into the chair of Philosophy at Copenhagen, and in 1845 added to these duties those of court preacher. In 1840 he published a valuable monograph on *Meister Eckhart*, the German mystic, and nine years later laid the foundation of a European fame by a masterly work, from the conservative Lutheran standpoint, on *Christian Dogmatics* (Eng. trans. 1866). This gained him in 1854 the primacy of Denmark, and this again was the cause of a powerful satirical attack upon him by Kierkegaard, which started a controversy in which Martensen suffered severely. His great intellectual energy, however, and the force of his character soon enabled him to recover from the blow, so that, after the publication of another great work, in 3 vols., on *Christian Ethics* (1871-78; Eng. trans. 1881-82), his influence in the country was more dominant than ever. With a mind wonderfully acute and powerful, he was deficient in intellectual sympathy. Nevertheless he stood for many years a bulwark of defence to conservative theology. He died on 3d February 1884. See his *Autobiography*, in Danish (1883), *London Quarterly* (1883), and *Brit. and Foreign Evang. Review*, vol. xxxv.

Martha's Vineyard, an island on the south coast of Massachusetts, 21 miles long, 6 miles in average width. It is noted as a summer health-resort.

Martial. Marcus Valerius Martialis, one of the finest among the few original Latin poets, and still the first of epigrammatists in verse, was born 1st March 38 or 41 A.D., in Celtiberian Spain, at Bilbilis, famed as a steel factory, for which its iron-mines and ice-cold Salo torrent specially fitted it—a centre, too, of Roman culture, which afforded him the good education he got under the eye of his parents, Fronto and Flaccilla. Like other gifted young provincials, he repaired to Rome, where (64 A.D.) he became a client of the influential Spanish house of the Senecas, through which he found other patrons, among them L. Calpurnius Piso, the leading man of his day. The tragic failure of the Pisonian plot lost Martial his warmest friends—Lucan, and still more Seneca, from whose heirs, however, he doubtless derived the small wine-growing estate at Nomentum. Of his life till Domitian became emperor we know little, except that he never maintained himself by the steady professional work to which his compatriot Quintilian seems to have exhorted him, but rather courted imperial and senatorial patronage by his rare social gifts and his genius for *vers de circonstance*. When (80 A.D.) Titus, by a series of gladiatorial spectacles, dedicated the Colosseum to the amusement of Rome, Martial signalled the occasion by epigrams which brought him the *jus trium liberorum* and the equestrian rank—probably proposed by Titus, and afterwards confirmed by Domitian. Substantial independence, however, he did not obtain from either emperor, though his venal flattery of Domitian and of that despot's corrupt retinue was gross enough to leave a stain on his memory. In request as a diner-out, he divided his day between the baths, the theatres, the recitation-halls, and the composition of epigrams, and so far saw his ambition gratified as to count the most distinguished senators of the time among his friends, and all the *literati* in city or province among his readers. Of envy and detraction he had, of course, his share; but what he

most complained of was not, for instance, the jealousy of Statius, his young Neapolitan competitor for imperial favour, but the use of his name by malignant poetasters, who fathered on him their own libels on the leaders, including the ladies, of society. His life, indeed, was not a happy one—continually shadowed by that 'ignoble melancholy which arises from pecuniary embarrassment,' so that we find him importuning a patron even for a toga or a mantle. From 86 to 90 he had a lodging, three stories high, at the sign of the 'Pear' on the Quirinal, and in 94 a house of his own in the same quarter; while his Nomentan *pied-à-terre*, which, under better husbandry, might have yielded a living, was prized by him mainly as a retreat from the bores (or duns) of the city. During his thirty-four years of Roman life he seems to have made an excursion from it only once (in 87)—to Forum Corneli and other resorts in the *Æmilia*. But, by degrees, the capital, its cares and its pleasures, became irksome to him; advancing years bereft him of Domitian and his friends of the palace; and the austere Nerva and Trajan had to be conciliated by other and less congenial arts than the adulatory epigram. In a fit of nostalgia he borrowed from his admirer, the younger Pliny, the means of revisiting those haunts of childhood he had never forgotten—Bilbilis on the mountain-side overhanging the headlong Salo, the snowy peaks of the Sierras, the golden Tagus, the rich orchards, the awe-inspiring oak-forests—his home, with its frugal meals and simple joys. Here again his good genius found him patrons—among them the highly-cultured Marcella, who presented him with an estate, on which, with its grove, its fountain, its vineyard and rosary, its kitchen-garden, its fish-pond and dovecot, he led an idyllic life. But the *vita municipalis* palled on him once more, and even in such surroundings we find him fretting for the *vita urbana* and angling for patrons in that distant world of theatres and libraries, cultured connoisseurs, and social dissipation he was never again to see. Baulked of his wish to attain his seventy-fifth year, he died, at latest, in 104, aged sixty-three or sixty-six.

Martial possessed, for good and evil, the artistic temperament, its lack of steady purpose, its love of hand-to-mouth independence. This latter he enjoyed by humouring the contemporary vices he could not reform, though, conscience-stricken, he excuses himself on the ground that if his 'page were wanton, his life was honest.' Much of his best work, unfortunately, is his least pure, and this has produced an exaggerated impression of his moral turpitude. If, however, we excise 150 epigrams from the 1172 of the first twelve books, his collective writings (including his early 'spectacular' epigrams and his *Xenia* and *Apophoreta*) are free from licentiousness. On the other hand, his genius and skill in verse it were hard to over-estimate. An *improvisatore* in readiness, he could attain to the most fastidious finish; with his love of antithetic shocks and electric surprises, he had the true poet's eye for nature; he could alternate the organ-note of a masterful eloquence with minor tones of the most tremulous pathos—witness his epigrams on 'Arria and Pætus,' on 'Pompeii,' on his little slave-girl 'Erotion,' and on 'Fornix' with its lovely seaboard. But it is as an epigrammatist, even in its modern and restricted sense, that he remains without a peer, wielding a weapon peculiarly his own, bright and pointed as a rapier from the anvils of his native Bilbilis, chastened in the rushing Salo. Unequal, of course, he often is, but never vulgar—rarely (it has been well observed) with all his sense of the ridiculous degenerating into caricature. He lifts the veil from the Rome of Domitian and exposes it mainly on its seamy

side, with a Hogarthian vividness not outdone by Juvenal himself.

Martial has had to wait long for an adequate commentator, and has found him in the author of the *Stittengeschichte Roms*, Ludwig Friedländer, who alone combined the critical power and the archaeological knowledge necessary for the task. The same writer's *M. Valerii Martialis Epigrammaton Libri mit erklärenden Anmerkungen* (2 vols. Leip. 1886) furnishes the student of Martial with every help available—the editor's own work reinforced by that of the best of his predecessors and contemporaries, including the illustrious Cambridge scholar, Munro, to whom the edition appropriately is dedicated.

Martial Law is the exercise of arbitrary power by the supreme authority in a district or country where the ordinary administration has ceased to be operative, either on account of civil disturbance or because of the presence therein of a hostile force, though, in the latter case, the country would be more correctly described as being governed by the 'Laws of War.' Martial law was formerly synonymous with military law, and is often still confounded with it, perhaps because in the above-mentioned circumstances the supreme authority often avails himself of courts-martial and of the troops under his command to maintain order. Military Law (q.v.) is the law contained in the Army Act of 1881, which governs the soldier at all times, but affects civilians only when accompanying a force on active service; while martial law has been defined as 'no law,' but simply the will of the supreme authority. It is not recognised by British jurisprudence, and no rules are laid down for its application. It is assumed that, when the ordinary civil tribunals fail, the supreme authority will do his best to maintain order. He may therefore, if he thinks right, announce his intention of treating the civil population as though under military law, or in any other way that commends itself to him; but if they are British subjects he will have afterwards to justify his action by showing that it was absolutely necessary, and so obtain an indemnity from parliament for conduct which is in itself illegal. Military tribunals have several times been given power by Act of Parliament to try offenders against the public peace in Ireland, as in 1798, but the proclamations on these occasions merely justified the use of arms against rebellious subjects, not against peaceable citizens. They were announcements of the existence of a state of things in which force would be used against wrong-doers for the protection of the public peace, and were always followed by Acts of Indemnity.

On the Continent the practice is different, and when necessary a 'state of siege' is proclaimed in the disturbed district or occupied territory, and the inhabitants are thereby brought to a certain extent under military law.

Martigny, or MARTINACH (the *Octodurus* of the Romans), three united hamlets in the Swiss canton of Valais, is situated on the Simplon railway, 24 miles SE. of the Lake of Geneva. Two noted routes, one to the vale of Chamouni by the Tête Noire or the Col de Balme, the other over the Great St Bernard to Aosta, branch off here. Pop. 4417.

Martigues, a town in the French department of Bouches-du-Rhône, is situated on several islands, united by bridges, at the entrance to the Étang de Berre, 20 miles NW. of Marseilles. From its position, it has been called the Provençal Venice. Pop. 4783, chiefly engaged in catching and curing fish and in shipbuilding.

Martin. See SWALLOW.

Martin, the name of five popes, of whom the fourth and fifth deserve a brief notice.—MARTIN IV., a native of Brie in Touraine, was born about

1210, made cardinal in 1261, and elected pope in 1281. He was a mere tool of Charles of Anjou, and degraded himself even by employing the weapons of spiritual censure in his behalf. But all his efforts to buttress the French power in Sicily proved futile, and three years after the atrocity of the Sicilian Vespers he died, 1285.—MARTIN V. must be noticed as the pontiff in whose election was finally extinguished the great Western Schism (see ANTIPOPE, CHURCH HISTORY). He was originally named Otto di Colonna, of the great Roman family of that name. On the deposition of John XXIII., and the two rival popes Gregory XII. and Benedict XIII., in the Council of Constance, Cardinal Colonna was elected (1417). He presided in all the subsequent sessions of the council, and the fathers having separated without discussing the questions of reform, at that period earnestly called for in the church, Martin undertook to call a new council for the purpose. It was summoned to meet at Siena, and ultimately assembled at Basel in 1431, but the pope died suddenly just after its opening.

Martin, ST, Bishop of Tours, was born at Sabaria in Pannonia about the year 316. He was educated at Pavia, and at the desire of his father, who was a military tribune, entered the army, first under Constantine, and afterwards under Julian the Apostate. The virtues of his life as a soldier are the theme of more than one interesting legend. On obtaining his discharge from military service, Martin became a disciple of Hilary of Poitiers. He returned to his native Pannonia, and converted his mother to Christianity, but he himself endured much persecution from the Arian party, who were at that time dominant; and in consequence of the firmness of his orthodoxy, he is the first confessor, rather than martyr, honoured in the Latin Church with an office and a feast. On his return to Gaul about 360 he founded a convent of monks near Poitiers, where he himself led a life of great austerity and seclusion; but in 371 he was drawn by force from his retreat, and made Bishop of Tours. The fame of his sanctity, and his reputation as a worker of miracles, attracted crowds of visitants from all parts of Gaul; and in order to avoid the distraction of their importunity, he established the monastery of Marmoutier near Tours, in which he himself resided. He died between 397 and 401, and St Ninian, who had visited him at Tours and ever preserved the greatest veneration for him, dedicated to his memory the church he was then building at Whithorn in Galloway. His life by his contemporary, Sulpicius Severus, is a very curious specimen of the Christian literature of the age, and in the profusion of miraculous legends with which it abounds might take its place among the lives of the medieval or modern Roman Church. The only extant literary relic of Martin is a short *Confession of Faith on the Holy Trinity*, which is published by Galland, vol. vii. 559. In the Roman Catholic Church the festival of his birth is celebrated on the 11th November. In Scotland this day still marks the winter-term, which is called *Martinmas*. Formerly people used to begin St Martin's Day with feasting and drinking; hence the French expressions *martiner* and *faire la St Martin*, 'to feast,' and the fact that St Martin is the patron of drinking and of reformed drunkards. See the books by Reinkens (Gera, 3d ed. 1876), Chamard (Poitiers, 1873), and Cazenove's *St Hilary and St Martin in 'Fathers for English Readers'* (1883).

Martin, BON LOUIS HENRI, a great French historian, was born at St-Quentin, 20th February 1810, and educated for a notary, but already at twenty had determined for a literary career. His first book was an historical romance, *Wolfthurm*

(1830), followed by three others treating of the period of the Fronde. He next joined Paul Lacroix, the 'Bibliophile Jacob,' in his vast project for a history of France in 48 volumes, consisting of extracts from histories and chronicles from the earliest period to 1830. He published the first volume in 1833, and henceforward toiled alone at the vast undertaking, which was completed on a smaller scale in 1836. He now set himself to a still more gigantic task, his great *Histoire de France* (15 vols. 1833-38). A third and much improved edition (19 vols. 1837-54) earned the Gobert prize; the fourth edition (17 vols. 1855-60) was awarded by the Institute in 1869 the great prize of 20,000 francs. This magnificent work comes down only to 1789; its continuation to the author's own time formed the less admirable *Histoire de France Moderne* (2d ed. 5 vols. 1878-85). Martin acted for a time as maire of one of the arrondissements of Paris; and was chosen deputy for Aisne in 1871, senator in 1876. He was elected a member of the French Academy in 1878. He wrote several minor histories, such as the *Histoire de Soissons* (1837), *Daniel Manin* (1859), *Jeanne d'Arc* (1872); and died at Paris, 14th December 1883. Martin was the last of the giants of French history influenced by Augustin Thierry, who aimed at comprehending the whole field within their range of study. As sensitive to the romantic as Michelet, he kept his imagination in check by the weight of his learning, the solidity of his sense, and by due respect to documents. Only in his treatment of the earlier period did he give free play to his fancy in his reconstruction of a history of Gaul, in which Druidism was discovered to be a sublime religion, with Merlin as its prophet, and medieval chivalry but its legitimate outcome. Yet his study of Celtic antiquities contains much that will remain of the highest value. The whole work reveals impartiality and insight, is excellently arranged, and admirably written—the work of a true patriot, and if a Chauvinist, a Chauvinist of genius. It is beyond doubt the best work dealing in detail with the history of France as a whole.

See the Life by Hanotaux (1885), Mulot's *Souvenirs Intimes* (1885), and Jules Simon's *Mignet, Michelet, Henri Martin* (1889).

Martin, JOHN, painter, was born at Haydon Bridge, near Hexham, Northumberland, 19th July 1789. In 1806 he went up to London, in 1808 married, and, after a struggling youth as an heraldic and enamel painter, in 1812 exhibited 'Sadak in search of the Waters of Oblivion' at the Royal Academy, with which body he soon afterwards quarrelled. It was the first of his sixteen 'sublime' works, whose 'immeasurable spaces, innumerable multitudes, and gorgeous prodigies of architecture and landscape,' divided the suffrage of the many between Martin and Turner; Bulwer-Lytton indeed pronounced him 'more original, more self-dependent' than Raphael and Michael Angelo! Even yet their memory is kept lurid by the coloured engravings of the 'Fall of Babylon' (1819), 'Belshazzar's Feast' (1821), 'The Deluge' (1826), &c. For twenty-seven years Martin had also been busied with projects for the improvement of London, and for four had been working on four pictures illustrative of the 'Last Judgment,' when he died at Douglas, in the Isle of Man, 17th February 1854.

Martin, SIR THEODORE, born in Edinburgh in 1816, was educated there at the High School and university, and in 1846 settling in London, became a prosperous parliamentary solicitor. Among his earliest writings were the well-known 'Bon Gaultier' ballads, written in conjunction with Professor Aytoun. This was followed by

translations of Goethe's *Poems and Ballads*, Henrik Hertz's *King René's Daughter*, and Oehlenschläger's *Corregio and Aladdin or the Wonderful Lamp*. Further metrical translations were of Horace's *Odes* (1860), of his whole works (1882), Catullus (1861), the *Vita Nuova* of Dante (1862), *Faust*, part i. and ii. (1865-86), and Heine's *Poems and Ballads* (1878). In 1863 he issued a volume of original and translated poems, and in 1870 an admirable little book on Horace in the 'Ancient Classics for English Readers.' In 1875 he was made C.B., in 1880 K.C.B., and in November of that year was elected Lord Rector of St Andrews University. He has written a series of biographies of Aytoun (1867), the Prince Consort (5 vols. 1874-80), Lord Lyndhurst (1883), and the Princess Alice (1885).

LADY MARTIN, well known as an actress by her maiden name, Helen Faucit, was born 11th October 1820, and made her professional début as Julia in the *Hunchback* at Covent Garden in January 1836. She was at once successful, took a leading part in Macready's Shakespearian revivals, in the first representation of Lytton's plays, and in Browning's *Blot in the Scutcheon* and *Stratford*. As an interpreter of Shakespeare's heroines, Juliet, Rosalind, Portia, Beatrice, Imogen, Cordelia, and Lady Macbeth, she stood first among the actresses of her time. After her marriage to Theodore Martin in 1851 she left the stage, appearing only at rare intervals for public or charitable purposes, as in Beatrice at the opening of the Shakespeare Memorial Theatre at Stratford. In 1885 she published a volume of delightful studies entitled, *On Some of Shakespeare's Female Characters* (Ophelia, Portia, Desdemona, Juliet, Imogen, Rosalind, and Beatrice).

Martina, a town of Southern Italy, half-way between Taranto and Monopoli. Pop. 14,454.

Martineau, HARRIET, born at Norwich, 12th June 1802, was the daughter of Thomas Martineau, a Norwich manufacturer. She received a good classical education, and worked diligently and conscientiously, but did not in her school-days show promise of anything remarkable. Increasing deafness and constant ill-health made her often anxious and unhappy as a girl, uncertain in temper, and silent in habit. Her first appearance in print was in 1821, when she wrote an article for the *Monthly Repository*, a religious periodical. In the next few years she wrote *Devotional Exercises*, articles for the *Monthly Repository*, and short stories about machinery and wages. In 1829 the failure of the house in which she, and her mother and sisters, had placed their money obliged her to earn her living. In 1830 she wrote *Traditions of Palestine*, and gained three prizes for three *Theological Essays* for the Unitarian Association. In 1831 she resolved to bring out a series of stories as *Illustrations of Political Economy*, knowing that the work was wanted. Notwithstanding repeated refusals and discouragements from publishers, she persevered in her plan, and in 1832 the first number appeared. A fortnight after publication the demand for this number reached five thousand, and from that day the way was open to her for life, and she never had any other anxiety about employment than what to choose, nor any real care about money. Her popularity was extraordinary during the appearance of *Illustrations of Political Economy*. She removed to London in 1832, the better to carry on her work. In 1834 she went to America for two years, and soon after her return published *Society in America* and a novel, *Deerbrook*, in 1839. She went abroad the same year, returned ill, and settled at Tynemouth, where she remained, a complete invalid, till 1844. During her illness she wrote *The Hour and the*

Man, four volumes of children's tales, and *Life in the Sick-room*. She recovered through mesmerism, left Tynemouth, and fixed her abode in the Lake Country, where in 1845 she built herself a house in Ambleside. The same year she published *Forest and Game-law Tales*. In 1846 she visited Egypt and Palestine, and on her return issued *Eastern Life*. In 1849 she completed Knight's *History of the Thirty Years' Peace*; in 1851, in conjunction with Mr H. G. Atkinson, she published a series of *Letters on the Laws of Man's Social Nature and Development*; and in 1853 she translated and condensed Comte's *Philosophie Positive*. She also wrote *Household Education, Biographical Sketches*, and contributed largely to the daily and weekly press and the larger reviews. She died 27th June 1876, and was buried at Birmingham. Her *Autobiography*, written and printed many years before, was published with an editorial volume in 1877.

Harriet Martineau was brought up as a Unitarian, and describes herself when a girl as 'sincerely and heartily religious.' Her views gradually changed, and she became an Agnostic. She was a vigorous thinker, seeing clearly and saying clearly what she had to say. Her sympathy, kindness of heart, integrity of mind, and impartiality of judgment won esteem and affection for her, even from those who did not share her opinions, and few literary women have in their time enjoyed more fame than she did.

Martineau, JAMES, theologian, brother of the preceding, was born at Norwich, 21st April 1805. He was educated at the grammar-school of his native city, and under Dr Lant Carpenter at Bristol, and had already been a Unitarian minister at Dublin and Liverpool, when in 1841 he was appointed professor of Mental and Moral Philosophy at Manchester New College. He removed to London when that institution was transferred thither in 1857, becoming also one of the pastors in Little Portland Street Chapel. He became principal of the college in 1868, and held the office till his retirement in 1885. Martineau was recognised for fifty years as one of the profoundest thinkers and most effective writers of his day. Earnest and lofty in his aims, and catholic in his sympathies, he unites strong grasp of thought and power of subtle analysis to a rare mastery of English style. Indeed in the power of elucidating the most abstract thought he has seldom been surpassed, and he is no less learned than original. Martineau received the degree of LL.D. from Harvard in 1872, Doctor in Theology from Leyden in 1875, and D.D. from Edinburgh in 1884. He was one of the founders of the *National Review* (1855-64), and was a frequent contributor to its pages.

His principal works are *The Rationale of Religious Inquiry* (1836); *Hymns for the Christian Church and Home* (1840); *Endeavours after the Christian Life* (2 vols. 1843-47); *Miscellanies* (1862); *Studies of Christianity* (1858); *Essays, Philosophical and Theological* (2 vols. 1868); *Hymns of Praise and Prayer* (1874); *Hours of Thought on Sacred Things* (2 vols. 1876-80); *A Study of Spinoza* (1882); *Types of Ethical Theory* (2 vols. 1886); *A Study of Religion: its Sources and Contents* (2 vols. 1888); *The Seat of Authority in Religion* (1890); and *Studies, Reviews, and Addresses* (1891).

Martinet, a French general of the time of Louvois (q.v.).

Martinique, called by the natives Madiana, is one of the Lesser Antilles, in the West India Islands. It is 43 miles long by 12 to 20 broad, and has an area of 380 sq. m., and (1888) 175,391 inhabitants, of whom only 10,000 are whites. The island was discovered by the Spaniards in 1493, colonised by the French in 1635, and except for three short intervals (1761-63, 1794-1802, 1809-14), when it was held by the British, it has been a French

colony ever since. A mountain-knot in the north (4430 feet) and another in the south are connected by a low ridge, all being densely covered with trees. There are numerous short streams. The coasts are irregular and high, except on the west, where stand St Pierre (pop. 20,000), the principal commercial place, and Fort de France (15,000), the capital, which was nearly destroyed by fire in 1890. The climate is moist and hot (annual mean 79° F.), and yellow fever is a not unfrequent visitor. The soil is very productive. About one-half of the land in cultivation is occupied with sugar-cane the staple crop. Of the other half about 75 per cent. is planted with manioc, sweet potatoes, bananas, and other food plants, whilst coffee, cocoa, and tobacco are each cultivated to a small extent. There is also considerable grazing of cattle, sheep, and goats. The exports (sugar, molasses, and rum mostly) average nearly £850,000 annually; the imports (textiles, flour, fish, rice, and cotton, &c.) about £955,000. Slavery was abolished in 1848; labour is largely performed by coolies (27,000). Railways connect the principal towns. See works in French by Pardon (1877), Huc (1877), Rey (1881), Aube (1882), and Basset (1886).

Martinmas, in Scotland, is one of the four term-days for paying rent—viz. 11th November.

Martinsburg, capital of Berkeley county, West Virginia, in the Shenandoah Valley, 114 miles by rail W. of Baltimore, contains a large distillery, several mills and factories, and extensive railway-shops. Pop. (1880) 6335; (1890) 7207.

Martin's Ferry, a town of Ohio, on the Ohio River, 89 miles by rail SW. of Pittsburg, contains iron-works, &c., and very large glass-works. Pop. (1890) 6247.

Martius, CARL FRIEDRICH PHILIPP VON, traveller and naturalist, was born on 17th April 1794, at Erlangen, and studied medicine there. In 1817-20 he went to Brazil as member of a scientific expedition sent out by the Austrian and Bavarian governments, and by his researches in that country acquired a reputation which ranked but little inferior to that of Humboldt. This reputation was chiefly established by the books he published after his return—one on the journey (3 vols. 1824-31), several on the cryptogams, palms, and other plants of Brazil, on the medicine of the Indians, and on the ethnology and languages of that region, besides other botanical works. He was professor of Botany (1828-64) and Director of the Botanic Garden (1832-64) at Munich, and died in that city on 13th December 1868.

Martius' Yellow. See DYEING.

Martos, a town of Andalusia, Spain, 16 miles SW. of Jaen, on a steep hill crowned by an old castle. Pop. 14,654.

Martyn, HENRY, a missionary-martyr, was born at Truro, February 18, 1781, and educated at Truro grammar-school and St John's College, Cambridge. He was senior wrangler and first Smith's prizeman in 1801, and next year became Fellow of his college. At first he meant to study law, but the influence of Charles Simeon, acting on his own enthusiastic temperament, determined him for a missionary. After taking orders he served some time as Simeon's curate, but in 1805 sailed for India as a chaplain under the Company. He was stationed successively near Serampore, at Dinapore, and at Cawnpore, and from the beginning gave himself to the study of the native languages with an eager zeal that surmounted even his greatest difficulty—broken health. He translated the whole New Testament into Hindustani, Hindi, and Persian, as well as the Prayer-book into Hindustani and

the Psalms into Persian; and next, his ardour rising as the sands of his time ran swiftly out, sailed to Bushire, travelled thence to Shiraz, Tabriz, Erivan, Kars, Erzeroum, and Tokat, where he sank exhausted by fever, 6th October 1812. His *Life* was written by Sargent (1819; new ed. 1885), and by Wilberforce (1837).

Martyr (Gr. *martus*, *martur*, 'a witness'), the name given in ecclesiastical history to those who, by their fearless profession of Christian truth, and especially by their fortitude in submitting to death itself rather than abandon their faith, bore the 'witness' of their blood to its superhuman origin. Of the same use of the word there are some examples also in the New Testament, as in Acts, xxii. 20; Rev. ii. 13; xvii. 6. But this meaning, as its technical and established signification, is derived mainly from ecclesiastical writers. During the persecutions of the Christians in the first three centuries (see CHURCH HISTORY), contemporary writers, as well pagan as Christian, record that many Christians, preferring death to apostasy, became martyrs or witnesses in blood to the faith, often in circumstances of the utmost heroism. The courage and constancy of the sufferers won the highest admiration from the brethren. It was held a special privilege to receive the martyr's benediction, to kiss his chains, to visit him in prison, or to converse with him; and a practice arose by which the martyrs gave to sinners who were undergoing a course of public penance letters of commendation to their bishop (see INDULGENCE). The day of martyrdom, moreover, as being held to be the day of the martyr's entering into eternal life, was called the *natal* or *birth* day, and as such was celebrated with peculiar honour, and with special religious services. Their bodies, clothes, books, and the other objects which they had possessed were honoured as Relics (q.v.), and their tombs were visited for the purpose of asking their intercession (see CANONISATION). Cyprian says of catechumens who died before baptism, that they had been baptised 'with the most glorious baptism of blood;' and the blood-baptism was held to remit sin and the temporal penalty of sin also. The number of martyrs who suffered death during the first ages of Christianity has been a subject of great controversy. The ecclesiastical writers, with the natural pride of partisanship, have, it can hardly be doubted, leaned to the side of exaggeration. Some of their statements are palpably excessive; and Gibbon, in his well-known 16th chapter, throws great doubt even on the most moderate of the computations of the church historians. But it is clearly though briefly shown by Guizot, in his notes on this celebrated chapter, that Gibbon's criticisms are founded on unfair and partial data, and that even the very authorities on which he relies demonstrate the fallaciousness of his conclusions. The first recorded martyr of Christianity, called the 'protomartyr,' was Stephen, whose death is recorded in Acts, vi. and vii. The protomartyr of Britain was Alban of Verulam, who suffered under Diocletian in 286 or 303.

MARTYROLOGY, a list of the commemoration days of Christian martyrs, generally with some account of their life and death, arranged in the order of months and days, and intended partly to be read in the public services of the church, partly for the guidance of the faithful in their devotions. The use of the martyrology is common to both the Latin and the Greek Church; in the latter it is called *menology*, or 'month-calendar.' Nearly all the later Western martyrologies are based upon one or other of three works, the Hieronymian, the Lesser Roman, and Bede's Martyrology. The first, which was stated to be compiled by St

Jerome from records of martyrdoms collected by Eusebius, is itself a compilation from numerous earlier calendars, and contains notices of many facts long subsequent to Jerome's time. A copy of the Lesser Roman Martyrology was discovered at Ravenna by Ado, Archbishop of Vienne, in 850, and seems to have been rather a private historical calendar than one intended for public use. The independent compilation by Bede has come down to us only in later editions, chiefly of the 9th century, as that of Florus of Lyons, Hrabanus Maurus, Ado of Vienne, and Usuard of Paris, as well as that of Notker of St Gall (912). The best-known *menology*, that compiled by order of the Emperor Basil, the Macedonian, in the 9th century, was edited in 1727 by Cardinal Urbini. In 1866 Professor W. Wright published a Syriac martyrology recently discovered by him, and written in or before 412. The official 'Roman Martyrology,' designed for the entire church, was published by authority of Gregory XIII., with a critical commentary, by Baronius in 1586; an enlarged edition of the same was issued by Rosweyd in 1613.

Martyr, PETER. See PETER.

Marut is, in Hindu Mythology, the god of wind. See INDIA, Vol. VI. p. 104.

Marvell, ANDREW, was born March 31, 1621, at Winestead, in the East Riding of Yorkshire, where his father, who three years later became master of the grammar-school and lecturer at Trinity Church in Hull, was rector of the parish. In his thirteenth year he went to Trinity College, Cambridge, with a Hull exhibition, and in 1639 graduated B.A. In January 1641 he lost his father, drowned in crossing the Humber, 'to the great grief of all good men,' says Fuller, and at the close of the same year his university career came to an end, through non-observance of his 'days and acts.' It was probably after coming of age in 1642 that he set out on his travels. It is said that he met Milton in Rome, and that 'they publicly argued against the superstitions of the Romish Church, even within the verge of the Vatican;' but unfortunately for the legend Milton came home nearly three years before Marvell set out. He was four years abroad, in Holland, France, Italy, and Spain, but there is no sign of his return until 1649, when his name appears to one of the 'Elegies on the Death of Lord Hastings,' and in the *Lucasta* of 'his noble friend Richard Lovelace,' the royalist. His sympathies were still more clearly shown next year in his fierce lines on May, the historian of the Long Parliament. In the summer of 1650 Lord Fairfax engaged Marvell, whose father he no doubt knew, as tutor to his young daughter Mary Fairfax, afterwards Duchess of Buckingham. By him, apparently, Marvell was introduced to Milton, who in February 1653 recommended him to Bradshaw as a good scholar and linguist, and well qualified to act as assistant Latin secretary. Though unsuccessful, the recommendation, it seems, brought him under Cromwell's notice, for in July he was appointed by him tutor to a Mr Dutton, called, unaccountably, Cromwell's nephew. In 1657 he was appointed Milton's assistant, and in January 1659 took his seat in Richard Cromwell's parliament as member for Hull, for which he was returned again in 1660, and again in 1661. In 1663-65 he accompanied Lord Carlisle as secretary to the embassy to Muscovy, Sweden, and Denmark, but the rest of his life was devoted to watching over the interests of his constituents in parliament, resisting the misapplication of the money voted for the defence of the nation, and doing battle, in the House and out of it, with the partisans of intolerance and arbitrary government. He died somewhat suddenly, August 18, 1678. The Popish

Plot panic had just set in, and, being a marked man, he was supposed to have been made away with by poison. His death, however, was really due to natural causes, an attack of tertian ague and 'the ignorance of an old conceited doctor' (Morton's *Pyratologia*, 1692: *Athenæum*, No. 2419). He was buried in St Giles's-in-the-Fields, 'under ye pewes in ye south side,' according to Aubrey.

Marvell's claims to remembrance are concisely summed up when he is described as 'poet, patriot, and friend of Milton,' but the second is the title by which he is best known. The refusal of a coarse bribe has sent him down to posterity as a prodigy of patriotic virtue, and the fact is as severe a satire on the corruption of his time as anything in his own writings. Attempts have been made to tone down popular admiration in his case, by suggestions, for example, of intemperate habits, founded on a casual remark of Aubrey's, though it is clear from the context that Aubrey meant nothing of the kind; and a stain on his character has been found in the groyness and virulence of the political satires that bear his name. But we should remember that, except in one or two cases, we have no right to assume that he was the author of these things. The *Advice to a Painter* is vouched for by Aubrey, but for the rest we have no better authority than the printer of *Poems on Affairs of State* (1689), a man with a muck-rake scraping together the scurrilities of the two past reigns; and, as he has put the name to two or three pieces Marvell did not write, he may have put it to more. But, even if Marvell did write them, we must recollect that it was a coarse age, and that to be effective he had to use its language and ideas. Because he served under Cromwell and was a friend of Milton, it is often assumed that he was a Roundhead and a republican, but his own words belie the assumption. The royalist fervour of his youth cooled, and he admired Cromwell because he put down anarchy with a strong hand, and 'made England great and his enemies tremble,' but he was no admirer of Cromwell's rule. He was a constitutionalist before all things. In his prose tracts and his letters to his constituents, he makes it clear that if Charles could have kept straight he would have had no sturdier supporter than Andrew Marvell, but even in his despair his attitude is expressed in his own noble line, 'Tis godlike good to save a falling king.' Marvell's works are divided by the Restoration into two very distinct groups. After 1660 his pen was given up to politics, except when his friendship for Milton drew from him the lines prefixed to the second edition of *Paradise Lost*. In 1672-73 he wrote the *Rehearsal Transposed* in answer to Parker, afterwards Bishop of Oxford, who had come forward as the advocate of religious intolerance; and in 1676 a similar work, *Mr Smirke, or the Divine in Mode*, in reply to Turner, Master of St John's, Cambridge, to which he added a *Historical Essay on General Councils*. In 1677 his most important tractate, the *Account of the Growth of Popery and Arbitrary Government*, was printed at Amsterdam, the title-page says; in 1678 his defence of the Nonconformist John Howe; and to complete the list his voluminous correspondence with his constituents should be added. His poetry was printed in folio in 1681 with a preface by his widow, which Cooke, the editor of a new edition in 1726, denounced as the work of an impostor, an aspersion disposed of by the letters of administration granted in 1679 to *Marice Marvell, relictæ*. As a poet Marvell belongs altogether to the pre-Restoration period. Most of his poems seem to have been written during his residence with Fairfax, and all, clearly, before he entered public life. 'A witty delicacy,' as Lamb

called it, and a certain classical turn of expression that betrays the scholar, give a peculiar character to his poetry, but unquestionably his distinguishing characteristic as a poet is his genuine, hearty enjoyment of nature, of which, perhaps, no English poet between Chancer and Wordsworth had so large a share.

The only complete and accurate edition of Marvell's works is that of Dr Grosart, in 4 vols. 1872-74. The edition by Captain Thompson (3 vols. 4to, 1776) printed for the first time the poems on Cromwell, in one of which occurs the famous passage about the death of Charles I. For Thompson's absurd claim of poems by Addison, Mallet, and Dr Watts, see the *Cornhill Magazine*, July 1869.

Marvár. See JODHPUR.

Marx, KARL, the founder of international socialism, was born at Trèves, 5th May 1818. His father was a lawyer in that town, and the young Marx was sent to the universities of Bonn and Berlin to study with a view to the same profession; but he seems really to have devoted his time to history and philosophy. He was apparently a disciple of Hegel, and he had for a time the intention to settle at Bonn as a lecturer on philosophy. Marx, however, soon gave up the idea of following an academic career, and in 1842 undertook the editorship of the democratic organ, the *Rhenish Gazette*. His experience on the journal convinced him that his economic knowledge required enlarging; and after his marriage he proceeded in 1843 to Paris, the headquarters of revolutionary economics. In the *Deutsch-Französische Jahrbücher* he began that course of literary activity which, varied by agitation, constituted the work of his life. Expelled from France in 1845, he settled in Brussels, where amongst other productions he wrote his attack on Proudhon's *Philosophie de la Misère*, entitled *Misère de la Philosophie*.

But his chief work at Brussels was the reorganising, along with Fr. Engels, of the Communist League, for which he wrote the famous *Manifesto* (see INTERNATIONAL). In 1848 Marx took an active part in the revolutionary movement on the Rhine, and after its failure finally settled in London in 1849. Here at the British Museum he acquired his marvellous knowledge of economic literature and of the economic development of modern Europe. The early fruits of his labour appeared in a work, *Zur Kritik der politischen Oekonomie* (1859), the theories of which were, however, carried forward into the first volume of his *Kapital* (1867). Before that year Marx had, in 1864, resumed his work as agitator. He had the foremost part in founding and directing the International, and after the death of Lassalle he won practical control of the social-democratic movement in Germany. He died in London, 14th March 1883.

Marx's works leave us in no doubt that he was a man of extraordinary knowledge, which he handled with masterly skill. To one who has taken the pains to understand his terminology his style is lucid and powerful, though also sometimes tedious owing to the minuteness of his exposition; and the march of thought is varied by humour, unsparing invective, and flashes of light from the most unexpected quarters. Since the beginning of literature few books have been written like the first volume of Marx's *Kapital*. It is premature to offer any definitive judgment on his work as revolutionary thinker and agitator, because that is still very far from completion. There need, however, be no hesitation in saying that he, incomparably more than any other man, has influenced the labour movement all over the civilised world; his theories have in a thousand ways already penetrated the different strata of society, even the highest, but most of all the working-classes. It

may also be safely said that his views can have any hope of realisation only after very extensive modification. In many respects his analysis of the economic development of modern society has been justified by subsequent events, but in many also it has been falsified; and it could be shown that he has left out of account some of the decisive factors in social development.

As he tells us in the preface to the *Kapital*, the final aim of his great work is to reveal the economic law that moves modern society. The social development of modern times depends on capital; the cardinal fact in modern history is the rise, culmination, and final catastrophe of capitalism. But the full development of capital and of the class representing it involves the rise of socialism and of the proletariat. The great work of Marx, therefore, gives us an historical analysis of capital and by implication a forecast of socialism.

The development of capitalism depends on the appropriation and accumulation of surplus value; we cannot understand the nature of capitalism without understanding surplus value. With the analysis of value, therefore, the great work of Marx begins. The wealth of modern society, in which the capitalistic method of production prevails, appears as an enormous collection of commodities, which are exchanged one against another in the utmost variety of ways. But they have one common characteristic: they are products of human labour. The value of all the commodities that circulate in the world-market is constituted by human labour, and measured in human labour-time; not this or that individual labour, but the average labour of the community, under the normal social conditions of production, with the average degree of skill and intensity of labour.

But labour cannot be carried on without the means of labour, which are land and capital. Taking England as the classic example of the fully-developed capitalism, Marx shows that since medieval times the course of historic evolution has tended to render the instruments of labour the monopoly of a special class. It is clear that the rise of such a class has had as complement the rise of another class who are destitute of the means of production, but who being free may sell their labour at the wage it can obtain in the market. They accordingly sell their labour for a wage, which represents the average subsistence necessary for themselves and the children required to continue the supply of labour. Their labour, however, when utilised by the capitalist produces a value greater than their wage. This is the *surplus value* of Karl Marx. The growth of capitalism depends on the appropriation and accumulation of this surplus value; and the history of modern society is a history of the antagonism of the two classes concerned—of the capitalist class, who absorb surplus value, and of the proletariat, who produce it.

The progress of the conflict leads to many remarkable results. On the one hand the great capitalist goes on destroying the smaller, until the wealth of the world is concentrated in the hands of a few colossal capitalists. On the other hand the development of the capitalistic system causes degradation, demoralisation, misery, and pauperism among the labouring classes, but it at the same time organises them in industrial armies; above all it raises them to a clear consciousness of their class position. In this way the process goes on in obedience to its own inherent laws, wealth accumulating at one pole of society and wretchedness at the other. Capitalism is at last ruined by an excess of the sustenance on which it grew—viz. surplus value. When things have become intolerable, the organised proletariat take the initia-

tive, and seizing possession of the means of production carry on the economic process for the good of all. Government—which has always hitherto been an arrangement for keeping the producing classes in subjection—will simply become a control of productive processes.

As understood by Marx, socialism does not propound utopian schemes, nor even does it seek particularly to offer programmes of social reform. The great aim of his teaching is to understand a process of historical transformation which proceeds before our eyes; scientific socialism is simply a conscious participation in this process. Agitation and revolutionary action can be effective only in so far as they comprehend and co-operate with the inevitable tendencies of social evolution. The change contemplated by socialism is an economic revolution brought about in accordance with the natural laws of historic evolution. We must also remember that Marx regards the economic factor as cardinal and decisive in history. Law and politics, religion and philosophy, are all moulded and controlled by the prevailing economic conditions. With this view of Marx is naturally associated his materialistic conception of history. 'According to Hegel, the thought-process, which he transforms into an independent subject under the name idea, is the creator of the real, which forms only its external manifestation. With me, on the contrary, the ideal is nothing else than the material transformed and translated in the human brain.' In short, the system of Marx is an evolutionary and revolutionary socialism, based on a materialistic conception of the world and of human history. He seeks to change the economic basis of society, and thereby to change the whole structure, but only by a conscious participation in, and willing co-operation with, historic tendencies, which in themselves are inevitable.

In his later and mature productions so far as published Marx has not given any definite forecast of the form likely to be assumed by the new society, and indeed has expressly disavowed any wish to provide a recipe for social betterment. The responsibility for a development in detail like that made by Schäffle in his *Quintessenz des Sozialismus* rests entirely with the author of that work. As already indicated, Marx's great aim is to elucidate an historical process which is inevitable, to make it clear to the consciousness of the class most profoundly interested—the proletariat, and as far as possible to shorten and alleviate the pangs of travail of the new era, which in any case will come to the birth when its time is fulfilled. Thus regarded, the life and work of Marx have a notable unity and reach and fixity of purpose. All that he did and wrote as scientific economist on the one hand and as agitator on the other, though at first sight inconsistent, is really formed and animated by the one idea.

The leading works of Marx have been mentioned in the foregoing article; a 3d edition of his *Kapital*, vol. i., appeared in 1883; vol. ii. was published under the editorship of Fr. Engels in 1885. Most economic works that have been published during the last twenty years have something to say about Marx, but no adequate exposition and criticism of his system has yet appeared.

Mary (Heb. *Miriam*, Gr. *Maria* or *Miriam*), 'the mother of Jesus' (Matt. ii. 11; Acts, i. 14), called the Blessed Virgin, is the mother of our Lord according to the flesh, held in high honour by all Christians; and her intercession is invoked with a higher religious worship and a firmer confidence than that of all the other saints, not only in the Roman Church, but in all the Christian churches of the East. Of her personal history but few particulars are recorded in Scripture. Some details are filled up from the works of the early

Fathers, especially their commentaries or deductions from the scriptural narrative, some from the apocryphal writings of the first centuries, and some from mediæval or modern legends. The genealogy of our Lord in St Matthew is traced through Joseph (q.v.); and, as it is plainly assumed that Mary was of the same family with her husband Joseph, the evidence of the descent of the latter from David is equivalently an evidence of the origin of Mary from the same royal house. But the genealogy of Christ as traced in St Luke is commonly held to be the proper genealogy of his mother in the flesh, Mary. The incidents in her personal history recorded in Scripture are few in number, and almost entirely refer to her relations with our Lord. They will be found in Matt. i. ii. xii.; Luke i. ii.; John ii. xix.; and Acts, i. where the last notice of her is of her 'persevering in prayer' with the disciples and the holy women at Jerusalem after our Lord's ascension (Acts, i. 14). The apocryphal gospels entitled 'The Gospel of the Nativity of Mary,' and the 'Protevangelion of the Birth of Christ,' contain some additional, but, of course, unauthentic particulars as to the lineage, birth, and early years of Mary, among which is the miraculous story of her betrothal with Joseph, immortalised by the pencil of Raphael. As to her history after the ascension of her Son the traditions differ widely. A letter ascribed to the Council of Ephesus speaks of her as having lived with John at that city, where she died, and was buried. Another epistle, nearly contemporaneous, tells that she died and was buried at Jerusalem at the foot of the Mount of Olives. Connected with this tradition is the incident which has so often formed a subject of sacred art, of the apostles coming to her tomb on the third day after her interment, and finding the tomb empty, but exhaling an 'exceeding sweet fragrance.' On this tradition is founded the belief of her having been assumed into heaven, which is celebrated in the festival of the Assumption (q.v.). The date of her death is commonly fixed at the year of our Lord 63, or, according to another account, the year 48. Another tradition makes her survive the crucifixion only 11 years.

Of theological questions regarding the B.V.M. (*Beata Virgo Maria*), one is treated at IMMACULATE CONCEPTION. The perpetual virginity of Mary is not explicitly attested in Scripture, and there are even certain ambiguous phrases which at first sight seem to imply that children were born of her after the birth of Jesus, as that of his being called (Matt. i. 25; Luke, ii. 7) her 'first-born son,' and that of James and others being more than once called 'brothers of the Lord;' for which see JOSEPH. The perpetual virginity of Mary is held as a firm article of belief in the Roman and Eastern churches.

MARIOLATRY (Gr. *Maria*, and *latreia*, 'adoration') is the name given by polemical writers to the worship paid by Roman Catholics to the Virgin Mary. This name is intended to imply that the Catholic worship of the Virgin is the supreme worship of *latreia* or adoration, which Catholics earnestly disclaim, although, from her relation to our Lord, they hold her worship, which they style *hyperdulia*, to be higher than that of all other saints. Many examples of prayers addressed to Mary (such as the 'Litany of the Sacred Heart of Mary'), of acts of worship done in her honour, and of expressions employed regarding her, are alleged by controversialists, for the purpose of showing that the worship of Mary in the Roman Church is in effect 'adoration.' To these and similar allegations Roman Catholics reply that many of the objected prayers and devotional practices are entirely unauthorised by the church, and that some of them are undoubtedly liable to misinter-

pretation; but they further insist that all such prayers, however worded, are to be understood, and are, in fact, understood by all Roman Catholics, even ordinarily acquainted with the principles of their faith, solely as petitions for the intercession of Mary, and as expressions of reliance, not on her own power, but on the efficacy of her prayers to her Son.

Although no trace is found in the New Testament of any actual worship of the Virgin Mary, yet Roman Catholic interpreters regard the language of the angel Gabriel, who saluted her as 'full of grace,' or 'highly favoured,' and as 'blessed among women,' and her own prediction in the canticle of the Magnificat, that 'all nations should call her blessed' (Luke, i. 48), as a foreshadowing of the practice of their church; and they rely equally on the language employed by the early Fathers, as, for instance, Irenæus, regarding the Virgin, although Protestants consider it as having reference to the Incarnation. But it seems quite certain that during the first ages the invocation of the Virgin and the other saints must have held a subordinate place in Christian worship; the reason for which, according to Roman Catholics, was probably the fear which was entertained of reintroducing among the recent converts from paganism the polytheistic notions of their former creed. But from the time of the triumph of Christianity in the 4th century, the traces of it become more apparent. St Gregory Nazianzen, in his panegyric of the virgin martyr Justina, tells that in her hour of peril she 'implored Mary the Virgin to come to the aid of a virgin in her danger.' But it was only after the heresy of Nestorius that the worship of Mary seems to have obtained its full development. His denial to her of the character of mother of God, and the solemn affirmation of that character by the ecumenical council of Ephesus (430 A.D.), had the effect at once of quickening the devotion of the people and of drawing forth a more marked manifestation on the part of the church of the belief which had been called into question. The 5th and 6th centuries, both in the East and in the West, exhibit clear evidence of the practice; and the writers of each succeeding age till the Reformation speak with gradually increasing enthusiasm of the privileges of the Virgin Mary, and of the efficacy of her functions as a mediator with her Son. St Bernard, and, still more, St Bonaventura, carried this devotional enthusiasm to its greatest height. The institution of the 'Rosary of the Virgin Mary,' the appointment of a special office in her honour, and, more than all, the fame of many of the sanctuaries which were held to be especially sacred to her worship gave a prominence to the devotion which Protestants find it difficult to reconcile with the honour which they hold due to God alone. The chief festivals of the Virgin, common to the Western and Eastern churches, are the Conception, the Nativity, the Purification, the Annunciation, the Visitation, and the Assumption. The Roman Church has several other special festivals, with appropriate offices—all, however, of minor solemnity. For accounts of representations of Mary in Art, see MADONNA, PIETÀ.

Mary I., queen of England, daughter of Henry VIII. by his first wife, Catharine of Aragon, was born at Greenwich on 18th February 1516. She was in her youth a great favourite with her father, and at the age of seven was betrothed to the Emperor Charles V. In her tenth year she was sent with certain commissioners and a species of viceregal court to the marches of Wales to carry out measures for the better government of the country. She was well educated, a good linguist, and fond of music. She was virtuous and pious, devoted to her mother, and devoted to her church.

With the divorce of her mother her troubles began. Henry treated her with great harshness, and even forced her to sign a declaration that he was supreme head of the church, and that her mother's marriage had been 'by God's laws and man's law incestuous and unlawful.' During the reign of her half-brother Edward she lived in retirement, and no threats could induce her to conform to the new religion. On the death of Edward (6th July 1553), she became entitled to the crown by her father's testament and the parliamentary settlement. The Duke of Northumberland had, however, induced Edward and his council to set Henry's will aside in favour of Lady Jane Grey, to whom the duke had married his son Guildford Dudley. Lady Jane was proclaimed on 10th July, but the whole country suspected Northumberland and favoured Mary, who, supported by her friends, was able without bloodshed to enter London on 3d August in triumph. The queen now showed remarkable leniency towards her opponents. Northumberland and two others were executed as traitors, but Lady Jane and her husband were, for the present, spared. She had promised the mayor of London that she would not strain consciences, and she proceeded very gradually and cautiously to bring back the old religion. She reinstated the Catholic bishops and imprisoned some of the leading Reformers, but dared not restore the pope's supremacy, and she herself retained, under the advice of Gardiner, the title of supreme head of the church. Cardinal Pole was immediately on her accession designated papal legate, but prudence and the counsel of the emperor prevented his entering England. The question of the hour upon which all turned was the queen's marriage. Some thought of Courtenay, Earl of Devon; others of Cardinal Pole, then only in deacon's orders; but the queen, in the face of the fears and protests of the nation, obstinately and morbidly set her heart on Philip of Spain. The unpopularity of the proposal brought about the rebellion of Wyatt and an attack upon London. The rebellion was quelled mainly through the courage and coolness of the queen, but the consequences of her easy triumph were fatal to her. The hapless Lady Jane, who had seemingly been detained as a hostage for the good-behaviour of her friends, was with her husband and father brought to the block. The Princess Elizabeth was suspected, but without proof, of complicity in the treason, and was committed to the Tower. Injunctions were sent to the bishops to restore ecclesiastical laws to their state under Henry VIII. In July 1554, twelve months after her accession, Philip landed and was married to Mary at Winchester. In the November following Pole entered England, and parliament, having made it sure that restitution would not be exacted from the owners of the confiscated church property, consented to petition for reconciliation to the holy see, and the realm was solemnly absolved from the papal censures. Soon after, the savage persecution which gave to the queen the name of 'Bloody Mary' began. In 1555 Ridley, Latimer, and other martyrs were brought to the stake. Cranmer was burned in March 1556, and Pole was consecrated Archbishop of Canterbury in his place. In August 1555 Philip had left England, to return only once more for a few weeks, and Gardiner died in November of the same year. Pole was now left supreme in the councils of the queen, and still the persecution raged; during the last three years of her reign some 300 victims perished in the flames. How far Mary herself was responsible for the cruelties practised is doubtful. During this period she was rendered almost helpless with ill-health. She was constantly deluded with the belief that she was about to become a mother. Broken down with sickness, with grief at her husband's heart-

lessness, and with disappointment at her childlessness, she became a prey to the deepest melancholy. Finally the evils which the nation predicted from the Spanish alliance came about. The queen was induced by Philip to enter upon war with France. The consequence was the loss of Calais to England. Mary died 17th November 1558.

See the histories of Lingard and Froude; *England under the reigns of Edward VI. and Mary*, by P. F. Tytler; *Privy Purse Expenses of the Princess Mary*, with a memoir by Sir F. Madden; and other books cited at HENRY VIII., ELIZABETH, GREY (LADY JANE).

Mary II. (1662-84), wife from 1677 of William III. (q.v.).

Mary Queen of Scots was the daughter of James V. of Scotland by his second wife, Mary of Lorraine, daughter of Claude, Duke of Guise (q.v.), and widow of Louis of Orleans, Duke of Longueville. She was born at Linlithgow on the 8th of December 1542. Her misfortunes may be said to have begun with her birth. The tidings reached her father on his death-bed at Falkland, but brought him no consolation. 'The deil go with it!' he muttered, as his thoughts wandered back to the marriage with Bruce's daughter, which brought the crown of Scotland to the Stewarts—'it cam with ane lass, and it will pass with ane lass!' Mary became a queen before she was a week old. Within a year the Regent Arran had promised her in marriage to Prince Edward of England, and the Scottish parliament had declared the promise null. War with England followed, and at Pinkie Cleuch the Scots met a defeat only less disastrous than Flodden. But their aversion to an English match was unconquerable; they hastened to place the young queen beyond the reach of English arms, on the island of Inchmahome, in the Lake of Menteith, and to offer her in marriage to the eldest son of Henry II. of France and Catharine de' Medici. The offer was accepted; and in July 1548 a French fleet carried Mary from Dumbarton, on the Clyde, to Roscoff, in Brittany, whence she was at once conveyed to St Germain-en-Laye, and there affianced to the Dauphin.

Her next ten years were passed at the French court, where she was carefully educated along with the king's family, receiving instruction in the art of making verses from the famous Ronsard. On the 24th of April 1558 she was married to the Dauphin, who was six weeks younger than herself. It was agreed, on the part of Scotland, that her husband should have the title of King of Scots; but Mary was further betrayed into the signature of a secret deed, by which, if she died childless, both her Scottish realm and her right of succession to the English crown (she was the great-granddaughter of Henry VII.) were conveyed to France. On the 10th of July 1559 the death of the French king called her husband to the throne by the title of Francis II. The government passed into the hands of the queen's kinsfolks, the Duke of Guise and the Cardinal of Lorraine; but their rule was short-lived. The feeble and sickly king died on the 5th of December 1560, when the reins of power were grasped by the queen-mother, Catharine de' Medici, as regent for her next son, Charles IX. Mary must have been prepared, under almost any circumstances, to quit a court which was now swayed by one whom, during her brief reign, she had taunted with being 'a merchant's daughter.' But there were other reasons for her departure from France. Her presence was urgently needed in Scotland, which the death of her mother, a few months before, had left without a government, at a moment when it was convulsed by the throes of the Reformation. Her kinsmen of Guise had ambitious projects for her marriage; great schemes

were based on her nearness of succession to the English crown; and both these, it was thought, might be more successfully followed out when she was seated on her native throne.

She sailed from Calais on the 15th, and arrived at Leith on the 19th August 1561, having escaped the English ships of war which Elizabeth despatched to intercept her. Her government began auspiciously. The Reformation claimed to have received the sanction of the Scottish parliament, and if Mary did not formally acknowledge the claim, she was at least content to leave affairs as she found them, stipulating only for liberty to use her own religion—a liberty which Knox and a few of the more extreme Reformers denounced as a sin against the law of God. She is said to have rejected the violent counsels of the Roman Catholics; it is certain that she surrounded herself with Protestant advisers, her chief minister being her illegitimate brother, James Stuart, whom she soon afterwards created Earl of Moray. Under his guidance, in the autumn of 1562, she made a progress to the north, which, whatever was his design, ended in the defeat and death of the Earl of Huntly, the powerful chief of the Roman Catholic party in Scotland. For the Chastelard episode, see CHASTELARD.

Meanwhile the courts of Europe were busy with schemes for Mary's marriage. The king of Sweden, the king of Denmark, the king of France, the Archduke Charles of Austria, Don Carlos of Spain, the Duke of Ferrara, the Duke of Nemours, the Duke of Anjou, the Scottish Earl of Arran, and the English Earl of Leicester were proposed as candidates for her hand. Her own preference was for Don Carlos, the heir of what was then the greatest monarchy in Christendom; and it was not until all hopes of obtaining him were quenched that she thought seriously of any other. Her choice fell, somewhat suddenly, on her cousin, Henry Stewart, Lord Darnley, son of the Earl of Lennox, by his marriage with a granddaughter of King Henry VII. of England. He was thus among the nearest heirs to the English crown, and his claims to the succession were believed to have the support of the great body of English Roman Catholics. But except this and his good looks he had no other recommendation. He was weak, needy, insolent, and vicious; his religion, such as it was, was Roman Catholic; his house had few friends and many enemies in Scotland; and he was three years younger than Mary. Her best friends, both Roman Catholic and Protestant, warned her against him, but in vain. The marriage was celebrated at Holyrood on the 29th July 1565. It was the signal for an insurrection by Moray and the Hamiltons, who hoped to be joined by the whole Protestant party. But their hope was disappointed; and the queen, taking the field in person, at once quelled the revolt, and chased the rebels beyond the Tweed.

Her triumph was scarcely over when misunderstandings began to arise between her and her husband. Darnley's worthlessness and folly became only too apparent; she was disgusted by his debauchery, and alarmed by his arrogance and ambition. She had given him the title of king, but he now demanded that the crown should be secured to him for life, and that, if the queen died without issue, it should descend to his heirs. Mary hesitated to comply with a demand which would have set aside the settled order of succession; and what she refused to grant by favour the king prepared to extort by force.

Mary's chief minister, since Moray's rebellion, had been David Rizzio, a mean-looking Italian, of great astuteness and many accomplishments, but

generally hated beyond the palace walls as a base-born foreigner, a court favourite, and a Roman Catholic. The king and Rizzio had been sworn friends, sharing the same table, and even sleeping in the same bed; but the king was now persuaded that it was Rizzio who was the real obstacle to his designs upon the crown. In this belief, he entered into a formal compact with Moray, Ruthven, Morton, and other chiefs of the Protestant party, undertaking, on his part, to prevent their attainer, or procure their pardon, and to support and advance the Protestant religion; while they, on the other part, bound themselves to procure the settlement of the crown upon him and his heirs, and to take and slay, if need were, even in the queen's palace and presence, every one who opposed it. The result of this conspiracy was the murder of Rizzio on the 9th of March 1566, the king leading the way into the queen's cabinet, and holding her in his grasp, while the murderers dragged the poor Italian into an ante-chamber, and mangling his body with more than fifty wounds, completed what they deemed a justifiable act. When Mary learned what had been done she broke out in reproaches against the king as being the chief cause of the deed. 'I shall be your wife no longer,' she told him, 'and shall never like well till I cause you have as sorrowful a heart as I have at this present.' As had been agreed beforehand among the conspirators, Mary was kept prisoner in Holyrood; while the king, of his own authority, dismissed the parliament which was about to forfeit Moray and his associates in the late insurrection. The plot was thus far successful; but Mary no sooner perceived its objects than she set herself at work to defeat them. Dissembling her indignation at her husband's treachery and the savage outrage of which he had been the ringleader, she succeeded by her blandishments in detaching him from the conspirators, and in persuading him not only to escape with her from their power by a midnight flight to Dunbar, but to issue a proclamation in which he denied all complicity in their designs. The conspiracy was now at an end; Ruthven and Morton fled to England, while Moray was received by the queen; and the king, hated by both sides, because he had betrayed both sides, became an object of mingled abhorrence and contempt.

It was an aggravation of the murder of Rizzio that it was committed, if not in the queen's presence, at least within a few yards of her person, only three months before she gave birth (on the 19th June 1566) to the prince who became James VI. As that event drew near, the queen's affection for her husband seemed to revive; but the change was only momentary; and before the boy's baptism, in December, her estrangement from the king was greater than ever. Divorce was openly discussed in her presence, and darker designs were not obscurely hinted at among her friends. The king, on his part, spoke of leaving the country; but before his preparations were completed he fell ill of the smallpox at Glasgow. This was about the 9th of January 1567. On the 25th Mary went to see him, and, travelling by easy stages, brought him to Edinburgh on the 31st. He was lodged in a small mansion beside the Kirk of the Field, nearly on the spot where the south-east corner of the university now stands. There Mary visited him daily, and slept for two nights in a room below his bedchamber. She passed the evening of Sunday the 9th of February by his bedside, talking cheerfully and affectionately with him, although she is said to have dropped one remark which gave him uneasy forebodings—that it was much about that time twelvemonth that Rizzio was murdered. She left him between ten and eleven o'clock to take part in a masque at Holyrood, at the marriage of

a favourite valet. The festivities had not long ceased in the palace, when, about two hours after midnight, the house in which the king slept was blown up by gunpowder; and his lifeless body was found in the neighbouring garden.

The chief actor in this tragedy was undoubtedly James Hepburn, Earl of Bothwell (q.v.), an unscrupulous noble, who, since Moray's revolt, and still more since Rizzio's murder, had enjoyed a large share of the queen's favour. But there were suspicions that the queen herself was not wholly ignorant of the plot, and these suspicions could not but be strengthened by what followed. On the 12th of April Bothwell was brought to a mock-trial, and acquitted; on the 24th he intercepted the queen on her way from Linlithgow to Edinburgh, and carried her, with scarcely a show of resistance, to Dunbar. On the 7th of May he was divorced from the young and comely wife whom he had married little more than a twelvemonth before; on the 12th Mary publicly pardoned his seizure of her person, and created him Duke of Orkney; and on the 15th—only three months after her husband's murder—she married the man whom every one regarded as his murderer.

This fatal step at once arrayed her nobles in arms against her. She was able to lead an army against them, but it melted away without striking a blow on the field of Carberry (15th June), when nothing was left to her but to abandon Bothwell and surrender herself to the confederate lords. They led her to Edinburgh, where the insults of the rabble and grief at parting with Bothwell threw her into such a frenzy that she refused all nourishment, and, rushing to the window of the room in which she was kept prisoner, called for help, and showed herself to the people half-naked.

From Edinburgh she was hurried to Lochleven, where, on the 24th of July, she was prevailed upon to sign an act of abdication in favour of her son, who, five days afterwards, was crowned at Stirling. Escaping from her island-prison (where she was confined of still-born twins) on the 2d of May 1568, she found herself in a few days at the head of an army of 6000 men. On the 12th it was met and defeated by the Regent Moray at Langside, near Glasgow. Four days afterwards, in spite of the entreaties of her best friends, Mary crossed the Solway, and threw herself on the protection of Queen Elizabeth, only to find herself a prisoner for life. From Carlisle, her first place of captivity, she was taken, in July, to Bolton; from Bolton she was carried, in February 1569, to Tutbury; from Tutbury she passed in succession to Wingfield, Coventry, Chataworth, Sheffield, Buxton, Chartley, and last of all to Fotheringhay. The presence of Mary in England was a constant source of uneasiness to Elizabeth and her advisers. A large minority in the country were still Catholic, and naturally looked to Mary as the likely restorer of the old faith. Plot followed plot, therefore, to effect her deliverance, and to place her on the throne of Elizabeth. Of these plots the most famous is that of Antony Babington, which had for its object the assassination of Elizabeth and the deliverance of Mary. The conspiracy was discovered; certain letters of Mary approving the death of Elizabeth fell into the hands of Walsingham; and, mainly on the evidence of copies of these letters, Mary was brought to trial in September 1586. Sentence of death was pronounced against her on the 25th of October; but it was not until the 1st of February 1587 that Elizabeth took courage to sign the warrant of execution. It was carried into effect on the 8th, when Mary laid her head upon the block with the dignity of a queen and the constancy and resignation of a martyr, evincing to the last her devotion to the church of

her fathers. Five months afterwards her body was buried with great pomp at Peterborough, whence, in 1612, it was removed to King Henry VII.'s Chapel at Westminster, where it still lies in a sumptuous tomb erected by James VI.

The character of Mary was long one of the most fiercely-vexed questions of history, and is still in debate, although the great preponderance of authority seems now to be on the side of those who believe in her criminal love for Bothwell and her guilty knowledge of his conspiracy against her husband's life. Her beauty and accomplishments have never been disputed. She was confessed by every one to be the most charming princess of her time. Her large sharp features might perhaps have been thought handsome rather than beautiful, but for the winning vivacity and high joyous spirit which animated them. It has been questioned whether her eyes were hazel or dark gray, but there is no question as to their star-like brightness. Her complexion, although fresh and clear, would seem to have been without the brilliance so common among our island beauties. Her hair appears to have changed with her years from a ruddy yellow to auburn, and from auburn to dark brown or black, turning gray long before its time. Her bust was full and finely shaped, and she carried her large stately figure with majesty and grace. She showed to advantage on horseback, and still more in the dance. The charm of her soft, sweet voice is described as irresistible; and she sang well, accompanying herself on the harp, the virginal, and still oftener on the lute, which set off the beauty of her long, delicate, white hand. The consciousness how that hand was admired may have made it more diligent in knitting and in embroidery, in both of which she excelled. Her manner was sprightly, affable, kindly, frank perhaps to excess, if judged by the somewhat austere rule already beginning to prevail among her Scottish subjects. She spoke three or four languages, was well and variously informed, talked admirably, and wrote both in prose and in verse, always with ease, and sometimes with grace or vigour. In the ring of which she was the centre were statesmen like Moray and Lethington, soldiers like Kirkcaldy of Grange, men of letters like Buchanan, Leslie, Sir Richard Maitland, and Sir James Melville. The first poet of France published verses deploring his absence from her brilliant court; Damville, the flower of French chivalry, repined at the fate which called him away from it so soon; Brantôme and the younger Scaliger delighted to speak, in old age, of the days which they passed beneath its roof.

Mary's prose-writings have been collected by the enthusiastic devotion of Prince Alexander Labanoff, in his *Recueil des Lettres de Marie Stuart* (7 vols. 1844). Setting aside the twelve so-called 'sonnets' which she is said to have written to Bothwell, and which survive only in a French version of an English translation, no more than six pieces of her poetry, containing in all less than 300 lines, are now known. They have no remarkable merit. The best is the poem of eleven stanzas on the death of her first husband, Francis II., printed by Brantôme. The longest is a *Méditation* of a hundred lines, written in 1572, and published two years afterwards by her ever faithful follower, Bishop Leslie of Ross. All are in French, except one sonnet, which is in Italian. The sweetly simple lines beginning 'Adieu, plaisant pays de France,' so often ascribed to her, are probably the work of A. G. Meunier de Querlon, a French journalist, who died in 1780. A volume of French verse on the *Institution of a Prince*, which she wrote for the use of her son, has been lost since 1627, along with a Latin speech in vindication of learned women, which, when no more than thirteen,

she delivered in the hall of the Louvre, in presence of the French court.

To enumerate all that has been written on Mary would fill a volume. Among the chief works are Jebb's *De Vita et Rebus Gestis Mariæ Scotorum Reginæ* (1725); J. Anderson's *Collections Relating to the History of Mary, Queen of Scotland* (1727-28); Bishop Keith's *History of the Affairs of Church and State in Scotland* (1734; new ed. 1844-50); W. Goodall's *Examination of the Letters said to be written by Mary, Queen of Scots, to James, Earl of Bothwell* (1754); Principal Robertson's *History of Scotland*; W. Tytler's *Inquiry into the Evidence against Mary, Queen of Scots* (1759, 1790); M. Laing's *History of Scotland*; G. Chalmers's *Life of Mary, Queen of Scots* (1818, 1822); P. F. Tytler's *History of Scotland*; Prince Labanoff's *Recueil des Lettres de Marie Stuart* (1844); David Laing's edition of John Knox's *History of the Reformation* (1846-64); the *Life* by Miss Strickland in her *Lives of the Queens of Scotland* (1850-59; new ed. 1873); A. de Montaignon's *Latin Themes of Mary Stuart* (1855); Prince Labanoff's *Notice sur la Collection des Portraits de Marie Stuart* (1856); Mignet's *Histoire de Marie Stuart* (1852); Teulet's *Lettres de Marie Stuart* (1859); Chernel's *Mariæ Stuart et Catherine de Medicis* (1858); Joseph Robertson's *Catalogues of the Jewels, Dresses, Furniture, Books, and Paintings of Mary, Queen of Scots* (1863); Hosack's *Mary, Queen of Scots, and her Accusers* (1870-74; a popular ed. 1888); histories by Petit and De Flandre (1874), Chantelaune (1876), and the interesting document by Claude Nau, her secretary (ed. by Father Stevenson, 1883); Leader, *Mary Stuart in Captivity* (1881); Baron Kervyn de Lettenhove, *Mariæ Stuart* (2 vols. 1889). The question of the genuineness of the so-called Casket Letters has of late passed into a new phase by the discovery of Morton's Declaration regarding the manner in which the Casket fell into his hands. For an account of this document and its bearing on the question of Mary's authorship of the letters, see Henderson's *Casket Letters* (Edin. 1890). Reference to the latest literature on the subject will be found in Mr Henderson's book.

The best representations of Mary are the contemporary portraits by the French painter, Francis Clouet, more commonly called Jehanet or Janet, and the statue, by an unknown sculptor, on her tomb at Westminster. All portraits which cannot be reconciled with these types may safely be rejected as spurious.

Maryborough, a port of Queensland, on the Mary River (here spanned by a wooden bridge), 25 miles from its mouth and 180 N. of Brisbane, with which there is communication by steamer and coach. The wharves admit vessels drawing 17½ feet. Gold from Gympie (61 miles by rail) and copper from Mount Parry and other mines, with sugar and timber, form the chief exports. There are two dozen sugar-mills at work in the neighbourhood, and three iron-foundries, and brewing, tanning, and shipbuilding are carried on. Pop. (1886) 9000.

Maryland lies between the parallels of 37° 53' and 39° 44' N. lat., and the meridians of 75° 4' and 79° 33' W. long. It contains 12,210 sq. m.—very nearly the size of Holland—of which about one-fifth is water. The length from east to west is 196 miles, and the breadth 128 miles. On the north and east it is separated from Pennsylvania and Delaware by 'Mason and Dixon's Line' (q.v.); the south-western border follows the course of the Potomac River, the whole of which, with the exception of about 12 miles in the District of Columbia (q.v.), is under the jurisdiction of Maryland, down to the low-water mark on the Virginia side.

The surface elevation varies greatly, from sea-level to an altitude of 3500 feet. In the west it is mountainous (see BLUE RIDGE); in the middle hilly and rolling; in the east and south-east low and undulating. A line drawn from the mouth of the Susquehanna to the city of Washington will cut the state into two nearly equal parts, and divide the mountain and hill country from the low lands on both sides of the Chesapeake Bay. The

productions and occupations are largely determined by the physical features—in the west coal and lumber; in the middle corn and wheat; in the east fish, fruit, and vegetables. The climate is generally regarded as unusually healthful. The mean summer temperature is 75°, the mean winter temperature 34°. The annual rainfall varies from 38 inches in the mountains to 46 inches near the Atlantic coast. The mountain air is regarded as a specific for hay-fever. The prevalent diseases on the shores of the Atlantic and the Chesapeake Bay were formerly bilious and intermittent fevers of a mild form, and they still exist to some extent in these districts.

The geological formations vary with the surface elevations. The southern section of both the eastern and western shores is alluvial; north of the alluvial deposit is a tertiary formation; north-west of this come metamorphic rocks; west of them a wide belt of Silurian and Devonian formation; and still farther west Carboniferous strata beginning at Cumberland. In the Tertiary we find marl in abundance; in the metamorphic rocks gneiss, granite, limestone, and iron; in the Carboniferous extensive veins of bituminous coal of the best quality. One remarkable vein in the George's Creek district is 14 feet thick. Over 200 kinds of marble have been found in the state, some of them equal to the Italian marbles. Copper-mines are extensively worked in the middle district; and almost all the chrome used in the United States comes from the same location. Near Baltimore are large beds of clay, from which bricks of peculiar excellence and beauty are manufactured; and in an adjoining county valuable quarries of soapstone are worked with profit.

The soil is well adapted to cultivation, with the exception of the mountain tops in the west, and a small proportion of marsh land in the east, which might, however, be easily and profitably reclaimed. The forest-trees are principally pine, chestnut, and oak; hickory and walnut are becoming scarce. The staple fruit-tree is the peach, which covers many thousands of acres: Maryland peaches, preserved in air-tight cans, are exported to all quarters of the world. Tobacco is the principal crop in the peninsula between the Chesapeake and the Potomac, as it was the main reliance of the early settlers, constituting even their ordinary medium of exchange. Tomatoes, melons, small fruits, and all kinds of vegetables are cultivated on the eastern shore and sent to the markets of Baltimore and Philadelphia. The mountains still contain many deer; and wild geese, swans, and turkeys are found in considerable numbers at the proper season, as well as woodcock, grouse, and quail (locally called partridge). Immense flocks of wild ducks of various species throng the estuaries of the Chesapeake on the approach of cold weather: the 'canvas-back' is found nowhere else in perfection.

The Chesapeake Bay (q.v.) divides Maryland into two unequal portions, the Eastern and the Western Shore. With its estuaries it gives the state a coast-line of more than 500 miles, and almost that number of steamboat landings: on the Eastern Shore there is scarcely a farm more than 5 miles distant from a navigable river, accessible to steamboats of light draught. Shad and herring are caught in large numbers, and the average annual supply of oysters reaches 20 millions of bushels, giving employment to more than 30,000 persons. For the leading manufactures, see BALTIMORE, where most are located. Baltimore is also the principal port and great commercial centre of the state. Maryland has about 1300 miles of railway, and two canals (from Cumberland, in the west, to Washington, 184½ miles, and between the Chesapeake and Delaware Bays, 12½ miles).

Maryland has a well-developed system of free public schools. In 1889-90 there were in attendance 184,251 pupils (of whom 36,372 were coloured), the total expenses for public school purposes being for the year \$1,942,197.33. There is in Baltimore a state normal school, and in every county a high school or academy. The colleges supported in whole or in part by the state are St John's College, Annapolis (originally King William's School); Washington College, Chestertown, Kent county, to the foundation of which George Washington contributed £100 sterling; the Agricultural College, near Bladensburg; and the Western Maryland College, Westminster. There are also several denominational colleges. The foremost of the educational institutions of Maryland is the Johns Hopkins University, in Baltimore. There is a school for the feeble-minded at Pikesville; a school for the deaf and dumb at Frederick; and in Baltimore a school for the blind, and a school for coloured blind children and deaf-mutes, all supported by the state at an annual expense of about \$60,000. The asylum for the insane at Catonsville is admirably managed.

Maryland returns six members to congress. The Legislature is styled the General Assembly, and consists of two houses—the Senate and the House of Delegates. The Senate is composed of one member from each of the twenty-three counties and three from the city of Baltimore, elected by the people. The House of Delegates has ninety-one members, eighteen from Baltimore city, and the remainder from the counties in proportion to their respective population. The seat of government is at Annapolis. Baltimore had in 1890 a pop. of 434,439. The other principal towns are Cumberland, Hagerstown, Frederick, Westminster, on the western shore; Salisbury, Easton, and Cambridge, on the eastern. Pop. (1830) 447,030; (1860) 687,049; (1880) 934,943; (1890) 1,042,390.

History.—In 1632 Charles I. of England issued a patent to Cecil Calvert, Lord Baltimore, granting him all the land 'from Watkins Point on the Bay, northward to the 40th degree of latitude, and from the Atlantic Ocean and Delaware Bay on the east to the Potomac River on the west.' This grant included not only the present Maryland, but also parts of Pennsylvania and Delaware, which led to many vexatious disputes, some of which were settled only in 1890. The district was named in honour of Henrietta Maria, Charles's queen. In March 1634 a party of English gentlemen and their servants and retainers, under the command of Leonard Calvert, a brother of Lord Baltimore, landed on the shore of a river now called St Mary's, a branch of the Potomac, and bought from the Indians a tract of land. The friendly relations thus commenced with the Indians, and but rarely interrupted, together with the announcement of toleration and protection to all Christians of whatever shade of religious belief, led to the rapid and peaceful growth of the new colony. Maryland was among the first of the colonies to take an active part in the war of independence. In the war between the states (1861-65) the people of Maryland were divided in sentiment, but the state remained within the Union. See J. T. Scharf, *History of Maryland* (3 vols. Baltimore, 1879).

Maryport, a seaport of Cumberland, at the mouth of the Ellen, 28 miles SW. of Carlisle by railway (1837). The town gets its name from the fact that Mary Queen of Scots landed here in her flight from Scotland, though it was called Ellenfoot down to 1750, when its harbour was constructed. A new dock was opened in 1884. Ship-building and its kindred employments are carried on, and there are iron-foundries and iron-furnaces, sawmills, flour-mills, tanneries, breweries, &c.

The annual value of the total exports, chiefly coal and iron, in 1885 to 1889 ranged from £67,000 to £544,000; the imports of foreign and colonial merchandise in the same period ranged from £179,000 to £136,000. The average number of vessels entering is about 1550, of some 220,000 tons burden. Pop. (1851) 5698; (1881) 8126; (1891) 8784.

Marysville, capital of Yuba county, California, on the Yuba River, at the head of navigation, 52 miles by rail N. of Sacramento. It is a great resort of gold-miners, and though somewhat declining, has an extensive trade, and contains flour-mills, a foundry, woollen factory, &c. Pop. (1890) 3936.

Masaccio, a Florentine painter, whose proper name was TOMMASO GUIDI, was born in 1401 or 1402 in the Arno valley, probably at Castel San Giovanni. He was nicknamed Masaccio ('Slovenly Tommy') because of his ungainly appearance and careless manners. A reputed pupil of Masolino, he was enrolled in the Florentine guild of painters in 1424. Whilst still a young man he seems to have executed a fresco of the Crucifixion and scenes illustrating the lives of some of the later saints in the church of St Clement. But his greatest achievements were wrought on the walls of the Carmine church, especially in the Brancacci chapel. It has been matter of controversy as to which pictures precisely were from the brush of Masaccio; Masolino worked at the same walls before him and Filippino Lippi after him. Those which are assigned to him beyond doubt or question are 'Expulsion from Paradise' (greatly admired by Raphael, who repeated the design in the loggie of the Vatican), 'Peter and the Tribute-money,' 'Temptation of Adam and Eve,' 'Peter Preaching,' and the same saint 'Baptising,' 'Healing the Sick,' 'Giving Alms,' and (in part) 'Restoring the Young Man to Life.' These works mark an advance in Italian painting, in that they exhibit a more vigorous and correct representation of nature, with improved perspective and harmony of arrangement between the figures and the background. Many of the subsequent 15th-century painters of Italy were greatly influenced by the study of them. Towards the end of 1428 Masaccio suddenly left Florence, and is reported to have gone to Rome and to have died there before the year 1429 ran out.

Masai, a people of East Equatorial Africa, dwelling in a district that stretches from 1° N. to 5° S. lat., and from 34° to 38° E. long., and includes Kilimanjaro, Kenia, and Lake Baringo. The southern half of the district is low and barren, with no rivers and little rain, whilst in the north it rises into a plateau-region (5000 to 9000 feet), rich in running streams, forests, and grass-land. The Masai are not a Negro or Bantu race; they resemble the Gallas, being men of magnificent stature and Apollo-like forms, though their faces are ugly and ferocious in expression. This is due to the warlike habits of their youth, when, for nearly a score of years, they live in military kraals, spending their time in alternate idleness and on the war-path, eating nothing but beef, drinking nothing but milk, and having indiscriminate intercourse with the unmarried girls of the tribe. After marriage, which takes place when they lay aside the habits of the warrior, they settle down as cattle-breeders. The arms of the warriors consist of an ox-hide shield, a spear with a blade 2 to 2½ feet long and 3 inches broad, affixed to a shaft of 15 inches, a sword, and a knobkerry. They are an aristocratic race, and clever public speakers. The work is done by slaves and by the women and boys. They speak a Hamitic language. See Joseph Thomson, *Through Masai Land* (1885), and compare H. H. Johnston, *Kilimanjaro Expedition* (1886).

Masaniello (properly TOMMASO ANIELLO), a fisherman of Amalfi, born in 1623, was the leader of the revolt which took place in Naples in July 1647 against the Spanish viceroy, the Duke of Arcoa. The people had been exasperated by oppression, and great excitement had been produced by a new tax upon fruit. Masaniello himself was aggrieved by the harsh treatment which his wife had received after being detected in an attempt to smuggle a little flour. Taking advantage of a quarrel between the fruit-sellers and the tax-collectors on 7th July 1647, Masaniello stirred up the multitude to a revolt. Their triumph was complete; palaces and public buildings were plundered, mostly for arms, a bloody popular justice was executed, and the viceroy was forced into a regular treaty with Masaniello in the church of the Carmelites on 13th July. But success and the weight of his responsibilities turned the fisherman's head; he gave himself up to excess, and his capricious despotism immediately became terrible to his own associates. He was assassinated by agents of the viceroy on 16th July.

Masaya, a busy town of Nicaragua, about 20 miles by rail SE. of Managua, near the volcano of Masaya. Pop. 12,000.

Mascara, a town of Algeria, 50 miles SE. of Oran, stands 1800 feet above sea-level, on a slope of the Atlas Mountains. It was for some time (1832-41) the headquarters of Abd el-Kader. Pop. 14,320.

Mascarene Isles, or MASCARENHAS, the collective name given to the islands of Réunion, Mauritius, and Rodriguez.

Masham, Mrs. See MARLBOROUGH.

Mashonaland, or MASHUNALAND, is the name of the region lying north-east of Matabeleland, between 16° 30' and 19° 10' S. lat. and 30° and 32° E. long. It embraces the plateau (4000-4600 feet) whose backbone is formed by the Umvukwe Mountains, and in which some of the chief feeders of the Zambezi, Limpopo, Sabi, and Mazoe have their origins. It is reported to be the healthiest part of South Africa, with rich soil, grass all the year round, and an abundance of running streams. A constant cold south-east wind tempers the heat, and renders the air strong and bracing. When their land was invaded by the Matabele, those of the Mashona who escaped massacre took refuge in the mountainous districts, and there they have ever since maintained themselves, building their villages on almost inaccessible crags. A peaceful and industrious people, of Bantu race, they live in perpetual fear of their fierce neighbours. They are the best husbandmen in South Africa, and before being dispossessed of their country owned large herds of cattle. They now grow rice, Kaffir corn, maize, ground-nuts, sweet potatoes, tobacco, and cotton; this last they weave into blankets. They are also good iron-workers. Iron, copper, and gold (in quartz and river sand) exist in immense quantities in the country. Mauch, a German traveller, in 1871 discovered many old mines that had at one time been worked with some degree of scientific skill, especially at a place called Zimbabwe, which he identified with the Ophir (q.v.) of the Bible, and thus gave some support to Milton's identification of that region with Sofala. Mashonaland was put under British protection on 11th February 1888, and was taken actual possession of by the British South Africa Company in August 1890.

The MAKALAKA are a people closely allied to the Mashona, and have had nearly the same history. Those who escape the Matabele live chiefly in the mountain fastnesses in the southern part of Matabeleland, and follow the same occupations

and mode of life as the Mashona. The Banyai tribes—likewise refugees from the Matabele—live south-east of the Makalaka, along the middle course of the Limpopo. See books quoted under MATABELELAND.

Masinissa, king of the Eastern Numidians, was born about 238 B.C., and brought up at Carthage. Having helped the Carthaginians to subdue Syphax, king of the Massylii or Western Numidians, he accompanied his allies to Spain and fought valiantly and successfully against the Romans. But about 210 the Carthaginians gave his promised bride to Syphax; and for this and other reasons he became henceforward the bitter foe of Carthage, and zealously backed up the Romans in their struggle against their African rival. He received as his reward the kingdom of Syphax, together with large portions of the territory of Carthage. But before he died, in 149 B.C., he saw that he had fostered a most dangerous enemy for his own people, the Massylii, and the kingdom he left to his sons, and slackened his zeal for Rome.

Mask (through the medium of Fr. and Span. from the Arabic *maskharat*, 'a jester') is an artificial covering for the face, worn by many different peoples for different purposes. Masks are common amongst the inhabitants of New Britain, New Ireland, New Guinea, and the adjoining islands, amongst the North American Indians and the Eskimo, the Chinese, the aborigines of Australia, and some Negro tribes. The masks these peoples use are generally very hideous and repellent in aspect, being designed expressly to inspire terror in the mind of the beholder. The primary object is to scare away the demons and spirits who bring misfortunes, diseases, national calamities, or other evils upon the tribe; the exorcism is usually practised by processions of masked men, who dance and utter loud cries calculated to frighten the enemy away. Where totemistic beliefs prevail, it is customary for the people to celebrate dances clad in the skins of wild animals, and on such occasions masks are worn shaped to resemble the animals represented in the dance. It is highly probable that practices of a similar nature were current amongst the primitive Greeks, Egyptians, and other peoples. The myth of the snake-haired Gorgon is traced back to this origin; so too is the practice of covering the faces of the dead with a mask, intended to keep the demons away from them whilst they were on their journey to the abode of shades, a practice common to the ancient Greeks and Egyptians, and the ancient Peruvians and Mexicans. Death-masks of gold have been found in tombs of Mycenæ and Kertch; those of the Peruvians were made of silver and wood; some found at Carthage were of clay, painted in divers colours; and copper and wood were used in Mexico. Masks, besides being worn by living men, were sometimes attributed to their gods, as in ancient Egypt and Greece, and in India, or were put on over the faces of the gods' images, as in ancient Mexico. The Greeks, moreover, in their theatrical performances, employed masks shaped to represent the expression of a particular emotion or passion, as rage, grief, sly cunning, &c. These, made of linen, tree-bark, leather, or even wood, had large funnel-shaped mouth-openings, for the purpose of giving the voice of the actor a penetrating sound (whence Lat. *per-sona* = 'a mask'), so that it might be heard all over the vast theatres in which he had to act. Passing on to the Romans, the custom of putting masked actors on the stage was transmitted by them to the Italian theatres of the middle ages; nearly all the actors in the *Commedia dell'Arte* wore masks. The custom was also practised in the

English Masque (q.v.) of Elizabethan and subsequent times. The Masquerade (q.v.) or masked ball is a survival of the same observance; but in them the mask is worn for the purpose of disguising the identity of the wearer, as it was in the case of the Man with the Iron Mask (see IRON MASK).

See Dall, *Masks, Labrets, and Certain Aboriginal Customs* (Washington, 1885); Sand, *Masques et Buffons* (1860); Fioroni, *De Larvis Scenicis* (1754); and A. B. Meyer, *Masken von Neu-Guinea* (1889).

Maskelyne, NEVIL, D.D., F.R.S., astronomer and physicist, inventor of the prismatic micrometer, was born in London, 6th October 1732. From Westminster School he passed to Catharine Hall, and subsequently to Trinity College, Cambridge, where he obtained a fellowship in 1756. In 1758 he was elected a Fellow of the Royal Society, and resolved to devote himself to astronomy. In 1763 he went to Barbadoes for the Board of Longitude to test the newly-invented Harrison chronometers, and after his return was (1765) appointed astronomer-royal. During the forty-six years that he held this office he acquired universal respect by his diligence and the accuracy of his investigations, made several improvements in the arrangements and employment of the instruments, and was the first to mark the time to tenths of a second. In 1774 he visited Schiehallion, Perthshire, to make observations determining the density of the earth in connection with that hill (see EARTH). The first of his very numerous publications was the *British Mariner's Guide* (1763). In 1767 he commenced the *Nautical Almanac*. His *Tables for computing the Places of the Fixed Stars, &c.* were published by the Royal Society in 1774. In 1776 he produced the first volume of the *Astronomical Observations made at the Royal Observatory, Greenwich, from 1665*—an invaluable work still continued. He was rector from 1775 of Shrawardine, Salop, and from 1782 of North Runcton, Norfolk, and died 9th February 1811.

Mason, GEORGE HEMMING, A.R.A., was born in Staffordshire in 1818. He studied for the medical profession, but in 1844 abandoned it and travelled on the Continent studying art till 1858. His best works were 'The Evening Hymn' (1868), 'Girls Dancing by the Sea' (1869), and 'The Harvest Moon' (1872). He died from heart disease on 22d October 1872. His pictures show great pathos and rich effects of colour. Shortly after his death a collection of his pictures was exhibited by the Burlington Club.

Mason, SIR JOSIAH, manufacturer and philanthropist, born at Kidderminster, 23d February 1795, began life by selling cakes on the street, and after turning his hand to various employments took over the split-ring business of Mr Harrison (1822) at Birmingham. He began to make pens in 1829 for Perry & Co., and his business increased till he became the largest pen-maker in the world. Partner with Elkington in the electro-plating trade (1842-65), he gave Dr (afterwards Sir) C. W. Siemens his first start in life by paying him £1600 for a patent; and he paid Krupp, founder of the works at Essen, £10,000 for the patent for machinery to roll the metal 'blanks' from which spoons and forks are made. Mason erected and endowed almshouses, and an orphanage at Erdington, at a cost of £260,000, and was the founder of the Josiah Mason College at Birmingham. He died at Erdington, June 16, 1881. See the *Memoir* by J. T. Bunce (1890).

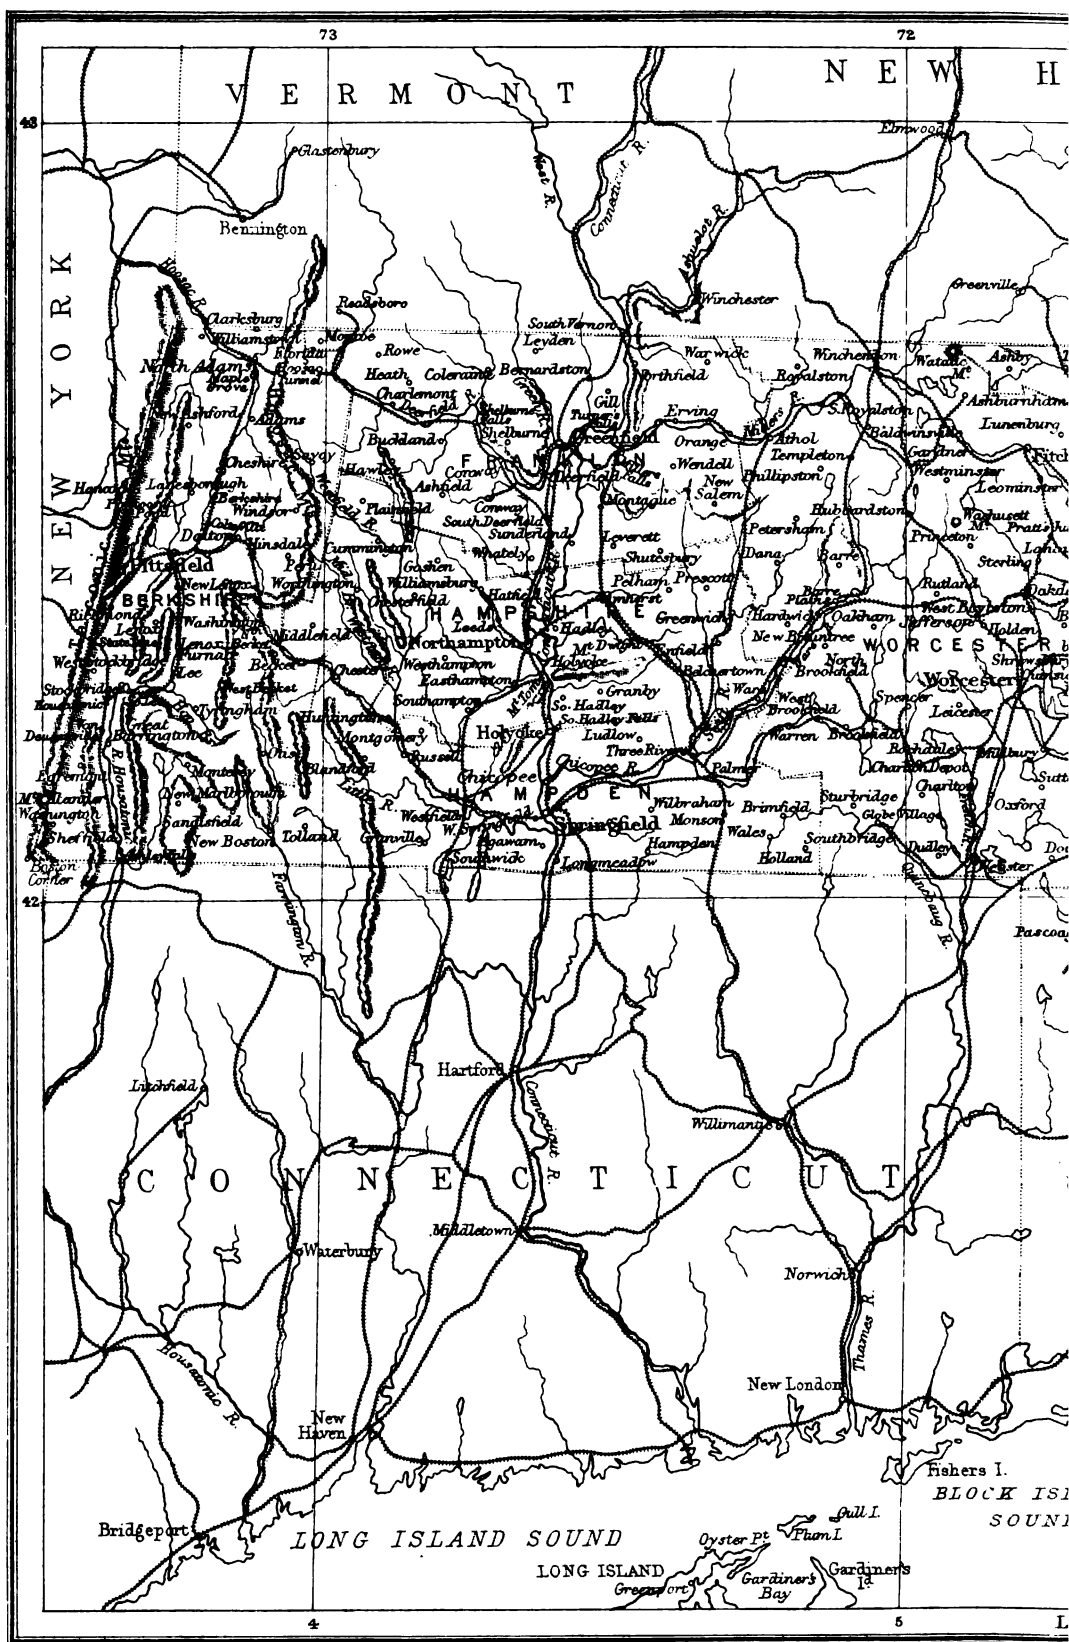

Mason, WILLIAM, minor poet, but more famous as the literary executor of Gray, was born son of a Yorkshire clergyman in 1725, studied at St John's College, Cambridge, graduated B.A. in 1745, and was soon after elected Fellow of Pembroke College

through the influence of Gray, who had been attracted to him by his *Museus* (1747), a poetic lament for the death of Pope (1744), in imitation of *Lycidas*. He published later two absurd but ambitious tragedies, *Elfrida* and *Caractacus*; the *English Garden* (1772-82), a long and tedious poem in blank verse; and the *Memoirs of Gray* in 1775, the serious defects of which have at length been demonstrated to all readers through the painstaking and honest labours of Mr Gosse. Mason took orders in 1754, and became vicar of Ashton, in Yorkshire, and later also precentor and canon of York, where he died 7th April 1797.

Mason and Dixon's Line is popularly supposed to have been a line dividing the slaveholding from the non-slaveholding states, and to have run due east and west. In reality it ran for more than one-third of its length between two slave states, Maryland and Delaware, and a small part of it is an arc of a circle. It was run by two English engineers, Charles Mason and Jeremiah Dixon, between the years 1764 and 1767, for the purpose of settling the disputed boundaries between Maryland on the one side and Pennsylvania and Delaware on the other. Their instructions were to begin at the most easterly point on the Atlantic Ocean, and run due west to a point midway between the Atlantic and the Chesapeake Bay; thence northward, so that the line should become a tangent to the north-western boundary of Delaware, which was a circle described from New Castle Court-house as centre, with a radius of 12 miles. The line was then to follow the curve in a westerly direction until it reached a point due north of the point of tangency; thence due north until it intersected a line run due west from a point 15 miles south of Philadelphia; and thence due west until it intersected a line running due north from the most western source of the Potomac River. The work was done with such skill and accuracy that a revision in 1849, with instruments of much greater precision, disclosed no error of importance.

Masonry, the art of construction in stone. The earliest existing examples are among the most magnificent specimens of the art. No nation has excelled the ancient Egyptians, who did not use mortar in their important structures, such as the pyramids, the joints being all carefully polished and fitted. Cyclopean masonry, of which remains exist in many parts of Greece and Italy, also exhibits stones of great size and with carefully-adjusted joints. The walls of Mycenæ are among the earliest examples. These are built with huge irregular blocks, the spaces between being filled up with smaller stones. The Etruscan specimens are more carefully executed; the stones are not squared, but they are all carefully fitted together. The masonry of the Greeks and Romans very closely resembled that of the present day: *Rubble-work* (*opus incertum*), in which the stones are not regularly coursed; *Coursed-work*, where the joints are all level, and the stones of equal height; *Ashlar*, resembling the latter, but built with larger stones carefully dressed on the joints.

The early medieval masonry was of very bad construction, being, in fact, little better than common rubble, with an occasional use of Herring-bone Work. The Normans improved upon this kind of work, but their masonry was also so bad that many of the towers built by them either fell or had to be taken down. The art gradually improved with the advance of Gothic architecture, and ashlar was re-introduced for all important works. The ashlar-work so constantly used in Renaissance buildings has given place to the hammer-dressed and squared masonry. Special materials sometimes produce special kinds of work; thus, in Norfolk and Suffolk,

PHILADELPHIA: J. B.

where large flints abound, the walls are often faced with these, split so as to form a clean face and good joints, and arranged in bands or panels between stonework or brickwork.

Maspero, GASTON CAMILLE CHARLES, Egyptologist, was born at Paris, of Italian parents, on 23d June 1846. He began to lecture on Egyptology at the School of Higher Studies in Paris in 1869, and in 1873 was appointed professor of Egyptology at the College of France. In 1881 he founded a school of Egyptian archaeology at Cairo, and succeeded Mariette as director of explorations and custodian of the Boulak Museum. In 1886 he became professor at the Institute of Paris. As an explorer he has excavated or opened the pyramids of the kings belonging to the 5th and 6th dynasties, and the burial-fields of Sakkara and Dahshûr, and discovered new sepulchral sites of great value at Deir el-Bahari, near the entrance to the Valley of the Tombs of the Kings, at Ekhmin, 130 miles S. of Thebes, and at other places. His most valuable written work includes the excellent *Histoire Ancienne des Peuples d'Orient* (best ed. 1885); *Guide to the Boulak Museum* (2d ed. 1885); *La Trouvaille de Deyr el-Bahri*; *L'Archéologie Égyptienne* (1887; Eng. trans. 1887); *Contes Populaires de l'Égypte Ancienne* (1882); *Études Égyptiennes* (1879-82); papers in *Recueil de Travaux*, and several other more technical productions.

Masque, a species of dramatic performance, much in vogue in England towards the close of the 16th and the beginning of the 17th century. It was in fact the favourite form of private theatricals at the time. The masque appears to have originated in the practice of introducing, in any solemn or festive processions, men wearing masks, who represented either imaginary or allegorical personages. At first it was simply an 'acted pageant,' as in the well-known progresses of Queen Elizabeth; but gradually it expanded into a regular dramatic entertainment, and in the hands of men like Fletcher and Ben Jonson attained a high degree of literary beauty. Jonson's masques were represented at court, and were greatly relished. The taste for this kind of amusement, however, died away in the reign of Charles I.; nevertheless, to the time of that monarch belongs the finest masque, and one of the most splendid poems ever written—the *Comus* of Milton (1634).

Masquerade, or MASKED BALL, a festive meeting in which the host and guests assume fictitious characters, and disguise themselves more or less for the occasion, the name being derived from the use of the mask. The public *mummeries* of former times, Easter plays, Festivals of Fools, &c., which were frequent in most parts of Europe, but somewhat various in different countries, probably suggested the idea of the masquerade, which, however, was not open to all, according to the well understood rules of these ancient amusements, but was limited to some select class, or to those who paid a certain sum for admission. Catharine de' Medici introduced the regular masquerade at the French court. It found its way to England in the reign of Henry VIII., but did not reach any of the courts of Germany till the end of the 17th century. The *bal costumé* is a very modified and much less objectionable form of the masquerade.

Mass is defined as 'the quantity of matter in a body;' and weight is proportional to mass (see GRAVITATION, MATTER).

Mass. See LITURGY.

Mass, MUSIC OF. Each part of the service of High Mass has its unisonal plain-song melody, varying according to the season or festival; the first collections of these melodies were made by St

Ambrose, and afterwards more completely by St Gregory. But since the invention of counterpoint certain portions have been selected for more elaborate treatment—viz. the *Kyrie*, *Gloria*, *Credo*, *Sanc-tus*, *Benedictus*, and *Agnus Dei*; each of which, but especially the *Credo*, is by common traditional practice divided into separate movements, also designated by the initiatory words. In the early contrapuntal music, a plain-song melody, or even a secular tune, formed the basis on which the whole was constructed, and the mass was named in accordance—e.g. the numerous *Missa L'Homme Armé*, founded on an old French love-song. This appropriation of secular tunes, which could never wholly lose their association with the often objectionable words, anticipates Shakespeare's Puritan 'who sings Psalms to hornpipes,' and the similar practices of recent revivalists. These compositions soon became more remarkable for their learning and ingenuity than appropriateness or reverential feeling; and to such an extent was this abuse carried that the Council of Trent condemned them in no measured terms, and a commission, appointed in 1564 to carry out certain of its decrees, was on the point of entirely forbidding the use in future of polyphonic music in the church, when the production by Palestrina of his world-famous *Missa Papæ Marcelli* convinced the cardinals that such music could be profoundly devotional as well as technically skilful; and its use was allowed to be continued. The succeeding epoch of church music, however, was one of decline; but in the later part of the 17th and commencement of the 18th centuries arose a new school, comprising Alessandro Scarlatti, Leo, and Durante, in whose compositions the introduction of instrumental accompaniment was the most important new feature; one which gave to all subsequent masses the style of the cantata, more individual and dramatic than devotional. In this style also are the stupendous masses of Bach in B minor, Beethoven in D, and Cherubini in D and A. Of less importance, though full of beautiful music, are those of Haydn, Mozart, Weber, Schubert, and Gounod.

The music of the Requiem, or *Missa pro defunctis*, differs of course considerably in its details from that of the ordinary High Mass. The most famous compositions for it are those of Mozart and Cherubini. Brahms' masterpiece, the German Requiem, is not a mass but a sacred cantata on scriptural words.

Massa, distinguished as MASSA DI CARRARA, a city of Northern Italy, 20 miles by rail SE. of Spezia. It is a bishop's see, has a public library, an academy of arts and sciences, a cathedral, and a ducal palace. The inhabitants, 8998 in 1881, rear silkworms, grow tobacco, press oil, make paper, saw timber, and trade in the white marble that all sculptors use.—The province of Massa and Carrara has an area of 648 sq. m., and a pop. (1881) of 169,469; (1889) 186,221. In 1568 the ruling family in Massa were created princes, and in 1664 dukes. The dukedom passed by marriage to the house of Modena-Este in 1741.

Massachusetts, one of the New England states of the American Union, lies between 41° 14' and 42° 53' N. lat., and between 69° 53' and 73° 32' W. long., and has an area of about 8040 sq. m.—larger than Wales. It is irregular in outline, its greatest length being about 182 and its average breadth 47½ miles. It is bounded on the east by Massachusetts Bay, a part of the Atlantic Ocean, from which the state derives its familiar name of the Bay State. The surface is uneven, varying from low plains, near the sea-coast, containing numerous small lakes, to a rolling country in the interior, becoming mountainous as the western boundary is

approached. This mountainous portion is composed of two distinct ranges, being part of the Green Mountains, which here extend southward from the adjacent state of Vermont. The highest of the peaks is Greylock (3505 feet), but most of them are wooded to the summit, and the scenery, while not grand, is of great beauty. The soil is in many portions, particularly in the east, rocky and sterile, and the state contains several quarries of importance yielding granite and syenite, red sandstone, and valuable marble. Along the river-valleys, however, and in certain other sections the soil is fertile. The value of farm products for the census year 1885 was \$47,756,033; of which \$13,080,526 was for dairy products, \$11,631,776 for hay and fodder, \$5,227,194 for vegetables, \$5,446,243 for animals and poultry, \$1,855,145 for cereals. The woodland in the state aggregated 1,389,502 acres.

The rivers, while not important for navigation, are the source of valuable water-power which has been utilised in manufacturing, in the annual output of which the state leads all others, except New York and Pennsylvania. The total number of establishments engaged in manufacturing and allied industries in 1885 was 23,431; the capital invested being \$500,594,377; stock used, \$389,757,458; value of goods made and work done, \$674,634,269; number of persons employed, 379,328; total wages paid during the year, \$147,415,316. The chief manufactures are textiles, boots and shoes, food preparations, building materials, clothing, iron and other metallic goods, leather, wooden wares, &c. The leading textile industries are cotton (165 establishments, 5,133,325 spindles), woollen (189 establishments), and worsted goods (23 establishments). In 1889 there were 3869 miles of railway in the state.

Massachusetts contains fourteen counties and returns 12 members to congress. The state senate consists of 40, the House of Representatives of 240 members. The executive branch of the government is vested in the governor, who is officially styled the governor of the commonwealth of Massachusetts, and whose title is His Excellency; lieutenant-governor, whose title is His Honour; and an advisory council consisting of eight members chosen by districts. The governor, lieutenant-governor, and heads of the executive departments are elected annually. The cities of the commonwealth must have a population of at least 12,000. The towns (corporate bodies having less than 12,000 pop.) are governed by a board of selectmen elected by popular suffrage in an annual town meeting of all the voters in the town, which meeting also makes appropriations for the maintenance of the different departments of the town government. All judges in the commonwealth are appointed by the governor with the advice and consent of the council, and hold their office during good behaviour. The active state militia in 1890 numbered 380 officers and 4751 enlisted men, a total of 5131. Besides this active militia all able-bodied male citizens between the ages of eighteen and forty-five, except exempt persons, are enrolled, and subject to military duty in time of exigency. The number so enrolled on 1st January 1890 was 325,185.

Popular education in Massachusetts, through the system of free public schools, is carried to a very high point. In 1888-89 there were in the cities and towns 7023 public, primary, and grammar schools, and 236 high schools. These are supported at public expense by taxation—tuition and text-books being free. Besides these there were 485 academies and private schools. The amount raised by taxation and paid for all school purposes was \$7,350,604, the average attendance being 270,851. Massachusetts maintains six normal schools, and there are in the state two technical institutes and twelve colleges and universities, the latter

including Harvard, Williams College, Amherst College, and Boston University and College. The savings-bank system is under state supervision. In 1889 there were 177 such banks in operation, having deposits amounting to \$332,723,688; besides 93 co-operative banks or building loan associations, with assets of \$1,601,639.

The leading cities of Massachusetts, with pop. in 1890, are Boston, the chief seaport and capital (448,477); Worcester (84,655), with manufactures in metals and machinery; Springfield (44,179) and Holyoke (35,637), on the Connecticut River, the centre of the paper manufacture; Fall River (74,398), Lowell (77,696), and Lawrence (44,654), devoted to cotton manufacturing; Lynn (55,727), Haverhill, (27,412), and Brockton (27,294), boot and shoe centres; Salem (30,801) and New Bedford (40,733), both noted seaports of former days and now possessing extensive cotton-mills; Taunton (25,448), with varied manufactures; Gloucester (21,651), noted for its fisheries; and Cambridge (70,028), near Boston, the seat of Harvard University. The state debt, January 1, 1890, was \$28,251,288, protected by a sinking fund of \$21,015,939. The aggregate valuation in the cities and towns for purposes of taxation, May 1, 1889, was \$2,072,170,863. Pop. (1800) 422,845; (1850) 994,514; (1880) 1,783,085; (1890) 2,238,943.

History.—The coast is supposed to have been visited by Northmen about the year 1000, but the first permanent settlement was made at Plymouth, near Cape Cod, December 22, 1620, by the company of the Pilgrim Fathers (q.v.), who were separatists from the English Church, and who sailed from Plymouth, England, in the ship *Mayflower*. This settlement became the nucleus of the Plymouth colony. In 1628 a company of Puritans under Endicott settled at Salem upon the coast farther north, and, together with settlements at Boston, Lynn, and elsewhere, became the Massachusetts Bay Colony. The union of these two colonies was accomplished under a new charter granted in 1692. Under this last charter the governor, lieutenant-governor, and secretary were appointed by the king. Prior to this none but the Puritan forms of religion had been permitted in the colony of Massachusetts, and its history had been marked by bitter intolerance and cruel persecutions. Now a system was adopted under which the majority of each town or parish chose the minister, who was maintained by the taxes paid by all alike. No consideration was shown to the minorities, and the old Puritan establishment was virtually continued nearly everywhere. The last vestiges of this union between church and state were not swept away until 1833.

During the early years the colonists suffered great privations from the rigours of the climate, and they were also subjected to troubles with the Indians. They were, however, a hardy and industrious race, and gradually grew in numbers and prosperity. They were involved in the difficulties between England and France in the New World, and in the expeditions against the French in Canada, especially at the first siege of Louisburg (q.v.), the citizen soldiers of Massachusetts performed effective service. After the war of the revolution, begun in Massachusetts in 1776 with the battles at Lexington and Bunker Hill, the colony became one of the original thirteen states of the Union, under the name of the commonwealth of Massachusetts. The second half of the 19th century has witnessed the gradual change of Massachusetts from a purely agricultural to a manufacturing state, until now a majority of the whole population is urban; not, however, because less land is cultivated, but simply because manufactures have increased much faster than agriculture. See J. S. Barry, *History of Massachusetts* (3 vols. 1855-57).

Massafra, a town of the Italian province of Lecce, 11 miles by rail NW. of Taranto. The 9463 inhabitants grow olives, wine, and fruits.

Massage (Fr., 'kneading') is the term used in medicine to denote a system of treatment in which the manipulation and exercise of parts ('passive movement') are employed for the relief of morbid conditions. The term is used in an elastic sense, and comprises a variety of forms of treatment extending in the one direction towards the composite gymnastic exercises of Swedish origin (see SLOYD), so useful in favouring a sound physical development in children, and in the other towards the jerking and wrenching movements, empirically employed, and familiar in Great Britain under the name of 'bonesetting.' For the most part, however, massage corresponds to the application of kneading, stroking, and rubbing, separately or combined with each other.

Massage is as old as, if not older than, any other form of medical treatment. Hippocrates (600 B.C.), the 'Father of Medicine,' has left in his writings a description of its application and uses; observing that 'it loosens stiff joints and gives tone and strength to those which are relaxed;' further, that 'it must be applied with soft hands and in all cases delicately.' In the Greek world, and also in the Roman (cf. Lytton's *Last Days of Pompeii*), massage formed a necessary complement to the toilet of the bath; but, apart from the slaves who were specially trained for such duties, there appears to have been a regular profession of 'rubbers' competing with, and often superseding the physicians of the period. The Chinese and the early races of India seem to have known the value of massage from a remote period, for it is frequently referred to in the ancient writings of both peoples. During the dark ages this method of treatment seems to have fallen into disrepute in Europe; and it is only within the later half of the 19th century that its practice has been thoroughly re-established, and that on a scientific basis. It is largely due to Dr Mezger, a physician of Amsterdam, that massage has become once more a systematised mode of medical treatment. He began to treat sprains by this method in 1853, and from that time to the present his system has attracted much attention, and has spread widely over the European and American continents.

Two chief methods of application are employed: (1) Stroking, or rubbing with a gliding movement, affecting chiefly the superficial parts (*effleurage*). (2) Pressing, tapping, or kneading, affecting chiefly the deeper tissues, and in one locality at a time (*tapotement*). To these may be added an important combination of the two, viz.: (3) Friction with kneading (*pétrissage*), in which the tissues are at the same time rubbed longitudinally and squeezed laterally, both superficial and deeper tissues being thereby equally affected. In applying these methods the hand and fingers of the manipulator alone are used. As a rule, if the hands are soft and moist no emollient substance is required, and the best effects are produced without such aid. In all cases the movements follow a direction towards the trunk. In stroking (*effleurage*) the finger-tips pass first lightly over the affected surface, followed by the outspread palm of the hand, which exerts a slightly firmer pressure. In tapping (*tapotement*) the finger-tips, the knuckles, or the edges of the palm are firmly thrust against the affected areas, so as to act chiefly on the deeper tissues, by compressing them firmly against the bony framework of the part. In friction (*pétrissage*) the tissues are grasped and raised between the fingers and thumbs, and slightly compressed laterally as well as longi-

tudinally as the manipulator's hands pass upwards over the part. The total time taken up in the application of one of these methods, or in a combination of any of them, should not exceed twenty minutes, and as a rule one such *séance* is sufficient in the twenty-four hours.

The chief vital effects produced by massage are soothing of pain by reduction of the sensibility of the nerves of the skin; an acceleration in the circulation both of blood and lymph in the parts operated on; and, as a result of this, increased nutrition of healthy tissues and accelerated removal of morbid products. General and local applications of massage are practised in medicine; the former when some general corporeal effect is aimed at, as in nervous emaciation, narcotic poisoning, and in the treatment of the apparently drowned; the latter, in local injuries, as sprains and bruises, and in local manifestations of constitutional conditions, as rheumatic joint affections, neuralgia, tic, and sciatica. In purely local joint and bone diseases it is, however, as a rule inapplicable and likely to do harm. See D. Graham, *Massage: History and Application* (New York, 1889).

Massagetae, a wild and warlike people, who inhabited the broad steppes on the north-east of the Caspian Sea, to the northward of the river Araxes or Jaxartes. Herodotus says that they had a community of wives; that they sacrificed and devoured their aged people; that they worshipped the sun, and offered horses to him; that they lived on the milk and flesh of their herds, and on fish, and fought on horseback and on foot with lance, bow, and double-edged axe. Cyrus is said to have lost his life in fighting against them, 530 B.C.

Masséna, ANDRÉ, Duke of Rivoli, Prince of Essling, and the greatest of all Napoleon's marshals, was born at Nice, it is said of Jewish origin, 6th May 1758. He began life as a cabin-boy, and served fourteen years in the Sardinian army, but left it because his plebeian birth precluded him from promotion. Early in the French Revolution he joined a battalion of volunteers, and rose rapidly in rank, becoming in December 1793 a general of division. He distinguished himself greatly in the campaigns in Upper Italy, especially at Saorgio (1794), Loano (1795), and Rivoli (1797), and earned from his chief his famous surname of *enfant chéri de la victoire*. After Jourdan's defeat at Stockach (25th March 1799) the chief command of the army in Switzerland devolved upon him in circumstances of great difficulty, but he kept his ground against the Archduke Charles, and finally by his crushing victory over Suvaroff's Russians at Zurich (25th September 1799) freed France from the danger of invasion. In 1804 Napoleon made him a marshal of the empire, and next gave him the command of the army of Italy. He kept the Archduke Charles in check, crushed him at Caldiero, and overran Naples. In 1807, after the battle of Eylau, he commanded the right wing of the French army, and at the end of the campaign was created Duke of Rivoli. During the peace he lost his left eye by accident at a hunting-party. In the campaign of 1809 against Austria he commanded on the right bank of the Danube, and covered himself with glory at Landshut, Eckmühl, and Ebersberg-on-Traun. On the second day of the battle at Aspern or Essling (22d May), with the most conspicuous bravery he covered the army in its crossing the Danube, and alone saved it from destruction, earning for himself the title of Prince of Essling. In 1810 he was sent to Spain to drive the English into the sea, and he compelled Wellington to fall back upon his impregnable lines at Torres Vedras. Finding it impossible to obtain any advantage, and harassed by lack of supplies, he

made a masterly retreat, to find himself recalled with ignominy by his imperious master. His failure he himself ascribed to the disobedience of his subordinates, Ney and Junot. He offered his services, however, again, when Napoleon was preparing for the Russian campaign, but was entrusted only with the command in Provence, and in this position he remained till the Restoration, when he gave in his adhesion to the Bourbons, and was made a peer. On Napoleon's return from Elba he invited Masséna to follow him, but received no response. He refused to sit on Ney's court-martial, and denounced the competence of the court. He died 4th April 1817, and was buried in Père-la-Chaise with the one word *Masséna* on his tombstone. In tactics Masséna resembled his master in quickness and fertility in resource. He was brave and indefatigable in the field, but as extortionate as a Roman prætor. His *Mémoires* were edited by General Koch (7 vols. 1849-50), and there is a *Life* by Toselli (1869).

Massenet, JULES, French musical composer, was born at Montaud, near St Etienne, on 12th May 1842, and after a most successful career as a student at the Paris conservatory, chiefly under Ambrose Thomas, he was appointed professor of Composition at that institution in 1878. He won the *Prix de Rome* in 1863, was favourably received as the composer of meritorious orchestral works and a comic opera, *La Grande Tante* (1867), before the Franco-Prussian war, and in 1873 took his place amongst the foremost of the younger composers of France, his fame being established by the comic opera *Don César de Bazan* (1872), the classical opera *Les Erinnyes* (1873), and the oratorio *Marie Madeleine* (1873). These were followed by the oratorios *Eve* (1875) and *Vierge* (1879), the great operas *Roi de Lahore* (1877), *Hérodiade* (1881), *Manon Lescaut* (1884), and *Esclarmonde* (1889), besides numerous pianoforte and orchestral pieces.

Massillon, JEAN BAPTISTE, one of the most distinguished of modern orators, was born at Hyeres in Provence, 24th June 1663. His father was a notary and had designed him for his own profession, but at length in 1681 the boy obtained permission to follow his vocation and enter the congregation of the Oratory. Later he subjected himself to a more rigorous discipline in the abbey of Sept-Fonts. His preaching power was soon discovered, and his funeral oration on M. Villars, the Archbishop of Vienne, established his fame, and led to his being summoned by Cardinal de Noailles to Paris, where he first had the opportunity of hearing Bourdaloue, whose style and manner powerfully influenced the young orator. It is said that the older preacher said when first he heard him, 'He must increase, but I must decrease.' Like Bourdaloue, he avoided the declamatory manner and theatrical action then popular in the French pulpit; and the earnest impressiveness of his face and voice more than counterbalanced the lack of such adventitious aids to effect. He gave a remarkable series of lectures in the seminary of St Magloire, and first preached before Louis XIV. in Advent 1699. It was to him that the king said, 'I have heard great orators in my chapel and have felt satisfied with them, but every time I have heard you I have felt dissatisfied with myself'—a saying which well expresses the characteristics of the fearless eloquence of this great orator, who, more than any of his contemporaries, was able to lay bare the secret springs of human action, and to use the feelings and the passions of his audience as arms against themselves. He was again appointed to preach the Lent at Versailles in 1704; but although the king was again equally warm in his admiration, Massillon was never after-

wards invited to preach in his presence. In 1717 Massillon was named Bishop of Clermont, and next year preached before the young king, Louis XV., his celebrated *Petit Carême*—a series of ten short Lenten sermons. It was not till 1719 that he was consecrated Bishop of Clermont, in which year also he was elected a member of the Academy; and in 1723 he preached the funeral oration of the Duchess of Orleans, his last public discourse in Paris. From this time he lived almost entirely for his diocese, where his charity and gentleness gained him the love of all. He died of apoplexy, 28th September 1742. Bossuet and Bourdaloue contest with Massillon the palm of oratory, yet it is not too much to say that he was a greater preacher than either. By French critics he has been termed the Racine of the pulpit, and the name may pass as regards the purity and elegance of Massillon's language, though it takes no count of his characteristic directness and vigour. For impassioned denunciation of vice marks his preaching, no less than gentle persuasiveness to virtue, although it remains true that he is greatest in the latter. His sermons on the Prodigal Son, on the Deaths of the Just and the Unjust, for Christmas, and for the Fourth Sunday in Advent may be named among his masterpieces.

His sermons were collected by his nephew (15 vols. 1745-48); later editions are those of Renouard (1810), the Abbé Guillon (16 vols. 1828), and Blampignon (4 vols. 1886). See Sainte-Beuve's *Causeries du Lundi*, vol. ix.

Massinger, PHILIP, dramatist, baptised at St Thomas's, Salisbury, 24th November 1583, was a son of Arthur Massinger, a retainer of the Earl of Pembroke. In a dedicatory epistle to Philip Herbert, Earl of Montgomery, prefixed to *The Bondman* (1624), he mentions that his father spent many years in the service of the Herbert family, 'and died a servant to it.' On 14th May 1602 Massinger entered St Alban's Hall, Oxford, and he left the university without a degree in 1606. Gifford supposed that during his residence at Oxford he became a convert to the Roman Catholic faith; and the plays afford some evidence in support of this view.

Massinger was writing for the theatre during the lifetime of the stage-manager Philip Henslowe, who died in January 1615-16. At Dulwich College is preserved an undated letter (*circa* 1613-14) to Henslowe from Nathaniel Field, Daborn, and Massinger. The three playwrights were in financial distress and begged for an advance of five pounds ('without which we cannot be bailed') on a play which they were preparing. Their petition was granted. On 4th July 1615 Daborn and Massinger borrowed from Henslowe the sum of three pounds. In later years Massinger wrote many plays single-handed; but much of his work is mixed up with the work of other men, particularly Fletcher. His friend Sir Aston Cokayne, in an 'Epitaph on Mr John Fletcher and Mr Philip Massinger,' expressly states, 'Plays they did write together, were great friends.' Beaumont had a share in only a few of the plays ascribed to 'Beaumont and Fletcher;' but Massinger and Fletcher continued to work together long after Beaumont's death. Fletcher was buried in St Saviour's Church, Southwark, 29th August 1625; and Massinger was laid in the same grave, 18th March 1638-39.

Probably the earliest of Massinger's extant plays is *The Unnatural Combat*, a repulsive tragedy, printed in 1639. The first in order of publication is *The Virgin Martyr* (1622), partly written by Dekker, who doubtless contributed the beautiful colloquy between Dorothea and Angelo (II. i.). In 1623 was published *The Duke of Milan*, a fine tragedy, but too rhetorical. *The Bondman*, *The*

Renegado, and *The Parliament of Love* were licensed for the stage between 3d December 1623 and 3d November 1624. In many of his plays Massinger introduces political allusions, and more than once his temerity was rebuked by Sir Henry Herbert, Master of the Revels. *The Bondman* contains some outspoken criticism on the feeble condition of the navy. There is considerable resemblance between *The Parliament of Love*, which was first printed by Gifford from a mutilated MS., and *A Cure for a Cuckold*, ascribed to Webster and Rowley (but not improbably the work of Massinger and Rowley). Of *The Roman Actor*, produced in 1626 and printed in 1629, Massinger declares 'I ever held it the most perfect birth of my Minerva.' It abounds in eloquent declamation, but is somewhat stiff. *The Great Duke of Florence*, produced on 5th July 1627, has a delightful love-story. Massinger's female characters are usually unattractive and sometimes odious; but in this comedy he has drawn a charming heroine—a modest, frank, warm-hearted girl. *The Maid of Honour*, published in 1632 and probably produced in 1628, is—like *The Bondman*—full of political allusions (as Professor S. R. Gardiner has shown, *Contemporary Review*, August 1876). *The Picture*, licensed for the stage 8th June 1629, and printed in 1630, has an improbable plot, but is well written. *The Emperor of the East*, produced in 1631 and printed in 1632, bears some resemblance to *The Duke of Milan*. In both plays a man of passionate, ungovernable temper unjustly suspects his wife of infidelity; but *The Emperor of the East* ends happily. Nathaniel Field joined Massinger in writing the fine tragedy *The Fatal Dowry*, printed in 1632, but produced some years earlier. From this play Rowe's once-famous *Fair Penitent* was largely drawn, without acknowledgment. *The City Madam*, licensed for the stage in 1632, and *A New Way to pay Old Debts*, printed in 1633, are Massinger's most masterly comedies. There is no warmth or geniality about them; but, as satirical studies, they have Ben Jonson's strength without his ponderousness. *A New Way* has held the stage down to recent times. Sir Giles Mompesson, the infamous extortioner, is supposed to have been the original of Sir Giles Overreach, a character which has been personated by many famous actors. *The Guardian* (1633), *A Very Woman* (1634), and *The Bashful Lover* (1636) were printed together, 1 vol., in 1655. The most interesting is *A Very Woman*, which is Fletcher's play *The Woman's Plot* revised by Massinger. *Believe as You List*, produced on 7th May 1631, and first printed from MS. in 1844, relates to the adventurer who at the beginning of the 17th century claimed to be the Don Sebastian killed in 1578 at the battle of Alcazar. Massinger represents the claimant as a model of kingly dignity, worthy to rank with Ford's Perkin Warbeck. Though *Believe as You List* has survived, several other MS. plays of Massinger were destroyed by Warburton's cook towards the close of the 18th century. The powerful and stately *Tragedy of Sir John Van Olden Barnavelt*, produced in August 1619, written by Massinger and Fletcher, was printed for the first time from MS. in vol. ii. of Bullen's *Old Plays* (First Series), and was reprinted in Holland. In spite of the Lord Mayor's prohibition it was acted with applause by the king's men.

Massinger showed great care and skill in the construction of his plays. Other playwrights affect us more powerfully, but few can compare with Massinger for general excellence. He was not only a sincere, high-minded artist, but a keen observer of state affairs. Hence his writings have a historical as well as a literary interest. Some of his plays are (as Coleridge said) as interesting as a novel;

others are as solid as a treatise on political philosophy. His versification is peculiar. He seems to have taken the metrical style of Shakespeare's latest plays as his model; but his verse, though it is fluent and flexible, lacks the music and magic of Shakespeare's. No writer repeats himself more frequently than Massinger; he had a set of favourite phrases that he constantly introduces. This trick of repetition, joined to his metrical mannerisms, helps us materially to distinguish his work from Fletcher's. Mr Robert Boyle (in papers contributed to *Englische Studien*) and Mr F. G. Fleay have discussed the difficult question how far Massinger was concerned in the authorship of plays that pass under the name of 'Beaumont and Fletcher.'

Massinger's plays were edited by William Gifford in 1808, 4 vols.; 2d ed. 1816. There is also an edition in the volume (from the text of Gifford) by the late Lieutenant-colonel Cunningham. Two volumes of selected plays, edited by Mr Arthur Symonds, are included in the 'Mermaid' series. See S. R. Gardiner, 'The Political Element in Massinger' in *Cont. Rev.* 1876.

Masson, DAVID, an eminent Scottish author, born at Aberdeen, 2d December 1822, educated at Marischal College in that city, and at the university of Edinburgh. At nineteen he became editor of a Scotch provincial paper, and later joined the literary staff of W. & R. Chambers. In 1847 he settled in London, writing for the reviews, the *Encyclopædia Britannica*, and the *English Encyclopædia*. In 1852 he succeeded Clough in the chair of English Literature in University College, and held it till his appointment in 1865 as professor of Rhetoric and English Literature in the university of Edinburgh. Masson edited *Macmillan's Magazine* from 1859 to 1868. His first published work was his *Essays, Biographical and Critical* (1856), reprinted with later essays in 3 vols. (1874-76) entitled respectively *Wordsworth, Shelley, and Keats; The Three Devils—Luther's, Milton's, and Goethe's; and Chatterton, a Story of the Year 1770*. His great work is his ponderous *Life of John Milton, narrated in connection with the Political, Ecclesiastical, and Literary History of his Time* (6 vols. 1859-80), the most complete biography of any Englishman, and of great value for the contemporary history. Other works are *British Novelists and their Styles* (1859); *Recent British Philosophy* (1865); *Drummond of Hawthornden: the Story of his Life and Writings* (1873); the 'Cambridge' edition of *Milton*, with introductions, notes, and an essay on Milton's English (3 vols. 1874; new ed. 1890), the 'Golden Treasury' edition (2 vols. 1874), and the 'Globe' edition (1877). Later works are an excellent study on *De Quincey* (1878) in the 'English Men of Letters' series, and a new edition of *De Quincey's works* in 14 volumes (1889-91). He was Rhind lecturer in 1885, and after 1879 he edited the *Register* of the Privy-council of Scotland, contributing the introductions to the volumes.

Massorah, or MASORA ('tradition'), a collection of critical notes on the text of the Old Testament, its divisions, accents, vowels, grammatical forms, and letters (see HEBREW LANGUAGE, Vol. V. p. 614). There can hardly be a doubt that the Massorah, like the Halacha and Haggada, was the work, not of one age or century, but of many ages and centuries, as, indeed, we find in ancient authorities mention made of different systems of accentuation used in Tiberias, Babylon (Assyria), and Palestine. It was in Tiberias also that the Massorah was first committed to writing between the 6th and 9th century A.D. Monographs, memorial verses, and glosses on the margins of the text seem to have been the earliest forms of the written Massorah, which gradually expanded into one of the most elaborate and minute systems, laid down in the

'Great Massorah' (about the 11th century), whence an extract was made known under the name of the 'Small Massorah.' The final arrangement of the Massorah, which was first printed in Bomberg's Rabbinical Bible (Venice, 1525), is due to Jacobben-Chayim of Tunis, and to Felix Pratensis. The language of the Massoretic writers is Chaldee, and the obscure abbreviations, contractions, symbolical signs, &c., with which the work abounds, render its study exceedingly hard. Nor are all its dicta of the same sterling value; they are not only sometimes utterly superfluous, but downright erroneous. See Dr Ginsburg's great work on the Massorah (4 vols. folio, 1880-86).

Massowah, or MASSAUA, a town built on a coral island off the west coast of the Red Sea, in 15° 36' N. lat., 39° 28' E. long. It was seized by Turkey in 1557, but in 1866 given by her to Egypt; and in 1885 it was occupied by Italy. The island is only about 1½ mile in circumference, and is connected with the mainland by a causeway, 1610 yards in length, resting on an intervening island. The pop. number 16,350, of whom 15,000 are natives, 500 Italians, 700 Greeks, and 100 Banyans. Fishing for pearls and mother-of-pearl is the principal industry, but there is also a little fishing and weaving of palm-fibres. Next after Suakin, Massowah is the most important harbour and trading-port on the African coast of the Red Sea. Its imports (cottons, chemical products, animals, grain and flour, groceries, spirits, hides, and timber) are valued at £412,000 annually, and its exports (pearls and mother-of-pearl) at £32,000. Skins, gums, ivory, wax, and gold are also exported, but their annual value cannot be stated. Massowah is very hot (mean of the year, 85·8° F.) and very unhealthy; nevertheless the advantages of its site have led the Italians to make it their headquarters in this part of Africa. Pop. of the district of Massowah, 65,500.

Master, in the royal navy, was an officer ranking with, but junior to, lieutenants, and charged with the details of sailing the vessel, under the general orders of the captain. In recent years the title has been changed to 'navigating lieutenant.' In the merchant navy the master of a vessel, usually, by courtesy, denominated the captain, is the officer commanding her.

Master and Servant. The relation of master and servant is constituted in Great Britain entirely by contract; for, there being no status of slavery recognised in law, one person can only serve another with his or her own free consent. Being a mere contract, it may, like other contracts, be broken at will, subject only to the usual consequence, that the party in the wrong is liable to pay damages for the breach. The engagement or hiring of a servant may be either verbal or in writing; but if the engagement is for more than one year it must be in writing. A servant undertakes to have competent skill for the duties of the service, and is bound to use due diligence, and to conduct himself respectfully. He is bound to obey all lawful orders of his master during the engagement, if they are within the scope of the particular service for which he is engaged. Thus, a coachman is not bound to do the duties of a cook, and *vice versa*. Every servant is bound to take due care of his master's property, and is liable to an action at the suit of his master for gross negligence, and also for fraud and misfeasance. A master is not entitled to chastise a servant, whatever the age of the servant may be, though, in the case of an apprentice under age, a moderate chastisement is justifiable. The grounds on which a servant may be lawfully discharged are wilful disobedience, gross immorality, habitual negligence, and incompetence.

If any person entice away a servant, and thereby cause loss to the master, the latter may sue such person for the injury. If the servant is a female, and is seduced, and thereby is unable to continue her service, the master may also bring an action against the seducer for any loss of service caused thereby; and on the same principle a master may bring an action against a third party who causes personal injury to the servant. In the case of the bankruptcy of the master a preference is given to the servant's wages if due and unpaid; but this extends only to two months' wages, and the servant is an ordinary creditor for the balance beyond that sum. The death of the master is a discharge of the contract. When a servant falls sick the master is not bound to provide medical attendance whether the servant lives under his roof or not; but, as in such cases a doctor is often sent for by the master without any understanding between the parties, the master is frequently made liable on the ground that the doctor was sent for by and gave credit to the master. As a general rule, the servant takes the risk of all the ordinary accidents attending the particular service; but under the Employers' Liability Act of 1880 a workman, or, if the injury results in death, his legal personal representatives, shall have the same right of compensation and remedies against the employer as if he had not been in the employer's service, in the following cases: If the workman suffer injury by reason of defect in the employer's works or machinery or plant; by the negligence of any other superior workman; by the negligence of any other servant in charge of locomotives or signal-points (see LIABILITY OF EMPLOYERS). Where a servant injures a third party the rule remains that the master is liable, if the servant at the time was acting within the scope of the master's orders, expressed or implied. Hence, if a coachman carelessly run down a person on the highway, or do injury to another, the master is liable; but if the coachman is driving the master's carriage without or contrary to the orders of the master, the servant alone is liable. So the master is not in any way responsible for the crimes or criminal offences committed by his servant; yet sometimes he is involved in fines. The above are the general rules as regards servants generally; but in England there is a distinction in many instances observed between domestic servants and other servants. The leading distinction is that, if nothing is said as to the length of service, it is presumed that the service can be terminated at any time, on giving a month's notice on either side, or in case of the discharge of a domestic servant without notice, then on payment of a month's wages. It is often popularly thought that a domestic servant cannot be turned out of the master's house at a moment's notice, even on paying a month's wages, but this can always be done, with or without cause. If a yearly servant wrongfully quit his master's service he forfeits all claim to wages for the part of the year during which he has served. In case of discharge without cause the servant is entitled to a month's wages, but not board-wages. The master's responsibility as to giving a Character to a Servant is the subject of an article; see also EARNEST.

In general, a servant, if he refuse to enter the service, or leave it without cause, is merely liable to an action of damages for breach of contract, which is no remedy at all, as few servants could pay the costs of a suit. As this conduct, however, might often cause great hardship to masters, especially where they are employed in trade or manufactures, statutes have been passed which give a power to justices of the peace to compel the servant to remain in the service until he give the legal notice to leave. This was formerly done by

panishing by imprisonment the servant who left the service without just cause. This law, complained of by workmen as one-sided, was modified by statutes, the regulations of which are now embodied in the Employers and Workmen Act, 1875, and the Conspiracy and Protection of Property Act, 1875. These acts give the county courts special powers with regard to the settlement of disputes between employers and workmen, and provide that a combination of two or more persons cannot be indicted for conspiracy to do what would not be criminal if done by one only. Workmen employed by gas and water companies are liable on breach of their contract to fine or imprisonment. The law of the United States does not recognise a distinction between domestic and other servants.

In Scotland the law as to master and servant differs from the above in several particulars, of which the following are the most important. With regard to domestic servants, in towns, if nothing is said, then the hiring is for half a year, and cannot be put an end to without forty days' warning before the end of the half year; and if the servant is dismissed without just cause, he or she can claim not only wages but board-wages till the end of the term. In case of the master's death the servant can claim wages for the whole of the current term, but is bound in that case to serve the executors, or look out for another situation. In case of the master's bankruptcy the servant is a privileged debtor for the wages of the current term. In most other respects the law as to servants is the same as in England. See C. M. Smith's *Law of Master and Servant* (4th ed. 1885).

Master of Arts (abbreviated M.A., and sometimes, particularly in America, A.M.) is a degree conferred by universities and some colleges. In the universities of England this title follows that of Bachelor (q.v.). The dignity of Master (*Magister artium liberalium*) was held in high esteem in the middle ages. In Germany it is now obsolete, having been superseded by that of doctor. A Master has the right to vote in congregation or convocation at Oxford, and in the senate at Cambridge, and consequently enjoys the university franchise; in the Scottish universities all Masters are members of the General Council, and as such elect the parliamentary representatives for the university. See DEGREES.

Master of Ceremonies, of the Rolls, &c. See CEREMONIES, ROLLS, &c.

Masterwort (*Peucedanum Ostruthium*), a perennial herb of the natural order Umbelliferae. It is a native of the north of Europe and the north of America, and is found in moist pastures in some parts of Britain, but apparently naturalised rather than indigenous, its root having formerly been much cultivated as a potherb, and held in great repute as a stomachic, sudorific, diuretic, &c. The root has a pungent taste, causes a flow of saliva and a sensation of warmth in the mouth, and often affords relief in toothache. *Astrantia major*, a herb belonging to the same natural order and having similar properties, is also named Masterwort.

Mastic, a species of gum-resin yielded by the Mastic or Lentisk tree (*Pistacia lentiscus*, natural order Terebinthaceae). It oozes from cuts made in the bark, and hardens on the stem in small round tear-like lumps of a light straw colour, or, if not collected in time, it falls on the ground; in the latter state it acquires some impurities, and is consequently less valuable. The chief use of this gum-resin is in making the almost colourless varnish for varnishing prints, maps, drawings, &c. It is also used by dentists for stopping hollow teeth, and was formerly employed in medicine. It is imported in

small quantities, chiefly from the Morocco coast, but some is brought from the south of Europe and the Aegean.—The name of mastic is also given to oleaginous cements, composed of about 7 parts of litharge and 93 of burned clay, reduced to fine powder, made into a paste with linseed-oil.

Mastiff. The characteristics of the mastiff group of dogs are very marked and constant. One variety of the breed has been known from ancient times as the English, another as the Bordeaux or mastiff of Gaul. These may be classed as the European, while another kind is the Asiatic, of which the Tibetan is perhaps the most typical. No group of domestic dogs has more appearance of being an original and distinct species, although the English mastiff has been crossed and recrossed from time to time, principally with the object of increasing the size; and, while the blood of the Asiatic variety was very probably introduced at an early date, subsequently crosses with the Alpine mastiff, the St Bernard, the boarhound, and the bulldog have undoubtedly been introduced, and the modern English mastiff must be regarded as a composite breed.

The English mastiff is thick-set and powerful, with a large head and broad, short, truncated muzzle, large, thick, pendulous lips, ears formerly often semi-erect, now hanging and of moderate size, smooth-coated, with frequently a full but not bushy tail. This variety formerly averaged from 25 to 28

English Mastiff ('Beaufort,' 1887).

inches at shoulder, but during the last half of the 19th century, owing to repeated crossing and selection, an average of from 30 to 32 inches at shoulder has been obtained, perhaps somewhat to the loss of muscular power and activity. The colours are all shades of fawn, tan, and black, with and without mixture of white. Formerly red and brindle were the commonest colours, but owing to selection fawn in all shades is now the most prevalent, with the muzzle, ears, and other extremities shaded with black or darker markings.

The mastiff was formerly very courageous, and would readily attack the lion or bear; now it is chiefly valued for exhibition purposes, and £70 is not an outside price for a really typical specimen. As a companion or watch-dog no other variety equals it, for, while faithfully protecting the property entrusted to it (at times with marvellous sagacity and discrimination), it has the additional merit of generally refraining from the infliction of personal injury on the invader, unless aggravatingly provoked. It becomes ardently and instinctively attached to its master, although not demonstratively affectionate. It has an excellent nose, but is of little or no use for sporting purposes, and dull at learning any kind of tricks.

The mastiff of Tibet was larger than the old English, but is smaller than the modern English

mastiff, averaging from 27 to 30 inches at shoulder. The head is longer, narrower, and more elevated at the back or cone, the skin much looser, and forming a fold from the eyebrows which descends to the lips, these being more pendulous than in the English variety, and partaking more of the character of the bloodhound. The hair is rough and dense, the tail bushy and curled generally over the back, colour mostly black, with tan or fawn shadings over the eyes, on the paws, and under the belly; but fawn-coloured specimens are not uncommon. Dogs of this kind are found in Nepal, Bhutan, Tibet, Mongolia, and probably northward through Russia and Siberia, in a state of more or less purity; and dogs presenting the characteristics of the Asiatic mastiff and of vast size appear to have existed since the days of the Assyrian empire, 650 B.C. See the Rev. M. B. Wynn's *History of the Mastiff* (1886).

Mastodon, a genus of extinct elephants, whose remains are found in Europe, Asia, and America, in Miocene, Pliocene, and Pleistocene strata. They equalled or excelled their modern relatives in size. The name mastodon refers to the mammillary cusps or teat-like prominences on the molar teeth. See ELEPHANT.

Masûdi, ABUL HASSAN ALI, an Arab traveller and author (died 957), was born at Bagdad about the end of the 9th century, and spent great part of his life in travel, visiting Egypt, Palestine, the Caspian shores, India, Ceylon, Madagascar, and perhaps even China. His chief works are the *Annals*, of which an abridgment, *The Meadows of Gold*, was printed with a French translation by Meynard in 1861-77 (one vol. of an English translation by Springer in 1841), and the *Indicator*.

Masulipatam, the principal seaport of Kistna district in the presidency of Madras, lies 215 miles N. of Madras city. Vessels anchor 5 miles from shore. Total value of trade £250,000 to £300,000 per annum. Here the English established an agency in 1611, and after 1628 it became the centre of their trade in those parts. Since 1841 the town has been an active missionary centre. In 1864 a storm wave swept over it and destroyed 30,000 lives. Pop. (1881) 35,056, many of whom weave cottons.

Matabeleland, a country stretching northwards from the South African Republic or Transvaal towards the Zambesi, and having Khama's territory on the south-west. It measures about 180 miles from north to south and 150 from east to west, and embraces the watershed between the river-systems of the Zambesi and the Limpopo. When the despotic Chaka ruled over the Zulus (q.v.), a section of the nation under a rival chief, Mosilikatze, rebelled and moved off towards the north. After remaining for a while in what is now the Transvaal, they finally settled in 1840 beyond the granitic Matopopo Mountains, subduing and almost exterminating the peoples they found there—the Mashona, the Makalaka, and the Banyai. The Matabele, who still preserve the warlike habits of the Zulu race, are simply a large standing army, ruled despotically by one chief, at present Lobengula, the son of Mosilikatze. They are divided into four territorial divisions, and number in all some 200,000 persons, of whom 15,000 are fighting men, distributed in regimental kraals. They periodically carry on savage forays upon their weaker neighbours, slay the men, and incorporate the women and children into their community. The king holds in trust for the entire body of fighting men and their dependents large herds of cattle; the women grow mealies and Kaffir corn. There are no industries. Quartz reefs rich in gold exist in various parts of the country, and mines

were worked at Tati, in the south-west, until the more prosperous opening of the diamond mines farther south caused them to be abandoned. The king's kraal is called Gubuluwayo, and, like most kraals, is generally moved after every ten years. Christian missionaries settled at Inyati (Emhlangen) in 1859, but their activity is greatly crippled by the all-powerful belief in witchcraft which reigns amongst the people. In 1890 the country was given to the British South Africa Company, and declared to be British territory.

See Selous in *Proc. Roy. Geog. Soc.* (1881; and 1888 for map), *Fortnightly Review* (1889), and *A Hunter's Wanderings in Africa* (1881); Government Blue-book, C-4643 (1886), for reports by Lieutenants Maund and Haynes; works by Dr Holub and by Mauch; Baines, *Gold Regions of South-east Africa* (1877); Montagu Kerr, *The Far Interior* (1886); and Oates, *Matabeleland* (2d ed. 1889).

Matador (Span., 'slayer'). See BULL-FIGHT.

Matamoros, a river-port of Mexico, lies opposite Brownsville, Texas, on the south bank of the Rio Grande, 40 miles from its mouth in the Gulf of Mexico. With the other Mexican towns on the river it has formed a free-trade league since 1861. The Rio Grande is navigable for small vessels as far as Reynosa, and a railway from Matamoros extends beyond this point to San Miguel (75 miles). Pop. 13,740.—Another Matamoros is in the Mexican state Puebla, 4160 feet above sea-level. It has coal-mines and a pop. of 13,408.

Matanzas, a fortified town and seaport on the north coast of Cuba, 55 miles by rail E. of Havana, to which city alone it is second in size and wealth. It is a well-built town, situated in an exceedingly rich and fertile district, has an excellent harbour, a large trade in sugar, molasses, rum, and cigars, and contains several distilleries and iron-foundries. Pop. 87,760.

Matapan, CAPE, the southernmost point, bold and precipitous, of the Morea in Greece, 36° 22' N. lat.

Mataro, a seaport of Spain, 17 miles by rail N.E. of Barcelona, has cotton, sailcloth, glass, and machinery factories, iron-foundries, and shipbuilding-yards, besides a marine school. Pop. 17,405.

Matches, the name now given to splints of wood tipped with some composition (often containing phosphorus) to produce a light by friction. These came into general use about the year 1834. Before that the common light producer was the flint and steel along with a tinder-box. The tinder (charred cotton) was set on fire by sparks from the flint and steel, but did not burst into flame. This was obtained by touching the burning tinder with a spunk or strip of wood tipped with sulphur. Perhaps the most primitive way of producing a light is by rubbing two pieces of wood together, or by rapidly twirling one piece of wood into a hole or socket in another piece, touchwood being ignited by either process when sufficient heat is raised. These methods of obtaining fire by the friction of two bits of wood are in use by some savage races (see FIRE). Among other devices formerly employed for the same purpose were a lens to concentrate the sun's rays on some inflammable substance; an arrangement (Döbereiner's lamp) for producing and kindling a jet of hydrogen gas by making it play on spongy platinum; the *oxymuriatic match*, consisting of a splint tipped with a mixture of chlorate of potash and sugar, which took fire on contact with sulphuric acid; and the *lucifer match*, which was tipped with a paste containing chlorate of potash and sulphide of antimony that ignited when drawn across sand-paper. This original lucifer match required to be rubbed with a good deal of pressure to produce a light, and as it gave off

sparks of kindled matter it was not free of danger. The introduction of phosphorus in 1834 was a great improvement.

The chief operations in the manufacture of matches embrace (1) cutting the wood splints; (2) immersing the splints in melted paraffin; and (3) preparing the igniting composition and dipping the splints into it. There is also the making of the boxes, which, in the case of safety matches, have the phosphorus composition glued upon their sides. Pine or aspen is the wood used for the splints.

There are several kinds of splint-cutting machines. One of the simplest is a special kind of lathe for which the tree trunks to be operated upon are sawn across in pieces 14 inches long, and the bark removed. One of these pieces is the length of seven matches, and is fixed on the chuck of the lathe and cut into a continuous slice or shaving equal to a match in thickness. The principal cutting tool is fixed on the slide-rest, and as the shaving comes away it is divided into seven equal widths by cutters placed above the chief slicing tool. After the two-inch wide shavings are cut into six feet lengths, they are divided into single splints by a guillotine cutter similar to that used for cutting paper. Under favourable circumstances this machine will cut a million splints in an hour.

For the purpose of being immersed in paraffin and afterwards dipped into the igniting composition the splints are fixed into a dipping-frame. This frame consists of thin wooden laths fully two feet long, placed parallel to each other and held in position by two round iron bars passing through holes in their ends. About fifty splints, projecting equally beyond the frame, are held firmly between every two of these laths at a little distance from each other, the whole frame containing between two and three thousand. The splints are supplied to the frames by filling-machines, of which there are several kinds, chiefly of American invention. In the dipping-room, to which these filled frames are taken, the igniting composition is spread of the proper thickness on a hollow iron table kept hot by steam, and the splints dipped into it to form them into matches. The rooms where the igniting-mixture is prepared and the matches dipped are, or at least were, the most unhealthy parts of a match-factory. In former days especially, among those who worked in these rooms cases of necrosis or caries of the lower jaw occurred from the action of the phosphorus fumes. But, owing to the lessened quantity of phosphorus now used in the dipping-mixtures and improved ventilation, this disease has become rare. It never occurs at all where red or amorphous phosphorus is employed, but common phosphorus is still very largely used.

Nearly every manufacturer has his own special mixture for the dipping of matches. One published recipe gives as the ingredients for this: $\frac{1}{2}$ part by weight of common phosphorus, 4 of chlorate of potash, 2 of glue, 1 of whiting, and 4 of finely-powdered glass. The proportion of phosphorus is small in this mixture. As it makes a more noiseless match, nitrate of potash is sometimes substituted for the chlorate. Other oxidising agents used instead of, or along with, these salts of potash are oxide of manganese and the red oxide or the dioxide of lead. Of course some water (slightly heated) is used in preparing dipping-mixtures. According to Gautier (*Cours de Chimie*, 1887), the igniting-mixture for ordinary matches made in France consists of 3 parts of common phosphorus, 2 of lead dioxide, 2 of sand, and 3 of gum. The same author states that safety or 'Swedish' matches are dipped in a composition of 5 parts of chlorate of potash, 2 of sulphide of antimony, and 1 of glue; and that the rubbing-surface for these

is a mixture of 5 parts of amorphous phosphorus, 4 of sulphide of antimony, and $2\frac{1}{2}$ of glue. It need hardly be mentioned that matches are made in enormous numbers, some large firms turning out a hundred millions daily.

Probably matches to the value of £1,500,000 are made annually in Britain. In Sweden and Norway, where of late the trade has most rapidly developed, there are some sixty factories; Jönköping alone employs some 6000 matchmakers. Germany and Austria have together as many as 450 factories. In the United States the manufacture is mainly controlled by one combination of capitalists; in France the making of matches is a government monopoly. As a contrast to present prices it may be added that in 1830 the first friction matches, the Congreves, were sold in tin boxes of fifty at half-a-crown a box, each box containing a piece of glass paper to strike the matches on.

Vestas only differ from ordinary matches in the stalks being formed of bits of stearin tapers (called wax-tapers) instead of wood splints. Vestivians used by smokers consist of a hard wood, or sometimes a hollow glass stalk, with a bulbous head formed of some slow-burning compound, such as a mixture of charcoal, saltpetre, sand, and gum, tipped with the igniting composition of ordinary matches. 'Flamers,' also for the use of smokers, have a thick head of a flaming mixture, with either a 'wax-taper' or wood stalk.

Matchlock. See FIREARMS.

Mate is an assistant, a deputy, or a second in any work. In the navy the use of the term is now confined to petty officers, such as boatswain's-mate, gunner's-mate, &c. In the merchant-service the mates are important officers, holding functions not greatly inferior to those of lieutenants in the royal navy. The first mate ranks next to the master or captain, commands in his absence, and is immediately responsible for the state of the vessel; the second and third (and fourth in large vessels) have various analogous duties.

Maté, or PARAGUAY TEA, a substitute for tea, extensively used in South America, and almost universally through Brazil. It consists of the leaves and green shoots of certain species of Holly

Maté (*Ilex Paraguayensis*).

(q.v.), more especially *Ilex Paraguayensis*, dried and roughly ground; the leafy portion being reduced to a coarse powder, and the twigs being in a more or less broken state. The term *maté*, which has by usage attached to this material, belonged originally to the vessels in which it was infused for drinking; these were usually made of gourds or calabashes, often trained into curious forms during their growth. Into the hollow vessels thus formed

a small quantity of the material, more properly called *Yerba de Maté*, is put, and boiling water is added; it is then handed round to those who are to partake of it, and each, being provided with a small tube about eight inches in length, with a small bulb at one end, made either of basket-work of wonderful fineness or of perforated metal, to act as a strainer and prevent the fine particles from being drawn up into the mouth, dips in this instrument, which is called a *bombilla*, and sucks up a small portion of the infusion, and passes the maté-bowl on to the next person. It is usual to drink it exceedingly hot, so much so as to be extremely unpleasant to Europeans. Its effect is much the same as tea, stimulating and restorative; and it derives this property from the presence of a large proportion of the same principle which is found in tea and coffee—viz. *Theine*. The collection and preparation of maté is a large industrial occupation in Paraguay and Brazil.

Matera, a city of the Italian province Potenza, situated 37 miles NW. of Taranto. Pop. 15,700. Here is the cathedral of the archbishopric of Acerenza and Matera. There are numerous caverns and stone-quarries in the vicinity.

Materialism is the theory of the world which professes to find in matter (monistic or philosophical materialism), or in material entities (atomistic materialism), or in material qualities and forces (scientific or physical materialism), a complete explanation of all life and existence whatsoever. Early philosophies are generally either theogonies or cosmogonies. Cosmogonies tend to postulate animated or living matter (hylozoism). Out of the earliest hylozoistic philosophemes of the Ionic school in Greece arose the atomistic materialism of Leucippus and Democritus, explaining the cosmos as an aggregation and segregation of ultimate indivisible material entities or atoms. The atomic theory of Democritus became the basis of the sensationalistic psychology and ethic of Epicurus, and was transmitted in the glowing verses of Lucretius' great didactic poem, *De Rerum Natura*, on to the later Roman period. Materialism as a basis for scientific research we find revived in history wherever a movement arose in favour of the methods and aims of experimental or natural science, as in the Renaissance period in Europe generally. Gassendi, though, it is who must be regarded as the renewer *par excellence*, in modern times, of systematic materialism. He developed the doctrine of Democritus, by endowing the atoms with force and even with sensation. Lamettrie, by his materialistic account of the functions of the mind, prepared the way in France for the comprehensive materialism of Baron Holbach, whose *Système de la Nature* is the *chef-d'œuvre* of French materialism. In Holbach materialism reaches its high-water mark. Applying materialism to anthropology, he seeks to show that man is only a physical being, and that morality or virtue is independent of the supports of positive religion and of theism.

The empirical method of Bacon and Locke, taken along with some things Locke said about matter being possibly made to think, and eagerly caught up by men like Voltaire, had countenanced in England as well as in France a materialistic treatment of the mental and spiritual powers of man, as in the works of Hobbes, Hartley, and Priestley. In German philosophy was in the main idealistic and speculative until the death of Hegel, but Vogt about 1850 applied the principles of materialism to psychology, holding that physiology pronounced definitely and categorically against the idea of individual immortality, as indeed against all notions founded on the idea of the independent existence of the soul. Moleschott and Büchner are associated with

Vogt as upholders of materialism. Büchner's *Kraft und Stoff* ('Force and Matter') is the Bible of German materialism. Feuerbach and Strauss may be mentioned as philosophers who exchanged the spiritualistic monism of Hegel for materialistic monism.

The form in which materialism now appears has been determined by the doctrine of evolution. Materialism indeed might be said to have been absorbed in the wider theory of evolution, which goes beyond the mere antitheism or atheism of materialism, and seeks *positively* to show how the diversities and differences in the world can be accounted for by natural as opposed to supernatural or creative process. Haeckel is perhaps the most prominent upholder of the Darwinian hypothesis on the Continent.

Materialism may be examined from many points of view. (1) Materialism is scientific realism. It believes, i.e., in real physical entities, such as atoms and forces, and spaces and times. Now a belief in atoms leads, in physics, in chemistry, and in astronomy, to insoluble contradictions: atoms, for example, for physical purposes must be at once absolutely impenetrable and unalterable, and yet absolutely elastic and alterable. It would be more correct, in fact, to reduce matter to forces than to atoms, as many theorists have done. But it is difficult to think of forces existing without some sort of substrate. Spaces and times too are not physical things. Thus science is full of hypotheses; nor can it dispense with hypotheses. Complete physical realism or materialism is, in short, theoretically impossible. (2) Even granting—which in strictness we cannot—the existence of 'mere matter,' science has as yet found insuperable difficulty in passing from unorganised to organised matter. (3) Psychology has as yet been unable to regard organic states as accounting for psychical or mental states. The two are totally different, and, though correlated, cannot be said to be causally connected. (4) Materialism cannot furnish a complete or consistent ethical theory. If man is entirely the product of natural forces, and in fact the sport of natural forces, it is meaningless to think or speak of him as morally obliged either to follow or to resist nature. Man not only follows and resists nature, but in mechanical and artistic construction commands and anticipates and surpasses nature. Of course to materialism the belief in human freedom, which practically makes history, is an illusion, but it is difficult to see how on the materialistic hypothesis even this illusory belief could have arisen. (5) Although materialistic evolution may succeed in showing that we ought not to regard certain natural adaptations and productions as special and final creations, it cannot and does not avoid the question of teleology. Neither hylozoism nor mechanism, nor unconscious selection and adaptation accounts for that relativity of everything to everything, which is really what at bottom is meant by teleology. There must be a world-soul or world-thought for whom the universe is realised end. (6) There is the philosophical question about mere matter. It has again and again been confessed by scientists as well as by philosophers that by matter can only, in the last resort, be meant what J. S. Mill calls the permanent possibility of sensation. There is in fact no object (or objective thing) without a subject (or consciousness). If the materialist at once reply that there is no subject without an object, he is in the right as against the thesis. The idealist, in short, and the materialist are in the right as against each other. Subject and object imply each other. We cannot begin with either in order to explain from it the other.

Materialism brings prominently before us that side of the universe which is compassed by the

methods of physical science. But physical science, like (say) economic or theological or mental science, takes a one-sided or 'abstract' view of experience. All sciences 'abstract' from the concrete whole of experience contain facts which they propose to investigate in detail. Physicists, like metaphysicians and theologians, are apt to become dogmatical about spheres of inquiry of which they know professedly nothing.

BIBLIOGRAPHY.—Text-books of Materialism which have not already been mentioned are: Gassendi, *De Vita, Moribus, et Doctrinis Epicuri* (Leyden, 1647); Lamettrie, *L'Homme Machine* (Leyden, 1748); Haeckel, *Natürliche Schöpfungsgeschichte* (1868; Eng. trans. 2d ed. 1875-76); Wiener, *Grundzüge der Weltordnung* (1863-69); and Huxley's Address at Belfast, 1875. For an examination of Materialism, see any account of Kant's *Critical Philosophy*; or the statement of Dogmatism given in *Fichte*, by Adamson (Blackwood's 'Philosophical Classics'); also *As regards Protoplasm*, by Dr Hutchison Stirling; *Concepts of Modern Physics*, by J. B. Stalls, containing a sifting examination of the atomic theory; *Reign of Law*, by the Duke of Argyll; and St George Mivart's books. The best history of Materialism is Lange's *Geschichte des Materialismus* (Eng. trans. 1878-81).

Materia Medica is that department of the science of medicine, belonging partly to pharmacology, partly to therapeutics, which treats of the materials employed for the alleviation and cure of disease, their properties, physiological actions, and uses. See PHARMACOPEIA, POISONS, MEDICINE, APERIENTS, and articles on the various drugs.

Mathematics (Gr. *mathēma*, 'learning'), the science which has for its subject-matter the properties of magnitude and number. It is usually divided into *pure* and *mixed* or *applied*; the first including all deductions from the abstract, self-evident relations of magnitude and number, the second the results arrived at by applying the principles so established to certain relations found by observation to exist among the phenomena of nature. The branches of pure mathematics which were first developed were, naturally, *Arithmetic*, or the science of number, and *Geometry*, or the science of quantity (in extension). The latter of these was the only branch of mathematics cultivated by the Greeks, their cumbrous notation opposing a barrier to any effective progress in the former science. Algebra or the science of numbers in its most general form is of much later growth, and was at first merely a kind of universal arithmetic, general symbols taking the place of numbers; but its extraordinary development within the last two centuries has established for it a right to be considered as a distinct science, the *science of operations*. Combinations of these three have given rise to trigonometry and analytical geometry. All those sciences in which a few simple axioms are mathematically shown to be sufficient for the deduction of the most important natural phenomena are regarded as belonging to applied mathematics. This definition includes those sciences which treat of pressure, motion, light, heat, sound, electricity, and magnetism—usually called *Physics*—and excludes chemistry, geology, political economy, and the other branches of science, which, however, receive more or less aid from mathematics. See GEOMETRY, and the works there cited; as also, besides articles on the subjects named above, and many others, the following:

Mather, INCREASE, a famous American colonial divine, was the sixth son of Richard Mather, an English Nonconformist minister, who emigrated to Massachusetts in 1635. He was born at Dorchester,

Massachusetts, June 21, 1639, graduated at Harvard College in 1658, and again at Trinity College, Dublin, in 1658. His first charge, at Great Torrington in Devonshire, was given him on the advice of John Howe. He next preached in Guernsey, but in 1661, finding it impossible to conform, returned to America, and in 1664 was ordained as pastor of the North Church, Boston, where he remained till his death, August 23, 1723. In 1681 he was also chosen president of Harvard College. An industrious student, he published no less than 136 separate works, most of which are now very scarce. Of these the most interesting, *Remarkable Providences* (1684), was reprinted in London in 1856. The *History of the War with the Indians* (1676) was reprinted at Boston in 1862. Mather's influence was great in the colony, and in 1689 he was sent to England to lay its grievances before the king. He was successful in obtaining a new charter from William III., and on his return was thanked by the speaker of the general assembly. The same year he became the first D.D. of Harvard. To his credit he was far less an alarmist about witchcraft than his son, and he had the good fortune to be absent in England during the time of fiercest excitement in the Salem mania. His *Causes of Conscience concerning Witchcraft* (1693) did much to cool the heated imaginations of the New England colonists, and saved lives by refuting the doctrine of 'spectral evidence.'

His son, COTTON MATHER, was born in Boston, February 12, 1663, and graduated in 1678 at Harvard, where his precocious learning and piety excited great expectations. He entered upon a course of fasting and vigils, cured a habit of stammering by speaking with 'dilated deliberation,' studied theology, and became the colleague of his father in the ministry of the North Church at Boston. His industry was phenomenal and his learning remarkable, while his vanity and fluency enabled him to pour from the press as many as 382 books. He took a fatal interest in witchcraft, and his *Memorable Providences relating to Witchcraft and Possessions* (1685) did much to fan the cruel fury of the New Englanders. The first phenomena of the notorious Salem witchcraft mania occurred in 1692, and Mather plunged into the discussion, and to convince the world wrote his *Wonders of the Invisible World* (1692). While it is true that his contemporaries fully shared his belief in witchcraft, none pursued the inquiry with such hateful zeal, and on the head of none rests a heavier burden of bloodguiltiness. Even himself afterwards confessed that 'there had been a going too far in that affair.' Mather died February 13, 1728.

The chief of his works is *Magnalia Christi Americana* (1702), an undigested mass of materials for the church history of New England. His feeble *Essays to do Good* (1710) was much esteemed by Franklin. His life was written by his son, Samuel Mather (1729). See also Charles W. Upham, *History of the Salem Delusion, 1692* (1831); and the Rev. Enoch Pond, *The Mather Family* (1844).

Mathew, THEOBALD, commonly known as FATHER MATHEW, an eminent Irish apostle of temperance, was born at Thomastown in Tipperary, October 10, 1790. He studied for the Roman Catholic priesthood at Kilkenny and for a short time at Maynooth, but relinquished the secular priesthood for the religious order of the Capuchins, in which he took priest's orders in 1814, and was sent to the church of his order in the city of Cork. Here he devoted himself to the ceaseless labours of his calling with untiring zeal, and, finding that the poverty and degradation of his people were to a great extent directly due to over-drinking, was driven by his enthusiastic temper to advocate the

drastic remedy of total abstinence. In 1838 he began his crusade, which quickly grew beyond the bounds of Cork, and extended to Dublin, to the North, to Liverpool, Manchester, London, Glasgow, and the other chief seats of the Irish population, even in the New World itself. His success had something of the marvellous in its character. The form of engagement partook of the religious, and was accompanied by the presentation of a medal, to which the utmost reverence was attached by the recipient; and an opinion prevailed among the poor that the mission of the 'Apostle of Temperance' was marked by many miraculous manifestations of the assistance of Heaven. Father Mathew's latter years were embittered by pecuniary embarrassments, the fruit of his unbounded charity, the enormous expenses connected with his mission, and perhaps his own improvident and unworldly habits. A Civil List pension of £300 was granted him in 1847, and a private subscription was also raised for his relief. The enthusiasm for his cause declined amid the sufferings of the potato-famine, and Father Mathew died, worn out by his labours, December 8, 1856. See Harriet Martineau's *Biographical Sketches*, and *Lives* by J. F. Maguire (1863) and F. J. Matthew (1890).

Mathews, CHARLES, comedian, was born in London, 28th June 1776, and educated at Merchant Taylors'. His father was a bookseller, and intended his son to follow the same 'serious calling'; but his early inclination for the stage overcame parental counsel, and he made his first appearance as an amateur—in the part of Richmond—at the Richmond theatre in 1793, and as a professional comedian in the Theatre Royal, Dublin, the following year. He then served an apprenticeship in the famous York company under Tate Wilkinson, and made his first appearance in London on 15th May 1803, at the Haymarket, then managed by George Colman. Next year he played at Drury Lane, and he afterwards acted at Covent Garden and the Lyceum; but he was not satisfied with the class of part given to him, and in 1818 he took up the profession of 'entertainer' and made an immense success with his 'At Home' and other entertainments. In this class of business he passed the remainder of his life, appearing frequently in the provinces and visiting America twice. He died at Plymouth on 28th June 1835. Mathews was a true comedian, with extraordinary powers of impersonation, entering into the very mind of the persons he imitated. He was not merely a 'mimic'—one who reproduces oddities and peculiarities: he *was* the person he represented. See his *Memoirs* by Mrs Mathews (4 vols. 1838-39).—His son, CHARLES JAMES (born 26th December 1803; died 24th June 1878), was a delightful light comedian, with no depth of feeling, but with charming grace and delicacy. In 1838 he married the famous Madame Vestris. See his *Life*, chiefly *Autobiographical*, edited by Charles Dickens (2 vols. 1879).

Mathias Corvinus. See MATTHIAS.

Mathilda, Countess of Tuscany, well known in history through her constant support of Pope Gregory VII. in his long struggle with the Empire, was a daughter of Boniface, Count of Tuscany, and of Beatrice of Lorraine, and was born in 1046. She married first Godfrey (surnamed the Hunchback), Duke of Lorraine, from whom she lived separate in Italy, and afterwards, when over forty years of age, the boy Guelph of Bavaria. Both were mere alliances of policy. In 1077 she made a gift of all her vast possessions to the church, a bequest that caused a long contest. It was at her castle of Canossa that Henry IV. did his humiliating penance to Pope Gregory. Four years later she alone stood by the pope when Henry poured his troops into Italy, she

supported him with money when he was besieged in Rome, and after his death at Salerno boldly carried on the war against the emperor. 'The great Countess' died in 1115.

Mathura. See MUTTRA.

Matteo (*Artanthe elongata*), a shrub of the natural order Piperaceæ, a native of Peru, remarkable for the styptic property of its leaves, which are used for stanching wounds, and for other medicinal qualities.

Matilda, 'the Empress Maud' (1103-67), was the only daughter of Henry I. (q.v.) of England, married in 1114 to the Emperor Henry V., and after his death in 1128 to Geoffrey of Anjou, by whom she became mother of Henry, afterwards Henry II. (q.v.) of England. There was civil war between her and Stephen (q.v.) from 1139 till 1147.

Matins. See BREVIARY.

Matlock, a Derbyshire parish, 17 miles N. by W. of Derby, containing Matlock Bath, Matlock Bridge, Matlock town, and Matlock Bank, which extend for about 2 miles along the romantic valley of the Derwent. Matlock Bath is noted for a huge lime-tree and for its hot springs of 68° F., the waters of which are largely charged with carbonic acid, and were first used for curative purposes in 1698. At Matlock Bank are several hydropathics, the earliest dating from 1851; and together the four Matlocks have a dozen hotels. Among the lions of this beautiful neighbourhood are the High Tor (400 feet), the Heights of Abraham and the Masson (1110 feet), and a number of large stalactite caverns with 'petrifying' wells. There are manufactures of cotton, paper, and spar ornaments. Pop. of parish (1851) 4010; (1881) 6093, of whom 4395 were in Matlock town.

Matriarchate. See FAMILY.

Matsumai, a seaport of Japan, situated at the south-west extremity of the island of Yesso (Yezo), at the western entrance to the Strait of Tsugaru. Formerly the principal town of the island, it has in recent times been outstripped by its more successful rival Hakodate. Pop. (1887) 31,037.

Matsys, or MASSYS, QUENTIN, Flemish painter, born at Louvain about 1466, was originally, according to a legend long current, a blacksmith who turned artist. However the connection be explained, it is certain that he settled in Antwerp in 1491, and was in that year admitted a member of the painters' guild of St Luke, and died in that city in 1530 or 1531. He forms a connecting link between the school of the Van Eycks and the later realistic Dutch school. His pictures are mostly religious, treated with a reverent spirit, but with decided touches of realism, and are remarkable for their glow of colour, their absence of light and shade, and their exquisite finish, especially in minor details. An altarpiece representing the Virgin and Child, painted for the cathedral of Louvain; another for the cathedral of Antwerp, the 'Burial of Christ,' flanked by the 'Martyrdom of John the Baptist' and the 'Martyrdom of John the Evangelist;' and two other examples of the Virgin and Child are his best religious pictures. Such genre-pieces as 'The Money-changers,' 'The Gaoler,' and others exhibit his realistic tendencies. Matsys also takes high rank as a portrait-painter; excellent specimens of his skill in this department are the portraits of Petrus Ægidius and of Maximilian of Austria. He seems to have been acquainted with Lucas van Leyden, Holbein, Dürer, Erasmus, Sir Thomas More, and other notable contemporaries.

Matter. It is impossible to give a really satisfactory definition of this term. We may employ as equivalents such words as Stuff, Substance,

Body, &c., but all are inadequate. The reason is simply that we do not yet know what Matter is, and it is probable that we shall never be able to obtain an exact and complete conception of its true nature. Metaphysicians differ among themselves more perhaps on this subject than on almost any other. Some of them deny altogether the possibility of objective existence. Many, however, tell us that 'Matter is whatever can be perceived by the senses.' Others vary the phrase slightly, and call matter a 'Permanent possibility of sensation.' Hegel defines it as 'Nature self-externality in its most universal form, with a tendency to self-internality or individuation shown in the nisms of gravitation'! Scientific men can, as yet, define matter only by some of its properties. One of their favourite definitions is Matter is what can occupy space. Another is that which possesses inertia. Again, it may be regarded as the vehicle of Energy (q.v.), inasmuch as energy is never found except in association with matter. But the scientific man, though confessing that none of his definitions can be adequate, knows that each of them expresses some part of the truth; and he also knows that the metaphysical definitions cited above (so far at least as they are intelligible) are erroneous. For it is by the senses alone that we know of the existence of energy, and energy is certainly not matter. Again, the notion of Force (q.v.) is entirely sense-suggested, and force is not matter—has not even objective existence.

But, though the ultimate nature of matter is unknown, we already know much about its structure and properties, as well as about what (for the present at least) we must call its various kinds. To a brief sketch of these the present article is devoted. Beside that unique and all-pervading species of matter which we call the Ether (q.v.), which certainly satisfies the scientific definitions quoted above, but about which we know little more, we have what is called gross or ordinary matter. This we find in two forms, solid or fluid. These are sharply distinguished from one another by their elastic properties. For, while solids (as a rule) possess, in a more or less imperfect degree, elasticity alike of bulk and of form, fluids possess the first in perfection and are absolutely devoid of the second. Fluids again are divided into liquids, vapours, and gases. These distinctions, in the case of any one substance, as well as that between solids and fluids, are found to depend mainly upon temperature.

The existence of the gaseous state, with its very special features, has enabled us to obtain great insight into the structure of matter. For experiment has assured us that a gas is not a continuous substance, but an assemblage of an enormous number of perfectly distinct and independent particles, each of which moves freely till it collides with another, and thus some eight thousand million times per second has its motion completely changed. The number of such separate particles in a single cubic inch of air contains twenty-one figures—i.e. is expressed in hundreds of trillions. Yet they are very far from filling that space. Their total bulk probably amounts to less than the five-hundredth part of it. We are unable to discover any differences among the particles of the oxygen group, or among those of the nitrogen: though, by delicate processes not involving chemistry, we can detect a difference between the properties of an oxygen and of a nitrogen particle.

As all known simple substances can be brought into the gaseous form, we have a proof that every simple solid or fluid must be built up of particles absolutely equal to one another. We figure to ourselves what we call Molecular Forces (q.v.) as the cause of the agglomeration, and ascribe the

various states of solid, liquid, vapour, and gas in any one substance to the greater or less relative activity of the molecular forces (attractive) and of the thermal motions (disjunctive or dispersive). The modern kinetic theory of Gases (q.v.) has thus enabled us to account for at least the more simple of their physical properties, such as the experimental relations among pressure, volume, and temperature, known as the laws of Boyle and Charles; and the equality of numbers of particles in a cubic inch of each of two gases at the same temperature and pressure, known as Avogadro's Law; as well as to study the mechanism of gaseous viscosity, diffusion, and heat-conduction. Much has already been done towards the explanation of the 'critical temperature' and the vapour state with its relation to that of liquid, and further progress may soon be expected. On the other hand, a great deal of information as to the liquid aggregate has been obtained from experiments on Capillarity (q.v.) and Compressibility (q.v.); and as to the solid aggregate from its elastic properties, &c., but specially from the forms of crystals (see CRYSTALLOGRAPHY). Besides the molecular forces mentioned above, which are generally understood as those exerted between particles of the same kind, we have those of Chemical Affinity, which are exerted between any two particles of different kinds. Physical experiments, following those of Andrews on the compressibility of gaseous mixtures, promise to give us much information on this subject; but, in the main, it is at present more immediately in the domain of Chemistry (q.v.), to which we must refer for the discussion of Atomic Weights, Combining Volumes, Valency, &c.

Beyond the state of equal independent particles, as in a simple gas, we know as yet nothing. Many of the properties of the individual particles can be obtained from the properties of the aggregate, others by the help of Spectrum Analysis (q.v.). But in answer to the question, Do the particles of different simple substances consist of one and the same ultimate material, or no? intensely attractive as it is, we have absolutely nothing to say. So it is with the question, Are these particles themselves further divisible, or are they atoms? Atoms (q.v.), whether Lucretian or Vortical, are not even proved to exist. We must, therefore, in further discussing the subject, content ourselves with a few brief statements as to the *Properties of Matter*.

One of the most remarkable of these, what has been called Conservation of Matter, is the experimentally ascertained fact that no process at the command of man can destroy even a single particle of matter. Still less can it create a new one. It is on this definite basis that the great science of chemistry has been securely built. The Balance (q.v.), used to determine quantity of matter with the utmost precision, is its chief instrument. And this attribute of unchangeable quantity furnishes the most powerful of the arguments for the objective reality of matter.

Quantity of matter, or mass, as it is technically called, is measured by Inertia, which (as expressed in Newton's First Law of Motion) may be looked on as the fundamental property of matter. For it is a property possessed by every body, even a particle, *in itself*, and independently of the vicinity or even the existence of any other body. It is in virtue of its inertia that a body can possess energy of motion, and that work is required in order to set in motion even the smallest particle of matter. Similarly, until it can transfer its energy to some other body, a moving mass must continue to move.

Next in order of simplicity to inertia, which, as we have seen, is a property of every single particle,

come the properties in virtue of which any system of two bodies, even if they be mere particles, possesses energy depending directly on the mass of each, and also upon their distance from one another. This part of the energy of a system gives rise to the phenomena of Gravitation (q.v.), Molecular Action, and Chemical Affinity. It has been shown by Sir W. Thomson that the first of these might suffice to account for the second if not the third (at all events in aggregates of particles), provided the structure of the aggregate were sufficiently heterogeneous. Be this as it may, we know much more about gravitation than about the other phenomena referred to, and will therefore confine our further remarks to it. And yet all that we know about gravitation can be summed up in the following statement: The potential energy of a system of two particles of matter is less when they are at a finite distance apart than when they are infinitely distant from one another, by an amount which is directly as the product of their masses and inversely as their distance apart. This statement, it is to be particularly observed, contains no allusion to attraction or (so-called) force of any kind; yet it suffices for the complete formation of the equations of motion of any system of gravitating masses, be it as complex as the solar system itself. The rest of the calculation is a matter of mathematics and of numerical data alone. Many attempts, often extremely ingenious, but all alike fruitless, have been made to explain gravitation. Such failure, however, in the eyes of a genuine scientific man is only an encouragement to perseverance; and the very remarkable success which has attended Clerk-Maxwell's attempt to explain electric and magnetic phenomena by means of the luminiferous medium renders it at least probable that the properties of the ether will, some day, explain gravitation—possibly inertia also. Mere speculation, of course, is of use in science only in so far as it originates or directs inquiry, so that we must be content simply to express the idea that the ether may be the one material substance in the universe (*urstuff*), gross matter being simply differentiated portions of it—denser or less dense than the rest, perhaps mere cavities or bubbles. If so, the words of Fresnel may in time be verified: 'La Nature ne s'est pas embarrassée des difficultés d'analyse; elle n'a évité que la complication des moyens.'

The various *properties of matter*, discussed for the most part under their several heads, may be roughly divided into two classes—those which belong more particularly to matter in itself, and those which are specially related to various forms of energy. Among the former class may be mentioned, but only as examples, Capillarity, Cohesion, Compressibility, Density, Elasticity, Friction, Gravitation, Hardness, Inertia, Impenetrability, Malleability, Plasticity, Rigidity, Tenacity, Viscosity. Among the latter we have Colour, Absorptive Power, Transparency, Refractive and Reflective Power, Melting and Boiling Points, Specific Heat, Latent Heat, Conductivity (Thermal and Electric), Thermo-electric Power, Expansibility, Specific Inductive Capacity, Magnetic Permeability, &c. Even to name all the more important would greatly exceed our limits. See also MOLECULE.

Matterhorn, called by the French MONT CERVIN, and by the Italians MONTE SILVIO, a peak of the Alps between the Swiss canton of Valais and Piedmont, rises to the altitude of 14,705 feet. The actual peak was first scaled by Lord Francis Douglas, the Rev. C. Hudson, Hadow, and Whymper, with three guides, on 14th July 1865, when the three first-named and one of the guides fell over a precipice and were killed. See Whymper, *Ascent of the Matterhorn* (1880).

Matthew (Gr. *Matthaios*, Lat. *Matthæus*, from Heb. *Matthai*, a shortened form of *Mattithya*, *Mattathya*, or *Mattathai*, 'gift of Jehovah'), one of the twelve apostles (Matt. x. 3; Mark, iii. 18; Luke, v. 15; Acts, i. 13), and, according to tradition, the author of the first of the four canonical gospels, was a publican or tax-gatherer (Matt. x. 3) at Capernaum when called to the apostolate by Jesus, as related in Matt. ix. 9. The closely parallel passages in Mark (ii. 14) and Luke (v. 27) mention Levi in the same connection, and the general belief is that this is simply another name for the same person (compare the double names Simon and Peter, Josès and Barnabas), though the identification has been disputed both in ancient and in modern times by many weighty authorities, among whom may be mentioned Origen, Grotius, Michaelis, Neander, Ewald, Reuss, and Keim. Except in the four lists of the apostles and in Mark, ix. 9, Matthew is nowhere mentioned by name in the New Testament, and ecclesiastical tradition has little to tell of him. An early authority (Heraclion, reported by Clement of Alexandria) represents him as having died a natural death; by other writers he is stated, but with considerable vacillations, to have written a gospel for the Christians in Palestine after the dispersion of the apostles, and, after having preached the word in Parthia and Ethiopia, to have suffered martyrdom. The most important extant statement regarding him is that of Papias (bishop of Hierapolis in the 2d century), preserved by Eusebius, to the effect that 'Matthew wrote in the Hebrew (Western Aramaic) dialect a collection of the sayings of the Lord, and each one interpreted them as best he could.' This passage was long accepted as conclusive testimony to the truth of the universally current belief that Matthew the apostle was the author of our first canonical gospel (it being tacitly or expressly assumed that at some later date an authentic Greek translation had been made by himself from the Aramaic original vouched for by Papias). Modern criticism of the gospels (see GOSPELS) has led to the general adoption of another view of the passage, according to which it refers to the 'logia' document, or collection of discourses and sayings of Jesus, written in Aramaic by Matthew, which is now believed to have been one of the most important written sources used by the authors of the existing first and third gospels. In this sense, and also as having been prepared primarily with a view to the needs of Jewish Christians, the first gospel is correctly described as the 'gospel according to Matthew.' But that this gospel cannot be of directly apostolic origin, or the work of an actual companion of Jesus, is shown by the artificiality of its arrangement, the vagueness of its references, and its obvious dependence on previous authorities. As to the date of its composition critics are not agreed whether it ought to be placed before or after the year 70 A.D., some seeing in the book numerous references to Jerusalem and the temple and its institutions as still subsisting, while others interpret such a passage as Matt. xxii. 7 as certainly showing that the destruction of the city had already taken place. The first gospel is much more largely quoted than any other by early Christian writers, and in view of the fact that it successfully aimed at a reconciliation between a Jewish and a cosmopolitan conception of Christ as 'legal, yet above the law, as Jewish, yet above Judaism,' it has been characterised by Renan as 'the most important book ever written.' For literature, see GOSPELS.

Matthew of Westminster, long supposed to be the author of the meritorious *Flores Historiarum*. Sir F. Madden considered his existence as more than doubtful, the work being merely a

special abridgment of the larger work of Matthew Paris, made under that writer's supervision down to 1249; brought down at St Albans to 1259, at which year Paris's chronicle ends; thereafter continued there down to 1265; next brought down to 1325 at Westminster, in part by John Bever, *alias* John of London. Sir T. D. Hardy, however, thinks it based on the original writer who preceded Wendover as historian at St Albans, whom he identifies as one Walter of St Albans, precentor and librarian in the latter half of the 12th century. Copies of his chronicle would become disseminated, and that at Westminster, by its borrowings from the works of Wendover and Matthew Paris, might well have been taken for a mere abridgment of these. The *Flores Historiarum* was first printed by Archbishop Parker in 1567. A translation by Yonge was published in Bohn's 'Antiquarian Library' (2 vols. 1853).

Matthew Paris. See PARIS.

Matthias Corvinus, king of Hungary, the second son of John Hunyady (q.v.), was born at Klausenburg on 27th March 1443. His father having died, his elder brother was slain and himself imprisoned by order of Ladislaus Posthumus, king of Hungary and Bohemia. After the death of this king Matthias was elected by the magnates to the vacant throne (1458). But it cost him a six years' hard struggle against Turks, Bohemians, the Emperor Frederick III., and disaffected magnates before he could venture to have himself crowned at Stuhlweissenburg. He drove the Turks back across the frontiers of his kingdom, and made himself master of Bosnia (1462), and of Moldavia and Wallachia (1467), before he granted them a truce. This breathing-space Matthias employed in making war upon Podiebrad, king of Bohemia, his own father-in-law, whose crown had been offered to him by the pope. Podiebrad died in 1470, but the war was continued against his successor, Ladislaus of Poland. In the midst of the war the magnates rebelled, because their king disregarded their political rights and influence, and offered his throne to Casimir, brother of Ladislaus. But Matthias managed to appease them, and in 1478 he concluded peace with Ladislaus, obtaining Moravia, Silesia, and Lusatia. Out of this war grew another with Frederick III., in which Matthias besieged and captured Vienna (1485). This he made his capital, and two years later he took possession of a large part of Austria proper. Since 1469 the Turks had renewed their terrible invasions of Hungary; but at length in 1479 they met with just chastisement, at Kenyermezö, at the hands of Stephen Bathori of Transylvania. But Matthias, who died at Vienna on 6th April 1490, was more than an ambitious conqueror. He greatly encouraged arts and letters: he founded the university of Budapest, built an observatory, summoned scholars and artists to his court, adorned his capital with the works of renowned sculptors, employed a staff of literary men in Italy to copy valuable manuscripts, and so founded a magnificent library. This was scattered when the Turks captured Budapest in 1526. The surviving books were restored by the sultan in 1877. At the same time the finances were brought into a flourishing condition, industry and commerce were promoted by wise legislation, and justice was administered strictly to peasant and noble alike. But his rule was arbitrary and his taxes heavy; he wasted much money in pompous display; and he overrode the rights of the magnates.

Matto Grosso ('dense forest'), an inland state of Brazil, bordering on Bolivia: it is second to Amazonas alone, both in size and sparsity of population. Area, 532,708 sq. m.; pop. (1888) 79,750, nearly all Indians and blacks. Within this vast territory several great rivers rise, including the

Madeira and the Paraguay; but in most parts there is a scarcity of water during the dry season. The vegetation is generally scanty, grass, bush, and low trees covering the sandstone plateau; high trees and rich vegetation are confined to the river-valleys. The gold and diamonds which formerly constituted the wealth of Matto Grosso have been exhausted, and agriculture (insufficient for the wants of the state) and cattle-raising, with the gathering of medicinal plants by the Indians, are now the principal industries. The capital is Cuyabá (q.v.). The former capital, Matto Grosso, on the Guaporé, decayed with the gold-mining industry, and is now a fever-haunted place with only some 1500 inhabitants.

Mattoon, a town of Illinois, 172 miles by rail S. by W. of Chicago. It contains railway-shops, flour-mills, and grain-elevators, and manufactures castings and drain tiles. Pop. (1890) 6829.

Maturin, a section of the Venezuelan state Bermudez, lying W. of the Orinoco delta, and consisting almost entirely of llanos. Area, 13,100 sq. m.; pop. (1886) 60,541.—Maturin town, on the Guarapiche, has plantations of cacao, and a trade with the West Indies. Its port is Colorado, 25 miles below, and a railway has been constructed to this point. Pop. 11,351.

Maturin, CHARLES ROBERT, dramatist and romancer, was born in 1782, waged warfare with poverty as curate of St Peter's, Dublin, and died there, October 30, 1824, after making his name at least notorious by a series of extravagant novels that outdid Miss Radcliffe. These were *The Fatal Revenge*, *The Wild Irish Boy*, *The Milesian Chief*; and later, *Women*, *Melmoth*, and *The Albigenes*. His tragedy, *Bertram*, had a success at Drury Lane in 1816; its successors, *Manuel* and *Fredolpho*, were promptly damned.

Maubeuge, a fortified town in the French department of Nord, 4 miles from the Belgian frontier; pop. 5499.

Mauch Chunk, a mining-town of Pennsylvania, capital of Carbon county, is situated among picturesque hills on the Lehigh River, 90 miles by rail NNW. of Philadelphia. There is a switchback railway, 9 miles long, from the town to Summit Hill—a place famous for its 'burning mines,' which have been on fire since 1858. Pop. (1880) 3752; (1890) 4098.

Mauchline, a town of Ayrshire, 12 miles ENE. of Ayr, and 10 SSE. of Kilmarnock. It has long been noted for its wooden snuff-boxes and similar nicknacks. There is a monument (1830) to five martyred covenanters; and 1 mile N. is Mossiel, Burns's farm from 1784 till 1788; whilst in the village itself are 'Poosie Nancy's,' the scene of his *Jolly Beggars*, and Mauchline kirk, of his *Holy Fair*. Pop. 1616. See works by W. Jolly (1881) and the Rev. Dr Edgar (1886).

Maud. See MATILDA.

Maudsley, HENRY, a prominent student of mental pathology, was born near Giggleswick in the West Riding of Yorkshire, February 5, 1835, and was educated at Giggleswick grammar-school and University College, London. He graduated M.D. at the university of London in 1857, was for a time physician to the Manchester Royal Lunatic Asylum, but returned to London in 1862 to be a consulting physician. In 1870, now an F.R.C.P., he was Gulstonian lecturer; and from 1869 to 1879 he filled the chair of Medical Jurisprudence at University College. His works are *The Physiology and Pathology of the Mind* (1867), *Responsibility in Mental Disease* (1872), *Body and Will* (1883), and *Natural Causes and Supernatural Seemings* (1886).

Maulmain, or MOULMEIN, a town in the province of Tenasserim, Burma, near the mouth of the Salween River. It is backed by a fine range of hills, on whose heights flash the gilded spires of innumerable pagodas; and here, too, are built many pretty residences, commanding a fine view of the town, river, and adjacent country, which for picturesque beauty and varied scenery has few equals. There are numerous public buildings, churches, chapels, and missionary establishments, several charitable and educational institutions, barracks, a hospital, gaol, &c. Pop. (1856) 43,683; (1881) 53,080; of whom about 27,000 were Buddhists, 11,000 Hindus, 6000 Mussulmans, and 2000 Christians. The value of exports reaches £1,500,000 in some years, and of imports about £1,000,000. The principal exports from Maulmain are teakwood and rice; the imports consist of general merchandise, chiefly piece-goods, hardware, provisions, and sundries. See BURMA.

Mauder, SAMUEL, compiler, was born about 1790, and died 30th April 1849. He was a brother-in-law of Samuel Pinnock, assisted him in the preparation of his catechisms, and amongst other works which he compiled are *Biographical Treasury*, *Scientific and Literary Treasury*, *Treasury of Knowledge*, *Treasury of History*, &c. These books have been frequently revised and new editions issued.

Maundeville. See MANDEVILLE.

Maundy-Thursday, the Thursday of Holy Week (q.v.). The name *Dies mandati* is derived from the ancient custom of washing the feet of the poor on this day, and singing at the same time the anthem *Mandatum novum*, which is taken from John, xiii. 34. This rite, called *mandatum* or *lavipedium*, is of great antiquity, both in the Eastern and Western churches. In more modern times it came to be accompanied by a distribution of 'doles,' placed in small baskets, thence called 'maunds.' In the royal usage of the maund in England, the number of doles distributed is reckoned by the years of the monarch, and their value is 1d. for each year of the sovereign's life. James II. was the last English sovereign who performed this ceremony in person; but the Austrian emperor, Francis Joseph, continued the custom from 1849 till 1888, washing every year the feet of twelve old men. In Madrid the ceremony is retained, the feet of twelve old men and twelve old women being touched with a sponge and towel by the sovereign, who afterwards serves them at table; and in 1889 the feet of twelve boys were washed in the Roman Catholic pro-cathedral at Kensington by one of the bishops, each boy also receiving a piece of money. During the middle ages the maund was held in all monasteries and great houses; and in the Household Book of the Earl of Northumberland, which begins in 1512, there are entries of 'al maner of things yerly yevin by my lorde of his Maundy and my laidis and his lordshippis childeren.' See Skeat's edition of *The Vision of Piers the Plowman* (vol. i. p. 488, l. 140, note).

Maupassant, GUY DE, a clever French writer, was born 5th August 1850, at the castle of Miromesnil in Normandy, and, after carrying a musket through the Franco-German war, was initiated by Gustave Flaubert into the craft of letters. He attached himself to the younger branch of the naturalistic school, and wrote himself in by a story contributed to the *Soirées de Médan* (1880). He next produced a play, *Histoire du Vieux Temps*, and a striking volume of lyrics published under the title *Des Vers* (1880). But he won his real reputation as a novelist and storyteller, with *La Maison Tellier* (1881), *Les Sœurs*

Rondoli (1884), *Contes du Jour* (1885), *Contes et Nouvelles* (1885), *Monsieur Parent* (1885), *Bel-Ami* (1885), *La petite Roque* (1886), *Pierre et Jean* (1888), and *Fort comme la Mort* (1889).

Maupertuis, PIERRE LOUIS MOREAU DE, a French mathematician, was born at St Malo on 17th July 1698. After serving in the army for five years, he withdrew from it to pursue his favourite study, mathematics. His able advocacy of Newton's physical theory, in opposition to that of Descartes, gained him admittance to the Royal Society of London in 1728. In 1736-37 he was placed at the head of the Academicians whom Louis XV. sent to Lapland, to obtain the exact measurement of a degree of longitude, whilst the same thing was being done in Peru by La Condamine. This operation Maupertuis described in *De la Figure de la Terre* (Paris, 1738). In 1740 he went to Berlin, on the invitation of Frederick II., who made him president of the Academy. Having accompanied the Prussian army to the field, he was taken prisoner at Mollwitz by the Austrians in 1741. He returned to Berlin in 1744; but his morbid *amour-propre* and tyrannical disposition excited general dislike. Besides being engaged in a bitter quarrel with König as to the merits of Leibnitz, he incurred the enmity of Voltaire, who satirised him in *Micromegas* and *Diatribes du Docteur Akakia*, which drove Maupertuis away to Basel to recoup his health, and to enjoy the society of the Bernouillias, but he died there, 27th July 1759. Maupertuis was a mathematician of good ability, but owed his celebrity as much to the idiosyncrasies of his manners and disposition as to his merit. His *Works*, 4 vols., appeared at Paris in 1752, and at Lyons in 1768. See Life by Beaumelle (1856).

Maurepas, JEAN FRÉDÉRIC PHÉLIPPEUX, COMTE DE, a French statesman, born in 1701 at Paris. He was brought up for public life, and was early entrusted with office, but contrived to displease the all-powerful Pompadour, and was banished from court in 1749. He was recalled and made first minister at the accession of Louis XVI. (1774), and he succeeded in carrying out his policy of humiliating England by recognising the United States; but his was not the hand to hold the helm in the face of fast-gathering storms. Yet he brought into the ministry men far greater and wiser than himself—Turgot, Malherbes, and Necker. He died 21st November 1781. His *Mémoires* (4 vols. 1792) were edited by his secretary, Sallé.

Maurice, PRINCE OF ORANGE and COUNT OF NASSAU, one of the most skilful generals of his age, was the son of William the Silent, Prince of Orange, and was born at Dillenburg, 13th November 1567. After his father's assassination in 1584, the provinces of Holland and Zealand, and afterwards Utrecht and the others, elected him their stadtholder. A great portion of the Netherlands was still in the hands of the Spaniards; but, under the admirable leadership of Maurice, the Dutch, aided by an English contingent under the Earl of Leicester and Sir Philip Sidney, rapidly wrested cities and fortresses from their enemies. In 1590 Breda, and in 1591 Zutphen, Deventer, Nimeguen, and other places fell into their hands, in 1593 Geertruidenberg, and in 1594 Groningen. In 1597 he defeated the Spaniards at Turnhout in Brabant, and in 1600 won a splendid victory at Nieuwpoort. Then for more than three years he baffled all the power of Spain by his defence of Ostend. Finally, in 1609, Spain was compelled to acknowledge the United Provinces as a free republic. But from this time keen dissension grew up between the Orange party, who favoured the Gomarists, and

the Remonstrants or Arminians, who found their chief supporters in aristocratic republicans like Olden Barneveldt (q.v.; see also ARMINIUS). The former emerged victors from the struggle, and Maurice at once (1621) renewed the war with Spain. He died, unmarried, at The Hague, 23d April 1625. See Groen van Prinsterer, *Maurice et Barneveldt* (Utrecht, 1875).

Maurice, JOHN FREDERICK DENISON, one of the most influential thinkers and social reformers of his age, was the son of a Unitarian minister, and was born at Normanston, near Lowestoft, 29th August 1805. In 1814 the family removed to Frenchay, near Bristol; and in 1823 he went up to Trinity College, Cambridge, thence migrating to Trinity Hall. His reputation at the university for scholarship stood high, but, being at this time a dissenter, he left Cambridge in 1827 without taking a degree, and commenced a literary career in London. He wrote a novel, *Eustace Conway*, and for a time edited the *Athenæum*, then recently started. His spirit had, however, been profoundly stirred and influenced by Coleridge, and he resolved to take orders in the Church of England. He proceeded to Oxford, where he took the degree of M.A., and was ordained a priest in 1834. He became chaplain to Guy's Hospital in 1837; in 1840 professor of Literature at King's College, London, where he was professor of Theology from 1846 till 1853. In 1846 he was appointed chaplain of Lincoln's Inn, and left Guy's Hospital. He continued chaplain of Lincoln's Inn until 1860, when he accepted the incumbency of Vere Street Chapel, which he held until his election as professor of Moral Philosophy at Cambridge in 1866. He died in London on 1st April 1872, and was buried at Highgate. The publication in 1853 of his *Theological Essays*, in which he dealt with the difficulties which hinder the acceptance of faith in Christ, lost him the professorship of Theology in King's College. The controversy turned on the doctrines of the atonement and eternal life. The atonement he declared to be not a terrible necessity but a glorious gospel, not of pardon for sin but deliverance from sin (see ATONEMENT); while Christ's definition of life eternal he maintained was opposed to the popular doctrine, which he regarded as a mixture of paganism and Christianity. The views set forth in this and other works were mainly these: that Christ was not the founder of 'a religion,' but king of all men, ruling now where he least seems to rule; that Christ's church does not consist of a few privileged persons, but is the body which represents 'the marriage of the Lamb,' that marriage being the incarnation, or uniting of the Godhead with manhood; that the 'fall of Adam' is not the centre of theology, but an incident in the early education of the race, important only as representing the weakness of man apart from Christ, in whom he lives and moves and has his being; that the curse of Adam was the condemnation of the false position of the man apart from God, resting on his own strength; that Christ came preaching 'the kingdom of heaven,' that is, the actual reign of righteousness in the world, the revelation of which is not contained in a closed book, but is always going on, and looks not backward to the restoration of an Eden of tropical fruits and easy culture, but forward to the cultivation by work and rest of all man's faculties unto the measure of the stature of the fullness of Christ; that faith consists in trust in this King of men, and belief in the power of right and the impotence, despite its seeming strength, of evil, not in the acceptance of formulæ: that creeds, the Bible, the church, are valuable just in so far as they set forth Christ the King as the object of the faith of man; as substitutes for that faith they

319

are only mischievous. His principal books are his *Moral and Metaphysical Philosophy*, *Religions of the World*, *Prophets and Kings of the Old Testament*, *Patriarchs and Lawgivers of the Old Testament*, *The Kingdom of Christ*, *The Doctrine of Sacrifice*, *Theological Essays*, *Lectures on the Ecclesiastical History of the First and Second Centuries*, *Gospel of St John*, *The Conscience*, and *Social Morality*. Maurice strenuously controverted Mansel's views on our knowledge of God, and denounced as false any political economy founded on selfishness and not on the Cross as the ruling power of the universe. He was the mainspring of the movement known as Christian Socialism, and the president of the society for promoting working-men's associations; and was also the founder and first principal of the Working-man's College, and the founder and the guiding spirit of the Queen's College for Women, in both of which he taught. He vehemently repudiated the position of a party-leader, and his influence consequently extended throughout all parties in the church. He denounced the whole party-system as tending to divide Christ's body, both in church and state. See the *Life of F. D. Maurice*, based mainly on his own letters, by his son, Colonel Maurice (2 vols. 1884).

Maurice of Saxony. See SAXONY.

Maurier. See DU MAURIER.

Maurists, a reformed congregation of Benedictines, originally established in Lorraine, but from 1618 onwards named after the 6th-century St Maur, and established at the abbey of St Maur-sur-Loire, 14 miles NW. of Saumur. Originally noted for their austerity, they were afterwards especially known for their services to learning. The headquarters of the order was subsequently in three houses near Paris, especially St Germain-des-Prés. The congregation was dissolved with other monastic orders in 1792, and the splendid conventual buildings at St Maur destroyed during the revolutionary troubles. Amongst the learned fathers of St Maur were such scholars as Mabillon, Montfaucon, D'Achéry, Martène, Rivet, Tassisi, Bouquet, Ruinart, Lami; and amongst the works published, besides admirable editions of the fathers, the *Art de Vérifier les Dates* (1787), a new edition of Ducange's *Glossarium*, *De Re Diplomatica*, *Acta Sanctorum S. Benedicti* (9 vols. 1702), *Annales Ordinis S. Benedicti* (6 vols. 1739), *Gallia Christiana*, *Veterum Scriptorum Amplissima Collectio*, *Histoire Littéraire de France*, &c.

Mauritania, or MAURETANIA, the latter form that of the coins and inscriptions, was anciently the most north-western part of Africa, corresponding to the present Morocco and the western portion of Algiers. It derived its name from its inhabitants, the Mauri or Maurisii (see MOORS). It reached on the south to the Atlas Mountains, and was originally separated from Numidia on the east by the river Mulucha, now the Muluya, though at a later date it extended as far east as the Ampsaga. In ancient times it yielded great quantities of corn and valuable timber. See MOROCCO.

Mauritius, or ISLE OF FRANCE, an island in the Indian Ocean, belonging to Great Britain since 1810, and situated 550 miles E. of Madagascar. It is of volcanic origin and elliptical in shape. A girdle of reefs, broken only by passages opposite the mouths of the small streams, renders it somewhat difficult of approach. The contour rises rapidly into a tableland, that shoots up into ridges 500 to 2700 feet in height. Of individual peaks, Pouce (2850 feet) resembles the human thumb, Pieter Botte (2676), a sharp cone, supports a gigantic crag on its summit, and Rivière Noire (2711) is the culminating point of the island. Lavas

and basalts abound, and volcanic lakes, as Grand Bassin, are not uncommon. During the French occupation (1715-1810) Mauritius, or, as they called it, Isle of France, was well wooded. Its picturesque beauty forms the appropriate background of Bernardin St Pierre's idyl, *Paul and Virginia*, and is well described in Besant and Rice's novel, *My Little Girl*. But during the 19th century the forests were cut down to make room for sugarcane plantations. Consequently but little of the native flora remains. Most of that which now flourishes has been introduced. The more conspicuous trees and plants are the ebony-tree, cocoa-nut and other palms, bamboo, benzoin, ironwood, aloe, traveller's tree, and numerous tropical fruits, besides food plants, such as sugar, vanilla, coffee, cocoa, maize, rice, yams, manioc, &c. The existing fauna consists almost entirely of imported domestic animals. The extinct fauna embraced the interesting Dodo (q.v.), the rail called *Aphanapteryx*, and a short-winged heron. Fossil tortoises of great size have been discovered. The birds resemble those of Madagascar; and the neighbouring seas swarm with fish. Owing to the deforesting of the island the rainfall is uncertain. Though pleasant enough in the cool months, the climate is very hot during the rainy season (December to April or May), and terrific cyclones are common, though less common, it is believed, since the woods have been felled. At Port Louis the annual mean is 78° F.; but at Curepipe (pop. 7880), on the central plain of the uplands (1800 feet), the thermometer is generally 7° or 8° less, and the climate resembles that of the south of France. In 1854 the cholera carried off 17,000 people, and thirteen years later 30,000 perished of a malignant fever. The upper classes, very intelligent, cultured, and well educated, are mostly descended from the old French colonists, except that the government officials, with a few others, are English. There is a large number of half-castes, and a considerable body of Negroes, Malagasy, Singhalese, Malays, Chinese, &c. But the greater part of the population consists of coolies, who have been imported nearly every year since 1842 to work the sugar-fields. Pop. (1881) 359,874; (1889) 369,302, of whom 251,550 were Hindus. The people of European origin are mostly Roman Catholics (108,000); there are 8000 Protestants. The chief towns are Port Louis (q.v.), the capital, on the north-west coast; Curepipe, to which the government and merchants of the capital retire in the hot season; and Mahébourg (4490) on the south coast. This last town is connected by rail with both the preceding; the line then sweeps round northwards to the mouth of Grand River on the east coast. These, with a couple of branch-lines in the south, make a total of 92 miles. The one great crop of the island is sugar, which is exported to the value of £1,867,600 on an average every year. Rum also is exported to the annual value of £18,000, cocoa-nut oil to £5430, vanilla £14,340, whilst the export of aloe fibres (known in commerce as Mauritius hemp) has risen in value from £12,633 in 1886 to £46,057 in 1888. The total exports are valued at £2,189,820 (average of 5 years ending 1888), and the total imports at £1,500,825. Sugar, drugs, caoutchouc, &c., are exported to Great Britain to the annual value of £282,780 in return for cotton and iron goods, coals, machinery, and clothing, to the annual value of £290,225. The crown colony of Mauritius, with its dependencies the Seychelles Islands, Rodriguez, Diego Garcia, and several minor islands, is administered by a governor, aided by an executive council. There is also a Council of Government, consisting of the governor and twenty-seven members, of whom ten are elected (since the amended constitution of 1885 came into

force), nine are appointed by the crown, and eight are *ex officio*. There is a military force of about 600 men and a police force of 700. Besides 144 primary schools, there is the Royal College (188 pupils in 1888), with a couple of preparatory schools attached. There is a Roman Catholic bishop of Port Louis, and a Protestant bishop of Mauritius. The island was discovered by Mascarenhas (whence it and the neighbouring islands are called the Mascarenes) in 1507; at that time it was uninhabited. The Portuguese having abandoned it after ninety years' possession, it was seized by the Dutch in 1598, who named it after their Prince Maurice (q.v.); but they in their turn abandoned it in 1710. It was the French governor Mahé de Labourdonnais (1735-46) who introduced the sugarcane, and laid the foundation of its prosperity as a colony, during the French occupation. Theodore Hook was treasurer in 1812-18.

See works by Grant (1801), Flemyng (1862), Ryan (1864), Boyle (1867), J. G. Baker (1877), and G. Clark (1881).

Maurocordatos, or MAVROCORDATO, a Fanariote family, distinguished for ability and political influence, and descended from Greek merchants of Chios and Constantinople.—ALEXANDER MAUROCORDATOS (circa 1637-1709) studied medicine in Italy, and, having a talent for languages and diplomacy, became dragoman or interpreter to the Porte in 1681, and rendered valuable service in the negotiations with Austria of the immediately following years, his labours finding their culmination in the treaty of Carlovitz (1699). For some time after that he was one of a triumvirate in whose hands all power in the Ottoman empire rested.—His son, NICHOLAS (died 1730), was the first Greek who was hospodar of Moldavia and Wallachia.—CONSTANTINE, son of Nicholas, became hospodar of Wallachia in 1730, and abolished serfdom in that country.—His brother's grandson, ALEXANDER MAUROCORDATOS, born at Constantinople on 15th February 1791, took an active part in the Greek struggle for liberty, and prepared the declaration of independence and the plan of a provisional government, being himself elected president of the executive body. Then he undertook in 1822 an expedition to Epirus, which ended in the unsuccessful battle of Peta; but he saved the Peloponnesus by his resolute defence of Missolonghi (1822-23). Notwithstanding the opposition of Colocotroni and Dimitrios Ypsilanti, he laboured earnestly in the cause of Greek independence and union. But unpopularity dogged his efforts, because he was a steadfast admirer of English policy and institutions, and a fierce opponent of the pro-Russian government of Capo D'Istria. After the accession of King Otho, he was at different times cabinet-minister and ambassador of Greece at various courts. At the outbreak of the Crimean war he was placed once more at the head of the government—a dignity, however, which he soon resigned. He died at Ægina, 18th August 1865.

Maury, JEAN SIFFREIN, French orator and prelate, was born on 26th June 1746 at Valréas (dept. Vaucluse), and, his studies completed at Avignon, he went to Paris. Eloquent *éloges* on the dauphin, Charles V. of France, St Louis, St Vincent de Paul, and others gained him the abbacy of Frinade, and in 1784 admission to the Academy. In 1786 he was made prior of Lihons-en-Santerre, and in 1789 was sent by the neighbouring clergy to represent them in the States-general. Bold, confident, vehement, gifted with a magnificent voice and an imposing presence, and master of the resources of the skilled orator, Maury was the worthy rival of Mirabeau, and sometimes got the better of him in a parliamentary bout. At the

dissolution of the Constituent Assembly, he withdrew from public life, and even from France. The pope, admiring his devotion to Louis XVI., summoned him to Rome, made him Archbishop of Nicea *in partibus*, then cardinal (1794), and, besides bestowing upon him a valuable living, sent him as his nuncio to witness the coronation of the Emperor Francis II. In spite of his zeal for the Bourbons, Maury made his submission to Napoleon in 1804, and Napoleon in return appointed him grand almoner to his brother Jerome, and in 1810 chose him to be Archbishop of Paris. This step cost Maury the favour of the pope; that of the Bourbons he had of course already lost. He consequently died in disgrace on 11th May 1817. Maury wrote *Essai sur l'Éloquence de la Chaire* (2 vols. 1810), 'one of the best books in the language'; his *Œuvres Choies* were published in 5 vols. in 1827. See Lives by his nephew, L. S. Maury (1827), Poujoulat (1835), and Ricard (1887); also Sainte-Beuve, *Causeries de Lundi*, vol. iv.

Maury, MATTHEW FONTAINE, an American naval officer, astronomer, and hydrographer, was born near Fredericksburg, Virginia, January 14, 1806. In 1825 he was appointed midshipman in the United States navy, and during a voyage round the world in the *Vincennes* commenced his well-known *Navigation* (1834), which was adopted as a text-book in the navy. After thirteen years' service he became lieutenant in 1837, but an accident two years later lamed him for life. He devoted himself to study and the promotion of naval reform, and in 1842 was appointed superintendent of the Hydrographical Office at Washington, and two years later of the observatory. Here he carried out a system of observations on winds and currents, which enabled him to write his *Physical Geography of the Sea* (1856), and to produce in 1844 his works on the Gulf Stream, Ocean Currents, and Great Circle Sailing. In 1855 he was promoted to the rank of commander, but resigned his commission on the secession of Virginia, became an officer of the Confederate navy, and as such was sent as commissioner to Europe. After the war he lived some time in Mexico, but finally accepted the chair of Physics in the Virginia Military Institute at Lexington, where he died February 1, 1873. He was a member of the scientific societies of Paris, Berlin, Brussels, St Petersburg, and may be considered almost as the founder of a new and important science. There is a Life by his daughter (New York and Lond. 1888).

Mausoleum, a sepulchral monument of large size, containing a chamber in which urns or coffins are deposited. The name is derived from the tomb erected at Halicarnassus to Mausolus, king of Caria, by his widow, Artemisia, in 353 B.C. It was esteemed one of the seven wonders of the world. Although apparently in good condition as late as the 12th century, it fell into decay during the following two centuries. The ruins were ransacked for building materials by the Knights of St John in the 16th century. The site was rediscovered in 1857 by Newton, who was instrumental in getting the remains carried to the British Museum (q.v., Vol. II. p. 463). The mausoleum consisted of a basement 65 feet high, on which stood an Ionic colonnade 23½ feet high, surmounted by a pyramid, rising in steps to a similar height, and on the apex of that stood a colossal group, about 14 feet in height, of Mausolus and his wife in the *quadriga*; these statues are supposed to have been the work of the celebrated Scopas. Later instances of large and magnificent mausoleums are Metella's tomb, Hadrian's (Castle of San Angelo), and that of Augustus at Rome, the

mausoleum of Frederick-William III. and Queen Louisa at Charlottenburg near Berlin, that of the House of Hanover at Herrenhausen, of the Prince Consort at Frogmore in Windsor Park, of Napoleon III. at Farnborough, and of A. T. Stewart at Garden City (q.v.), in the United States. The neighbourhood of San Francisco is studded with the mausoleums of American millionaires, one instance being the Lick (q.v.) Observatory; while magnificent structures mark the burial-places of such prominent men as Lincoln, Grant, and Garfield. See BURIAL, and other articles referred to there.

Maw-seed, a name by which poppy-seed is sold as food for cage-birds when moulting.

Maxim Gun. See MACHINE GUN.

Maximilian I., German emperor, the son of Frederick III., was born at Vienna-Neustadt, 22d March 1459. In his nineteenth year he married Mary, the heiress of Charles the Bold, Duke of Burgundy, whereby he acquired Burgundy and Flanders. But this involved him in war with Louis XI. of France, the French kings having for many years had covetous longings towards Flanders. After the early death of his wife (1482) Maximilian was forced to give Artois and the duchy of Burgundy to Louis. Nevertheless he continued to war against his enemy, in spite of the disaffection of his Flemish subjects. In 1486 he was elected king of the Romans. In 1490 he drove out the Hungarians, who, under Matthias Corvinus had seized (1487) great part of the Austrian territories on the Danube; and at Villach in 1492 he routed the Turks, who had been raiding in Carinthia, Carniola, and Styria. Charles VIII. of France having rejected Maximilian's daughter for Anne of Brittany, whose great possessions the emperor hoped to secure by marrying Anne himself, war was only averted by Charles ceding to his exasperated rival the county of Artois and Franche-Comté. On the death of his father in 1493, Maximilian became emperor. He subsequently married Bianca Sforza, daughter of the Duke of Milan, and turned his ambition towards Italy. But his schemes failed: after various changes of fortune, and years of war, he was compelled (1515) to give up Milan to France and Verona to the Venetians. Nor was he more successful against the Swiss, who in 1499 completely separated themselves from the German empire. The hereditary dominions of his house, however, were increased during his reign by several peaceful additions, chief amongst these being Tyrol; and the marriage of his son Philip with the Infanta Joanna united the houses of Spain and Hapsburg; whilst the marriage in 1521 of his grandson Ferdinand with the daughter of Ladislaus of Hungary and Bohemia, brought both these kingdoms to Austria. Two years after his accession the new emperor put an end to the intestine feuds of his nobles by proclaiming at Worms the Eternal Peace. He also improved the administration of justice by establishing the Imperial Tribunal and the Imperial Aulic Council, and by admirable police regulations. The empire was divided into six (afterwards ten) circles, each ruled by a separate governor. Maximilian greatly encouraged the arts and learning, and especially favoured the universities of Vienna and Ingolstadt, and caused at least two works to be written under his own personal direction, *Theuerdank* in verse and *Weisskunig* in prose, of both of which he himself is the hero. He died at Wels, in Upper Austria, 12th January 1519. Besides being excellently schooled in mental and artistic accomplishments, Maxi-

milian was well versed in all bodily exercises; and these advantages were further enhanced by a kingly presence, a chivalrous disposition, and a genial manner, so that he has been called 'the first knight of his age.' Like Henry VIII. of England, he loved to take part in the popular games of archery, &c. See *Lives* by Klüpfel (1864) and Ulmann (1884), and a history of his reign by Hegewisch (1782).

Maximilian, EMPEROR OF MEXICO. Ferdinand Maximilian Joseph, Archduke of Austria, was born on July 6, 1832, and was the son of the Archduke Francis-Charles, and the younger brother of Francis-Joseph I. He became an admiral of the Austrian navy, and in 1857-59 he was popular as governor of the Lombardo-Venetian territory. In 1862 the French were induced to interfere in the affairs of Mexico, and in 1863 called together an Assembly of Notables, which offered the crown of Mexico to Maximilian. After deliberation he solemnly accepted it; and in June 1864 he entered Mexico. For a time all went well; but he vainly tried to reconcile the Mexican parties. Juárez (q.v.) again raised the standard of independence; and soon after (1866) Louis Napoleon had to contemplate the withdrawal of his troops. In vain the Empress Charlotte, a daughter of Leopold I. of Belgium, went to Europe to enlist support for her husband; her reason gave way under the continued grief and excitement brought on by disappointment. The French were most anxious that Maximilian should leave with their troops; but he felt bound as a man of honour to remain, and share the fate of his followers. At the head of 8000 men he made a brave defence of Queretaro against a Liberal army under Escobedo. In May 1867 he was betrayed and tried by court-martial, and on July 19 he was shot. His body was conveyed to Europe in an Austrian frigate. His death was directly due to his own fatal edict of October 3, 1865, that all Mexicans taken in arms against the empire should be shot without trial. After the death of Maximilian, his writings were published under the title of *Aus Meinem Leben; Reiseskizzen, Aphorismen, Marinebilder* (7 vols. 1867). See MEXICO.

Max-Müller, FRIEDRICH, philologist, was born at Dessau, in the duchy of Anhalt-Dessau, 6th December 1823. His father, Wilhelm Müller, distinguished not only for his worth as a man and his extensive and thorough scholarship, but as one of the first German lyric poets, was librarian of the ducal library, but died prematurely, October 1827. Max-Müller received the elements of his education at Dessau, and then went to Leipzig, where he studied Greek and Latin under Hermann and Haupt, and took his degree in 1843. He began the study of Sanskrit under Professor H. Brockhaus, and soon chose it as his special pursuit. The first fruits of his labours appeared in a translation of the *Hito padesa* (Leip. 1844). In 1844 he went to Berlin to study under Bopp and Schelling, and consult the Sanskrit MSS. to be found there. In Paris, whither he repaired in 1845, he began, at the instigation of Burnouf, to prepare for an edition of the Rig-Veda, with the commentary of Śāyanācārya. With this view he came to England, June 1846, to examine the MSS. in the East India House, London, and the Bodleian Library at Oxford; and, on the recommendation of Professor H. H. Wilson, the East India Company commissioned him (1847) to edit the Rig-Veda at their expense (6 vols. 1849-74; new ed. 1890). In 1850 Max-Müller was appointed Deputy Taylorian professor of Modern Languages at Oxford; in 1854 he succeeded to the professorship; and in 1858 he was elected a Fellow of All Souls. While pursuing his labours connected with the Rig-Veda, Max-

Müller has published treatises on a variety of philological topics, which have done more than the labours of any other single scholar to awaken in England a taste for the science of language in its modern sense. Inheriting the poetic imagination and fire of his father, Max-Müller has at command such a felicity of illustration that subjects dry under ordinary treatment become in his hands attractive. He has published a translation into German of Kālidāsa's *Megha-dūta* (1847); *The Languages of the Seat of War in the East* (1854); *Comparative Mythology* (1856); *History of Sanskrit Literature* (1859); *Lectures on The Science of Language* (1861-63); *Lectures on The Science of Religion* (1870). Other works were *Chips from a German Workshop* (4 vols. 1868-75), the Hibbert *Lectures on The Origin and Growth of Religion* (1878), *Selected Essays* (1881), and *Biographical Essays* (1883). A novel written in German, *Deutsche Liebe*, which has gone through many editions, is attributed to him. He is editor of the important series of *The Sacred Books of the East*. In 1888 he delivered at Glasgow University the first series of Gifford Lectures, which were published in 1889 under the title of *Natural Religion*; and a second course was delivered by him in 1890. He is one of the eight foreign members of the Institute of France, and one of the twenty knights of the Ordre pour le Mérite. He has received the degree of LL.D. from Cambridge, Edinburgh, and Bologna.

Maxwell, JAMES CLERK, one of the greatest of modern natural philosophers, was the only son of John Clerk-Maxwell of Middlebie, in Dumfriesshire, and was born at Edinburgh, June 13, 1831. He was educated in boyhood at the Edinburgh Academy. His first published scientific paper was read for him by Professor Forbes to the Royal Society of Edinburgh before he was fifteen. He spent three years at the university of Edinburgh; and during this period he wrote two valuable papers, 'On the Theory of Rolling Curves,' and 'On the Equilibrium of Elastic Solids.' He went to Cambridge in 1850, obtained in 1854 the position of second wrangler, and was declared equal with the senior wrangler in the higher ordeal of the Smith's prize. In 1856 he became a professor in Marischal College, Aberdeen, and in 1860 in King's College, London. He had been successively Scholar and Fellow of Trinity, and was elected an Honorary Fellow of Trinity when he finally became in 1871 professor of Experimental Physics in the university of Cambridge. He died November 5, 1879.

The great work of his life is his treatise on *Electricity and Magnetism* (2 vols. 1873). His great object was to construct a theory of electricity in which 'action at a distance' should have no place; and his success was truly wonderful. There can be little doubt that he succeeded in laying the basis of a physical theory of electric and magnetic phenomena, quite as securely founded as is the undulatory theory of light (see *Nature*, vol. vii. p. 478). Another subject to which he devoted much attention was the perception of colour, the three primary colour-sensations, and the cause of colour-blindness. He was the first to make colour-sensation the subject of actual measurement. He obtained the Adams prize for his splendid discussion of the dynamical conditions of stability of the ring-system of Saturn. But he was perhaps best known to the public by his investigations on the kinetic theory of gases. His Bradford 'Discourse on Molecules' is a classic in science. Besides a great number of papers on various subjects, mathematical, optical, dynamical, he published an extraordinary text-book of the *Theory of Heat* and an exceedingly suggestive little treatise on *Matter and Motion*. In 1879 he edited, with copious and very valuable original

notes, *The Electrical Researches of the Hon. Henry Cavendish*. He took a prominent part in the construction of the British Association Unit of Electrical Resistance, and in the writing of its admirable reports on the subject; and he discovered that viscous fluids, while yielding to stress, possess double refraction. He was excessively ingenious in illustration, especially by means of diagrams, and possessed a singular power of epigrammatic versification. Some of his last and very best scientific work adorns and enriches the ninth edition of the *Encyclopædia Britannica*. He was, in the full sense of the word, a Christian. His *Scientific Papers* were edited by W. D. Niven (8 vols. Camb. 1890); and his life has been written by Lewis Campbell and William Garnett (1892).

Maxwell, SIR WILLIAM STIRLING-, the son of Archibald Stirling of Keir, in Perthshire, was born at Kenmure House, near Glasgow, in 1818. Having graduated from Trinity College, Cambridge, in 1839, he spent some time travelling in Italy and Spain, one outcome of which was *Annals of the Artists of Spain* (3 vols. 1848). He always retained his interest in Spanish subjects: in 1852 was published from his pen *Cloister Life of the Emperor Charles V.*, in 1855 *Velazquez and his Works*, in 1856 *Notices of the Emperor Charles V. in 1555 and 1556*, and in 1883 the sumptuous *Don John of Austria* (previously printed for private circulation). He also issued privately several other books, got up in a very sumptuous style, some dealing with Charles V. and two with the anatomist Vesalius. In 1866 he succeeded to the baronetcy and estates of his uncle, Sir John Maxwell of Pollok, adding the name of Maxwell to his own patronymic. Sir William's second wife (1877) was the Hon. Mrs Norton (q.v.). Besides representing Perthshire as a Conservative from 1852 to 1867, and again in 1872, he was a trustee of the British Museum and the National Portrait Gallery, and was chosen Lord Rector of St Andrews in 1863, of Edinburgh in 1871, and in 1875 Chancellor of Glasgow University. He died at Venice on 15th January 1878. A new edition of his Works was published in 6 vols. in 1891.

May. From a primitive period the revival of vegetation, which marks nature at this period, has been celebrated with various ceremonies. Hence the first of May has from time immemorial been a gala day in Britain, although like most of the festivals of the calendar it has suffered from the hand of time. It is no doubt a survival of the Floralia of the Romans, who in their turn, it has been suggested, derived their festival from India. The anniversary is still kept up by the Italians under the title of 'Calendi di Maggio'; young people sallying forth at daybreak to collect boughs with which to decorate the doors of their relatives and friends. A remnant of the May festival, as observed by the Druids, survives in the fires formerly lighted on this occasion—the day having been called by the Irish and the Scotch Highlanders *Bealtine* or *Beltane* (q.v.). In England, as we learn from Chaucer and Shakespeare and other writers, it was customary during the middle ages for all, both high and low—even the court itself—to go out on the first May morning at an early hour 'to fetch the flowers fresh.' Hawthorn (q.v.) branches were also gathered; these were brought home about sunrise, with accompaniments of horn and tabor and all possible signs of joy and merriment. The people then proceeded to decorate the doors and windows of their houses with the spoils. By a natural transition of ideas they gave the hawthorn bloom the name of the 'May'; they called the ceremony 'the bringing home the May'; they spoke of the expedition to the woods as 'going a-Maying.' The fairest maid

of the village was crowned with flowers as the 'Queen of the May,' and placed in a little bower or arbour, where she sat in state, receiving the homage and admiration of the youthful revellers, who danced and sang around her. How thoroughly recognised, too, the May-day games, with the accompanying morris-dance, became in England may be illustrated by the fact that in the reign of Henry VIII. the heads of the corporation of London went out into the high grounds of Kent to gather the May—the king and his queen, Catharine of Aragon, coming from their palace of Greenwich, and meeting these respected dignitaries on Shooter's Hill. Another conspicuous feature of these festive proceedings was the erection in every town and village of a fixed pole—called the Maypole—as high as the mast of a vessel of 100 tons, on which each May morning they suspended wreaths of flowers, and round which the people danced in rings pretty nearly the whole day; the earliest representation of an English Maypole being that reproduced in the *Variorum Shakespeare*, as depicted on a window at Betley, in Staffordshire. A severe blow was given to these merry customs by the Puritans, who caused Maypoles to be uprooted, and a stop put to all their jollities. They were, however, revived after the Restoration, and held their ground for a long time; but they have now almost disappeared. In France and Germany too, Maypoles were common, and in some places are still to be seen, and festive sports are even yet observed. See Chambers's *Book of Days*, vol. i. pp. 569–582. With Catholics, since 1815, the month of May has been specially celebrated as the Virgin's month; and in Scotland, from some time at least before Mary's marriage to Bothwell (1567), as long before with the Romans, it has been deemed an unlucky month to marry in.

May, ISLE OF. See FORTH.

May, THOMAS, dramatist and historiographer, was the son of Sir Thomas May of Mayfield in Sussex, and was born in 1594. Educated at Cambridge, he became a member of Gray's Inn and a courtier. He produced several dramas (*Antigone*, *Cleopatra*, *Agrippina*, &c.) and comedies, poems, and translations of the Georgics and Lucan's *Pharsalia*. During the Civil War he was made secretary and historiographer to the Parliament, and in that capacity produced a *History of the Parliament of England, 1640–1643* (1650; several times republished), and a *Breviary of the same history* (1650). He died 13th November 1650.

May, SIR THOMAS ERSKINE, Baron Farnborough, born in 1815, was educated at Bedford School, became assistant-librarian of the House of Commons in 1831, clerk-assistant in 1856, and clerk of the House in 1871. He was called to the bar in 1838, was made in 1860 Companion, in 1866 Knight Commander of the Bath, and shortly after his retirement from office in 1886 was raised to the peerage as Baron Farnborough, but died on 18th May of that year. His most important works are *A Treatise on the Law, Privileges, Proceedings, and Usage of Parliament* (1844), which, acknowledged as the parliamentary text-book, had gone through six editions before his death and been translated into German and Hungarian; *Constitutional History of England since the Accession of George III., 1760–1860* (1861–63; 3d ed., with supplementary chapter, 3 vols. 1871), a continuation of Hallam's work to our own times, and of which French and German translations have appeared; and *Democracy in Europe: a History* (2 vols. 1877), a work characterised by great learning and impartiality.

Mayas. See AMERICAN INDIANS.

Maybole, a town of Ayrshire, 3½ miles inland, and 9 by rail S. by W. of Ayr. In feudal times

the capital of Carrick, and a burgh of barony since 1516, it is an old-world place, which once boasted twenty-eight baronial mansions, several of which still remain; besides which, it has a new town-hall (1887) and a fine Roman Catholic church (1879). Shoemaking is the staple industry. The famous abbey of Crossraguel (q.v.) is in the vicinity. Pop. (1851) 3862; (1881) 4494.

Mayence. See MAINZ.

Mayenne (Lat. *Meduana*), a French department formed out of the old provinces of Maine and Anjou, now containing the arrondissements of Laval, Château-Gontier, and Mayenne, has an area of 1996 sq. m. and a pop. of (1872) 350,637; (1886) 340,063. The valleys of the Mayenne, Vilaine, and Sarthe are fairly fertile, and yield wheat, barley, flax, potatoes, hemp, and fruit (especially apples for cider). Cattle-breeding, coal and slate mining, and cotton spinning and weaving are the other chief industries. Chief-town, Laval.—The river Mayenne, after a course of 127 miles in a southerly direction, joins the Sarthe at Angers to form the Maine, a tributary of the Loire. It is navigable up to Laval.—The town of Mayenne, on the river Mayenne, 78 miles by rail S. by W. of Caen, has a picturesque ruined castle (taken by the English in 1424), steep narrow streets, and manufactures of calico and linen. Pop. (1872) 8790; (1886) 9940.

Mayer, JULIUS ROBERT VON, physicist, was born at Heilbronn, 25th November 1814, studied medicine at Tübingen, Munich, and Paris, began life as a ship's surgeon, and settled in his native town to practise his profession in 1841. Whilst at Batavia in 1840 his attention was first attracted to the studies he afterwards pursued in every interval of leisure. In 1842 he published in Liebig's *Annalen* a preliminary statement of the mechanical theory of heat, in which he clearly determined the numerical relation between heat and work. Three years later he restated his views with admirable clearness and with a great wealth of illustration, and at the same time gave a forecast of his theory of the meteoric origin of the sun's heat, elaborated in 1848. Contemporaneously with Mayer the mechanical theory of heat was worked out independently by Joule (q.v.) in England. Nevertheless a controversy arose as to the priority of discovery. The Royal Society gave him the Copley medal in 1871, and he was ennobled by the king of Württemberg two years before his death, on 20th March 1878. Mayer's papers were collected under the title *Mechanik der Wärme* (2d ed. 1874), and his *Correspondence* appeared in 1889. See Tyndall's paper in *Nature* (vol. v., and cf. vol. xvii.), and monographs by Dühring (1879) and Weyrauch (1889).

May-fly. See EPHEMERA.

Mayhem. See ASSAULT.

Mayhew, AUGUSTUS (1826-75), author, wrote in conjunction with his brother Henry ('the Brothers Mayhew') several notable works of humorous fiction, the best of which are named in the article below. In addition to this, the better-known part of his work, he wrote several stories which were popular at the time—*Paved with Gold* (1857), *The Finest Girl in Bloomsbury* (1861), *Faces for Fortunes* (1865), &c.

Mayhew, HENRY, journalist and littérateur, was born in London in November 1812. He ran away from Westminster School in consequence of unjust treatment, was sent on a voyage to Calcutta, and on returning was articled to his father, a solicitor. Mayhew's first adventure in literature was the starting, in conjunction with Gilbert à Beckett, of *The Cerberus*, the production of which was

stopped by A Beckett's father. The two youths in disgust left their homes, and with but fifteen shillings between them walked to Edinburgh, hoping to make fortunes there as actors and authors at the theatre of which Mayhew's brother Edward was lessee; this failed, for they were at once sent back. In 1831 they started *Figaro in London*, and the year following *The Thief*, which was the prototype of the 'Bits' journals of to-day. In 1841 Mayhew produced *The Wandering Minstrel*, a farce, and shortly after joined with his brother Augustus in one of the most successful of literary partnerships, during which (as 'the Brothers Mayhew') they produced some remarkably clever works of fiction, the best of which are *The Good Genius that turned Everything to Gold* (1847), *The Greatest Plague of Life* (1847), *The Image of His Father* (1848), *Whom to Marry* (1848), *The Magic of Kindness* (1849), *Living for Appearances* (1855). One of the originators and first editor of *Punch*, Mayhew was from early in the 'forties' a voluminous writer on many subjects—as on *The Peasant Boy Philosopher* (1854), *The Wonders of Science* (1855), *Shops and Companies of London* (1865), *London Characters* (1874), and *The Criminal Prisons of London*. The work by which Mayhew will perhaps be best remembered is his great *London Labour and the London Poor* (1851, &c.). Henry Mayhew, who had married in 1844 the elder daughter of Douglas Jerrold, died on July 25, 1887.—HORACE MAYHEW (1816-72), brother of the two foregoing, also made some mark in literature, more especially of a humorous and ephemeral kind. He was a constant contributor to *Punch*, of which he was at one time sub-editor.

Maynooth, a village of County Kildare, Ireland, 15 miles NW. of Dublin by rail; pop. (1881), including the college, 1174. It is of historical interest as the seat of the Geraldines, of whose castle striking ruins still remain; and as the scene of more than one struggle with the English power, especially the 'Rebellion of Silken Thomas,' in the reign of Henry VIII., and in the war of the Confederates (1641-50). But its chief modern interest arises from its Roman Catholic college, established (1795) by an act of the Irish parliament during Pitt's ministry, to meet a necessity created by the destruction, through the French Revolution, of the places of education in France, upon which the Irish Catholic clergy, excluded by the penal laws from the opportunity of domestic education, had been driven to rely. The original endowment, an annual vote of £8928, was continued, although not without controversy and keen opposition on the part of zealous Protestants, by the imperial parliament after the act of union. In the year 1846 Sir Robert Peel carried a bill for a permanent endowment of £26,000 a year, to which was added a grant of £30,000 for building purposes. The building erected under the original endowment is a plain quadrangle. The new college is a very striking Gothic quadrangle by Pugin, containing professors' and students' apartments, lecture-halls, and a singularly fine library and refectory.

Under the Act of 1845 the college was to receive 500 students, all destined for the priesthood. The patronage of the 500 studentships was divided in the ratio of population among the bishops of the several sees of Ireland; the candidates were subjected, before matriculation, to a comprehensive entrance examination. The full collegiate course was of eight years, two of which were given to classics, two to philosophy, and the remaining four to divinity, scripture, church history, canon law, and the Hebrew and Irish languages. The divinity students, 250 in number, received a money stipend of £20 annually; and at the close of the ordinary course, 20 'Dunboyne Scholarships' were assigned

by competition to the most distinguished students, and might be held for three years. The legislative authority was vested in a board of seventeen trustees, and the internal administration in an academical body, consisting of a president and vice-president, together with a numerous body of professors and deans. Of a board of eight visitors, five were named by the crown, and three elected by the trustees.

In 1869, by the Irish Church Act, the Maynooth endowment was withdrawn—a capital sum, fourteen times its amount, being granted to the trustees for the discharge of existing interests. The college, however, is still maintained on the same footing; and although the number of pupils, owing to the suspension of free studentships and exhibitions, fell off somewhat for the few years immediately succeeding the disendowment, the diminution was only temporary. In recent years the average number of students in residence has been 500. The visitatorial powers created under the act of parliament are now exercised by visitors appointed by the trustees, and all state connection is at an end. The college also possesses some landed and funded property, the result of donations and bequests, the most considerable of which is that of Lord Dunboyne, Roman Catholic Bishop of Cork. The new chapel, originally included in the design supplied by Pugin in 1846 for the new college, was (with the exception of a tower and spire 275 feet high) completed at the cost of £50,000, and dedicated in 1890. Designed by the late J. J. M'Carthy in the Decorated Gothic style, it consists of a great nave, choir, and sanctuary, ending in a five-sided apse, from which radiate five chapels. The entire length is 220 feet, the width 40 feet, the height from floor to groined ceiling 70 feet. The sides of the chapel are flanked by cloisters which exteriorly present the appearance of aisles. The interior is richly fitted as a collegiate chapel, with 450 choir-stalls of finely-carved oak, mosaic pavements of varied devices, altars of Carrara marble, rich painted glass, and a sweetly-toned organ, built on the electro-pneumatic principle. A great part of the college buildings was burned in November 1878, but has since been restored.

Mayo, a maritime county of the province of Connaught, Ireland, is bounded on the N. and W. by the Atlantic Ocean, E. by Sligo and Roscommon, and S. by Galway. Area, 1,360,731 acres, of which nearly 26 per cent. is bog and 18 per cent. barren. Of the remainder 168,149 acres were under crop in 1888 (cereals 55,687 acres, and green crops 61,263, including 48,089 acres of potatoes), 39,857 laid down to permanent pasture, and 11,240 sown with clover, sainfoin, &c. Pop. (1841) 388,887; (1861) 254,769; (1891) 218,406, of whom 213,167 were Roman Catholics and 4194 Protestant Episcopalians. The rearing of cattle and agriculture are the leading industries. The eastern half of the county is more or less a plain, the western half mountainous, the highest points being Mulreea (2688 feet), Nephin (2530), and Croagh Patrick (2370). Ironstone abounds, but owing to want of fuel is not worked; and there are several valuable slate-quarries. The chief towns are Castlebar (3885), Westport (4469), Ballina (5760, including 1442 in County Sligo), and Ballinrobe (2286). The coast-line of Mayo is about 250 miles, and is greatly indented, Killala, Blacksod, and Clew Bays, Killary Harbour, and Broad Haven being on this coast. Off Mayo, too, lie the islands Achil (35,283 acres), Clare (3959), and others. Loughs Mask and Corrib lie on the southern border, and Loughs Conn, Castlebar, Cullen, Carragh, Corramore within the county. A valuable salmon-fishery exists in the river Moy, and Lough Mask is the home of the 'gillaroo' trout. The Irish

language was in 1881 spoken by 8808 persons who did not know English, and by 138,930 who did. Four members are returned to the House of Commons.

Mayo formed part of the extensive territory granted by King John to Hubert de Burgh; but William, the third earl, seizing Galway and Mayo, threw off the English allegiance and adopted the 'customs of the Irish,' together with the Celtic name of Mac-William. The district was not subdued until 1586. The antiquities of Mayo are chiefly ecclesiastical, there being many ruins of monasteries. Four round towers exist, and at Cong the remains of a splendid abbey of the 12th century. The celebrated 'Cross of Cong,' now in the museum of the Royal Irish Academy, was made at Roscommon in 1120.

Mayo, RICHARD SOUTHWELL BOURKE, EARL OF, Indian statesman, was born in Dublin on 21st February 1822, and educated at Trinity College, Dublin. He entered the House of Commons as a Conservative in 1847, and was appointed Chief-secretary of Ireland by Lord Derby in 1852, 1858, and 1866. In 1868 he was sent out to succeed Lord Lawrence as Viceroy of India. He discharged the duties of his office with earnest zeal and uniform courtesy, maintained friendly relations with the neighbouring states, treated the feudatory princes and the native people with impartial justice tempered by great kindness, and effected considerable improvements in the economic management of the Indian government, in gaol discipline, in irrigation works, and in providing educational facilities for the native Mohammedan population. Whilst inspecting the convict settlement at Port Blair on the Andaman Islands, on 8th February 1872, he was fatally stabbed by a Punjab fanatic. See *Life* by Sir W. W. Hunter (2 vols. 1875).

Mayonnaise, a thick cold sauce for salads, cold meat, poultry, fish, vegetables, &c., made of the yolk of eggs, salad-oil, and vinegar, with a little salt, cayenne pepper, and meat-jelly; it is sometimes coloured red with powdered lobster coral, or green with spinach or parsley.

Mayor (Fr. *maire*, Lat. *major*; see MAJOR), originally a steward, bailiff, or overseer, thence the chief-magistrate of a city or corporate town in England or Ireland. The mayor is the head of the local judicature, and the executive officer of the municipality; he is elected by the council from the aldermen or councillors, and holds office for a year only. His duties include those of returning officer in all boroughs except those cities and towns which, being counties of themselves, have sheriffs of their own. The first Mayor of London was appointed in 1189, the first Mayor of Dublin in 1409. The mayors of London, York, and Dublin are called 'Lord Mayor.' The Lord Mayor of London has the title of 'Right Honourable'—which, along with the title 'Lord,' was first allowed by Edward III. in 1354—is the representative of royalty in the civil government of the city, the chief-commissioner of lieutenancy, the conservator of the river Thames, and on the demise of a sovereign is summoned to attend the Privy-council. To sustain the hospitality of the city he receives an allowance of £8000 a year, with the use of the Mansion House (q.v.), furniture, carriages, &c. He is chosen by the Livery (q.v.) on the 29th September, being commonly the senior alderman who has not already 'passed the chair.' Although the office is still one of dignity, it is only in the eyes of foreigners that the Lord Mayor of London is one of the most important public functionaries of the realm. The Mayor of Dublin was first styled Lord Mayor by Charles II. in 1665. The title of Mayor is used to denote the chief officer of a city in the

United States and the British colonies. In France the Maire is first officer of a town, commune, or district. For the Mayor of the Palace, see PEPIN. See also PROVOST.

Mayotte, one of the Comoro Isles (q.v.).

Maysville, capital of Mason county, Kentucky, on the Ohio River, 69 miles by rail N.E. of Lexington. It is the river-port of a rich territory, and contains many mills, distilleries, &c. Pop. 5350.

Mayweed, or Stinking Camomile (q.v.).

Mazamet, a town in the French department of Tarn, on the Arnette, 43 miles ESE. of Toulouse, and 12 by rail SSE. of Castres. It has extensive woollen manufactures. Pop. 10,939.

Mazanderan, a province of northern Persia, fringing the Caspian Sea for some 200 miles and lying between the provinces of Ghilan and Astrabad, consists of a belt of low marshy coast-land, 10 to 20 miles wide, backed by the well-wooded northern slopes of the Elburz. The climate is very changeable, in summer both rainy and unhealthy, but on the uplands fairly salubrious. Owing to the fertility of the soil, which is watered by numerous small rivers, the Persians call the province the 'Garden of Iran.' Rice, wheat, and other cereals, cotton, mulberry-trees, and a variety of fruits are produced. Horses, asses, and camels are extensively bred. Area of province, 10,400 sq. m.; pop. 300,000. The chief town is Sari, though Barfurush (see BALFRUSH) is the seat of the trade with Russia. Iron ores and mineral oils are very abundant.

Mazarin, JULES (*Giulio Mazarini*), cardinal and chief-minister of France during the minority of Louis XIV., was born 14th July 1602, at Piscina in the Abruzzi. He studied under the Jesuits at Rome, and later at Alcalá in Spain, where he relieved the tedium of study with love-making. He next entered the military service of the pope, but his ability for diplomacy was early recognised. Having accompanied a papal legate to the court of France, he became known about 1628 to Richelieu, who divined his promise and engaged him to maintain French interests in Italy, which he did while still employed by the pope as vice-legate to Avignon (1632), and nuncio to the French court (1634-36). In 1639 he openly entered the service of Louis XIII. and was naturalised a Frenchman; and two years later he received a cardinal's hat through the influence of Richelieu, who before his death (4th December 1642) recommended Mazarin to the king as his successor. His position was one of great difficulty amid the intrigues and jealousies of the time, and the first necessity was that he should make himself indispensable to the queen, who became regent on her husband's death in May 1643. But Mazarin was one of the most supple courtiers that ever bowed the knee before a throne, and moreover he knew how to touch a woman's heart by his romantic devotion. So he kept his place as minister, and it is certain, from his famous *cartes* and many of the Brühl letters, that the queen gave him her love, if it cannot with certainty be proved that there was a private marriage between them. It should be remembered that this was perfectly possible, for M. Chéruel has discovered that the cardinal had never taken more than the minor orders, of which a man could easily divest himself. Mazarin possessed admirable faculty for affairs and so much personal charm that he ruled with greater smoothness than Richelieu, although with almost as unlimited a sway. The parliament, thinking to regain political power, resisted the registration of edicts of taxation; but Mazarin caused the leaders of the opposition to be arrested (August 1648), upon which the disturbances of the Fronde (q.v.) began. The court retired to St Germain, but at length tri-

umphed by the aid of Condé, and the truce of Ruel, while it removed the obnoxious taxes, left Mazarin and his subordinates in office. The hatred against him, however, blazed out anew in the provinces, when at his instigation the queen-regent arrested Condé, Conti, and Longueville in January 1650. Mazarin triumphed at Réthel, but soon had to succumb to the strength of the combination against him and retire to exile at Brühl. Meantime the press teemed with pamphlets and satires against him—the famous *Mazarinades*, few of which, however, attained the dignity of literature. The cardinal now perceived the fatal consequences of his policy of isolating himself and the queen from every party in the state, and bent all his masterly powers of intrigue to form a new royal party. Turenne was gained over, and his military genius proved more than adequate as a counterpoise to the opposition of Condé. After one year's absence Mazarin returned to court in January 1652, but eight months later again retired to Sedan to admit of a reconciliation with the *parlement* of Paris. At length in February 1653 he returned in triumph to Paris, and thereafter his power remained secure, while he quickly regained all his popularity. Under his rule the influence of France abroad was greatly increased. He gained the alliance of Cromwell at the price of Dunkirk; secured the preponderance of French influence in southern Germany by the treaty of Westphalia (1648), and the league of the Rhine, formed in 1659; and by the treaty of the Pyrenees (November 7, 1659), and the marriage of Louis XIV. with the Infanta Maria Theresa, brought the succession to the throne of Spain within the range of French ambition. Mazarin died at Vincennes, 9th March 1661, leaving an immense fortune, variously stated at from 18 to 40 million livres. His magnificent library, which had long been placed freely at the disposal of the public, was bequeathed to the Collège Mazarin. His name survives characteristically in the 'Mazarin Bible,' one of the most priceless treasures of Bibliomania (q.v.).

His celebrated nieces whom he brought from Italy to the French court present all the possible contrasts of character and destiny. The eldest of the seven, the virtuous Laura Mancini, married the Duc de Mercœur, son of Henry IV. and Gabrielle, and died young. Anne-Marie Martinozzi, her cousin, married the Prince de Conti, an austere and gloomy hunchback, and also died young. Laura Martinozzi mounted a throne by marrying the Duke of Modena, and became mother of the second queen of James II. of England. Olympe Mancini, who became Comtesse de Soissons, was a woman formed for great crimes, whose true place would have been in the palace of the Cæsars or the Vatican of the Borgias. She plunged deep into a series of discreditable intrigues, and found herself obliged to flee from France to escape the punishment of a poisoner. After fitting awhile like an evil genius over the face of Europe, she died poor and obscure at Brussels. Hortense Mancini, the most beautiful of the seven, and her uncle's favourite, inherited his fortune, and was sought in marriage by the Duke of Savoy, the Prince of Portugal, and the King of England. The cardinal married her to the Duc de la Meilleraie, who took the name and arms of Mazarin. He was a gloomy bigot, who mutilated with the fury of a Byzantine iconoclast the magnificent antique statues which Mazarin had collected with all an Italian's love for art, shut up his wife, and treated her with a jealous severity which afforded in the morality of the time ample justification for her misconduct. She found at once a refuge from his pursuit in England, and a characteristic recreation in an intrigue with Charles II. Marie-Anne Mancini became Duchesse

de Bouillon, and was the generous patroness of Lafontaine and other men of letters. Her reputation was not spotless, but her wit brought her off triumphant from an examination for sorcery before the *Chambre Ardente* which her sister could not face. Marie Mancini, the least beautiful of the seven, was beloved by Louis XIV., who would have married her but for the self-denying opposition of his great minister. She found shelter but not consolation in the arms of Prince Colonna, one of the jealous husbands of old Italian story. She fled from his severity to Provence, to Flanders, and to Spain, but was at length secured and subdued into submission.

See the *Mémoires* of such contemporaries as De Retz, Madame Motteville, La Rochefoucauld, Turenne, Grammont, and Basin's *Hist. de France sous Louis XIII. et sous le Card. Mazarin* (4 vols. 1846); but especially the following works which have superseded all others: Chéruel's *Hist. de France pendant la Minorité de Louis XIV.* (4 vols. 1879-80), and its sequel, *Hist. de France sous le Ministère de Card. Mazarin* (2 vols. 1881-82), also Chéruel's edition of the *Lettres du Card. Mazarin pendant son Ministère* (4 vols. 1879-87). Other books that may be read are Cousin's *Jeunesse de Mazarin* (1865), Renée's *Les Nieces de Mazarin* (1856), and Gustave Masson's *Mazarin* (1886) in the 'Home Library' series. The Mazarinades were enumerated by Moreau in his *Bibliographie des Mazarinades* (3 vols. 1850-51; containing a list of no fewer than 4082), and collected in *Choix de Mazarinades* (2 vols. 1853).

Mazarron, or ALMAZARRON, a seaport town of Spain, 27 miles WSW. of Cartagena. Pop. 11,002.

Mazatlan, a fortified seaport of Mexico, at the entrance of the river Mazatlan, which falls into the Gulf of California, 230 miles SE. of Sinaloa. It is a well-built and picturesque town, the houses nearly all of one story, and possesses a cathedral, custom-house, barracks, a cotton factory, foundries, &c. The chief exports are gold and silver, archil, and mother-of-pearl. Pop. (1880) 17,395.

Mazeppa, IVAN STEPHANOVICH, hetman of the Cossacks, was born in 1644, descended of a poor but noble family of Podolia. He became a page at the court of John Casimir, king of Poland. A Polish nobleman, having surprised him in an intrigue with his wife, caused him to be stripped naked, and bound upon his own horse, lying upon his back, and with his head to its tail, and let the animal loose, leaving Mazeppa to his fate. The horse carried him, senseless from exhaustion, to its native wilds of the Ukraine, according to the usual account. A more credible story is that his horse carried him through woods and thickets and brought him back torn and bleeding to his own home. Mazeppa now joined the Cossacks, became secretary to their hetman, Samoilovich, and in 1687 was elected his successor. He won the confidence of Peter the Great, who loaded him with honours, and made him Prince of the Ukraine; but, on the curtailment of the freedom of the Cossacks by Russia, Mazeppa conceived the idea of throwing off the sovereignty of the czar, and for this purpose entered into negotiations with Charles XII. of Sweden. His treason was revealed to Peter the Great, who long refused to credit it, but after Pultowa ordered his effigy to be hanged upon the gallows, and his capital, Baturin, to be razed to the ground. Mazeppa's hopes perished in the disaster of Pultowa (1709), and he fled with Charles to Bender, where he died miserably the same year. His story is the subject of a famous poem by Byron, of a novel by Bulgarin, and a drama by Gottschall, of two paintings by Vernet, and of a masterly historical work by Kostomarov (1882).

Mazurka, a lively Polish round dance, the music of which is generally in $\frac{3}{4}$ time. The peculiarity of the rhythm, which has a pleasing effect, is

what characterises the music of the Mazurka. It is danced by four or eight couples, and is much practised in the north of Germany, as well as in Poland, from whose province Masovia it gets its name.

Mazzara, a walled cathedral city of Sicily, 32 miles by rail S. of Trapani, stands in a fine plain on the seashore. Pop. 13,074.

Mazzarino, a town of Sicily, 15 miles SE. of Caltanissetta. Pop. 12,964.

Mazzini, GIUSEPPE (English, JOSEPH), Italian patriot and republican, was born at Genoa, 22d June 1805. A clever, precocious boy, he began to study at the university of his native town when only thirteen, and before he was nineteen was practising as an advocate. In April 1821 his heart was deeply stirred and his imagination fired through seeing refugees from the unsuccessful rising in Piedmont, and from that moment he conceived the idea of the liberation of his country. At first he assailed the domination of the classical school of literature, and its 'monarchical' tyranny of rule and prescription. But the earnestness of his nature soon pushed him on to make 'the first great sacrifice of his life,' by renouncing 'the career of literature for the more direct path of political action.' In 1829 he joined the Carbonari (q.v.), although he mistrusted their aims, their methods, and the character of their organisation. He was betrayed in July 1830 to the Sardinian police, and imprisoned in Savona. In his prison cell he matured those thoughts which became the ruling principles of his life and work, and shortly after his release, early in the following year, organised at Marseilles the Young Italy Association. The first and last duty of its members was to labour to create a free, independent, and united nation of Italians. The great mass of the people were to be educated to understand their rights, and taught to obtain them, if need were, through insurrection. But Italy must first be freed from the yoke of the foreigner. Nothing but a republic could serve her political needs in the future. Once Italy were regenerated, she 'was destined to arise the initiatrix of a new life, and of a new and powerful unity to all the nations of Europe'—the selfsame rôle that Heine and Young Germany assigned to regenerated Germany. The ultimate goal was the governance of the world by the moral law of progress, through the effective agencies of association, man with man and nation with nation. 'The labour to be undertaken was not merely political, but above all a moral work; not negative, but religious.' It was essentially the practice of a faith, the living of a creed, a religion. It was in this spirit that Mazzini laboured to his life's end—unwaveringly, disinterestedly, through the bitterest humiliations of exile, and at the cost of the greatest personal sacrifices.

Shortly after Charles Albert ascended the throne of Piedmont (April 1831) Mazzini addressed to him a manly appeal, urging him to put himself at the head of the struggle for Italian independence, and to grant needful concessions to his people's cry for liberty. His answer was a sentence of perpetual banishment, Metternich having forced the new king to take a commission in the dragonnades of reaction. Further, in August 1832 the French authorities expelled him from the country. But he outwitted them, and lay hidden at Marseilles. From this time he led for more than twenty years 'a life of voluntary imprisonment within the four walls of a little room.' But no confinement could quell his spirit or restrain his activity. Henceforward he was the most untiring political agitator in Europe, the man most dreaded by its absolute governments; with Lassalle he was one of the most conspicuously successful of the century. He wrote incessantly, in a strain of such fervid eloquence,

and with such an intensity of conviction, that his words kindled in the hearts of those that read them the enthusiasm to do and dare all things. Though by nature frank, open, and bold, no man perhaps learned to understand better the tortuous arts of secret conspiracy. He was driven to adopt this underground method of warfare by the power and vigilance and unscrupulous character of the enemies he contended against, and the close and united front they presented to every revolutionary assault. In 1834 he organised an invasion of Savoy, which failed ignominiously, chiefly through the lukewarmness, if not treachery, of the soldier placed at its head. The next two years Mazzini spent in Switzerland, incessantly active, extending his organisation throughout Italy, instigating his countrymen to insurrection, and scattering broadcast through Europe the bursting seeds of republican revolt. In the year of the Savoy fiasco he drew up, at Bern, for Young Europe—i.e. Young Italy, Young Germany, and Young Poland united—the *Pact of Fraternity*, a code of abstract doctrines dictating to humanity a faith and rules of life. Being in the last days of 1836 banished from Switzerland, he found a refuge in London. Although for some years (1841–48) he struggled hard against poverty, he nevertheless contrived to help his poorer, ignorant countrymen, the organ-boys of London, by gathering them round him in night-classes and teaching them and civilising them. In 1844 he charged the English government with opening his letters, and communicating their contents to the rulers in Italy, and made good his accusation. This raised a great storm of indignation throughout the country, and drew from Carlyle a spirited testimonial to Mazzini in *The Times*. Sir James Graham, the Home Secretary, even felt constrained to apologise in the House of Commons for having publicly repeated the calumnies of his enemies.

On the outbreak of the Lombard revolt in 1848 Mazzini hastened to throw himself into the thick of the struggle. The king of Sardinia sought to win him over by the promise to make him first minister in the new Piedmontese-Lombard state, and to grant him as large a share as he might desire in the framing of a constitution for it. But Mazzini's aims were not of personal ambition, and he would be no party to the aggrandisement of the dynasty of Savoy at the expense, or to the detriment, of a united Italy. After Milan capitulated, he tried with Garibaldi to keep the war alive in the valleys of the Alps; but, when he saw that all was over in Lombardy, he made his way to Tuscany. Leghorn received him with wild enthusiasm on 8th February 1849, the day before the republic was proclaimed at Rome, and elected him her deputy to the republican assembly in the papal city. On 29th March Mazzini, Saffi, and Armellini were appointed a triumvirate with dictatorial powers; they chose as their motto 'God and the People.' But on 25th April the French arrived before the city to reinstate the pope, and after a tough struggle were admitted within the walls. The republic fell, and the triumvirs indignantly resigned on the last day of June. Mazzini made his way back to London. Not however to rest: he planned the attempted risings at Mantua (1852), Milan (1853), Genoa (1857), and Leghorn (1857). Meanwhile in London he had founded, along with Kossuth and Ledru-Rollin, the European Association, and with them issued in September 1855 its republican manifesto. The Society of the Friends of Italy was organised about this time in England. In 1859 Mazzini condemned the alliance Piedmont had made with Napoleon III.; and the cession of Savoy and Nice to France not only justified his prophetic warning, but filled him (and Garibaldi) with the patriot's sorrowful indignation.

He supported Garibaldi in his expedition against Sicily and Naples with all his influence and all his resources; and when Piedmont stepped in to reap the fruits of the soldier's heroic exertions, and even scattered his followers and took him prisoner at Aspromonte (1862), Mazzini broke finally with the monarchial party. The king replied to his fulminant by again passing sentence of death upon him—the third time. But this did not deter him from stigmatising the Convention of September (see ITALY) as a base compromise. In 1866–67 Messina in protest elected him its deputy to the Italian parliament four times in succession. Two years later he was again expelled from Switzerland, and in the following year (1870) was arrested at sea, whilst on his way to Sicily, and carried prisoner to Gaeta. After being detained two months he was set at liberty. He settled at Lugano, but died at Pisa, 10th March 1872, and was buried in his native city, mourned by the entire nation he had done so much to create.

Although from one point of view a utopian idealist and political dreamer, the apostle of the new democratic evangel, and from another point of view a restless demagogue, a dark conspirator, and disturber of the peace of Europe, Mazzini must be acknowledged by both parties alike to have been a man of immense energy and resource, and of great organising power, who unquestionably had the full courage of his convictions, and was consistent and thoroughly sincere and disinterested in his aims. His temperament and the constitution of his mind made him feel impatience and scorn of the moderates, the calm, cautious watchers and waiters for opportunities. He was averse to nibbling advantage after advantage, and had no sympathy for the compromises and half-measures of statesmen and diplomats. His was the spirit that burns the bridges behind it, stakes all on one critical throw, and puts forth all its energy to bring about a decisive and final result. Cavour was of an opposite temperament: he was essentially the cautious, calculating statesman. Hence the fundamental antagonism between the two men. Cavour was a man of aristocratic birth and training, and the levelling doctrines of the new republicanism were in the highest degree repugnant to him. No wonder then that he disliked Mazzini, the ardent apostle of equality, fraternity, and humanity, the uncompromising enthusiast of action. And no wonder too that Mazzini failed to sympathise with the methods of Cavour: he saw in them no ruling principle beyond advantaging the House of Savoy, no desire to labour for the people, no plan, no promise for their progress, and nothing like faith in their future. Nevertheless, on more than one critical occasion he abstained from embarrassing the Sardinian government, even when he did not approve of its proceedings. His own ability to govern is best evidenced in his successful organisation of the difficult forces of secret insurrection; his brief tenure of office at Rome was beset by so many untoward conditions as to effectually preclude him from showing his real mettle. Mazzini has been called the prophet of Italian unity, Garibaldi its knight-errant, and Cavour the riveter of the bolts that finally united the *disjecta membra* of the nation together. Perhaps it would be more correct to say that Mazzini prepared the soil, sowed the seed, and fostered the growing plants, that Garibaldi did the work of gathering in the ripe fruit, but it was Cavour who gained the final advantage of the harvest.

All Mazzini's writings are, like Heine's, desultory in character, some few literary and critical, but most of them political, germane to the questions of the hour. His longest productions are *On the Duties of Man*, a noble outline of ethical theory,

and *Thoughts upon Democracy in Europe*, a discussion of the prominent schools of economics and socialism. Apart from his eloquence, the features of his writing that most forcibly arrest attention are his manly, outspoken tone, his candid fairness—except sometimes when he is speaking of the moderates—his sterling love of justice and of freedom, but above all things else his keen and accurate insight into the historical tendencies of modern Europe.

The best source for Mazzini's life and works is the collected edition of his *Scritti, Editti ed Inediti*, 16 vols., the first eight (1861-74) prepared for the press by Mazzini himself, the last eight (1877-89) by Aurelio Saffi, his brother triumvir at Rome. An English edition (6 vols. 1864-70; new ed. 1890-91) has been selected from the first eight vols. of the *Scritti*. See also *Memoir* by E. A. Vinturi (2d ed. 1877); Marriott, *Makers of Modern Italy* (1889); and Clarke, *Selected Essays of Mazzini* (1887).

Mead, a fermented liquor made from honey. The honey is mixed with water and fermented. Cottagers sometimes use the honey which remains in the combs after the usual processes of dropping and squeezing, for making mead, which is a thin and very brisk, but at the same time luscious beverage. Mead has been in use from very ancient times, and was known equally to the polished nations of southern Europe and the barbarous tribes of more northern regions. The Latin name is *Hydromel*.

Meade, GEORGE GORDON, an American general, was born 31st December 1815, at Cadiz, in Spain, where his father was a merchant and United States navy agent till 1816. He graduated at West Point in 1835, served for a time against the Seminoles and in the Mexican war, but was mostly employed on survey duty and in the construction of light-houses until the civil war, becoming captain of engineers in 1856, and major in 1862. In 1861 he obtained a brigade of volunteers, and during the peninsular campaign received a severe gunshot wound. He distinguished himself at Antietam and at Fredericksburg, and was promoted major-general in November 1862. In June 1863 he was placed in command of the Army of the Potomac, superseding Hooker (q.v.) on the night of the 27th. A week later Gettysburg had been fought, and Lee's effort to carry the war into the country north of the Potomac had been defeated. Meade became brigadier-general in the regular army on 3d July, and major-general in 1864. After the war he commanded various military departments, until his death, which occurred at Philadelphia, 6th November 1872. There is an equestrian statue of him (1887) in Fairmount Park there.

Meadow Saffron. See COLCHICUM.

Meadows-Taylor. See TAYLOR.

Meadville, capital of Crawford county, Pennsylvania, on French Creek, 113 miles by rail N. of Pittsburgh. It manufactures woollens, paper, glass, machinery, agricultural implements, &c., has oil-refineries and large railway-shops, and is the seat of Alleghany College (Methodist, founded 1815), and of a Unitarian theological school. Pop. (1890) 9520.

Meagher, THOMAS FRANCIS, Irish patriot, was born in Waterford, 3d August 1823, son of a wealthy merchant who represented Waterford for several years. He had his education at the Jesuit college of Clongowes Wood in Kildare, and at Stonyhurst, and early devoted himself to the patriotic cause as a prominent and fearless member of the Young Ireland party. In 1848 he was sentenced to death under the 'Treason-felony' Act, but was sent for life to Van Diemen's Land instead. He made his escape in 1852, studied law in the United States, but on the outbreak of the war volunteered into the national

army. In 1861 he organised the 'Irish brigade' for the Federals, and distinguished himself by his courage in the seven days' battles around Richmond, at the second battle of Bull Run, Fredericksburg, and Antietam. After the war he became secretary of Montana territory, and while taking measures as temporary governor to keep the hostile Indians in check, fell from the deck of a steamboat into the Missouri, near Fort Benton, and was drowned, 1st July 1867.

Meal. See BREAD.

Meal-tub Plot, a conspiracy fabricated in 1679 by Thomas Dangerfield to gain credit as an informer equal to that of Titus Oates and Bedloe. The son of a Roundhead farmer, he was born about 1650 at Waltham in Essex, and he had first started with the baseless assertion that the Presbyterians were conspiring to destroy the government and set up a republic. When this was discovered to be a lie he was flung into Newgate, whereupon he rounded at once upon the Roman Catholics, declaring that the pretended Presbyterian plot was only a cover for their own design upon the king's life, and that the papers would be found concealed at the bottom of a meal-tub in the house of one Mrs Cellier, who, together with Lady Powis, was actually tried and acquitted for the plot. Dangerfield himself was whipped and pilloried in June 1685, and on his way back from Tyburn was killed by a blow in the eye from the cane of a barrister, Robert Frances, who was executed for the murder.

Meal-worm, the larva of a small black beetle, *Tenebrio molitor*, allied to the common Blaps (q.v.). Both adults and larvæ are too common about bakeries, granaries, and stores, for the eggs are laid in meal, flour, and similar food-stuffs, on which the emerging larvæ feed voraciously. The adult resembles Blaps, and is about half an inch long; the larva is decidedly longer, thin and round, yellowish in colour. An American species, *T. obscurus*, has also become common in Britain. The preventive is thorough cleanliness. The meal-worms are often used as food for cage-birds.

Mealy Bug (*Coccus adonidum* or *Dactylopius longispinus*; see COCCUS), an insect naturalised in our hothouses, and very commonly found on such plants as Stephanotis and Camellia, orchids and pine-apples. The young appear like small reddish-brown moving specks on the leaves and small branches, to which they afterwards affix themselves by the beak. As they grow older they become darker in colour, and are covered over with a white powdery-looking substance. After fertilisation, which usually takes place in spring, the female, remaining in the position described, lays her eggs between her body and the surface of the plant, after which her body shrivels up until it forms a covering for the mass of eggs, rendered more effectual by the large amount of cottony material formed over it. The young can be seen developing in scores in the midst of this material, from which they afterwards free themselves, and run about on the plant. The Mealy Bug is disliked by gardeners chiefly on account of the amount of dirt that collects round it on the leaves and branches, and the injury it does to the flowers and fruit. Lightly syringing the plants with soft soap and quassia solutions with a little paraffin oil in addition is generally sufficient to check the ravages of this little pest, especially if put on before the larvæ acquire their mealy coats. On valuable plants this may be painted with brushes. Tobacco smoke proves useful in the early stages.

Mean, in Mathematics, is a term interpolated between two terms of a series, and consequently intermediate in magnitude. The Geometrical Mean (q.v.) of two numbers is always less than

their Arithmetical Mean (q.v.) and greater than their Harmonic Mean, and the geometric mean is itself a geometric mean between the two others.

Meanee. See MEEANEE.

Mearns. See KINCARDINESHIRE.

Measles (known also as RUBEOLA and MORBILLI) is one of the group of blood diseases termed *Exanthemata* (q.v.), although, from the eruption which appears on the surface of the body, it is sometimes classed with the skin diseases. It is communicable from person to person, not least so in the early stage when it is indistinguishable from an ordinary cold; and it seldom occurs more than once in the same individual. Its period of incubation—i.e. the time that elapses between exposure to the contagion and the first appearance of the febrile symptoms which precede the eruption—is usually about a fortnight; then come lassitude and shivering, which are soon followed by heat of skin, increased rapidity of the pulse, loss of appetite, and thirst. The respiratory mucous membrane is also affected, and the symptoms are very much the same as those of a severe cold in the head, accompanied by a dry cough, a slight sore throat, redness and watering of the eyes, and sometimes tightness of the chest.

The eruption which is characteristic of the disease usually appears upon the fourth day from the commencement of the febrile symptoms and the catarrh—seldom earlier, but occasionally some days later. It is a rash, consisting at first of red papules of various sizes, which, as they multiply, coalesce into crescentic patches. It is two or three days in coming out, beginning on the face and neck, and gradually travelling downwards. The rash fades in the same order as it appears; and, as it begins to decline three days after its appearance, its whole duration is about a week. The red colour gives way to a somewhat yellowish tint, and the cuticle crumbles away in a fine bran-like powder, the process being often attended with itching.

There are two important points in which it differs from Smallpox (q.v.), with which in its early stage it may be confounded; these are: (1) that the fever does not cease or even abate when the eruption appears, but sometimes increases in intensity; and (2) that the disease is not more severe or more dangerous because the eruption is plentiful or early. The character of the eruption, after the first day, will serve to remove all doubt regarding these two diseases; and the comparative prevalence of either disease in the neighbourhood will materially assist in forming the diagnosis. It is distinguished from Scarlet Fever (q.v.) or scarlatina (1) by the presence at the outset of catarrhal symptoms, which do not occur in the latter disease, at any rate prior to the eruption; (2) by the absence of the characteristic throat-affection, which always accompanies well-marked cases of scarlet fever; (3) by the character of the rash, which in measles is said to present somewhat the tint of the raspberry, and in scarlet fever that of a boiled lobster; which in measles appears in crescentic patches, and in scarlet fever is universally diffused over the parts affected; which in measles usually appears on the fourth day, and in scarlet fever on the second day of the disease.

In ordinary uncomplicated measles, the prognosis is almost always favourable. The chief danger is from inflammation of some of the textures that compose the lungs; and in scrofulous children it often leaves chronic pulmonary mischief behind it. No age is exempt from the disease, but it is much more common in childhood than subsequently. The reason probably is that most persons have it in early life, and are thus protected from an attack at a later period.

In mild forms of the disease, nothing more is requisite than to keep the patient on a low diet, attend to the state of the bowels, and prevent exposure to cold, which is best accomplished by keeping him in bed with the ordinary warmth to which he is accustomed in health. While the eyes are red and irritable, it is desirable that he should be shaded from the light. If the chest-symptoms become urgent, they must be treated according to their nature. Bronchitis (q.v.), sometimes extending into Pneumonia (q.v.), is most to be feared. If the eruption disappear prematurely, it may sometimes be brought back by placing the patient in a warm bath. In such cases stimulants are often required, but must, of course, only be given by the advice of the physician. The patient must be carefully protected from exposure to cold for a week or two after the disease has apparently disappeared, as the lungs and mucous coat of the bowels are for some time very susceptible to inflammatory attacks. In some cases considerable debility remains for a long time after the attack; and both the eyes and ears are very liable to injury from inflammations accompanying or succeeding it.

German Measles is a name somewhat loosely used of a disease, or possibly several diseases, resembling measles, but for the most part less prolonged and severe. The cases grouped under this title, however, require further elucidation, as descriptions given by different authors differ very widely from each other.

Measures. See WEIGHTS AND MEASURES.

Meat. For the dietetic value of meat, and the amount of meat imports, see FOOD. For extract of meat, see EXTRACTS, and see also PRESERVED PROVISIONS. The sale of unsound meat is prohibited under heavy penalties by the Public Health Act of 1875, which regulates the powers of medical officers and inspectors of nuisances to examine game, flesh, milk, &c., and to have such meat or other food, if unfit for human food, destroyed by order of a justice of peace.

Meath, a maritime county of Leinster, Ireland, bounded on the east by the Irish Sea, for 10 miles, and the counties of Dublin and Louth; area, 906 sq. m., or 579,861 acres, of which 34,300 are waste, bog, &c. Maximum length, north to south, 40 miles; maximum breadth, east to west, 47 miles. Pop. (1841) 183,116; (1861) 110,373; (1891) 76,616, of whom 71,389 were Roman Catholics and 4772 Protestant Episcopalians. The soil is a rich loam, and extremely fertile; but close upon 67 per cent. of it is devoted to pasture, the extent under crops (chiefly oats and potatoes) being about one-fourth of the total. The surface is for the most part undulating, being the eastern part of the great limestone plain of Ireland. The chief rivers are the Boyne and Blackwater; the Royal Canal passes along the southern border of the county. The principal towns are Trim, Navan, and Kells. A little linen and coarse woollen is manufactured. Anciently, Meath, which included West Meath, Longford, and parts of the adjoining counties, formed one of the kingdoms into which Ireland was divided, the royal seat being Tara (q.v.), where ancient earthworks still remain. After the English invasion it was occupied by Strongbow, and was erected into a county palatine by Henry II., who conferred it on Hugh de Lacy. In the end of the reign of Henry VIII. it was separated into East and West Meath. Celtic remains abound along the Boyne and Blackwater. John's Castle at Trim is one of the most extensive monuments of English rule in Ireland. There are a round tower and sculptured crosses at Kells, and a round tower at Donoughmore. Monastic ruins survive at Bective, Clonard, and

Duleek. Meath returns two members to parliament.

Meaux, a town in the French department of Seine-et-Marne, on a height above the river Marne, 28 miles N.E. of Paris. It is a bishop's see, and in its noble Gothic cathedral (12-16th century, but still unfinished) is the grave of Bossuet (q.v.), who was bishop for twenty-three years. There is a large trade with Paris in corn, flour, cream-cheeses, &c. Meaux was besieged by the serfs of La Jacquerie (1358), and captured from the League (1594). Pop. (1872) 11,202; (1886) 12,201. See Carro, *Histoire de Meaux* (1865).

Mecca (also anciently called *Becca*), the Makoraba of Ptolemy, is one of the oldest cities of Arabia and the capital of the Hedjaz, and as a holy city and focus of pilgrimage it may be called the metropolis of Islam. It is situated in 21° 30' N. lat. and 40° 8' E. long., 245 miles S. of Medina and 65 E. of Jiddah, its port on the Red Sea, in a narrow barren valley, surrounded by bare hills penetrated by two passes, and so secluded from observation that it is not visible until closely approached. The barrenness of the soil compelled the inhabitants to go outside for provisions, and the command of the principal caravan roads, both from north to south and from the coast to the highlands, gave the Meccans unusual facilities for commerce, and thus from a very early period the city was a notable trading centre. But the chief cause of its prosperity was its reputation as a holy place, possessing sacred objects, which well repaid a pilgrimage; though whether the original attraction was the Black Stone or fetish of the Káaba, or the medicinal spring Zemzem, is a matter of dispute. The city itself, which is mainly modern owing to the frequent devastations caused by the winter tor-

rents from the hills around, is about 1500 paces long and 650 broad, and is divided into more than twenty chief quarters. Along and beyond it runs the celebrated sacred course, a broad road extending from Safa to Marwa, which is run over by all pilgrims, and also forms a frequented bazaar. The streets are broad and airy, but unpaved and filthy, and the houses, climbing the hills on either side, are of stone, and well built, sometimes three or four stories high, with flat roofs and overhanging lattice-windows. The interiors are well kept, since the greater part of Mecca is devoted to the annual pilgrimage which is the main support of a multitude of lodging-house keepers, guides, and the other attendants of a fashionable sanctuary. There are charitable lodgings for the poorer pilgrims, and also public baths, and a hospital. Drainage there is none, though there is plenty of water. Provisions, meat, fruit, &c. are readily procured from neighbouring parts of Arabia. The population, which is notorious for its vice and corruption of every sort, is probably under 60,000; but these are annually reinforced by at least an equal number of pilgrims. The latter, however, are not numerous enough to

satisfy the natives, who fleece them without remorse, and are too idle to supplement their extortions by any industry more vigorous than the manufacture of sacred relics. The temple of Mecca, or the Great Mosque, stands in the broadest part of the valley, and consists of a large quadrangle, capable of holding 35,000 persons, surrounded by arcades or cloisters, with pillars of marble and granite, &c., and entered by nineteen gates surmounted by seven minarets. In the centre is the Káaba (i.e. cube), which was the temple of Mecca ages before the time of Mohammed, and then attracted pagan pilgrims just as now it draws thousands of Moslems. It has been twice rebuilt in historical times, but the old form has been preserved. It is not quite square, nor properly orientated; and it measures about 18 paces by 14, and 35 or 40 feet high. When Mohammed converted the heathen shrine into a Mohammedan focus, the original notion of an idol temple with a miraculous fetish was abandoned, and the legend was invented that the Káaba was built by Abraham on the occasion of the outcasting

Pilgrims round the Káaba. (From a private Photograph.)

of Ishmael. The celebrated fetish, or Black Stone, is apparently a meteorite, about a span long, built into the south-east corner at the proper height for kissing. There is also a 'Southern Stone,' of only inferior sanctity. The pilgrim circumambulates the Káaba seven times, kisses the Black and touches the Southern Stone, and also goes round the Hijr or semicircular enclosure containing the so-called graves of Hagar and Ishmael. The Káaba has always been richly decorated, and has long been annually re-covered (leaving only apertures for the two stones) with handsome brocaded hangings presented by the Sultan of Turkey, and brought with much state, along with the traditional Mahmal or Holy Carpet, by the Egyptian Hajj (q.v.), or caravan of pilgrims. The other chief decorations are the silver-gilt door, seldom opened, the marble inlay and silver-gilt plating and silk hangings of the interior, which contains little of interest. Hard by, and also within the court, is the celebrated well of Zemzem, a deep shaft covered by a cupola; the tepid water of which may once have been mineral, and is still regarded as miraculous, although the largest item in its present

analysis consists of sewage matter. This important attraction for pilgrims was long lost, but was rediscovered by Mohammed's grandfather. Another object of veneration is 'Abraham's Stand,' the stone of which, with the imprint of his foot, is concealed from view. Outside the Káaba are no sacred or antiquarian buildings of importance, though several houses are pointed out by the guides as dwellings of persons famous in the early days of Islam. In the time before Mohammed Mecca was under the control of the Kosaites, and then of the Koreish, from whom the Prophet reconquered it in 627, five years after his Flight or Hegira (q.v.) therefrom. It long remained under the rule of the califs, who spent large sums in its adornment. In 930 it was sacked by the Karnathians, who carried off the Black Stone, and kept it for twenty-two years. Mecca afterwards fell under the influence of whatever dynasty—Fatimite, Ayyûbite, or Mameluke—happened to rule in Egypt; and thus finally it came into the possession of the Ottoman sultans, whose power, however, is nominal, whilst the real governor is the sheriff, or reputed head of the descendants of the Prophet, who has long held the chief authority in the Hedjâz, and has the support of a large following of retainers. Burckhardt, the first Christian to visit Mecca, has, owing to native fanaticism, found but few successors.

See Snouck Hurgronje, *Mecca, mit Bilder-Atlas* (1888); W. Robertson Smith in *Ency. Brit.* (1883); Wüstenfeld, *Chroniken d. Stadt Mekka* (1857-59); Sir Richard Burton's *Pilgrimage* (1855; new ed. 1880); Burckhardt's *Travels in Arabia* (1829).

Mechanics is the science which treats of the nature of forces and of their action on bodies, either directly or by the agency of machinery. See **FORCE**, **ENERGY**, **DYNAMICS**. The action of forces on bodies may be in the form of pressure or of impulse, and may or may not produce motion. When the forces are so balanced as to preserve the body affected by them in a state of equilibrium, their actions are investigated in that branch of mechanics called Statics; when motion is produced, they are considered under the head of Kinetics (q.v.). See also the articles on Kinematics, Hydrostatics, Hydrodynamics, and Pneumatics.

Machines are instruments interposed between the moving power and the resistance, with a view of changing the direction of the force, or otherwise modifying it. Machines are of various degrees of complexity; but the simple parts, or elements of which they are all composed, are reducible to a very few. These elementary machines are called the Mechanical Powers, and are usually reckoned as six in number, three being primary—viz. the *lever*, *inclined plane*, and *pulley*; and three secondary, or derived from the others—viz. the *wheel-and-axle* (derived from the lever), the *wedge*, and the *screw* (both derived from the inclined plane). What is special to each machine will be found under its name.

Mechanics' Institutes are voluntary unchartered associations of mechanics or working-men for the purpose of providing themselves, at small individual cost, with instruction in elementary and technical branches of knowledge, by means of a library, reading-rooms, classes, and lectures. The management is wholly or in great part in the hands of a committee or committees elected by the members of the association. The earliest germ of the Mechanics' Institute was a class for journeyman mechanics formed by Dr Birkbeck (q.v.) at Glasgow in 1800; but the first Mechanics' Institute, properly so called, was organised by the same philanthropist in London in 1824. The original aim of the first institutes was to teach mechanics the correct knowledge of the principles of their

respective trades. Subsequently the basis was enlarged, and the teaching of the elements and principles of a general education aimed at. Out of these organisations have grown, through the introduction of means of recreation and temperate enjoyment, the Working-men's Social Clubs and Educational Institutes.

Mechitarists, a congregation of Armenian Christians who entered into communion with the Church of Rome, when Clement XI. was pope, in 1712. They derive their name from Mechitar (i.e. the Comforter) da Petro (1676-1749), who in 1701 founded at Constantinople a religious society for raising the intellectual and spiritual condition of his countrymen, and for the purpose of diffusing a knowledge of the old Armenian language and literature. Two years later, however, the sectarian jealousy of the Armenian patriarch in Constantinople led to their removal to the Morea, and thence, on the conquest of that portion of Greece by the Turks in 1715, to Venice, which in 1717 granted them the island of San Lazzaro. Their most useful occupation is printing the classic writings of Armenian literature, as well as valuable translations of works by Ephraem Syrus, Philo, Eusebius, and other writers, the originals being lost. At San Lazzaro they possess a large and valuable library of oriental works, and at Vienna (since 1810) an academy, with a printing-office, &c., to which non-Armenians are admitted. See Langlois, *Le Convent Arménien de Saint-Lazare de Venise* (1863).

Mechlin. See **MALINES**.

Mecklenburg, the common name of two grand-duchies of Germany, distinguished respectively as **MECKLENBURG-SCHWERIN** and **MECKLENBURG-STRELITZ**, and situated between the Baltic on the N. and Brandenburg on the S., whilst Pomerania lies on the E. and Sleswick-Holstein and Lübeck on the W. The former is a compact territory, abutting on the Baltic for 65 miles, its area being 5197 sq. m. (much less than Yorkshire). Mecklenburg-Strelitz (1144 sq. m.) consists of two detached portions, the grand-duchy of Strelitz, lying SE. of Mecklenburg-Schwerin, and the principality of Ratzeburg, wedged in between Schwerin and Lübeck. The region indicated forms part of the great North German plain, but is crossed by a low ridge from the south-east to the north-west, the water-parting between numerous small rivers that drain to the Elbe and to the Baltic. Along the line of this ridge there are more than 500 lakes, some of fairly large size. Canals too connect many of the lakes and navigable rivers, especially towards the Elbe. Except for sandy tracts and turfy moors the soil is fertile; agriculture is the chief occupation. The merino sheep are the finest in Germany. There is some iron-founding, making of agricultural implements and tiles, manufacturing of beet-root sugar, distilling, brewing, and tanning. Amber is found on the coast and some of the lakes, and turf is dug. The chief ports are Wismar and Rostock (Warnemünde). The population of Schwerin was 575,152 in 1885, 1903 less than in 1880; of Strelitz (1885) 98,371, against 100,269 in 1880. The diminution is chiefly due to emigration. The rural population are almost entirely Germanised Slavs, the nobility and the inhabitants of the towns for the most part of Lower Saxon stock. The popular dialect is Platt-Deutsch or Low German; the religious confession Lutheran. Rostock (q.v.), the largest town in Schwerin, has a university. The capital of each grand-duchy is a town of the same name as itself. Society in Mecklenburg is still organised on a feudal basis, and in the early part of the 19th century was not so advanced as England in the 13th century; serfdom was abolished only in 1824. At the head of

each grand-duchy stands a grand-duke; but both grand-duchies are represented in one and the same national assembly, which meets every autumn at Sternberg and Malchin alternately. This body embraces all landowners (about 680), who also represent the peasantry and agricultural labourers, and representatives of forty-eight towns. The principality of Ratzeburg, and the towns of Wismar and Neustrelitz, have each an independent administration. A permanent college of nine members, representing the assembly, sits all the year round at Rostock. The executive is in the hands of four ministers (external and home affairs, justice, and finances) in Schwerin, and one minister in Strelitz. No financial statements are ever published in either grand-duchy. In Schwerin, however, there are three separate budgets, one controlled by the grand-duke, one, very small, controlled by the estates, and one by both parties in common. For the representation in the imperial assemblies, see GERMANY, Vol. V. p. 179. Although the evils under which the country workmen suffered fifty years ago, of which Fitz Reuter, the great Platt-Deutsch writer, gives a painful description in his poem *Kein Hüsung*, have been greatly mitigated, still the fact that large numbers emigrate because they cannot find houses to live in, and the relatively high proportion of illegitimate children, owing to the restraints imposed upon marriage by the landowners, prove that they have not been altogether abolished yet. Fritz Reuter's great novel *Stromtid* (Eng. trans. *My Old Farming Days*, 1878-80) and other works give admirable pictures of the semi-patriarchal, semi-feudal life of his native country.

In the 6th century Slavic races settled in the districts now called Mecklenburg, which had just been left vacant by the Vandals. From the 9th to the 12th century the German emperors and the Saxon dukes attempted at different times to convert the inhabitants to Christianity. The country was only definitely incorporated in the German empire in 1170. It was divided over and over again, from 1229 onwards for more than five hundred years, amongst different branches of the descendants of the original Slavic princes. Of these dukes (dukes after 1348) the only one deserving special mention is Albert III., who, called to ascend the throne of Sweden in 1363, was kept a prisoner for many years by Margaret, queen of Denmark, Norway, and Sweden. The Thirty Years' War ruined the independent peasant proprietors. Wallenstein casting covetous eyes upon the duchies, they were sold (1628) to him by the emperor, but were restored to their rightful rulers in 1635. The two lines of Mecklenburg-Schwerin and Mecklenburg-Strelitz date only from 1701; in 1755 they agreed that the line which survived longest should inherit the territories of the other, and when both became extinct Prussia should be heir. The title of grand-duke was assumed by both reigning dukes in 1815. The year 1848 brought disturbances and tumults in Mecklenburg; a representative assembly was called together, and other reforms initiated; but the reaction of 1850 and following years restored things to their original condition. The two states were again agitated by reform questions in 1871-78; but nothing came of the agitation.

See books by Geinitz on the geology, soil, lakes, &c. of Mecklenburg (1884-86); Boll, *Geschichte Mecklenburgs* (1855-56); and various works on the history and social condition of the people by Wiggers (1840 to 1865).

Meconium (Gr. *mēcon*, 'a poppy'), the inspissated juice of the poppy; and *Meconic Acid* is an acid present in opium to the extent of about 4 per cent. in combination with the alkaloids (see OPIUM). Meconium is also the name given to the matter first discharged from the bowels of a new-born infant.

Medal (the same word as *metal*, through a Low Latin *medalla*), a piece of metal in the form of a coin, not issued or circulated as money, but struck to preserve the portrait of some eminent person or the memory of some illustrious action or event. Large medals are termed medallions; and works rectangular in form are known as plaques or plaquettes according to their size. The study of medals, which forms a branch of the science of numismatics, is interesting in a historical and antiquarian point of view, and important as illustrating the contemporary state of art. Like coins, medals are made in gold, silver, and copper, and some also consist of lead and alloys of other base metals. As they are generally produced in very limited numbers only as compared with coins, other methods of preparing them than by striking are available; and while all classical medals, and the bulk of those of modern times, are made in the same way as contemporary coinage, many of the most important and valuable of the medieval medals were cast by the *cire perdue* process. Important medals have also been made by *striking-up* or *répoussé* work, and highly esteemed works are also made simply by engraving. The earliest medals are medallions of ancient Rome, existing examples of which are principally in bronze, though some are in silver and in gold. They vary in size, being mostly about 1½ inch in diameter, but in weight they are so diverse as to exclude the notion that they were ever circulated as money. Medallions, prior to the time of Hadrian, are rare and of great value, one of the most beautiful and most famous being a gold medallion of Caesar Augustus; from Hadrian to the close of the empire they are comparatively numerous. In some of them a ring or rim of lighter-coloured metal (brass or orichalcum) surrounds the centre of bronze, and the inscription extends over both metals.

From the fall of the Roman empire till the end of the 14th century there is a blank in the production of medals. The revival of the medallic art was one of the first fruits of the Renaissance movement, and practically its earliest, as for all times its greatest exponent was Vittore Pisano (c. 1380-1456), the painter of Verona. His medallions, generally marked *Opus Pisani Pictoris*, and those of his numerous followers, including Matteo de Pasti, Guacialotti, Sperandio, Sangallo, and many others, are distinguished by their vividness of sculptural portraiture, and their singular breadth and simplicity of treatment. Figures 1 and 2 show to a scale of one-half the original size the obverse and reverse of one of the most famous medals of Pisano. It celebrates the visit of the Eastern emperor, John VIII. Palæologus, to the Council of Florence in 1439; the legend on the obverse being in Greek, and the reverse inscription, *Opus, Pisani, Pictoris*, being also repeated in Greek. Generally speaking, it may be said that all medieval medals, previous to the 16th century, were made by casting in the *cire perdue* process; and it was not till the beginning of the 16th century that medals struck from engraved dies, like coins, were issued, the first so produced being the medal of Pope Julius II., by Francia, struck about 1506. The larger medals of the 16th century, however, continued to be cast. The most elaborate and beautiful of the struck medals of the 16th century were the work of Benvenuto Cellini; and it may be remarked that with the introduction of dies for medal-striking the work passed into the hands of gem-engravers and jewellers, whose methods and excellences lie in quite a different direction from those of the 15th-century artist-medallists. Next to Italy, Germany was the country in which the medallic art flourished in medieval times, Nuremberg having been a centre from which many important works were issued.

Of the German school, Albert Dürer was the most famous of the early exponents. In Holland a remarkable series of *jettons* or medalets were issued in the 16th and early part of the 17th centuries, which give a record of the important events of which that country was then the theatre. In the 16th century the most important medals of French origin were produced by Jacques Primavera and Germain Pilon, and in the succeeding century Briot and Dupré were the great medallic portrayers of contemporary personages and events. English medals begin only with Henry VIII., and from Edward VI. onwards there is an unbroken succession of coronation medals. The earlier medals are cast in a very inferior manner, and are certainly not the work of native artists; indeed, it is not till

18, 1815, and above, 'Wellington.' The Peninsular medal, for military services between 1793 and 1814, was issued only by the Queen in 1847, and conferred upon every surviving officer and private present at any battle or siege during these years. It carries no fewer than twenty-eight clasps for as many separate engagements, the first of which is Egypt, 1801. Long-service and good-conduct medals of silver were instituted in 1830 and 1831, and rules then formed for their distribution among meritorious soldiers, sailors, and marines. On the edge of each of these medals is engraved the name, rank, and regiment or ship of its recipient. The Victoria Cross (q.v.) was instituted in 1856. Similar medals for military and naval services are issued by foreign powers.

Fig. 1.

Fig. 2.

the period of Elizabeth that we find native talent developed in the direction of medal-working, and even thereafter it was largely to Dutch, French, and Italian artists that the principal English medals were due. The Scotch coronation medal of Charles I. is the first medal struck in Britain with a legend on the edge. The medal is the work of Briot, and around the edge it reads, *Ex Auro ut in Scotia reperitur*. The medals of the Commonwealth and Charles II. are principally by Rawlins and the brothers Simon, and under Charles II. the three brothers Rottier did important medallic work in England. In the 18th century J. A. Dassier, a native of Geneva, executed a series of medals of English monarchs from the time of William I., and other important works were the production of Croker, Richard Yeo, and Thomas Pingo. Of 19th-century English medals the best are due to the Italian Pistrucci and to Thomas and William Wyon and their successors.

Official medals at the present day are principally issued for naval or military services. The first war medal given in England was the 'Ark in flood medal' bestowed by Queen Elizabeth in 1588 on naval heroes. The first English military medal was granted by Charles I. in 1643, and in 1650 an oval medal was executed by order of parliament for distribution amongst Cromwell's officers and soldiers engaged in the battle of Dunbar. Medals have been distributed to the troops in every victorious engagement and campaign since 1793 till the present time, but previous to the reign of Queen Victoria the Waterloo medal was the only one of this series struck. It was issued by order of the Prince Regent in 1816, and conferred on every officer and soldier present at the battle. The medal is of silver, with the head of the Prince Regent on the obverse, and on the reverse a figure of Victory seated on a pedestal, inscribed 'Waterloo,' with, beneath, the date June

See A. Heiss, *Les Médailleurs de la Renaissance* (vol. viii. 1890); Grueber's *Guide to the English Medals in King's Library, British Museum* (1881); Cochran-Patrick's *Catalogue of the Medals of Scotland* (1884); Lonbat's *Medallic History of the United States* (2 vols. 1878); D. Hastings Irwin's *British War Medals and Decorations* (1890); T. Carter's *British War Medals* (new ed. 1890); and a two-page illustration of medals of the preceding fifty years in the *Graphic* for 14th June 1890.

Medea, in Greek legend, a famous sorceress, the daughter of Æetes, king of Colchis, and of the Oceanid Idyia, or of Hecate. When Jason, the leader of the Argonauts, came to Colchis in search of the Golden Fleece, she fell in love with the young hero, helped him to obtain the Fleece, and fled with him. She prevented her father from pursuing by killing her brother Apsyrtus and strewing the sea with his limbs. She avenged her husband upon the aged Pelias by persuading his daughters to cut him in pieces and boil him in order to make him young again. Being deserted by Jason for Glauce or Creusa, daughter of Creon, king of Corinth, she revenged her wrongs by sending to her rival a poisoned robe or diadem which destroyed both her and her father. Medea then slew the children she had borne to Jason, and fled to Athens in a chariot drawn by dragons, which she obtained from Helios. There she was received by Ægeus, to whom she bore Medos; but, afterwards being compelled to flee from Athens, she took Medos to Aria, the inhabitants of which were thenceforth called Medes. She finally became immortal, and the spouse of Achilles in the Elysian Fields. The story of Medea was a favourite theme of the tragedians, but only the masterpiece of Euripides has come down to us. It was treated by Corneille and Grillparzer, and gave Cherubini the theme for an opera.

Medellin, (1) a town (pop. 1250) of Spain, on the Guadiana, 66 miles by rail E. of Badajoz. It is worth mention as the birthplace of Cortes.—(2) The second city of Colombia, capital of the department of Antioquia, lies in a lovely mountain-valley, 4850 feet above the sea, and 150 miles NW. of Bogotá. It is a handsome town, and possesses a cathedral, college, seminary, technical school, four printing establishments, and manufactures of pottery, porcelain ware, and jewellery. It has a considerable trade, exporting gold and silver. Pop. 40,000.

Media, in ancient times, the name of the north-western part of Iran or Persia, was bounded by the Caspian Sea and Parthia on the E., and by Assyria and Armenia on the W. It corresponded approximately to the modern Persian provinces of Azerbaijan, Ghilan, and Irak-Ajemi, and the eastern part of Kurdistan. The Medes were an Aryan people like the Persians; their state religion was Zoroastrianism, and the Magi (q.v.) its priests. They were at first a bold and warlike race, very skilful with the bow, and noted horsemen. The Median tribes who seem to have been in part subject to the king of Assyria, began towards 700 B.C. to be cemented together under a chief named Deioces (Dajaukku), who chose as his capital Ecbatana (q.v.), identified with the modern Hamadan. Their power grew stronger under his son Phraortes, who subdued the Persians, but perished in war with the Assyrians. Cyaxares, the son of Phraortes, renewed the war against Assyria, but it was interrupted by an invasion of Media by the Scythians. Having treacherously murdered their chiefs, he expelled their warriors. Then, in alliance with Nabopolassar, king of Babylon, he overthrew the Assyrian empire by capturing Nineveh about 607 B.C. Having annexed the northern provinces of the Assyrian empire, he began a war against Lydia; but the eclipse of 28th May 585, the same which had been foretold by Thales, terrified both parties into peace. Cyaxares was succeeded by his son Astyages. Against him the Persians, under their prince Cyrus, revolted about 550 B.C., and, being joined by a portion of the Median army under a chief named Harpagus, they took Ecbatana and deposed the Median king. From this time the two nations are spoken of as one people. Ecbatana became the summer residence of the Persian kings. After the death of Alexander the Great (324 B.C.), the north-western portion (Atropatene) of Media became a separate kingdom, which existed till the time of Augustus. The other portion, under the name of Great Media, formed a part of the Syrian monarchy. In 147 B.C. Mithridates I. took Great Media from the king of Syria, and annexed it to the Parthian empire. About 36 B.C. it had a king of its own, named Artavasdes, against whom and his ally, Phraates IV. of Parthia, Mark Antony engaged in a disastrous campaign. Under the Sassanian dynasty the whole of Media was united to Persia (q.v.).

Rawlinson, *Five Great Monarchies of the Ancient Eastern World* (3 vols. 1879); Dunker, *History of Antiquity* (6 vols.; Eng. trans. 1877-83); Lenormant, *Sur la Monarchie des Mèdes* (1871); Oppert, *La Peuple et la Langue des Mèdes* (1879); A. von Gutschmid, *Neue Beiträge zur Geschichte des alten Orients* (1876); and the popular *Media, Babylon, and Persia*, by Miss Ragozin (1889; 'Stories of the Nation' series).

Mediatisation. See GERMANY, Vol. V. p. 177.

Medical Jurisprudence, also called Forensic Medicine, is the branch of medicine which brings medical science to bear on legal questions, in determining criminal and civil responsibility. It has regard mainly either to civil rights or to injuries to the person. Among subjects in its province are those connected with birth, pregnancy, murder, natural death, rape, insanity, monstrosity, accidental or intentional injuries, the action of drugs, &c., all of which are dealt with in their several places. As specially belonging to this subject may be noted the articles on BLOOD-STAINS and POISONING. Good general handbooks are Dr Taylor's *Manual and Principles and Practice*, and Dr C. M. Tidy's *Legal Medicine* (2 vols. 1882-83).

Medical Staff Corps. See ARMY, I. 438.

Med'ici, a distinguished Florentine family which attained to sovereign power in the 15th century,

owed its earliest distinction to the success with which its members pursued various branches of commerce, and the liberality which they showed in devoting their wealth to the public good. Their well-known arms, representing six balls (from whence their war-cry of 'Palle'), were popularly but without reason believed to represent pills, as their name to show that they had been originally apothecaries. In 1465 Louis XI. of France honoured the Medici by conferring on them the right to wear the French fleur-de-lis on one of the balls. From the beginning of the 13th century the Medici took part in the government of their native republic, and from the period (1378) when Salvestro de' Medici was elected gonfaloniere the family rose rapidly in greatness. It was, however, Giovanni (born 1360) who amassed the immense fortune, and by his generosity and affability gained the position of influence hitherto unparalleled in the republic, to which his sons Cosimo and Lorenzo succeeded. With Cosimo (1389-1464), surnamed *Il Vecchio* ('the Ancient') and 'Pater Patriæ,' began the glorious epoch of the family; while from his brother Lorenzo was descended the collateral branch of the Medici which in the 16th century obtained absolute rule over Tuscany.

Cosimo's life, except during the brief period when the Albizzi and other rival families succeeded in successfully opposing the Medici influence in the government and exiling him from Florence, was one uninterrupted course of prosperity. He was successful in his political alliances, and procured for Florence security abroad and peace from civil dissensions within her walls. He employed his great wealth in encouraging art and literature. He made Florence the most brilliant centre of the revival of classic learning which distinguishes the 15th century, he enriched her with splendid buildings, and gave unrivalled treasures to the great libraries which he founded. Although his all-powerful influence was not explicitly recognised in the state, and the form of government remained republican, Cosimo in reality was entirely master of the town, and filled the public offices with his partisans. He was succeeded by his son Pietro I., surnamed *Il Gottoso* ('Gouty'), who, feeble in health and in character, was assisted in the government by the precocious talents of his son Lorenzo (1448-92), afterwards famous in history as *Lorenzo il Magnifico*.

On his father's death (1469) Lorenzo and his brother Giuliano were recognised as 'principi dello stato.' The growing power of the Medici had roused much envy amongst other great Florentine families; and in 1478 these malcontents, headed by the Pazzi and in league with the pope, Sixtus IV. (Della Rovere), who saw in the Medici a powerful obstacle to his schemes of temporal aggrandisement, formed a plot to overthrow their power, known as the conspiracy of the Pazzi. Only Giuliano was victim of the assassins who were to have killed both brothers during service in the cathedral, and the popularity of Lorenzo was increased by the courage and judgment shown by him in this crisis. Lorenzo was a worthy descendant of his famous grandfather, just in his government, magnanimous to his enemies, and not only a munificent patron of art and literature, but himself a man of wide culture and a distinguished lyric poet. To enlarge on the institutions, universities, and schools founded by him, and on the famous names of painters, sculptors, architects, philosophers, and poets who surrounded him would be to write the history of the Renaissance. He was one of the most zealous promoters of the art of printing, and established under Cennini a printing-press in Florence. Although he used his power in the state well, yet he sapped the existing forms

of government; and, in seeking only the advancement of his family to more absolute power, he left Florence at his death weakened and ready to be the prey of her enemies during the troublous times which began with the 16th century.

Lorenzo left three sons, Pietro, Giuliano, and Giovanni. His eldest son, Pietro II. (born 1471), possessed neither capacity nor prudence, and showed himself treacherous alike to friend and foe. He allied himself with the king of Naples against Lodovico Sforza of Milan, and the latter in 1492 called to his aid Charles VIII. of France and his army (see ITALY). Pietro, terrified at the advance of the powerful invader, hastened to meet the French troops on their entrance into the Florentine dominions, and surrendered to them Pisa and Leghorn. The magistrates and people, incensed at his cowardice and treachery, drove him from Florence and declared the Medici traitors and rebels, and deposed them from participation in the government. Pietro was drowned (1503) in the Garigliano, near Gaeta, having joined the French army in their attempted conquest of the kingdom of Naples. All efforts of the Medici to regain their power in Florence were vain until in 1512 the pope, Julius II., consented to send the Spanish army to invade Tuscany. Prato, near Florence, was taken and sacked, and the Florentines, helpless and terrified, drove out their gonfaloniere, Piero Soderini, and recalled the Medici, headed by Giuliano II. (born 1478). In 1513 the elevation of Giovanni de' Medici to the papal chair under the name of Leo X. (q.v.) completed the restoration of the family to all their former splendour and reduced Florence to a papal dependency. Giuliano II. at the pope's desire surrendered the government to Lorenzo II., son of his elder brother Pietro II. Giuliano, created Duke of Nemours on his marriage with a relative of Francis I. of France, died in 1516. The young Lorenzo II., born 1492, and the last legitimate male descendant of Cosimo 'Pater Patriæ', on whom the pope had also conferred the duchy of Urbino, was feeble, arrogant, and licentious. He died in 1519 leaving only one legitimate child, a daughter, Catharine (q.v.), afterwards wife of Henry II. of France, who played a conspicuous rôle as regent during her son's minority. An illegitimate son, Alexander, born 1510, was afterwards duke.

The power now passed into the hands of the Cardinal Giulio de' Medici, a natural son of the elder Giuliano, assassinated in the conspiracy of the Pazzi; and Giulio was created pope in 1523 under the name of Clement VII. During the invasion of Italy by the Emperor Charles V. in 1527, and the consequent weakening of the papal power, Florence rebelled against the regents imposed on her by the pope, and expelled them along with the young Prince Alexander. The pope and emperor, however, soon made peace, and their united forces were directed against Florence, which, during the famous siege lasting ten months, made her last desperate and unsuccessful stand for liberty. After the surrender of the town, August 1530, Alexander de' Medici was proclaimed hereditary Duke of Florence. His reign was one of unparalleled license and tyranny. He was assassinated in 1537 by his cousin Lorenzino, a descendant of the collateral branch which had its origin in Lorenzo, brother of Cosimo 'Pater Patriæ.' To this younger branch belonged also the next ruler of Florence, Cosimo I. (born 1519). He was son of the famous captain of free-lances, Giovanni delle Bande Nere ('of the Black Bands'). Cosimo, sometimes called the Great, possessed the astuteness of character, the love of art and literature, but not the frank and generous spirit of his greater predecessors. He was cruel and relentless in his enmities, but a just ruler. He

extended his territories, and in 1570 was created Grand-duke of Tuscany, and crowned by Pope Pius V. He died in 1574, and was succeeded by his son Francesco I. (born 1541). This duke possessed few of his father's abilities and many of his faults. He became a tool in the hands of his mistress, the unscrupulous Bianca Cappello, whom he married in 1578. The almost simultaneous death of Francesco and Bianca (October 1587) raised suspicions that they had been poisoned by the duke's brother and heir, the Cardinal Ferdinando. Maria, daughter of Francesco I., became the second wife of Henry IV. of France. Ferdinando I. and his son Cosimo II. were popular, and contributed to the prosperity of their country. But at the beginning of the 17th century the race rapidly degenerated; and, after several of its representatives had suffered themselves to become mere puppets in the hands of Austria or Spain, the family became extinct in 1737 at the death of its last male representative, Gian Gastone, the seventh grand-duke. His only sister, the Electress Palatine, the last of all the Medici, expired in 1743.

See, besides the works cited at FLORENCE, Roscoe's two well-known works on Lorenzo and Leo X.; and Reumont, *Lorenzo de' Medici the Magnificent* (Eng. trans. 1876).

Medicine. Lucretius imagines for us the first rude attempts of prehistoric man to repair the injuries received in conflict with wild beasts; and, according to Celsus, the most backward tribes have never been without their remedies for wounds and general ailments. The healing art, indeed, is coeval and co-extensive with humanity; but of its two great divisions—surgery and medicine—the former, as will be shown in its proper place, was incomparably the earlier, and, in practice, the more effective.

Egypt furnishes the earliest indications of medical art. The Papyrus-Ebers was written 3500 B.C., and is entitled *Book of the Preparation of Medicines for all the Corporeal Parts of Individuals*. In it formal invocations of a blessing on those medicines are followed by prescriptions and the names of the maladies they cure—disordered evacuation, intestinal worms, &c., while prominence is given to an obscure wasting-fever called 'uchet.' Anatomy, in its strict sense, was unknown to the Egyptians; and their medicine, while empirical, was highly specialised. Every physician belonged to a sacerdotal college, and the sick had recourse to the nearest temple, whence they procured the practitioner best suited to their case. The fees took the form of gifts to the temple, from the revenue of which its medical staff was maintained. Till Hippocrates appeared the physicians of Egypt were the most famous; but with her subjection by Alexander the Great, and the sway of the Ptolemies, her medicine gradually succumbed to the Greek, which for centuries had one of its chief schools at Alexandria.

The Israelites were in medical practice followers of the Egyptians, and, as with them, the priesthood attended the sick. Cleanliness was the distinctive note of their medicine, till like the Egyptian it became merged in the Greek, and, later, in the Arabian.

The sacred books of the Indians containing their oldest records of the healing art—the Vedas—date from about 1500 B.C. In them sickness appears as the work of hostile, recovery of friendly deities—the remedial agents being propitiation, prayer, and the sacrificial drink *Soma* (q.v.). The next or Brahmanic period is very prolific in medical literature, its most celebrated authors being Charaka and Susruta. To what age their works belong is much debated, some orientalists placing Susruta's *Ayur-Veda* long before Christ, others as late as the 8th or

9th centuries A.D. Just as difficult is the question whether the Indian medicine is an aboriginal product or an importation. But its earliest position was an exalted one, and its young votaries were drawn from the higher castes. Their curriculum lasted from the twelfth to the eighteenth year; decorum, piety, benevolence, unselfishness were inculcated on them as duties; and on the threshold of practice they took an oath significantly resembling the Hippocratic. Dietetics and bodily cleanliness play an important part in Indian medicine. From the vegetable, mineral, and animal kingdoms it draws remedial agents innumerable, including many antidotes to poisoning, snake-bite especially.

The old Persian medicine, as revealed in Zoroaster's *Zend-Avesta*, stood in the closest connection with religion. But Greece made her medical superiority felt in Persia, as in Egypt and India, and in later times the schools founded by the Nestorians were important centres whence Greek medicine was diffused throughout the East.

Chinese medicine meets us historically only in the 5th century B.C. Elaborate rules for noting the pulse and a portentous array of vegetable, mineral, and animal remedies are its chief characteristics. Old Japanese medicine was borrowed from it.

Greece is the mother-land of rational medicine. Already in Homer we find practitioners ranking with musicians and architects, and visiting patients for professional fees. Medicine, as distinct from surgery, is not in the Homeric foretime subordinate to religion as in the East. It has its tutelary deities—Apollo, Artemis, and Pallas, and its tutelary demigods—Æsculapius and his daughter Hygieia; but these were above and outside the medical art, while the sick who repaired to their temples were healed, not by treatment, but by such religious exercises as the 'temple-sleep,' in which they dreamt the dreams from which the priests divined their malady and prescribed the appropriate sacrifice. The service of Æsculapius had nothing to do with medicine or its practitioners, and was in the time of Hippocrates resorted to only by the superstitious among the lower orders.

Early in the Greek mainland and islands medicine had rounded itself off as a distinct science with application to practice. As a profession it became open to every free-born citizen, and included two classes—the qualified and the amateur. Its votaries began in boyhood with the study of remedial plants, the preparation of unguents, draughts, and plasters, the practice of blood-letting and minor surgery, and finally treatment at the bedside. Duly qualified, the physician took the celebrated 'oath'—and thereafter received patients in a house of his own (*iatrieon*), or visited them under their own roofs, or went on circuit. The fee included the cost of prescriptions when made up—the humbler practitioners receiving it in advance; but many towns kept a physician for the public service; and in some cases physicians of eminence became attached to foreign courts. Such was the position of the medical profession when Hippocrates (460 B.C.) gathered up all that was sound in the floating doctrine and practice, and not only augmented it, but gave it a character and direction of his own.

He strikes the keynote of his school in denying to disease a supernatural origin. 'From God comes one disease as well as another; but nothing happens except in conformity with nature.' In medicine proper his method was threefold: to ascertain the past, to examine the present, and to forecast the future of the patient. After carefully noting the previous history, generally from the patient's own lips, he made a thorough review of the symptoms as the basis of a diagnosis. This review, performed preferably in the morning when the

physician's faculties and senses were at their best, included the general nutrition, the bodily, particularly the facial, complexion, the temperature, the respiration, and the state of the digestion and genito-urinary systems. The pulse received quite secondary consideration. The Hippocratic diagnosis was seen to special advantage in thoracic and abdominal diseases. Percussion was not neglected; and succussion (i.e. shaking the patient to induce internal movements which were carefully listened to) was also among the aids to diagnosis. Prognosis, the third and last step in dealing with a patient, was likewise based on minute examination, and grew naturally out of the peculiarly Hippocratic doctrine of 'critical days.' Among the favourable signs were tranquil sleep, the setting in of perspiration, ease of bodily movement; while of contrary import were the *facies Hippocratica* (still the classic description of approaching dissolution), sinister revelations of the eye, the breath, the sputum, and the abdomen, with those of the excretions, particularly the urine. Dietetics hold the first place in the Hippocratic treatment. In acute cases the sustenance was the barley-ptisane, the drinks water mixed with honey, with acid, or with wine. External agents were oil, water, bay-salt in acid solution, wine, and acidulated lotions; in chronic cases diet and gymnastics, with vocal exercise in singing and declamation, sometimes the artificial production of obesity were employed. Venesection was sparingly employed—cupping more frequently. Drugs of indigenous and Egyptian, even of Indian origin, mostly in solution, were used with discrimination. See also SURGERY.

For at least a century after Hippocrates medicine advanced but little. His Greek successors, Diocles, Praxagoras, and Chrysippus, supplemented him by theorising and in a less degree by independent observation, and were for the former characteristic called Dogmatics by Galen.

The break-up of the Macedonian empire into kingdoms gave rise to so many foci of medical culture. The Alexandrian school, purely Greek in *personnel* and character, was represented by Herophilus and Erasistratus, both of them great anatomists. The former took account of the immediate causes of disease and such symptoms as the pulse and anatomical changes, while in treatment he relied mainly on drugs and venesection. The latter, much less loyal to the Hippocratic name, found in excess of nutrition with its results, dyspepsia and plethora, the chief causes of inflammation and fever. Herophilus and Erasistratus each headed a school, both called Dogmatic from their tendency to supersede their sound anatomical traditions by premature generalisation. Out of the conflict of Herophilite and Erasistratean sprang the Empirics, whose professional 'tripod' was clinical observation, previous history of the patient (*anamnēsis*), and 'transition from like to like' (analogical inference).

Rational medicine entered Rome with the Græcising wave that followed the expulsion of the learned from Alexandria and the subjection of the Hellenic world, and received a great impetus from the dictator Julius Caesar, who extended the Roman citizenship to all in the city who professed the healing art. Among these was Asclepiades of Bithynia, recommended to the Romans by his philosophy, rhetoric, and reliance on the gymnastic already in favour with them. Regarding the human body as composed of countless atoms divided from each other by invisible interspaces (pores), he made health consist in the normal behaviour of these atoms, by which the pores retained their proper calibre, and illness in their derangement, whereby the pores were widened or narrowed. He enjoined observance of the Stoic

maxim, to live conformably to nature, bodily exercises, including the manipulations of the bath-attendant ('massage'), and dietetics being his chief remedies. His immediate follower, Themison, simplified his etiology, and, ignoring the atoms, insisted on the abnormal condition of the pores as the one cause of disease, finding health in the *methodus* or 'middle passage' (as Häser explains it) of these channels, and the loss of health in their constriction or relaxation, or in the partial co-existence of both conditions. His therapeutics aimed at inducing a state opposite to that in which the patient was found, and so relaxation was treated with astringents, constipation with laxatives. The Methodics had the merit of ignoring mere authority, even the Hippocratic 'humoralism' still dominant, and studied the patient's general condition as the safest ground of diagnosis. Despising etiology, even in local affections, their therapeutics became an unreflecting routine. But their skill in dietetics amply explains their acceptance with the Roman world, ensuring the patient fresh air, and a pure and healthy skin, while rejecting all drastic or lowering medicines.

Aulus Cornelius Celsus, an adherent of no school and perhaps not a professional man at all, is yet the highest name in the Roman healing art, for his treatise *De Medicina*, which formed part of his encyclopædia—a sort of 'Whole Duty of the Roman Patrician.' Himself one of the order, he had doubtless to interest himself in the *ampla valetudinaria*, or infirmaries for slaves attached to every country-seat or urban palace. His experience of such hospitals enabled him to test the practice of the profession, and from the knowledge thus acquired, especially in dietetics, pharmacy, and surgery, he compiled his elegantly written book. Historically its value is priceless, as the source from which we have distinct knowledge of the Alexandrian period. He bases medicine, with Hippocrates, on anatomy, physiology, and the scientific investigation of the causes of disease, while, without excluding the hypothetical, he allows no hypothesis to influence practice. The whole work forms a compendium which, since its re-emerging to light in the 15th century, has held the first place in Latin medical literature. In the next generation to Celsus, Pliny the Elder deserves notice for his valuable, though incidental, allusions to medical authors. But to return to the Methodics. In the reign of Nero, Thessalus of Tralles was their most popular representative; half a century later Soranus of Ephesus took his place in Rome as the most distinguished of the school. His masterwork, written in Greek, is on obstetrics, while in medicine proper his treatise on acute and chronic diseases (lost in its Greek original, but preserved to us in the African Latinity of Caelius Aurelianus, who lived about the end of the 4th or beginning of the 5th century) exhibits the Methodic practice in its most favourable light. This, though with diminishing strength, resisted even the influence of Galen, till in the middle ages it took a fresh start.

An offshoot from the Methodic school had already appeared in the 1st century—viz. the Pneumatic, which sought to reconcile it with the Hippocratic humoralism. Its originator, Athenæus, derived its central doctrine from a hypothetic *pneuma* or soul pervading the universe; but in practice he combined the empiric and methodic therapeutics. About the same time arose the Eclectics, whose chief representatives were Rufus of Ephesus and the much abler Areteus of Cappadocia, who, for general culture, moral worth, and professional skill, to say nothing of the purity of his Ionic Greek, comes next to Hippocrates.

We have now reached the epoch-making Galen, born at Pergamus in 131 A.D., who, after varied studies in the Hellenic schools of the Levant, came as a qualified practitioner to Rome in 164. His rapid success aroused the jealousy of the profession there, and he again travelled in the East, to be recalled to Rome by the emperors Lucius Verus and Marcus Aurelius. He found medicine speaking a Babel of tongues while claiming to be a science, and posing as a profession. He sought to rehabilitate it by restoring to anatomy and physiology the value withheld from them by Empirics and Methodics, and by reinforcing practice with the discoveries of the Alexandrian school; in other words, to make diagnosis scientific by basing it on anatomy and physiology, and to reconstruct therapeutics by an unprejudiced clinical experience. His guide was Hippocrates—the treatise on Prognostics in particular; but unhappily he abandoned the sound Hippocratic method, and tried to unite professional to scientific medicine with a philosophic link. This he found in a hyper-idealistic Platonism, from which he evolved a teleological system which provided every question with an answer and every riddle with a solution. Hence arose a plausible appearance of infallibility, which kept medicine in chains till the 17th and 18th centuries. Adopting the Hippocratic view of the corporeal elements as consisting of the solid, the liquid, the warm, and the cold, he found them blended equally in the blood, while in the bile the warm predominated, in the phlegm the cold. His vivifying principle, the *pneuma*, reaches in man its highest development as the 'psychical,' the 'vital,' and the 'natural' spirit, and manifests itself in 'spiritual,' 'pulsating,' and 'natural' force. The processes regulating nutrition and structure he explained by attractive, secretive, propulsive, and expulsive powers. Recognising, however, that these do not cover all physiological processes, he added to them the occult powers of the 'whole substance,' the 'specific qualities' of his later followers; thus opening the sluice-gates to every kind of superstition.

Disease he ascribed, first, to immediate causes (such as plethora and corruption of the juices); next, to the disturbance thence arising; next, to the abnormal structural processes started by such disturbance; and finally, to the symptoms. Maladies he distributed according to their anatomical substratum: (1) those of the elementary substances (blood, phlegm, yellow and black bile); (2) irregularities of homogeneous substances (tissues), which, again, fall into anomalies of the physical condition (strain and atony), and of the primal qualities (warm, cold, &c.); (3) ailments of special organs. For the Hippocratic 'crudity,' 'coction,' and 'crisis,' manifested only in acute disease, he substituted the 'beginning,' the 'progress,' the 'culmination,' and the 'decline'; but retained the doctrine of crises and critical days; and he agreed with Hippocrates that the recuperative principle is nature, working necessarily through the attractive, transforming, and expulsive powers. He originated the doctrine of 'indications' in their bearing on the prevention of disease; on its character, stage, type, symptoms; on the idiosyncrasy of the patient and the nature of the affected organs—even on his dreams. Diet, gymnastics, baths, friction, and blood-letting formed his main therapeutics. Consistently, with his theories he classified medicines, according to the prevalence of one or more elements, into simple, compound, and those operating through their 'whole substance' (emetics, for instance, purgatives, poisons and their antidotes). In his own practice he preferred simples, and set peculiar value on opium, introduced by the Alexandrian school. It was not till after

his death that his influence began to prevail. His comprehensiveness, his prolix style, and sectarian jealousy kept his authority in the background, and it was with the philosophers rather than the profession that he was most in favour. Gradually his writings, having been translated into Latin, began to be studied in the West, till in the 6th and 7th centuries they were much in vogue. But it was the physicians of the Nestorian creed, expelled from Byzantium, who became his true apostles. Revering him for his teleology and almost Christian worship of a benevolent creator, they diffused his name and authority till the Arabian physicians became his devoted adherents, and spread his influence through East and West alike for more than a thousand years.

After Galen may be noticed the Byzantine school—viz. the compilers Oribasius (physician to Julian the Apostate), Aetius, the abler Alexander of Tralles, and the yet more independent Paul of Ægina. In the West Cœlius Aurelianus, above referred to, alone redeems medicine from the deterioration it had reached in the hands of herbalists and receipt-mongers.

Arabian medicine arose out of the Greek in those Hellenic cities which had passed under Moslem sway. Its importance begins with the Persian Rhazes (925-26), a follower of Galen, though not unacquainted with Hippocrates, practising in Bagdad. After him may be mentioned Mesua the younger, of Damascus, whose *materia medica*, dating from the 11th century, was much in vogue and was used by the London College of Physicians in framing their pharmacopœia in the reign of James I., and Abulcasis, author of a medical cyclopædia. Haly, compiler of the 'Royal Book,' was the standard Arabian writer till Avicenna, who, famed also as a philosopher, is the highest name in Arabian medicine. His 'Canon,' lucid in style and method, is an encyclopædia of the healing art, based on Aristotle, Galen, and his successors, Greek as well as Arabian, but evincing no clinical experience or research. His opponents were Avenzoar and the latter's pupil Averrhoes, compilers mainly, as was also the great Rabbi Maimonides, the last noteworthy writer on Arabian medicine. No advance was made by this school on the Greek, except in the description of smallpox and measles and, more distinctly, in pharmacy and the virtues of drugs. The Arabs owed this superiority to their chemical skill, which originated new or modified old remedies, and also to their more familiar relations with the East, imperfectly gleaned by their predecessors. Apothecaries' shops, and even the pharmacopœia, are among the innovations medicine owes to them.

European medicine, however, manifests no real break from its rise under Hippocrates. In the early middle ages the religious orders were the custodians of the degenerate knowledge and practice of the healing art transmitted from the later Roman authors till the curious mixture of ancient science with the black art, characteristic of monastic medicine, was superseded by the Benedictines, whose house at Monte-Cassino in Campania was the seat of the Hippocratico-Galenic revival, afterwards extended by the school of Salerno. This latter was a non-religious establishment, in which law as well as philosophy was taught, while the preponderance it gave to medicine as early as the 9th century earned for it the name of 'Civitas Hippocratica.' It attracted prominent men of the time in quest of health, among them the Norman invaders of Southern Italy. William the Conqueror was one of the visitors, and his son Robert is supposed to have been the king of England for whom was written the famous *Regimen Sanitatis Salerni*, the rhyming Latin poem

on 'health and the means of maintaining it,' which afterwards circulated so widely through Europe. The Salernitan school had many students, and, proportionately, a considerable staff of teachers, some of whom were women, their wives and daughters; the best known of them is Trotula (11th century), wife of Joannes Platearius, first of a medical family bearing that name, and author of *Practica*, a manual of medicine which long held its ground. But none of the Salernitan writers are other than compilers, chiefly from Hippocrates, Galen, and their successors. Diet was their sheet-anchor, though their pharmacy improved on the previous European standard, and their clinical teaching was also favourable to rational medicine. But the Arabian wave swept over the school, and, after the 13th century, almost obliterated it. It survived, however, though but the shadow of a name, till its suppression in 1811 by Napoleon.

Latin renderings of the Arabian compilers were the main channel through which Europe recovered its knowledge of the classical medical writers—Constantine Africanus (1050) being the earliest of these translators. Transmitted through the Arabic, the Greek medicine wore an eastern dress, and in such guise it found its way to Montpellier, a school which developed as that of Salerno waned. Bologna and Padua, too, derived their medical teaching from this oriental travesty of the Greek; but no great independent authority arose in any of these seats of learning. Häser points out that the practical tenor of the treatises they put forth—notably the Montpellier school—was due to British authors, who, like Gilbert the Englishman, and Gordon the Scot, had graduated there. But the fall of Constantinople and the immigration of Greek scholars into Europe reopened the fountains of ancient learning. Hippocrates and Galen now became known in the original, and the master-work of Celsus, till then a forgotten book, was once more read with profit. Rational medicine had returned to its parents.

To the writings of Galen was due the revived study of anatomy, and with it physiology; to Dioscorides the resuscitation of medical botany. The discovery of America, followed up by inland exploration, led to the introduction of new medicines, vegetable and mineral. The reaction against the Arabian masters was completed by 'authorised versions' of the Greek originals—versions chiefly the work of physicians who were also Hellenists, and by the middle of the 16th century Galen was reenthroned in the schools. The downfall of Arabian medicine was of earlier date in Italy and England than in France, while Germany was under the temporary sway of Paracelsus, a meteoric genius who followed no school, but vitiated his independence of judgment and great acuteness by the haughtiest arrogance. He had a positive as well as a mystical side, and, while regarding disease as 'spiritual,' with which, unassisted, nature herself could often cope, he also relied on chemical agencies for its cure. These owed their virtue to their secret power over disease, whence he called them 'arcana.' Opium, in the form of tincture, and antimony were among these. Beyond compelling a closer study of chemistry and showing an example of independence amid the universal belief in Galen, Paracelsus did no good to medicine, and indeed, outside Germany, was held in little account.

Meanwhile, the outbreak of disease on an epidemic scale, in forms unknown to the Greeks, threw the medical art on its own resources, and started that revolt against authority to which it owed its next advance. The sweating sickness was minutely described by Kaye (Latinised, Caius) in England, and syphilis by physicians on the

Continent. Hospitals, moreover, the special contribution of Christianity to the relief of the sick or physically injured, now became seats of clinical study, Italy leading the way in her celebrated school of Padua, which then began to attract students from all countries. Physics, which received a fresh impulse at the Renaissance, had also its effect on biology and medicine—Galileo and Cæsalpinus representing in Italy what Bacon and Harvey represented in England—a sounder scientific method on the one hand and a more penetrating physiological research on the other, leading to the discovery by Harvey of what Cæsalpinus and others had dimly adumbrated, the circulation of the blood. Concurrently with the mechanical contribution to biological and medical study, that of natural history was equally important, pharmacy in particular receiving new accessions, notably cinchona bark, which found a place in the dispensaries or pharmacopœias now beginning to multiply. Love of system, however, a perennial hindrance to medical progress, was no less prolific than inductive research, and so, contemporaneously with Harvey, we have mystics such as Van Helmont, who, like Paracelsus, left no enduring mark on sound medicine beyond encouraging independence of authority and innovations in treatment. The Iatro-mechanical school was another development in the theorising direction, its most prominent names being the Neapolitan Borelli, the Roman Baglivi, and the Scottish Pitcairne. Physiology is more indebted to these quasi-scientific systematisers than therapeutics, which, however, is under distinct obligations to another school, the Iatro-chemical, whose Dutch founder, Sylvius, applied to treatment the results of the improved biology and chemistry. He had many followers in Germany as well as Holland; but his ablest disciple was the English Willis, who worked permanent good in the examination of secretions, to say nothing of his still classic account of diabetes and of nervous maladies. Reaction against the theorising tendency was led by Sydenham, whose guide in practice was Hippocrates, with his 'natural history of disease.' Nature he held to have a self-restoring power, which it was the physician's duty to watch and assist. As a practitioner Sydenham was especially great, while his descriptions of disease—gout, for example—are those of an artist in medicine. But it was in his rejection of theory and as an observer and utiliser of facts that his influence was soundest. Coming as it did after the anatomical, physiological, and chemical work of the previous generation, it gave practical direction to so much of it as had stood the clinical test.

Theory, however, is too attractive for ingenious minds to be long idle, and again we find medicine turning into 'the high *priori* road.' The Iatro-mechanical school underwent something like a revival, thanks to the brilliant astronomy of Newton and the able advocacy of Pitcairne and his pupil Cheyne. Sydenham's example, however, was still powerful enough to curb the theorising tendency, so that enthusiastic mathematicians like Mead did not allow their love of hypothetical symmetry to vitiate their practice. The next great name in medicine is that of Boerhaave of Leyden, a disciple of Hippocrates and Sydenham, familiar with all that was valuable in other schools, but strenuous in his pursuit of anatomical and physiological fact, in which he worked assiduously with the microscope. As a clinical lecturer he was the forerunner of the most refined teaching of the modern day, and his clinique was resorted to by aspiring students of every country. The love of system which he shared with so many of the master-minds of medicine is seen in his *Institutiones*, long a

text-book, but now, like his *Aphorisms*, superseded by the juster knowledge of which he was the pioneer. Among his pupils was Van Swieten, founder of the Vienna school, while contemporary with him were Hoffmann and Stahl, both of them professors at Halle, in advance of their time as chemists, and enthusiastic systematisers, the former eager to reconcile the 'spiritual' with the 'materialistic' view of nature, the latter bent on eliminating the 'material' from man and making the 'psychical' the essence of his being.

Physiology and rational medicine made a new start under the all-accomplished Swiss Von Haller, whose teaching prevailed for good in spite of recurrent outbreaks of the systematising tendency. Muscular irritability, to the exclusion of the hypothetical *anima*, and as distinguished from nervous sensibility, was a discovery of his which threw fresh light on living movements, while medicine proper owes to him a series of experiments, better appreciated by later science, on the influence of drugs on the healthy subject. Morgagni of Bologna laid practical medicine under yet more lasting obligations by his elaborate work in morbid anatomy, of which he may almost be regarded as the creator. His *De Sedibus et Causis Morborum* may still be consulted with advantage, followed up as it was and its results extended by other pathologists, the Scotsman Baillie in particular. From the sound leading of Von Haller and Morgagni a partial deflection was made by Cullen of Edinburgh, an expositor of rare ability. His *Lines of the Practice of Physic* and his larger *Nosology* were a skilful adaptation of the new physiology and pathology to classification and therapeutics, and from their attractive clearness were long in favour with teacher and student alike. A more brilliant, though far less judicious systematiser was his pupil John Brown, father of the Brunonian system, of which the keynote is the part played by 'excitability' in health and disease. To maintain this property at its normal strength was the object of the physician, who, indeed, in 97 per cent. of the diseases brought before him, had to make his treatment a 'stimulating' one. The superficial simplicity of the system explains its wide acceptance and tenacious vitality, though its popularity was always greater in Italy and Germany than in Great Britain. Another exemplar of the systematising spirit in the same century was Hahnemann, the creator of the Homœopathic school. Dwelling chiefly on the symptoms of disease, he constructed an elaborate scheme of therapeutics (see HOMŒOPATHY), and benefited practical medicine, even as Brown did, by favouring a milder than the so-called heroic treatment.

Before quitting the 18th century, its contributions to special departments of medicine must be noticed. In Italy Valsalva and Lancisi did good service, the latter by his observations on the causes of sudden death, including cardiac and aneurismal lesions, while Albertini was also meritorious in the same walk. Germany produced Auenbrugger of Vienna, author of direct 'percussion.' In Britain state-medicine owes its start to Baker, followed up by Jenner, whose discovery of vaccination is memorable not only for its prevention of smallpox, but for its influence on the study of infectious disease. Pringle, ably preceded by Huxham, enlightened the profession on fevers, especially as occurring in prisons and camps; and Fothergill on putrid sore throat ('diphtheria') and tic-douloureux, and Heberden in therapeutics did honour to the English school.

The 19th century opened with a sound preference for inductive research over premature generalisation, and France, in the background for many

years, now came to the front with Bichat and Broussais—the former a great anatomist and physiologist, the latter distinguished in pathology. Pathological anatomy had contributed much to localise disease, and diagnosis was made still more precise by Corvisart and Piorry in perfecting the ‘percussion’ of Auenbrugger. By Laennec’s advance upon this—auscultation to wit—the movements of the lungs and heart are heard through the thoracic walls by the stethoscope. Concurrently with this ‘mediate auscultation,’ morbid anatomy connected the lesions of the intra-thoracic viscera with the sounds so transmitted—a twin-source of medical knowledge, rich in results on diagnosis and treatment. Bayle, Chomel, Louis, Cruveilhier, and Andral, each in his own way, did memorable work in scientific and practical medicine, founding the great clinical school which, continued under Bretonneau, Rostan, D’Alibert, Rayer, and Trousseau, made Paris the resort of aspiring young physicians from both hemispheres. In Great Britain medical education was steadily improved by sounder chemical and physical, as well as anatomical and physiological knowledge, while the preference of rational observation to theory was admirably illustrated by Willan on the skin, Bright on the kidney, and Addison on the supra-renal capsules. The Paris school found apt pupils in the British Islands—the Scottish Forbes and the Irish Stokes, with the English Hope, Latham, and Watson, doing much to diffuse a sounder diagnosis and treatment of chest diseases; while Scotland, in particular, maintained the traditional celebrity of her clinique by Gregory, Abercrombie, and Alison in Edinburgh, to whom worthy counterparts were produced in Dublin by Graves, Stokes (already mentioned), and Corrigan. In the northern capital Christison, the Begbies, father and son, Hughes Bennett, and Laycock upheld the fame of the school, and south of the Tweed Parkes, Murchison, Hilton Fagge, and Jenner have bequeathed a rich harvest of practical doctrine to their successors. Italy, with Galvani, Volta, Nobili, and Matteucci, is the parent of electro-therapeutics; but it is to Germany that recent medicine owes its greatest and most productive achievements. Vienna, under Van Swieten and Auenbrugger, had already won a European name for clinical research when Skoda enhanced it by improving on Laennec’s discovery, and Rokitsansky and, quite recently, Bamberger carried Viennese teaching to the highest pitch of academic efficiency. Romberg is another representative name; but Schönlein, by the unanimous voice of Germany, has placed her in the van of medical progress. Founder of the modern ‘natural history school,’ his teaching has led up to bacteriology, which already in the hands of such men as Pasteur and Koch has for cholera, malaria, lupus, and tuberculosis (see TUBERCLE) become one of the most powerful instruments of which medicine, in diagnosis and even in practice, has yet been able to boast. The marvellous advances in cerebral physiology, from Broca to Hitzig and Ferrier, have had great results in practice, surgical as well as medical; and the Americans have done splendid work, especially in therapeutics.

Häser’s *Grundriss der Geschichte der Medizin* (Jena, 1884) and Puschmann’s *Geschichte des medicinischen Unterrichts* (Leip. 1889) have been closely followed in the foregoing article. The student who wishes to pursue the history of medicine into minuter detail should consult the larger work of Häser, in 3 vols. (Jena, 1875–79); Daremberg’s *Histoire des Sciences Médicales* (2 vols. Paris, 1870); and Puccinotti’s *Storia della Medicina* (3 vols. Pisa, 1859). For a key to the very numerous articles on diseases, see DISEASE, and the list appended to ANATOMY. See also SURGERY, HYGIENE, BACTERIA, GERM THEORY, and the notices of HIPPOCRATES, GALLEN, and other great physicians.

Medick (*Medicago*), a genus of plants of the natural order Leguminosæ, sub-order Papilionacæ, nearly allied to Clover (q.v.), but distinguished from that and kindred genera by the sickle-shaped, or, in most species, spirally-twisted legume. The species, which are very numerous, are mostly annual and perennial herbaceous plants, with leaves of three leaflets like those of clover, and are natives of temperate and warm climates. A number of them are found in Britain, and many more in the south of Europe. They generally afford good green food for cattle, and some of them are cultivated like the clovers for this use, amongst which the most important is the Purple Medick, or Lucerne (q.v., *M. sativa*). Besides this, the Black Medick, Nonsuch, or Lupuline (*M. lupulina*), is one of the most generally cultivated. It is a common native of Britain, where it is very generally sown mixed with Red Clover and Rye-grass, and is useful where a close turf is desired.

Medīna, EL- (Arabic for ‘The City’), or, more fully, Medinat en-Nebi (‘City of the Prophet’), or Medinat Rasuli-elah (‘City of the Apostle of God’), because it was there that Mohammed took refuge after his Hegira or Flight from Mecca in 622, and there that he lived till his death. Formerly called Yathrib, and mentioned by Ptolemy as Iathrippa, the holiest city of the Mohammedan world after Mecca, and the second capital of the Hedjâz in western Arabia, it is situated about 270 miles N. of Mecca, and 132 N. by E. of the port of Yanbu’ on the Red Sea, and contains about 16,000 inhabitants (Burton), chiefly engaged in agriculture. It consists of three principal parts—a town, a fort, and suburbs of about the same extent as the town itself, from which they are separated by a wide space (the Munakha). It is about half the size of Mecca, and forms an irregular oval within a walled enclosure, 35 to 40 feet high, flanked by thirty towers, and enclosing the castle where the Turkish garrison is lodged—a fortification which renders it the chief stronghold of the Hedjâz. Two of its four gates are massive buildings with double towers. The streets are narrow but partly paved. The houses are flat-roofed and double-storied, and are built of stone, brick, and palm-wood. The principal building is the Prophet’s Mosque El-Haram (‘the Sacred’), supposed to be erected on the spot where Mohammed died, and to enclose his tomb. It is of smaller dimensions than that of Mecca, being a parallelogram, 420 feet long and 340 feet broad, with a spacious central area, surrounded by a peristyle with numerous rows of pillars. The present building is, however, only the last of many reconstructions, of which the best was that of Kait Bey, the Mameluke sultan, in 1481, whose dome and pulpit still stand. The Mausoleum, or Hujrah, is an irregular doorless chamber, 50 to 55 feet in extent, situated in the south-east corner of the building. It is surmounted by a large gilt crescent above the ‘Green Dome,’ springing from a series of globes, and hedged in with a closely-latticed brass railing, in which are small apertures for prayer. The interior is hung with costly curtains embroidered with large gold letters, stating that behind them lie the bodies of the Prophet of God and of the first two califs—which curtains, changed whenever worn out, or when a new sultan ascends the throne, cover a square edifice of black marble, in the midst of which is Mohammed’s tomb. Its exact place is indicated by a long pearly rosary—still seen in 1855—suspended from the curtain. The Prophet’s body is believed to lie undecayed at full length on the right side, with the right palm supporting the right cheek, the face directed towards Mecca. Close behind him is placed, in the same position, Abul-ekr, and behind him Omar; and Fâtimel’s house

is represented by a modern erection hard by. There seems no reason to doubt that the Prophet was buried in the space (originally Ayesah's hut) now enclosed in the mosque; nor is it likely that the grave was ever rifled. That his coffin, said to be covered with a marble slab, and cased with silver (no European has ever seen it), rests suspended in the air is of course an idle Christian fable. Of the treasures which this sanctuary once contained, little now remains. It is a meritorious act to perform the pilgrimage to Medina, though there is no fixed season for it. As in Mecca, a great number of ecclesiastical officials are attached in some capacity or other to the Great Mosque; and not only they, but many of the towns-people live to a great extent on the pilgrims' alms and custom. There are few other noteworthy spots in Medina, save the minor mosques of Abu-bekr, 'Ali, 'Omar, Bilal, &c. Thirty Medressehs, or public endowed schools, represent what learning there is left in the city, once famed for its scholars and theologians. In the 7th century Medina was the capital of Islam; but since then it has passed under the rule of emirs, sherifs, Turkish pashas, and Wahabis, though the internal government of the city is still Arabian.

Medina Sidonia, a city of Spain, 25 miles SSE. of Cadiz, stands on an isolated hill overlooking a wide plain, and has the ruins of a castle, the ancestral seat of the dukes of Medina Sidonia, descendants of Guzman the Good, conqueror of Tarifa (1292). It was a member of this house who commanded the 'invincible Armada' (q.v.). Pop. 12,397, who make pottery.

Medinet-el-Fayyum. See FAYYUM.

Meditatio Fugæ. See DEBT, Vol. III. p. 717.

Mediterranean Sea, so named from lying in the midst between the continents of Europe, Asia, and Africa. It is the largest enclosed sea in the world, and is connected with the open ocean only by the narrow Strait of Gibraltar, 9 miles in width at the Pillars of Hercules. Since 1869, however, it has been artificially connected with the Red Sea and Indian Ocean by means of the Suez Canal (q.v.). From its great size the Mediterranean might be ranked with the oceans, but from being so completely cut off it presents distinctly local characters when compared with the great ocean-basins, and is consequently of special interest to the student of physical science. The Mediterranean, in a nearly east and west direction, is about 2200 miles in length from the Strait of Gibraltar to the Syrian coast; its width varies from 500 or 600 miles in some places to less than 100 miles between Sicily and Cape Bon, where it is divided by relatively shallow banks into two distinct hydrographic basins, the eastern one being the larger. It is connected with the Black Sea through the Dardanelles, the Sea of Marmora, and the Bosphorus. The African and Syrian coasts are comparatively even and unindented, the wide gulfs of Gabes and Sidra scarcely presenting an exception; on the other hand, the shores of Europe and Asia Minor are cut up into numerous gulfs and bays, the largest of which is the Adriatic Sea. Various parts of the Mediterranean have been known by special names, such as the Tyrrhenian and Iberian Seas in the western, and the Levant, Ægean, and Ionian Seas in the eastern basin. The principal islands in the western part are Sardinia and Corsica, the Balearic and Lipari Islands, the two latter groups being of volcanic origin. The continental islands of Sicily and Malta are situated on the banks dividing the two basins; Pantellaria, Limosa, and Graham Island (now reduced to a shoal) are, however, volcanic though situated on the same banks. In the eastern regions there are

the large islands of Cyprus and Crete, with the Ionian Islands and the islands of the Archipelago. The Mediterranean is frequently subject to earthquakes, and Vesuvius, Stromboli, and Etna are among the most famous of its active volcanoes. The scenery of the shores of this great inland sea is varied, mountain-ranges and high tablelands predominating. Although there is considerable diversity between the climates of Northern Italy and the desert shores of North Africa, still the terrestrial fauna and flora are not markedly distinct in the different regions of the Mediterranean basin, many of the plants and animals being identical on the northern and southern shores, and there is abundant evidence that this similarity was much more pronounced in recent geological times. The countries bordering the Mediterranean have been the cradle of civilisation, Phœnicia, Greece, and Italy having been successively the homes of knowledge and progress, and at the present time this inland sea is commercially the most important waterway of the world.

The area of the Mediterranean is estimated at about 900,000 sq. m., or, including the Black Sea and Sea of Azov, at 1,053,000 sq. m. The area of land draining into the Mediterranean is estimated at 2,969,350 sq. m., or nearly 3,000,000 sq. m. of the richest country on the earth's surface. The annual amount of rain that falls on this land is estimated by the writer at 1598 cubic miles, and of this amount about 226 cubic miles reach the Mediterranean through the annual discharge of rivers, the principal of which are the Rhone, Po, Danube, Dnieper, Don, and the Nile.

The basin of the Mediterranean commences about 50 miles to the west of Gibraltar, where there is a ridge with a maximum depth of about 200 fathoms. There is a similar depth on the ridge between Sicily and Africa which separates the Mediterranean into two basins: 2040 fathoms is the greatest depth recorded in the western, and 2187 fathoms the greatest in the eastern basin; the mean depth of the whole sea is 768 fathoms. The area of the sea-bottom with a less depth than 100 fathoms is estimated at about one-fourth of the whole area; the area with a depth of from 100 to 1000 fathoms is estimated at 300,000 sq. m., and with a depth of from 1000 to 2000 fathoms at 15,000 sq. m. The bulk of water is estimated at 709,800 cubic miles. The greatest depth in the Black Sea is 1070 fathoms, the average depth being 412 fathoms.

On the whole northerly winds prevail over the Mediterranean, due chiefly to the influence of the anticyclonic region of the North Atlantic, although in the eastern portions the alternate cyclonic and anticyclonic area of northern Asia has a distinct influence on the direction of the winds. The Mediterranean lies wholly between the annual isotherms of 60° F. in the north and 70° in the south. The temperature of the surface waters may occasionally reach 90°, but is usually much less, the mean of the winter months being between 53° and 57°. Generally the temperature of the sea is higher than that of the air, especially in winter, but in some of the summer months the reverse is the case. Whatever the temperature of the surface water may be, at a depth between 100 and 200 fathoms a temperature of 54° to 56° is met with, and this persists without sensible variation to the greatest depth. The temperature of the bottom water in the western basin is about 54°·5, and in the eastern basin a little warmer, 56°·0, these temperatures being fully 20° higher than the temperature of the bottom water of the Atlantic at corresponding depths. From recent observations it would appear that the deep water of the Mediterranean is subject to slight annual variations, dependent on the temperature of the previous

winter. The evaporation from the surface of the Mediterranean exceeds both the precipitation and the annual discharge of the rivers flowing into it from the surrounding catchment basin, for we find the specific gravity of its waters (1.02800 to 1.0300) to be greater than that of the Atlantic on the west (1.026 to 1.027), or that of the Black Sea on the east (1.012 to 1.014). There is even an outflow of warm dense Mediterranean water into the Atlantic beneath the lighter Atlantic water which flows in at the surface through the Strait of Gibraltar. There is a similar state of things at the entrance of the Black Sea, where there is an inflow of fresh water from the Black Sea at the surface, and an outflow in the opposite direction of saltier Mediterranean water by an undercurrent. Were it not for the inflow of Atlantic water the Mediterranean would slowly become saltier, and shrink till reduced to two salt lakes like the Dead Sea. The Mediterranean is usually called a tideless sea. At Algiers there is a rise of $3\frac{1}{2}$ inches at springs and half that amount at neaps; at other places the rise and fall is about 18 inches, and in the Gulf of Gabes the range reaches 5 feet, but the solilunar tides are as a rule completely masked by the rise of level and the surface currents produced by the action of the winds. The deposits now forming in the Mediterranean in deep water are all blue muds, with a yellowish upper layer, containing usually from 10 to 30 per cent. of carbonate of lime, which principally consists of the shells of pelagic Foraminifera. The mineral particles and clayey matter are derived from the disintegration of the neighbouring land. In some of the shallower depths there are glauconitic and more calcareous deposits. The deep-sea dredgings show that life, though present, is much less abundant in deep water than at similar depths in the open ocean, in which respect the Mediterranean agrees with enclosed seas in general. There is an extensive red coral fishery and tunny fishery on some parts of the coasts. The Mediterranean region appears to have been covered by the sea from early geological times, and during Tertiary times must have had much wider communication with the open ocean.

Medjidie, an Ottoman decoration, instituted in 1852 by the Sultan Abd-ul-Medjid as a reward of merit either civil or military. It was conferred after the Crimean campaign, to a considerable extent, on British officers. The order consists of five classes, and the decoration is a silver sun of seven triple rays, with the device of the crescent and star alternating with the rays.

Medlar (*Mespilus*), a genus of trees or shrubs of the natural order Rosaceæ, sub-order Pomeæ, having a 5-cleft calyx with leafy segments, nearly round petals, a large honey-secreting disc, and 2-5 styles, united together in the flower, but widely separated on the fruit, the upper ends of the bony cells of which are exposed. The Common Medlar (*M. germanica*), a small tree, spiny in a wild state, but destitute of spines in cultivation, is a native of the south of Europe and of the temperate parts of Asia, but is a doubtful native of Britain, although it is to be seen in hedges and thickets in the southern parts of England. It has lanceolate, undivided leaves, solitary large white flowers at the end of small spurs, and globular or pear-shaped fruit. The medlar is much cultivated in some parts of Europe, and is common in gardens in England, but it does not generally ripen well in Scotland without a wall. It is very austere, but when *blotted*, or its tough pulp has become soft and vinous by incipient decay, it is relished by many.

Medmenham, a village of Buckinghamshire, near the Thames, 3 miles SW. of Marlow. Here

stood a Cistercian abbey (1204); and here, soon after the middle of the 18th century, Sir Francis Dashwood, afterwards Lord le Despencer (1708-81), founded his mock brotherhood of 'Franciscans,' whose motto was the familiar inscription on Rabelais' abbey of Thelema, 'Fay ce que voudras,' and two of whose twelve members were John Wilkes and Paul Whitehead the poet. Pop. of parish, 336. See W. Fraser Rae's *Wilkes, Sheridan, Fox* (1874).

Médoc, a district in the French department of Gironde, famed for the quantity and excellence of the wine it yields, some of the most famous growths of Bordeaux (q.v.), such as Château-Margaux, Château-Lafite, and Château-Latour. The district lies on the left bank of the estuary of the Gironde, being separated from the Landes by low hills, and is 40 miles long by from 5 to 10 wide. See *Chambers's Journal* (March 1890).

Medulla Oblongata. See BRAIN.

Medusæ. See JELLY-FISH.

Medway, a river of Kent, rising in three head-streams in Sussex and Surrey, and flowing 70 miles north-eastward (including 12 miles of estuary), past Tunbridge, Maidstone, Rochester, Chatham, and Sheerness, until it joins the estuary of the Thames. It is tidal and navigable to Maidstone, but large vessels do not ascend above Rochester bridge. See CHATHAM.

Meeanee, or MIANI, a village in Sind, India, on the Indus, 6 miles N. of Hyderabad, was the scene of a battle between Sir Charles Napier with 2800 men and a Baluch army, 22,000 strong, on February 17, 1843. The latter were totally routed, losing 5000 men; the British loss was 256. The result of this victory was the conquest and annexation of Sind.

Meerane, a prosperous manufacturing town of Saxony, 43 miles by rail S. of Leipzig. From an unimportant, small country town, it has increased rapidly in size and importance through the development of its woollen manufactures and the large export trade which it carries on with England, France, and America. Pop. (1849) 7345; (1885) 22,013. See Leopold's *Chronik von Meerane* (1863).

Meercat (*Cynictis*), a South African carnivore akin to the Ichneumon (q.v.).

Meerschäum (*Sepiolite*), a mineral existing in many parts of the world. In Europe it is found chiefly at Hrubshitz in Moravia, and at Sebastopol and Kaffa in the Crimea; and in Turkey in Asia it occurs abundantly just below the soil in the alluvial beds of several districts—especially at Eski-shehr. It is also found in Spain and South Carolina. Meerschäum, from its having been found on the seashore in some places, in peculiarly rounded snow-white lumps, was ignorantly imagined to be the petrified froth of the sea, which is the meaning of its German name. Its composition is silica, 60.9; magnesia, 26.1; water, 12.0. Almost all the meerschäum found is made into tobacco-pipes, in which manufacture the Austrians have been for a long time pre-eminent. Vienna contains many manufactories, in which some very artistic productions are made; and pipes worth 100 guineas, from the beauty of their design, are by no means uncommon. The French pipe-makers have lately used meerschäum, and have displayed great taste in their works. When first dug from the earth, meerschäum is quite soft and soap-like to the touch, and as it lathers with water, and removes grease, it is employed by the Turks as a substitute for soap in washing. Similarly in Algeria it is sometimes used in place of soap at the Moorish baths. The waste in cutting and turning the pipes was formerly thrown away, but it is now

reduced to powder, mixed into a paste, and compressed into hard masses, which are carved into inferior pipes.

Meerut, or more correctly **MERATH**, a town, district, and division in the North-western Provinces of British India. The town lies 40 miles N.E. of Delhi, about half-way between the Ganges and the Jumna. Its most important edifice is the English church, with a fine spire and an excellent organ. There are also several ruins of native edifices. Here in 1857 the great mutiny broke out (see INDIA, Vol. VI. p. 119). Pop. (1881) 99,565, of whom 38,617 were in the cantonment, an important military station, the rest in the city. The district has an area of 2379 sq. m.; pop. of (1881) 1,313,137. The division has an area of 11,320 sq. m.; pop. (1881) 5,141,204.

Megaceros. See **ELK**.

Megalichthys (Gr., 'great fish'), a genus of extinct Ganoid fishes. Their remains found in Carboniferous strata testify to fishes of large size, completely buckled by big strong smooth scales. The jaws bear large conical teeth suggestive of predacious carnivorous habits, and the fishes were doubtless a terror in their ancient haunts. Along with related genera, *Megalichthys* is placed not far from the modern genus *Polypterus*.

Megalithic Monuments. See **DOLMEN**, **STANDING STONES**, **STONE CIRCLES**, &c.

Megalonyx, a large fossil edentate of the United States, smaller than the *Megatherium* (q.v.).

Megalosaurus (Gr., 'great lizard'), a gigantic extinct reptile, whose remains are found in Jurassic and Cretaceous strata. The huge body seems to have measured about 30 to 50 feet in length, and from the nature of the skeleton it is inferred that the animal moved and sat half upright, in a kangaroo-like fashion. The formidable teeth indisputably suggest a carnivorous diet. See **REPTILES**.

Megapodidae. See **MOUND BIRDS**.

Megaris, a small mountainous region of Hellas, or Greece proper, lying between Attica and the Isthmus of Corinth. The people were excellent sailors, and founded several colonies, of which the most famous were Byzantium (667 B.C.), Chalcedon, and Megara (Hyblæa) in Sicily. They were generally regarded as guilty of deception and dissimulation, hence the phrase 'Megarian tears.' The capital was Megara, long an important commercial city, and famous for its white shell marble, and for a white kind of clay, of which pottery was made.—From Euclid (q.v.) the philosopher, who, as well as Theognis the poet, was born at Megara, the Megaric school took its name.

Megasthenes, a Greek ambassador stationed by Seleucus Nicator (306–298 B.C.) at the court of Sandrocottus (q.v.), or Chandra Gupta, in the valley of the Ganges. Here he gathered materials for his work *Indica*, from which Arrian, Strabo, and others borrowed. The fragments that remain have been edited by Schwanebeck (1846) and Müller (1848).

Megatherium (Gr., 'great beast'), a gigantic extinct quadruped of the order Edentata, nearly allied to the sloth, found in the Pleistocene deposits of South and North America, but more particularly in those of the South American pampas. In structure it is very near its modern representative, except that the whole skeleton is modified to suit the requirements of an immense heavy-boned and heavy-bodied animal, fully equal in bulk to the largest species of rhinoceros. The appellation *tardigrade*, which Cuvier applied to the sloth, cannot be given to the *Megatherium*: its limbs were comparatively short and very strong, and the feet adapted for walking on the ground, approach-

ing in this respect nearer to the allied ant-eaters, but with this peculiarity, that the first toe of each of the hind-feet was furnished with a large and powerful claw, which was probably used as a digger to loosen roots from the soil, and enable the creature the more easily to overturn the trees on

Skeleton of the *Megatherium*.

the foliage of which it browsed. The enormous development of the bones of the pelvis, the hind-legs, and the tail, gave the animal great power when, seated on its hind-legs and tail, as on a tripod, it raised its fore-legs against the trunk, and applied its force against a tree that had already been weakened by having its roots dug up. The structure of the lower jaw seems to indicate that the snout was prolonged and more or less flexible, and it seems probable that the *Megatherium* was furnished with a prehensile tongue like that of the giraffe, with which it stripped the foliage from the trees. The remains of several allied genera of huge Edentata are associated with the *Megatherium* in the deposits on the pampas. They form the family *Megatheriidae* of Owen, which includes *Myiodon*, *Megalonyx*, *Scelidotherium*, &c.—genera which are separated from *Megatherium* chiefly from peculiarities in the dentition. The modern sloth is a native of South America, and the fossil remains of these immense creatures, which represented it in the newer Tertiaries, are found only in the American continent.

Meghna, the estuary of the Ganges (q.v.) and Brahmaputra (q.v.). See Map at CALCUTTA.

Megiddo, an ancient city of Palestine, the site of which is somewhat uncertain, in the plain of Esdraelon. In the battle there Josiah (q.v.) was slain in 609 B.C.

Megilp. See **MAGILP**.

Megrin. See **HEADACHE**.

Megrims and **Vertigo** are the terms usually applied when a horse at work reels, and then either stands for a minute dull and stupid, or falls to the ground, lying for a time partially insensible. These attacks come on suddenly, are often periodical, and are most frequent during hot weather and when the animal is drawing up a hill, or exposed during heavy work to the full rays of a hot sun. Liability to megrims constitutes unsoundness, and usually depends upon the circulation through the brain being temporarily disturbed by the presence of tumours, or by weakness of the heart's action. Horses subject to megrims are always dangerous; if driven at all, they should be used with a breast-

plate or pipe-collar, so as to prevent, as much as possible, pressure on the veins carrying the blood from the head; they should be moderately and carefully fed, and during hot weather have an occasional laxative.

Mehemet Ali, better **MOHAMMED 'ALI**, Viceroy of Egypt (1805-49), was born in Albania in 1769, and was sent to Egypt with a Turkish force in 1799. See **EGYPT**, Vol. IV. p. 242.

Méhul, **ETIENNE NICOLAS**, operatic composer, was born at Givet, 22d June 1763, studied in Paris, and in 1795 became professor at the Conservatoire. He died 18th October 1817. Among his best-known works are the operas *Une Folie* (1801), *Les Aveugles de Tolède* (1806), and *Joseph* (1807); and the patriotic songs *Chant du Départ*, *Chant de Victoire*, *Chanson de Roland*. See *Life* by Pougin (1889).

Meilhac, French playwright, born in 1832 in Paris, was trained as an artist and published his first dramatic work in 1855. He has subsequently produced a long series of light comedies—some in conjunction with Halévy. Some are well known through Offenbach's music. His *chef-d'œuvre* is *Frou-Frou* (1869).

Meinam. See **SIAM**.

Meiningen, the capital of the German duchy of Saxe-Meiningen, lies in a narrow valley on the banks of the Werra, 43 miles by rail NW. of Coburg. The ducal castle (1682), the most prominent building in the town, contains libraries, a picture-gallery, collection of coins, &c. There is a fine 'English garden' here. The town has been in great part rebuilt since 1874, when a fire destroyed the old streets. It was an appendage of the see of Würzburg from 1008 to 1542, and in 1583 came into the hands of the Saxon ducal family. Pop. (1875) 9521; (1885) 11,448.

The Meiningen Court Company of Actors, under the able management of Duke George of Saxe-Meiningen and the actor Chronéck, gained the highest reputation in Germany (from about 1874) for the historical accuracy and beauty of their scenery, dress, and mounting, and the excellent discipline, balance, and harmony of their acting in its *ensemble*. They appeared at Drury Lane, London, in May and June 1881. The company was dissolved in 1890.

Meissen, a town in the kingdom of Saxony, is situated in a beautiful district on the left bank of the Elbe, 14 miles by rail NW. of Dresden. Its chief building is the cathedral (c. 1266-1479), one of the finest Gothic churches in Germany, surmounted by an exquisite spire (263 feet) of open work, and containing many fine brasses. The castle was built in 1471-83, and in 1710 was converted into the porcelain factory over which Böttger presided (see **POTTERY**). In 1863 the castle was restored, its walls being adorned with frescoes by modern painters, the porcelain factory having been removed in 1860 to other premises; 800 men are employed. Other manufactures are iron, machinery, jute, and cigars. Here is the celebrated school of St Afra, where Gellert and Lessing were educated. It was founded by Duke Maurice in 1543, and until 1879 occupied the former Afra monastery (built in 1205). Meissen was founded in 928 by Henry I. of Germany, as a stronghold against the Slavonians, and was long the capital of the margraviate and burgraviate of Meissen, which was subsequently merged in the duchy of Saxony. The town was burned down by the Swedes under Banér in 1637. Pop. (1875) 13,002; (1885) 15,474.

Meissonier, **JEAN LOUIS ERNEST**, figure-painter, was born at Lyons, 21st February 1813. When he was still a child his father established himself as a druggist in Paris; and the son,

having resolved upon art as a profession, studied under Jules Potier and Léon Cogniet. His drawings were praised by Johannot, and about 1833-34 he was employed by Curmer the publisher on designs for the *Royaumont Bible* and other works. He first made a distinct mark in 1838, by his illustrations to *Paul and Virginia* and the *Chaumière Indienne*; many other volumes were enriched by his pencil, and his career as a book-illustrator closes with his spirited designs to the *Contes Rémois* of the Comte de Chevalgny. Meanwhile, he had been steadily practising painting. In 1834 he began to contribute to the Salon with a water-colour and an oil-picture, the latter strongly suggestive of the work of the figure-painters of Holland, who powerfully influenced Meissonier during his whole career. Two years later he exhibited the first of his various groups of 'Chess-players,' and here his accurate precision of draughtsmanship and quietly dramatic truth of attitude and expression first became clearly visible. It was followed by a long series of elaborate and successful genre-pictures, in which, with the most careful and finished—if sometimes rather hard and unsympathetic—execution, and with the most perfect verisimilitude of costume and local colouring, the artist depicted the civil and military life of the 17th and 18th centuries, passing—in such works as the 'Napoleon I.,' a small single-figure picture which Mr Ruskin sold in 1882 for £6000; the 'Campagne de France, 1814' (1864); 'Solferino' (1866), now in the Luxembourg Gallery; 'Cuirassiers or 1805' (1871); and 'Friedland or 1807,' bought by M. Secrétan in 1878 for 400,000 francs—to subjects of genre or history taken from the 19th century. Among the most celebrated of his other military scenes may be named 'La Rixe' (1854), purchased by Queen Victoria; and not less fascinating are his simpler groups of students, artists, collectors, &c., such as 'La Lecture chez Diderot' (1859), 'Les Amateurs de Peinture' (1860), and 'La Lecture du Manuscrit' (1867). He also executed some striking portraits, including 'Dumas fils' (1877) and 'M. Victor Lefranc' (1883). Finally, we may refer to his design for the decoration of the Panthéon—'the apotheosis of France'—the cartoons of which were exhibited to the commission in 1889. Many of his pictures have been engraved and otherwise reproduced; and he himself etched some dozen plates, impressions from most of which are scarce.

He became a Commander of the Legion of Honour in 1867, Grand Cross 1889, and a member of the Institute in 1861; and he was an honorary member of the Royal Academy. He died January 31, 1891. An exhibition of 146 of his works was brought together at Paris in 1884. See *Clarette*, *Ernest Meissonier* (Paris, 1881); *Life and Work of Leighton, Alma Tadema, Meissonier*, &c. (1890).

Meistersänger. See **GERMANY**, Vol. V. p. 187.

Mekhong, the greatest river of the Siam peninsula, is usually identified with the Lan-tsan, which rises in the neighbourhood of Chiamdo in Tibet—its exact sources are not known. It pursues a generally southerly direction to the China Sea, which it enters by several mouths in Cochin-China. This country indeed is formed by its deltaic deposits. The river has a total length of 2800 miles; but is not navigated higher than 14° N. lat. owing to rapids and cliffs which beset its bed in the mountainous regions.

Meklong, a town of Siam, near where the Meklong River runs into the Gulf of Siam. Among its 10,000 inhabitants many are Chinese.

Mela, **POMPONIUS**, the first Latin writer who composed a strictly geographical work, was born at Tingentera in the south of Spain, and lived in

the time of the Emperor Claudius; nothing else is known concerning him. His work, an unsystematic compendium, is in three books, and is entitled *De Situ Orbis*. The text is greatly corrupted. The *editio princeps* appeared at Milan in 1471; the best modern edition is that by Parthey (Berlin, 1867).

Melaleuca. See CAJEPUT.

Melancholia. See INSANITY.

Melanchthon, PHILIP, Luther's fellow-labourer in the Reformation, was born, February 16, 1497, at Bretten, in the Palatinate of the Rhine, now in the grand-duchy of Baden. His name was originally Schwarzerd ('black earth'), of which Melanchthon is a Greek translation. He was educated at the university of Heidelberg, where he took the degree of Bachelor of Philosophy in 1512. In the same year he went to Tübingen, studied theology, took the degree of Doctor, and in 1514 gave lectures on the Aristotelian philosophy and the classics. About this time he published a Greek grammar. On his relative Reuchlin's recommendation he was appointed in 1518 professor of Greek in Wittenberg. Brought into contact with Luther in that town, he at once became his fellow-worker in the great religious revolution with which Luther's name is identified. Melanchthon brought to his aid an extent of learning that made him to be regarded as another Erasmus, and a gift of lucid exposition and purity of Latin style unrivalled among his contemporaries. The natural sweetness of his temper and the habitual moderation of his views also advantageously tempered Luther's vehemence. In 1521 he published his *Loci Communes Rerum Theologicarum*, the first great Protestant work on dogmatic theology. It passed through more than fifty editions in the course of the author's life. In 1530 he made a most important contribution to the cause of Protestantism, in the Augsburg Confession (q.v.). In 1541 he went to Worms, and soon after to Ratisbon, to conduct the cause of the Protestants in the conferences there. But the influence of the papal legate counteracted all his efforts for a peaceful accommodation, and his own party were much dissatisfied on account of the concessions which he made. After Luther's death, Melanchthon lost in some measure the confidence of some of the Protestants by those concessions to the Catholics which his anxiety for peace led him to make; whilst the zealous Lutherans were no less displeased because of his approximation to the doctrine of Calvin on the Lord's Supper. His consent, conditionally given, to the introduction of the Augsburg Interim (q.v.) in Saxony, in 1549, led to painful controversies, which filled the latter years of his life with disquietude. He died at Wittenberg, 19th April 1560. By his calm wisdom and the reputation of his genius, Melanchthon did much to save the Reformation from those excesses that would have made its progress impossible. In the performance of this task he incurred much opposition from Luther himself, and still more from the enthusiasts who came to the front after Luther's death; but the subsequent religious history of Germany is conclusive proof of the wisdom of his action. By his labours as a scholar and public teacher, Melanchthon ranks with the very highest names in the history of learning and education. Alike by his temper and intellectual interests, he is to be regarded as blending in the happiest proportion the humanist and the reformer. The most complete edition of his works (which comprise a Greek and Latin Grammar, editions of and commentaries on several classics and the Septuagint, biblical commentaries, doctrinal and ethical works, official documents, declarations, dissertations, responses, and a very extensive correspondence with friends

and the leading men of the age) is that by Bretschneider and Bindseil in their *Corpus Reformatorum* (28 vols. 1834-60). Melanchthon's Life has been written by his friend Camerarius (1566). See also Lives by Cox, Matthes (Altenb. 1841), Nitzsch, Schmidt (Elberf. 1861), Meurer (2d ed. Leip. 1869), Schaff (Lond. 1887), and Hartfelder (Berlin, 1889).

Melanesia (Gr. *melas*, 'black') is a name given to those Pacific islands near New Guinea which are inhabited by the Papuan race. See POLYNESIA.

Melaphyre. See BASALT.

Melbourn, in Derbyshire, 7 miles SE. of Derby by rail; pop. 3123. It is noted for its market-gardens, and has some manufactures. Melbourn Hall, formerly seat of Lord Melbourne, belongs to Earl Cowper.

Melbourne, the metropolis of the Australian colony of Victoria, and the most important city of Australasia, stands at the northern extremity of Port Phillip Bay, and is bisected by the river Yarra; it is in 37° 49' S. lat. and 144° 58' E. long. To facilitate navigation and enable large vessels to discharge their cargoes almost at the doors of the warehouses, a canal was cut from a point near the mouth of the river to the Melbourne quays and opened in 1888. Williamstown and Port Melbourne, built on the shores of the bay, give extensive pier accommodation, and are thriving ports. Melbourne is a chessboard city, built on strict mathematical lines, its streets intersecting at right angles, the principal thoroughfares being of considerably greater width (99 feet) than is necessary or desirable in such a warm climate.

Collins Street is architecturally imposing, being lined on either side by tall, massive, and ornate buildings, chiefly banks, offices, warehouses, and hotels. Bourke Street corresponds to the London Strand; but it is three times as wide and four times as long. Here most of the theatres, music-halls, and retail shops are situated. An extensive system of cable tramway locomotion was inaugurated in 1886.

Melbourne has a flourishing university, founded in 1853 largely through the instrumentality of Mr Childers, its first vice-chancellor. There are three affiliated colleges in its immediate vicinity—Trinity (Episcopalian), Queen's (Wesleyan), and Ormond (Presbyterian). The last—one of the finest educational structures in the southern hemisphere—was built at the expense of the Hon.

Francis Ormond, to whom Melbourne is indebted also for its working-men's college, which is doing noble work in technical education, and its endowed chair of music in the university. The Wilson Hall, the gift of Sir Samuel Wilson, M.P., is also a noteworthy adjunct of the university. The Exhibition building in the Carlton Gardens and the General Post-office are two of the most conspicuous and ornamental of Melbourne's public buildings. The Houses of Parliament, completed in 1891, have cost nearly a million of money. They form a magnificent pile of buildings, the western façade being particularly striking and effective. The Trades Hall, a quadrangular structure founded in 1857, stands on the northern boundary of the city proper. Melbourne possesses an excellent and well-appointed public library of about 200,000 vols., and associated with it on the same reserve are a national art gallery and a technological museum. The three institutions are governed by a body of trustees, and are supported by a large state endowment. The town-hall has an immense assembly-room, largely used for concerts and public meetings, and also an organ of fine tone and colossal size. Crowning the summit of the western hill of Melbourne are the new law-courts, forming an extensive square, and topped by a lofty and graceful dome. Close by is the Melbourne branch of the Royal Mint, established in 1872. Other notable public institutions are the Melbourne and Alfred hospitals, the Benevolent Asylum, the Immigrants' Home, the Orphan Asylums, the Custom-house, the Treasury, and the Public Offices, the last-named being a vast and labyrinthine pile in which most of the government departments are housed. St Patrick's Roman Catholic cathedral, close to the Houses of Parliament, is a towering Gothic structure and the most conspicuous ecclesiastical edifice in Melbourne. The Anglican cathedral of St Paul suffers in appearance by its depressed site and by the fact that it is hemmed in by clustering warehouses. The Scots Church is the architectural gem of Collins Street. Its soaring spire, of more than 200 feet, is peculiarly graceful and harmonious in design.

Melbourne supports three morning and two evening journals, besides a host of weeklies and monthlies. Railways have been pushed on with energy in Victoria (whose railway-system connects with those of South Australia, New South Wales, and Queensland), and, as Melbourne is the converging point of all the systems, the western end of the city, where the railway department is quartered and the central station has been built, is a scene of incessant activity. Melbourne has grown with remarkable rapidity. In 1841 its population was 11,000; in 1851, the year of the gold discoveries, it was less than 25,000; in 1861, 191,000; in 1871, with suburbs, 206,780; in 1881, 282,907 (of whom 65,800 were in 'the city'). According to the official estimates, it had in 1890 a population of 450,000, there having been of late years a large influx from the country districts and from the other colonies. This estimate includes all the suburbs within a radius of 10 miles from the General Post-office. Protection to native industry is the fiscal policy of the colony, and Melbourne has developed into a considerable centre of manufacturing enterprise. Foundries, flour-mills, boot and clothing factories, &c. are numerous in the suburbs. The Royal Park, the Carlton, Fitzroy, Botanical, and Flagstaff Gardens are the principal popular recreation reserves. The water-supply of Melbourne, which is abundant, comes from the Yan-Yean reservoir in the Plenty Valley, and had cost up till 1876 about 1½ million sterling. The sanitary condition of Melbourne is not so good as might have been expected from the general

mildness of its climate and the high average of prosperity of the inhabitants. Typhoid fever notably has been excessively prevalent, and of late years there has been increase rather than the steady diminution which has been the rule in the cities and towns of Europe and America. It is recognised that this is mainly due to defective drainage, and an unsatisfactory method of night soil disposal. An eminent London engineer reported in 1890 on the subject, suggesting a scheme for a complete system of underground drainage at a cost of over £5,000,000.

Port Phillip Bay, the maritime approach to Melbourne, is a spacious land-locked inlet of the South Pacific covering 800 sq. m., and mostly available for anchorage. The entrance, known as 'The Heads,' is very narrow, and strong fortifications were begun by the Victorian government in 1875. A well-equipped pilot station is maintained here.

Melbourne was first occupied by white men in 1835, and the infant settlement was originally known as Doutta-Galla, that being the name of the tribe of blacks who inhabited the neighbourhood. In 1837 it was christened after the reigning premier, Lord Melbourne, in 1842 it was incorporated, and in 1851 it was advanced to the dignity of a capital when the Port Phillip province was separated from New South Wales and erected into the autonomous colony of Victoria. Simultaneously with this latter event the Victorian goldfields were opened up, and the history of Melbourne ever since has been one of marvellous strides in material progress and prosperity. By way of celebrating the centenary of the colonisation of Australia, an International Exhibition was held in Melbourne during the later half of 1888. It cost the colony a quarter of a million. A great conflict between labour and capital took place in 1890, and a strike by the labour-unionists took place on a very extensive scale both in Victoria and New South Wales. The imports of Melbourne during 1888 were valued at £19,145,159; and the exports, in which wool and gold bulk most largely, at £12,521,980. See *Victoria and its Metropolis, Past and Present* (Melbourne, 2 vols. 1889).

Melbourne, WILLIAM LAMB, VISCOUNT, statesman, was second son of Penistone Lamb, first Viscount Melbourne, and was born in London, 15th March 1779. His education he received at Eton, at Trinity College, Cambridge, and at Glasgow. He entered the House of Commons for Leominster in 1805 as a Whig, a follower of Charles James Fox. But, having become a convert to Canning's views, he accepted in 1827 the chief-secretaryship of Ireland in his government, and continued to hold the post under Lord Goderich and the Duke of Wellington. In 1828 the death of his father transferred him to the Upper House. Returning to his allegiance to the Whigs, in 1830 he took the seals of the Home Office in the government of Earl Grey, and in July 1834 succeeded his chief as prime-minister, but only remained at the head of affairs until the following November. Peel, however, gave way to Melbourne again in 1835; and he continued in office when Victoria ascended the throne (1837). He succeeded by his uncommon tact in introducing her pleasantly to the various duties of a constitutional monarch. In 1841 he once more passed the seals of office to Sir Robert Peel, and thenceforward took little part in public affairs. He was ineffective as a speaker, but displayed aptitude for affairs and common sense in the ordering of them. His easy cheerful temper and cordial frankness of manner gained him many friends. Sydney Smith, in his second letter to Archdeacon Singleton, has described his character with an

exquisite mixture of sarcasm and compliment. Melbourne died November 24, 1848. He married (1805) a daughter of the Earl of Bessborough, who, under the title of Lady Caroline Lamb (1785-1828), attained some celebrity as a novel-writer, besides notoriety from her relations with Lord Byron. The charge brought against him by the husband in 1836 of seducing the famous Mrs Norton was thrown out by the jury without leaving the box.

See *Memoirs* by Torrens (2 vols. 1878); *Lord Melbourne's Papers*, edited by L. C. Sanders (1889); *The Greville Memoirs* (parts i. and ii. 1875-85); and *Life* by Dunckley (1890).

Melchites, the name given to a body of Christians in Syria, Palestine, and Egypt, who acknowledge the authority of the pope, and accept the doctrines of the Church of Rome, but use the liturgy and ceremonies of the Greek Church. They conduct divine service in the vernacular tongue, receive the Lord's Supper in both kinds, and follow the Eastern Calendar. Their priests need not be celibate, but must not marry after ordination. They number close upon 80,000, and are ruled by a patriarch at Damascus, and twelve bishops. The name Melchites (lit. Royalists, from Syriac *melcha*, 'a king') dates from the 5th century, and was given to those members of the orthodox Eastern Church who supported the emperors against the Monophysites (q.v.) and Nestorians (q.v.).

Melchizedek ('king of righteousness'), in the story of Genesis, king of Salem and priest of 'Supreme El.' He met Abram on his return from the victorious expedition against Chedorlaomer, gave him his blessing, and received tithes from him. The ante-legal king-priest stands in Psalm cx. as a figure typical of the vicegerent of Jehovah, and in Hebrews, vii. 3, of the kingly priesthood of Jesus. The chapter in Genesis containing his story stands alone in character in the Pentateuch, and according to Wellhausen is one of its latest additions. Some count it the earliest portion of ancient secular history, as Ewald, who thinks it may be based on old Canaanitish records; others, as Nöldeke, explain it as utterly unhistorical.

Melcombe Regis. See WEYMOUTH.

Melegnano, formerly MARIGNANO, a town of Northern Italy, by rail 12 miles S.E. of Milan. Pop. 5438. Here Francis I. of France defeated the Swiss in 1515; and in June 1859 a French force under Baraguay d'Hilliers routed the Austrian rearguard under Benedek.

Melfi, an ancient episcopal town of Southern Italy, 30 miles N. of Potenza. It is situated on a bed of lava to the north-east of the volcanic Monte Vulture. The once magnificent cathedral, erected in 1155, was almost entirely destroyed by an earthquake in 1851. Melfi was a great stronghold of the Normans and capital of Apulia. Pop. 11,765.

Melford, LONG, a picturesque village of Suffolk, 13 miles S. of Bury St Edmunds by rail. It has a very fine Perpendicular church 260 feet long. Pop. of parish, 3293. See two works by Sir W. Parker and E. L. Conder (1888).

Melilot (*Melilotus*), a genus of clover-like plants of the natural order Leguminosæ. The Common Melilot, a yellow-flowered annual, pretty common in hedgerows and the borders of fields in Britain, has when in flower the peculiar sweet odour of *Tonka Bean*. The odour increases in drying. The flowers and seeds are the chief ingredients in flavouring Gruyère cheese, being bruised and mixed with the curd before it is pressed.—The Blue Melilot (*M. caerulea*), a native of the north of Africa, with short racemes of blue flowers, is cultivated in many parts of Europe, particularly

in Switzerland and the Tyrol, and has the peculiar melilot odour in a high degree. The name Bokhara Clover has been given to one or more species.

Melinite, an explosive obtained from Picric Acid (q.v.), itself a powerful explosive, by the admixture of some other substance. The fabulous powers attributed to melinite when introduced for artillery purposes (for shells) by General Boulanger in 1886 have not been realised; the substance has been found not stable or reliable, and has caused some bad accidents.

Meliphagidæ. See HONEY-EATER.

Melissic Acid. See WAX.

Mellifont Abbey, a ruin standing 4 miles N.W. of Drogheda, was the first Cistercian foundation in Ireland, founded by St Malachy (q.v.) in 1142. In 1539, when it surrendered to Henry VIII.'s commissioners, it had 140 monks. Its remains were excavated during 1884-85. See *Mellifont Abbey*, by K. F. B. (1886).

Melo, a town of Cerro Largo in Uruguay, on the Tacuari, here crossed by a stone bridge, 'built in 1865 by a Frenchman who was murdered for collecting toll' (Mulhall). Pop. 5000.

Melodeon, an instrument of the type of the Harmonium (q.v.), superseded by the American organ. In 1859 over 20,000 melodeons were made in the United States. The name is also applied to an improved variety of the Accordion (q.v.).

Melodrama (Gr. *melos*, 'a song,' and *drama*) strictly denotes a half-musical drama, or that kind of dramatic performance in which declamation is interrupted from time to time by instrumental music. The name, however, which was first applied to the *opera* by its inventor, Ottavio Rinuccini, has come to designate a romantic play, depending mainly on sensational incidents, thrilling situations, and an effective dénouement. Great sums are spent in the staging of such pieces, and the costumes, scenery, and mechanical effects are often very striking. The expression 'transpontine drama' refers to a time when such plays were identified with houses on the Surrey side of the Thames; nowadays the home of melodrama in London is to be found in such theatres as Drury Lane and the Adelphi.

Melon (*Cucumis melo*), a plant of the same genus with the Cucumber (q.v.), much cultivated for its fruit, which is sweet, with a delicious though peculiar flavour and smell. The melon is an annual, with trailing or climbing stems, lateral tendrils, rounded angular leaves, small, yellow, monœcious flowers, and large round or somewhat ovate fruit. It is supposed to be a native of the subtropical parts of Asia, although it has never been discovered in a wild state. Its English name was originally *Musk Melon*. The varieties in cultivation are very numerous, some of them distinguished by a thick and warty rind, some by a rind cracked in a net-like manner, some by ribs and furrows, some by a perfectly smooth and thin rind; they differ also in the colour of the *flesh* of the fruit, which is green, red, yellow, &c.; and in the size of the fruit, which varies from 3 or 4 inches to a foot or more in diameter. The melon is eaten either by itself or with sugar, and sometimes with pepper or ginger. Its cultivation in hotbeds and in specially constructed hothouses is extensively carried on in all parts of Britain, and very great care is bestowed on it. A loamy soil is best suited to it. The *setting* of the fruit by dusting the female flower with the pollen of the male flower is constantly practised by gardeners. Warmth and bright sunshine are requisite to the production of fruit of good quality.—The Water Melon or Citrul (*C. citrullus*), although rarely

cultivated in Britain, is highly esteemed and much cultivated in almost all warm countries. It is a native of the warm parts of the Old World. It has deeply lobed and gashed leaves, and a large round fruit with smooth dark-green spotted rind, and pink or white flesh, less sweet than the melon, but much more juicy or watery, and therefore much prized in many warm countries. In America it is only the water melon that is ever called simply melon; for the other the old English name is retained where 'cantaloupe' is not used. In South Carolina the water melon has reached 45 lb.—South Africa has another species of Water Melon (*C. Caffer*), very valuable to the inhabitants.—The Chate (*C. Chate*) is a native of Egypt and Arabia.—The Kaukoor (*C. utilisissimus*) is a native of India, and much cultivated in some parts of that country; it has oval fruit, smooth, variegated with different shades of yellow, and about 6 inches long, with much the flavour of the melon. The fruit will keep for several months, and is much used both raw and in curries. The half-grown fruit is pickled. The seeds contain much farina and oil, and are ground into meal; the oil is also expressed, and used both for food and in lamps. The seeds of others of this genus may be used in the same way; and they are said to be useful as a diuretic medicine.

Melos (Ital. *Milo*), a Greek island, the most south-westerly of the Cyclades, 13 miles long by 8 broad, with 4200 inhabitants. The island is volcanic, and produces sulphur, salt, pumice-stone, stucco, millstones, and a little oil and wine. Amongst the ruins of the ancient city of Melos, and near its theatre, was found the priceless antique, the Venus de Milo, now one of the chief treasures of the Louvre. See VENUS.

Melpomene ('the singing one'), one of the nine Muses, the representative of Tragedy.

Melrose, a pleasant little town of Roxburghshire, on the south bank of the Tweed, and at the north base of the triple Eildons (q.v.), 37 miles SSE. of Edinburgh by rail. At Old Melrose, 2½ miles farther east, was founded about 635 the Columban monastery, of which St Cuthbert (q.v.) became a monk. It was burned by Kenneth MacAlpine in 839, and had been quite deserted for upwards of fifty years, when in 1136 the great Cistercian abbey of Melrose itself was founded by David I. Twice burned by the English, this was slowly rebuilt on a scale of increased magnificence between 1322 and 1505, only forty years after which date two fresh English invasions commenced the destruction that was speedily completed by the Reformers. The abbey was in the Second Pointed style, with approaches to Third Pointed, and was beyond doubt the most beautiful structure of which Scotland could boast in the middle ages. What now remains is the ruined conventual church, 215 feet long by 116 across the transepts, with some fragments of the cloister, which seems to have been a square of 150 feet. The carvings and traceries, hewn in a stone of singular excellence, are scarcely surpassed by any in England. Melrose shines in Scott's pages with a splendour its meagre history fails to sustain. The second abbot, St Waltheof, the royal founder's stepson; Alexander II. and Johanna, his queen; the heart of Robert Bruce; the good Sir James, the Knight of Liddesdale, the hero of Otterburn, and others of the Douglas line;

the 'wondrous Michael Scott;' and Sir David Brewster—all these are buried here; else, the annals of Melrose have little to record. A burgh of barony since 1609, the town possesses a market-

Melrose Abbey.

cross (1642), a suspension foot-bridge over the Tweed (1826), a hydropathic (1871), and half a dozen hotels, it being a great tourist centre, as well for its abbey as from the vicinity of Abbotsford, Dryburgh, &c. Pop. (1841) 893; (1881) 1550.

See the *Chronica de Melros, 731-1275*, ed. by Joseph Stevenson (Bannatyne Club, 1835); the *Liber S. Marie de Melros*, ed. by Cosmo Innes (Bannatyne Club, 1837); *Scott's Abbot and Lay of the Last Minstrel*; and works by Wade (1861) and Pinches (1879).

Melton-Mowbray, a town of Leicestershire, in the centre of a great hunting district, is seated on the river Eye near its junction with the Wreak, 15 miles NE. of Leicester, and 104 NNW. of London. It has a fine cruciform church, mainly Early English, and is famous for its manufactures of pork pies and Stilton cheese, chiefly for retail in the London, Manchester, and Leeds markets. Near the town in February 1644 a severe engagement took place between parties of royalist

and parliamentary troops, resulting in the defeat of the latter; and amongst its natives have been Archbishop de Melton, who lies buried in the church, and 'Orator' Henley. Pop. (1801) 1766; (1881) 5820; (1891) 6392.

Melun, the capital of the French department of Seine-et-Marne, on the Seine, near the Forest of Fontainebleau, 28 miles SE. of Paris. It has two interesting churches, and manufactures of leather, pottery, &c. Melun, the *Melodunum* of Cæsar, fell into the hands of the English after a six months' siege, in 1420, and was held by them for ten years. Pop. (1872) 11,098; (1886) 12,527.

Melusine, or MELUSINA, the name of a fairy lady who figures prominently in the celebrated medieval French romance so called, the *motif* of which is similar to that of the legend of Eros (Cupid) and Psyche, is of far-reaching antiquity, and has many parallels and analogues in the legends and popular fictions of most countries, Asiatic as well as European. Briefly stated, Melusine consents to marry a knight called Raymondin, or Raymond, on the condition that he should never see her on a certain day every week, to which he binds himself by solemn oaths. She bears him eight sons, the warlike exploits of seven of whom occupy the greater portion of this entertaining romance. At length Raymond is induced by his brother to break his promise, and on the usual day of Melusine's seclusion he discovers her in a bath, the lower part of her body being like a great serpent. Soon after this Raymond, enraged at the cruelty of one of his sons, upbraids the innocent Melusine as 'a false serpent,' whose offspring could never come to any permanent good. Melusine forgives him, but her doom cannot be averted, and, after a touching scene, she takes her flight through the window in the likeness of a monstrous dragon; and in this form she afterwards appeared hovering near the castle of Lusignan—erected by her own fairy power for her beloved lord Raymond—when ever one of her descendants was about to die, thus acting the part of the Irish *Banshee*.

In the myth of Cupid and Psyche the mortal maiden is not to behold her celestial spouse; but, incited by her envious sisters, she takes a lighted lamp to look upon him one night as he lies asleep, and, in her agitation at beholding his marvellous beauty, a drop of oil from the lamp falls on him, whereupon he and the splendid palace vanish, and Psyche finds herself on a desolate heath. She is reunited to him, however, after performing a number of seemingly impossible tasks by order of her vindictive mother-in-law, Venus. This myth has deeply penetrated European folklore. In a Sicilian tale a girl is married to a green bird, who changes to a handsome young man on bathing in a pan of milk. She is not to ask his name. In a Norse tale a prince is bewitched by his step-mother, so that he is a white bear by day and a man by night; in a Danish tale, a wolf; in a Chilian tale (of European origin doubtless), a hideous black man; and in all three, and many other analogues and variants, the bride loses her enchanted spouse for a time in the same manner as in the Græco-Roman myth, which several learned scholars have endeavoured to interpret as typifying the natural phenomenon of the Dawn.

One of the oldest legends of this class is the Hindu myth of Urvashi and Pururavas, the condition which the celestial nymph imposes on her husband being that she is not to see him naked—which Mr Andrew Lang (*Custom and Myth*) considers, with good reason, as signifying 'a custom of women.' Pressine, the mother of Melusine, imposes on her husband, the king of Albany, the condition that he should never see her in child-

bed. He forgets his promise and loses his fairy spouse. According to a Spanish legend of the princely family of Haro, a lord of Biscay, while chasing the wild boar, meets with a fairy, who consents to wed him if he promise never to pronounce a holy name in her presence.—In another Hindu legend, Bhelki, the frog, is a maiden who consents to marry a king on the condition that he never shows her a drop of water: being faint one day, she asked her husband for water, which he gave her, forgetting his promise, and she disappeared.

A very striking parallel to the legend of Melusine is found in a tale current among the Esthonians, in which a wandering youth falls in love with a maiden sitting on a rock by the shore, who takes him (like Undine with the knight in Fouqué's charming tale) down into a submarine palace, where she marries him, but imposes on him one condition, that he must not seek to see her on a Thursday. His curiosity at length overpowers his prudence, and he discovers her in a great tank of water, with the lower part of her body like that of a fish, the result being that he finds himself near his native village, where nobody knows him, for he is now an old man, and all his relatives are dead. Undine is also a daughter of the stream, and she makes her husband promise that he will never speak angrily to her when on or near any water. So, too, in the Persian tale of King Ruzvanshah and the Turkish tale of the king of Yemen, both of whom espouse daughters of the genii; the condition is that the husband must not question or complain of anything his wife should do, however strange it might appear. Such conditions occur so frequently in the fairy tales of almost every people (see also LOHENGRIK); and it may be added that tales of Forbidden Chambers, familiar to readers of the *Arabian Nights*, of which many examples are current in Europe, are closely allied to legends of the Urvashi and Pururavas, Eros and Psyche, and Melusina cycle.

See Max-Müller's *Chips from a German Workshop*, vol. ii.; Baring-Gould's *Curious Myths of the Middle Ages*; Cox's *Mythology of the Aryan Nations* (1870); Grimm's *Teutonic Mythology* (trans. Stallybrass); Clouston's *Popular Tales and Fictions* (1887); Clouston's *Group of Eastern Romances and Stories* (1889); and the old English version of the romance of Melusine, from the French of John of Arras (1387), printed for the Early English Text Society (1891), from a unique MS. of the 15th century, with full appendix notes by the present writer on the Cupid and Psyche and Melusina cycle of legends.

Melville, the name of an island, a sound, and a peninsula in the polar regions of North America. The island is crossed by 75° N. lat. and 110° W. long., and is separated on the west by Fitzwilliam Strait from Prince Patrick Island. Greatest length, 200 miles; greatest breadth, 130 miles. In 1819 Parry, who gave the island its name, passed the winter here with his crews. The sound, about 250 miles long by 200 broad, extends south-east of the island, and communicates with the Arctic Ocean on the west by Banks Strait, and with Baffin Bay on the east by Barrow Strait and Lancaster Sound. The peninsula projects from the continent at its north-eastern corner, and has on the N. the Fury and Hecla Strait, and on the E. Fox Channel. It is 250 miles in length by about 100 in average breadth.—Another Melville Island lies across the entrance to Van Diemen Gulf off the shore of the northern territory of South Australia. Area, 143 sq. m. It is hilly and covered with vegetation. The earliest British settlement on this coast was made here in 1824.

Melville, ANDREW, a champion of Scottish Presbyterianism, was born 1st August 1545, at

Baldovy, near Montrose. He was educated at the grammar-school of Montrose, whence he removed in his fourteenth year to the university of St Andrews. Here he remained four years, and left it with the reputation of being 'the best philosopher, poet, and Grecian of any young master in the land.' He then proceeded to Paris, where he continued his studies for two years. His reputation must have been already considerable, for in his twenty-first year he was chosen regent in the college of St Marceon, Poitiers. Some time afterwards he proceeded to Geneva, where through the influence of Beza, with whose opinions in religion and politics he already sympathised, he was appointed to the chair of Humanity in the Academy. On his return to Scotland (1574) he was appointed Principal of the college of Glasgow, where he did the highest service to the cause of learning throughout the country. He had a very important share in drawing up that charter of the Presbyterian polity, the Second Book of Discipline (see DISCIPLINE). In 1580 Melville was chosen Principal of St Mary's College, St Andrews. Here, 'besides giving lectures on theology, he taught the Hebrew, Chaldee, Syriac, and Rabbinical languages.' In 1582 he preached the opening sermon before the General Assembly, and boldly 'inveighed against the bloody knife of absolute authority, whereby men intended to pull the crown off Christ's head and to wring the sceptre out of his hand.' Two years later Melville was summoned before the Privy-council on account of a sermon preached at St Andrews; and to escape imprisonment he removed to London. Here he remained till the downfall of Arran in the following year, and then after an absence of twenty months returned and resumed his office at St Andrews. He was repeatedly elected moderator of the General Assembly and rector of the university. At Cupar in 1596 Melville headed a deputation to 'remonstrate' with the king; and when James reminded the zealous remonstrant that he was his vassal, 'Sirrah!' retorted Melville, 'ye are God's silly vassal; there are two kings and two kingdoms in Scotland: there is King James, the head of this commonwealth, and there is Christ Jesus, the King of the church, whose subject James the Sixth is, and of whose kingdom he is not a king, nor a lord, nor a head, but a member.' In 1605 Melville was called to England to attend the famous conference at Hampton Court. Having ridiculed the service in the Chapel Royal in a Latin epigram, he was summoned before the English Privy-council, when he broke out into a torrent of invective against the Archbishop of Canterbury for encouraging popery and superstition, profaning the Sabbath, &c. The king, violating every principle of justice, immediately sent him to the Tower, where he remained for more than four years. In 1611 he was released on the solicitation of the Duke of Bouillon, who wanted his services as a professor in his university at Sedan in France. Melville, now in his sixty-sixth year, would fain have returned to Scotland, but James would not listen to his request. Melville died about 1622, but neither the date of his death nor the events of his last years are ascertained. See *McCrie's Life of Melville* (2 vols. 1819).

JAMES MELVILLE, nephew of Andrew Melville, was born near Montrose in 1556. After receiving the best education that Scotland could then offer, he became regent or tutor in the college of Glasgow, and afterwards professor of Oriental Languages in the university of St Andrews. In 1586 he settled as minister in Kilrenny, Fife, taking an active though not a commanding part in the affairs of the church at large. He is mainly remembered, however, for his so-called *Diary*, extending from 1556 to 1601. Ejected in 1606, he died in 1614 at Berwick-on-Tweed. Melville sees all the persons

and events of his day from his own point of view as a Presbyterian minister. Nevertheless his record is of real interest and importance for students of the period which it covers. There are editions in the Bannatyne Club (1829) and Wodrow Society (1842).

Melville, HERMAN, an American author, was born in New York city, August 1, 1819. He became a sailor, but in 1842 he deserted from a whaling-ship, owing to the captain's harsh treatment, at the Marquesas Islands. There he was kept four months as the prisoner of a savage tribe in the Typee Valley, whence he was rescued by an Australian whaler. Returning to the United States in 1846, he published *Typee*, a spirited account of his residence in the Marquesas, in 1847 *Omoo*, a continuation of his adventures in Oceania, and a number of tales and three volumes of poetry. Died in New York 28th September 1891.

Melville, SIR JAMES, of Halhill, born in 1535, was sent as page of honour to the young Queen Mary in France, and subsequently undertook numerous missions to the court of England and of the Elector Palatine. He died 1st November 1607, leaving interesting Memoirs, of which the standard edition is that of the Bannatyne Club (1827).

Melville, WHYTE. See WHYTE-MELVILLE.

Membrane, in Anatomy. This term is applied to designate those textures of the animal body which are arranged in the form of laminae, and cover organs, or line the interior of cavities, or take part in the formation of the walls of canals or tubes. The structure and special uses of some of the most important of the animal membranes are noticed in separate articles, such as Mucous Membrane (see DIGESTION), Serous Membrane (q.v.), &c.; and the membranes in which the fœtus is enclosed are described in the article Placenta.

Memel, a Prussian seaport, defended by a citadel and two forts on the sea side, lies at the northern extremity of the Kurisches Haff, at its opening into the Baltic, 70 miles NNE. of Danzig. It has a large harbour, and exports from Lithuania and Russia timber, flax and linseed, coal, manure, grain, and herrings to the annual value of £900,000 to £1,000,000, timber constituting half the value; Great Britain takes one-third of the total. The imports, which generally exceed a million sterling, include the exports in transit, and textiles, colonial produce, and wine and spirits for local use. The town possesses manufactories of brandy, soap and chemicals, saw-mills, iron-foundries, breweries, and shipbuilding-yards. There is a good school of navigation. Pop. (1875) 19,796; (1885) 18,748. Memel was founded in 1252 by the Livonian order, who gave it to the Teutonic Knights, by whom it was fortified in 1404. It suffered severely in the Lithuanian wars (13th to 15th centuries). Here in 1807 Frederick-William III. of Prussia took refuge, and a treaty with England was signed. Having been almost wholly destroyed by fire in 1854, it was rebuilt in modern style. For the river Memel, see NIEMEN.

Memling, or more correctly MEMLINC, HANS, Flemish painter, was born at Mainz in the first half of the 15th century, of Dutch parents, and died at Bruges, where most of his life was spent, on 11th August 1494. His painting gained him a wide reputation, extending even to England and Italy. His principal works are sacred subjects, such as 'The Last Judgment' (at Danzig), 'Seven Sorrows and Seven Joys of the Virgin', 'Marriage of St Catharine', 'Adoration,' several Madonnas, and the fourteen small paintings that adorn the shrine containing St Ursula's relics at Cologne; and portraits, as of Sir John Donne, of Burgo-

master Moreel, and of Moreel's daughter. See *Lives* by Weale (in Dutch, 1871) and Michiels (in French, 1883); also *Art Journal* (1885, p. 318).

Memmingen, an old town of Bavaria, 33 miles SSE. of Ulm, played a prominent part in the religious wars of the 16th century. Here Moreau defeated the Austrians under Kray, 9th and 10th May 1800. Linen, cloth, &c. are manufactured. Pop. 8688.

Memnon, a hero of Greek mythology, son of Tithonus and Eös (the Dawn), who led to Troy a host of Ethiopians to aid his step-uncle Priam after the death of Hector, slew Antilochus, Nestor's son, in single combat, and was himself slain by Achilles. Various legends are told of his supposed rule at Susa, where he was said to have built the acropolis, and of his vassalage to the Assyrian Teutamus. His corpse was removed from the battlefield by Eös, whose early tears for her son are by mortals called dewdrops, and his followers the Memnonides were turned into birds. Memnon is chiefly a post-Homeric hero, and attained his greatest celebrity in very late times, when the Greeks discovered the two famous colossal statues of Amenoph III. standing in front of his now vanished temple on the left bank of the Nile at Thebes, and regardless of history dubbed the eastern one Memnon. It is an imposing throned figure, originally about 60 feet high, carved in breccia, but broken in ancient times and repaired with sandstone blocks. Its special peculiarity, which procured it the name of the 'Vocal Memnon', and the honour of forming one of the seven wonders of the world, was the property of emitting a metallic sound, like the snapping of a chord, especially about sunrise, whence the imaginative Greeks concluded that it was the voice of Memnon hailing his newly-risen mother the Dawn. Considerable difference of opinion has prevailed as to the real cause of this phenomenon, which has been variously ascribed to the artifice of the priests, who struck the sonorous stone of which the statue is composed, to the passage of light draughts of air through the cracks, and to the sudden expansion of aqueous particles under the influence of the sun's rays. This remarkable quality of the statue is first mentioned by Strabo, who visited it in company of Ailius Gallus about 18 B.C.; and upwards of a hundred inscriptions of Greek and Roman visitors incised upon its legs record the visits of ancient travellers to hearken to Memnon when he

Softly sings beneath the Libyan hills,
Where spreading Nile parts hundred-gated Thebes,

from the ninth year of Nero, 63 A.D., to the reign of the Emperor Severus, when it became silent. Amongst visitors whose names are recorded are the Emperor Hadrian and his wife Sabina. Septimius Severus also visited the statue, and is believed to have restored it in its present shape; for Juvenal mentions it as broken in half (*dimidio magica resonant ubi Memnone chordæ*), and no notice of it occurs under the Pharaohs or Ptolemies (see *Edinburgh Review*, July 1886).—The name of Memnoneum was given to the sepulchral quarter of Thebes, and there were Memnonea at Abydos.—Besides the mythical Memnon two historical personages of this name are known—one a Rhodian commander of the mercenaries of Artabazus in the war against Artaxerxes-Ochus, who subsequently fled to Macedon, and afterwards entering the Persian service defended Persia against Alexander (336 B.C.), and finally died at the siege of Mitylene (333 B.C.): the other a Greek historian, who wrote a history of Heracleia Pontica in 16 books, which have been epitomised by Photius.

Memory. See MNEMONICS.

Memory, DISEASES OF. Memory, or the power of reproducing mental or sensory impressions, is impaired by age, wounds, or injuries to the head or nervous system, fevers, intemperance, and various physical conditions. It is affected in most kinds of mental derangement, but is in a most signal manner obliterated or enfeebled in *Dementia*. There are, however, examples of memory surviving all other faculties, and preserving a clear and extensive notion of long and complicated series of events amid general darkness and ruin of mind. Incoherence owes some of its features to defective or irregular memory. Cases of so marvellous an exaltation of this faculty as where a whole parliamentary debate could be recalled, or a whole play of Shakespeare's recited by a man at one time, which would be ordinarily impossible for him, are common in the beginning of attacks of mania, and always should suggest disease. There are, however, special affections of the faculty. It may be suspended while the intelligence remains intact. Periods of personal or general history may elude the grasp, and even that continuity of impressions which goes far to constitute the feeling of personal identity is broken up, and a duality or multiplicity of experiences may appear to be conjoined. The converse of this may happen, and impressions that had completely faded away may, under excitement or cerebral disease, return. There are, besides, states in which this power is partially affected, as in the instances where the numbers 5 and 7 were lost, and where a highly-educated man could not retain any conception of the letter F; secondly, where it is perverted, recalling images inappropriately and in an erroneous sequence of order or time, and different from what are desired; and thirdly, where, while the written or printed signs of ideas can be used, the oral or articulate signs are forgotten. Such examples of diseased memory are now classified as *amnesia*, simple loss of memory; *amnesic aphasia*, loss of memory of spoken words (see APHASIA); and *amnesic agraphia*, loss of memory of written words. Most of these special deviations from health depend upon morbid changes in a very limited portion—'Broca's convolution'—of the left side of the brain. The discovery of this fact by Broca was the first of the brilliant discoveries as to the localisation of function in the brain cortex. See Feuchtersleben, *Medical Psychology*; and Ribot, *Les Maladies de la Mémoire* (1881).

Memphis, a celebrated Egyptian city, situated at the apex of the Delta, or Lower Egypt, the ancient capital of the country, called by the Egyptians *Men nefer*, or 'the Good Station,' by the Hebrews *Moph*, and by the Arabs *Memf*. It was founded by Menes, the first monarch of the 1st dynasty, who, according to Herodotus, changed the bed of the Nile, and made an embankment 100 stadia above Memphis to protect the new city against inundations, the remains of which still exist about 14 miles above Mitrabenny, the centre of old Memphis, and the site of the temple of Ptah. Menes fortified the city, and laid the foundations of the temple. The site was well chosen; protected alike by the Libyan and Arabian chains of mountains against the river and the incursions of the sand, defending the approach of the country from the incursions of Asiatic nomads, and communicating with the Red Sea and the Mediterranean. The city, which at one time had a circumference of 150 stadia, was composed of two portions—one built of crude bricks, the other, on which was the citadel, of calcareous stone. The palace, built by Menes, was enlarged by his son Athothis, and was always inhabited either by a monarch or by his viceroy. After the 6th dynasty the city declined in importance, and was apparently held by

the Hyksos after the 13th and before the 18th (1500 B.C.). At this period Memphis was ruled by a viceroy, a prince of the blood, and still remained a religious capital. It rose again to great importance under the Saïte monarchs, about 600 B.C., who restored it; and it was conquered by Sennacherib. Its temples were magnificent, and comprised the Iseum, a large temple of Isis, completed by Amasis II. just prior to Cambyses (525 B.C.); a temple dedicated to Proteus, in the foreign quarter; the temple of the Apis, having a peristyle and court ornamented with figures, opposite the south propylæum of the temple of Ptah, where the sacred bull resided; the Serapeum, or temple of Serapis, discovered by M. Mariette; the Nilometer; a temple of Ra; and the shrine of the Cabiri. Here were the statues of Rameses II., one of which is known as 'the fallen colossus,' at Mitrahenny. Still more remarkable was the great necropolis of the city, in the centre of which towered the pyramids (see PYRAMIDS). During the attempts of the native rulers to throw off the Persian rule, Memphis was an important strategic point. Ochus inflicted severe injury on this town, having plundered the temples and thrown down the walls after he had driven out Nectanebes. Alexander the Great here worshipped the Apis, and his corpse was brought to this city by Ptolemy before it was finally transferred to Alexandria. The first Ptolemies were crowned in the Serapeum. Ptolemy VIII. destroyed the city, and it fell with the rest of Egypt under the Roman rule, and afterwards was conquered by 'Amr ibn el-Asi (640 A.D.). Its ruins, which served as quarries for later buildings, were large and important in the 13th century, when they were seen by Abd-ul-Latif; but little is now to be seen beyond deeply-buried walls. See works cited at EGYPT.

Memphis, a city and port of entry of Tennessee, stands on a high bluff on the east bank of the Mississippi River, 826 miles above New Orleans, and 230 miles by rail WSW. of Nashville. The river to this point is navigable for the largest sea-going vessels, and eight lines of railway terminate here; the trade of Memphis is accordingly very large. It is a handsome town, with wide, regular streets, and great warehouses bordering the esplanade that extends along the bluff. The public buildings include a custom-house, cotton exchange, a large hospital, a Roman Catholic college, and numerous churches. Memphis is one of the first cotton marts in the United States, and has numerous manufactories, including foundries, machine-shops, oil, lumber, and flour mills, steam-gins, &c. The city was visited by fearful epidemics of yellow fever in 1878 and 1879, since when its drainage and sewerage have been thoroughly reconstructed. Pop. (1850) 8841; (1870) 40,226; (1890) 33,592; (1890) 64,495. See *Harper's Magazine* (September 1888).

Menado. See CELEBES.

Ménage, GILES, a French writer, born at Angers in 1613, gave up the bar for the church, but chiefly spent his time in literary pursuits. He founded, in opposition to the Academy, a salon, the Mercuriales, which gained him a European reputation, and the ridicule of Molière as Vadius in *Femmes Savantes*. His *Dictionnaire Étymologique de la Langue Française* (1650; best ed. by Jault, 2 vols. 1750), and his *Origini della Lingua Italiana* (1669), are erudite works, but contain many fanciful etymologies. He died in 1692. See *Life* by Baret (Paris, 1859).

Menai Strait, a channel between Carnarvonshire and the island of Anglesey, running east-north-east from its southern extremity to Bangor, a distance of 14 miles, where it widens out into Beaumaris Bay. Its width varies from about 200

yards to 2 miles, whilst the scenery on both sides is very picturesque. The navigation is hazardous, but for the sake of expedition vessels under 100 tons, and occasionally some of larger size, pass through the strait. At its entrance the tides sometimes rise to a height of 30 feet; ordinary neap-tides, however, do not rise more than from 12 to 15½ feet. Communication between the mainland and Anglesey was formerly solely maintained by ferry-boats at different points, but since 1825 access has been afforded by a suspension bridge, and since 1850 by the Britannia Bridge. See BRIDGE.

Menam. See SIAM.

Menander, the most famous Greek poet of the New Comedy, was born at Athens in 342 B.C., and was drowned at the Piræus in 291. He was the friend, if not the pupil, of Theophrastus, himself a disciple of Plato and Aristotle; and he was the intimate of Epicurus, and the favourite of Demetrius Phalereus and Ptolemy the son of Lagus. His comedies seem to have been more successful with cultured than with popular audiences, for we are told that only eight out of a hundred comedies gained the prize. Unhappily we possess but fragments of his work, but we may safely take our estimate of the 'mundus Menander' from his close copyist and imitator, Terence, and from the words of such writers as Ovid, Propertius, and Pliny. The Attic New Comedy was essentially domestic rather than political in character, and its chief figures are conveniently summed up in the lines of Ovid:

Dum fallax servus, durus pater, improba lena
Vivet, dum meretrix blanda, Menandros erit.

His most famous comedy seems to have been the *Thais*, and it is interesting that of the five lines preserved one is quoted by St Paul (1 Cor. xv. 33). The fragments will be found in Meineke's *Fragmenta Comicorum Græcorum*, and Kock's *Comicorum Atticorum Fragmenta*. See works on him by Guizot (1855) and Horkel (1857).

Menchikov. See MENSCHIKOFF.

Mencius, the Latin form of MENG-TSE, the name of a Chinese sage, a contemporary of Plato and Aristotle, who was born in the province of Shan-tung in 372 B.C. He was brought up by his mother—the pattern of all mothers ever since in the eyes of the Chinese—and founded a school on the model of that of his great predecessor Confucius, for whom Mencius entertained a feeling of reverent admiration. When forty years of age he led out his disciples and travelled from one princely court to another during more than twenty years, seeking a ruler who would put into practice his system of social and political order. But, finding none, he again withdrew into retirement, and died in 289 B.C. After his death his disciples collected his conversations and exhortations, and published them as the *Book of Meng-tse*. The aim of Mencius' teaching was essentially practical: how men, especially the rulers of men, shall best regulate their conduct, both public and private. The philosophic root of his system is belief in the ethical goodness of man's nature, which quality he takes to be the essential characteristic of the humanity of men. From this root grow the cardinal virtues of benevolence, righteousness, moral wisdom, and propriety of conduct. It should be the aim of the individual to perfect himself by practising these virtues in all the relations of his social and political life. The flowering of this goodly plant which Mencius planted for the ordering of the lives of men, both individual and collective, assumed the form of a liberal and enlightened system of political economy. Amongst other things he advocated freedom of

trade, the deposition of unworthy rulers, division of labour, inspection of work by the government, encouragement of markets, maintenance of good roads and bridges, &c., condemnation of war, care for the poor and neglected, but above all the promotion of education—the summary of the whole being that the welfare of the people should be the chief consideration of the state. There is also an aristocratic element in his teaching. The highest types of individual character are exhibited by the scholar, the great man, the superior man or sage, and the holy or ideal man; their personal example is the best educator the people can have. The fruits of Mencius' teaching have always been highly valued by his countrymen from his own times to the present. 'The chief *dicta* of modern Chinese ethics and politics are mostly taken literally from Mencius, or adhere closely to his teaching.'

See Legge, *Life and Works of Mencius* (1875; 'Chinese Classics' series); and Faber, *Mind of Mencius* (Eng. trans. 1882).

Mende, capital of the French department of Lozère, on the Lot, in a valley surrounded by high hills, 66 miles NW. of Nîmes, has a cathedral, and manufactures serges and coarse cloths. Pop. 6740.

Mendeans. See MANDEANS.

Mendeleëff, DMITRI IVANOVITCH, chemist, was born at Tobolsk, 7th February 1834, studied at St Petersburg, and, after having taught at Simferopol, Odessa, and St Petersburg, became professor of Chemistry in the university of St Petersburg in 1866. He has enriched every section of chemical science, but is especially distinguished for his contributions to physical chemistry and chemical philosophy. See ATOMIC THEORY; and *Nature* (vol xl. 1889).

Mendelssohn, MOSES, philosopher, was born 6th September 1729, at Dessau. From his father, whose name was Mendel, a Jewish schoolmaster and scribe, he received his first education; and in his thirteenth year he proceeded to Berlin, where, amid very indigent circumstances, he contrived to learn Latin and modern languages, and to apply himself to the study of philosophy, into which early readings, chiefly of Maimonides' *Moreh Nebochim*, had initiated him already. After many years of comparative poverty he became the partner of a rich silk-manufacturer, whose children he had educated. The intimate friend of men like Lessing, Sulzer, Nicolai, he, directly and indirectly, contributed in a vast degree to the abolition of the disgraceful laws and brutal prejudices against the Jews. On the other hand, he acted in the most beneficial manner on his own co-religionists, by rousing them from the mental apathy with which they regarded in his day all that had not a distinct reference to religion, and by waging fierce war against their own religious and other prejudices. He died 4th January 1786, and Ramler wrote the following epitaph on him: 'True to the religion of his forefathers, wise as Socrates, teaching immortality, and becoming immortal like Socrates.' He was the prototype of Lessing's *Nathan*, and was called a 'second Moses.' He was a diligent student of Locke, Shaftesbury, and Pope: a zealous defender of enlightened Monotheism, and, in spite of Lessing, strongly anti-Spinozist. His principal works are a volume on Pope as a philosopher, along with Lessing (1755), on the Sensations (1755), on Evidence in Metaphysics (1763); *Phædon* (1767), a dialogue on the immortality of the soul in the manner of Plato; *Jerusalem* (1783), a defence of Judaism as a religion; *Morgenstunden*, essays in refutation of Pantheism and Spinozism. His works were edited in 1845 (8 vols.), and again in 1880 (2 vols.). See the *Life* by Kayserling (2d ed. 1887).

Mendelssohn-Bartholdy, FELIX, composer, was born at Hamburg on February 3, 1809. The family name was already remarkable by the fame of his grandfather, Moses Mendelssohn. Abraham, the second son of Moses Mendelssohn, had entered a banking business in Paris, but subsequently, on his marriage with Lea Salomon in 1804, settled in Hamburg. The French occupation in 1811 forced him to escape with his family to Berlin, where he founded the eminent firm of bankers known by his name. He resolved about this time to bring up his children as Protestant Christians, and added the name of Bartholdy to that of Mendelssohn in order to distinguish his own from the Jewish branch of the family.

The education he bestowed on Felix appears to have been as liberal as it was systematic. In his eighth year we find the child studying composition under Zelter and the pianoforte under Ludwig Berger, besides receiving lessons in drawing and the violin. Two years later he made his first public appearance, playing the pianoforte part in a trio at a concert in Berlin. With 1820 began that period of prolific production which lasted almost till his death. At the same time he entered upon a ceaseless round of gaiety and activity which largely determined his character. The home-life of the Mendelssohn family was eminently suited to the musical tendencies of the boy. A concert was given at the house on alternate Sunday mornings, when some of Felix's compositions generally found a place in the programme. Within the next few years he formed the acquaintance of such men as Goethe, Weber, and Moscheles, and had composed his Symphony in C minor and the B minor Quartet. A short visit to Paris with his father in March 1825 did not impress him favourably with the French musicians.

The following July saw the completion of his opera, *Camacho's Wedding*, which was destined to be the beginning of his unpleasant relations with the Berliners; and his well-known Octet for strings was finished in October. With the composition of the *Midsummer Night's Dream* overture, in August 1826, Mendelssohn may be said to have attained his musical majority, and his lessons with Zelter ceased. On April 29, 1827, the opera *Camacho's Wedding* was produced in Berlin. Though received with vehement applause it never reached a second performance, owing, among other reasons, to the illness of one of the principal singers, and the personal criticisms on the work in the press. Soon after this Mendelssohn commenced the formation of a small choir of sixteen voices, which met at his house for the purpose of studying Bach's Passion Music; and, in spite of the difficulties of the work and the determined opposition of Zelter, the scheme culminated in the famous performance by the Singakademie on March 11, 1829, the first since Bach's death. For some reason, however, his success did not improve his relations with Berlin musicians. Accordingly, being now twenty years old, he resolved to leave home and to visit the different countries of Europe. England, afterwards the land of his most pleasant associations, was his first destination. He arrived in London on April 21, 1829, and was warmly welcomed by the Philharmonic Society. He made his first appearance at one of their concerts, when he conducted his Symphony in C minor. A tour through Scotland in the summer inspired him with the *Hebrides* overture and the Scotch Symphony.

During the next year he visited Munich and Vienna. By October he had reached Venice, and the following winter he spent in Rome. Returning to Munich he proceeded thence to Paris, paying his second visit to London in April 1832. He shortly afterwards returned to Berlin, having been

absent three years. In the spring of 1833 he was invited to conduct the Lower Rhine festival at Düsseldorf, where his success led to his being offered the entire direction of the music for three years. He at once accepted the post and commenced his new duties in September. His work at the theatre, however, proved uncongenial, and was accordingly relinquished. His stay at Düsseldorf was full of responsibilities and worries, and he ultimately left the town in October 1835 to conduct the Gewandhaus concerts at Leipzig. A subsequent visit to Frankfort brought him in contact with Rossini, and was also the occasion of his first meeting with Cecile Jeanrenaud, who afterwards became his wife. The marriage took place in 1837, and was followed by a visit to Birmingham, where he conducted his *St Paul*, which had been first heard at Düsseldorf the previous year. His attention was now chiefly devoted to Leipzig, but September 1840 found him again at Birmingham conducting the *Lobgesang*. About this time Mendelssohn was requisitioned by the king of Prussia to go to Berlin to assist in the foundation of an Academy of Arts; and, though loth to leave a place where he was so much appreciated and beloved as in Leipzig, he removed to Berlin in May 1841, on the understanding that his stay there should not exceed one year. The king's idea of reviving the ancient Greek tragedies led to the composition by Mendelssohn of the music to the *Antigone* and *Edipus*.

In 1843 he had the satisfaction of seeing his favourite scheme carried into effect by the opening of the new music-school at Leipzig, with Schumann and David among his associates. He was in London the following year to conduct the last five concerts of the Philharmonic season; and in 1846 he paid his ninth visit to England for the production of *Elijah*, which took place at Birmingham on September 26. But his hard work was now beginning to tell on him, for, although his Berlin duties and his position as chief of the Leipzig Conservatorium entailed constant labour and anxiety, he persisted in carrying out all his engagements. He had scarcely returned from his tenth and last visit to England, in May 1847, when the news of his sister Fanny's death reached him. Periods of illness and depression rapidly followed; and on November 4, 1847, he expired at his house in Leipzig. The body was conveyed to Berlin, and was interred in the family burial-place on the Alte Dreifaltigkeit Kirchhof.

In stature Mendelssohn was short, and his handsome countenance was of a decidedly Jewish cast. He was eminent both as pianist and organist, especially in his rendering of the works of Bach, Mozart, and Beethoven. He moreover possessed a remarkable facility of improvisation. His gifts also included a talent for landscape-drawing; and he has left behind him a whole series of sketches illustrating his different journeys. His music dwells almost exclusively on the sunny and gay side of life. Rarely, if ever, does he touch the innermost depths of passion and feeling. Yet it can never be a matter of regret to us that Mendelssohn was spared misfortunes such as fell to the lot of Beethoven and Schumann, and has thus given us music which, though lacking the profounder beauties and more pathetic qualities found in their works, has always the power to imbue us with his own spirit of habitual cheerfulness. He shares with Handel the exceptional lot of having been able to appeal successfully to English audiences. For the last forty years his *Elijah* has enjoyed a popularity equal to that of the *Messiah* itself.

See two collections of Mendelssohn's Letters (1861 and 1863; trans. by Lady Wallace, 1862-63), and those to the Moscheles (1888); the Lives by Benedict (1850),

Moscheles (1873; trans. by Coleridge), and Lampadius (1886); Reminiscences by Devrient (1869; trans. by Mrs Macfarren), Hiller (1874), Horley (1873), Marx (1865); Hensel, *Die Familie Mendelssohn* (1879; trans. 1884); and other works quoted in the article in Sir George Grove's *Dictionary*.

Mendicancy. In spite of the stringency of the laws against vagrancy and begging, and the numerous aid societies in every town in Britain for the relief of the poor and unemployed, quite an army of men, women, and children wander from place to place, and pick up a living from the thoughtless benevolence of their better-off and more industrious neighbours. This class is largely recruited from the lazy, idle, drunken, and vicious, though there is always a certain percentage who are really the victims of misfortune. Though the law is against begging—English statutes for the repression of mendicancy date from the 14th century—there is no law against giving to beggars. But indiscriminate charity only feeds the evil it seeks to remove, and the weak-willed, shiftless population continues to be a problem to the benevolent. The truest charity consists in helping people to help themselves, and those societies and individuals are most useful that aid the fallen to gain work and self-respect, and so rise in the social scale. There are no fewer than 83 societies in Great Britain for improving the condition of the poor, 42 of which are in London and 11 in Scotland. The relief given may consist in supplying immediate necessities, helping the poor into hospitals and convalescent homes, to emigrate, or to secure temporary work. Tickets are in some cases supplied to subscribers, which entitle the party to whom they are given to one meal. Tickets for a night's shelter can also be had, to be given instead of money. The Mendicity Society in London (established for the suppression of public begging in 1818), whose work has been much aided by the Charity Organisation Society (see CHARITIES), has caused some 25,000 vagrants to be convicted as impostors, and relieves some 13,000 or 14,000 cases in a year. A police census of December 23, 1888, credited Edinburgh, in a population of a little over a quarter of a million, with 898 common beggars and tramps; of whom 589 were Scotch, 210 Irish, 83 English, and 16 foreigners. In London it is calculated that one in thirty of the inhabitants live on charity; in Paris, where there is a well-organised syndicate of professional mendicants, one in eighteen (see *Chambers's Journal*, 1890). Mr Booth estimated that there were 3,000,000 persons in England who could not live for a week on their own resources, including 100,000 homeless waifs, sleeping on or under bridges, and hedgerows, carts, &c., and for them he devised the scheme of rescue propounded in his *In Darkest England* (1890). See also POOR-LAWS, VAGRANTS.

Mendicant Orders, certain religious associations in the Roman Church, which, carrying out the principle of religious poverty and self-humiliation to its fullest extent, make it a part of their profession to denude themselves of all property, whether real or personal, and to subsist upon alms. In the mendicant orders alms were commonly collected by the lay-brothers; in some, by actual solicitation; in others, by the ringing of the convent bell when the stock of provisions was exhausted. See the articles DOMINICANS, FRANCISCANS, CARMELITES, AUGUSTINIANS; also FRIAR.

Mendip Hills, a range in Somersetshire, extending 23 miles south-eastward from Weston-super-Mare to Shepton Mallet, and 3 to 6 miles in breadth. The highest point is Black Down (1067 feet). The limestone of the Mendips is pierced by numerous caverns, some of which have yielded prehistoric

remains; and lead-mining, now much decreased in importance, has been carried on from pre-Roman days, calamine-mining being a later industry.

Mendoza, a western department of the Argentine Republic, with an area of 62,000 sq. m., and a pop. (1887) of 160,000. The Andes occupy the western portion: Aconcagua (22,427 feet), the highest peak in America, is on the north-west frontier. The rest of the province is pampa land, fertile wherever it can be irrigated by the waters of the Mendoza and other streams, but elsewhere almost worthless. The annual rainfall is only 8 inches. Minerals, especially copper, abound, and are beginning to be worked; petroleum and coal have also been found. Vines flourish, and a large quantity of wine is exported to the other provinces.—The *capital*, Mendoza, 640 miles by rail W. by N. of Buenos Ayres, is on the trans-continental railway, which reached this point in 1884. It is a handsome town, lying among vineyards and gardens, 2320 feet above the sea; its streets have shade-trees and streams of running water, and the Alameda is the most beautiful on the continent. An active trade is carried on with Chili. An earthquake in 1861 destroyed Mendoza (founded 1559) and 13,000 of its 14,600 inhabitants; many of the ruins are still visible in the larger city which has been raised on its site. Pop. 20,000.

Mendoza, the name of an illustrious family that throughout Spanish history distinguished itself wherever distinction was to be won, in war, statesmanship, diplomacy, the church, and literature. A descent from the Cid has been claimed for it; but it was of Basque origin, and its progenitors the lords of Biscay some generations before the Cid's time. Of its more notable members the first is Ifiño Lopez de Mendoza, created Marquis of Santillana by John II. of Castile in 1445 for his services on the field of Olmedo and elsewhere. Besides being a gallant soldier, he was a wise statesman and a sturdy patriot, and in himself a proof of the truth of his own saying, that 'the lance never blunted the pen, nor the pen the lance,' for among the poets he stood next to Juan de Mena, and his exquisite little song of the 'Vaquera de la Finojosa' has secured a place for him in every Spanish anthology. He served literature, moreover, by leaving an excellent account of the Provençal, Catalan, and Valencian poets, and he has a further claim to remembrance as the first of folklorists and the first collector of popular proverbs 'such as the old women repeat over the fire.' The most famous of his six sons was Pedro, Archbishop of Toledo, commonly called 'The Grand Cardinal,' who was for many years the trusted prime-minister of Ferdinand and Isabella, a man whose integrity and nobleness of character, no less than his commanding abilities, make him a prominent figure in an age by no means poor in great men.

The best known of the name is the marquis's great-grandson, DIEGO HURTADO DE MENDOZA (1503-75), the strong-handed lieutenant to whom Charles V. entrusted the conduct of his Italian policy and the representation of his views at the Council of Trent. He inherited a full measure of his great-grandfather's gifts as a statesman and as a man of letters. Almost as much as his kinsman Garcilaso de la Vega and Juan Boscan he was instrumental in grafting Italian poetry on the Spanish stem, but as a poet he was more national than either of his allies. His largest work is his *War of Granada*, a history of the revolt of the Moriscoes in 1568-70 against the oppression of Philip II. It is constructed on Latin models, but a masterpiece of Spanish prose, marked throughout by rare narrative power, and by a generous spirit towards the miserable Moriscoes which is rarer

still. Greater glory yet would surround his name if his right to the little tale of *Lazarillo de Tormes* could be proved, but his title, it must be confessed, is not quite clearly made out. We have, it is true, the positive assertion of the Flemish scholar André in his catalogue of Spanish authors (1607), and we must suppose he had evidence that satisfied him, but what it was we know not. Beyond this there is nothing but the consensus of opinion in Spain, the fact that there is no other claimant (for inexorable dates dispose of Ortega's claim), and a certain amount of circumstantial evidence, which, however, partly rests upon the probable but not yet proved existence of a first edition printed at Antwerp in 1553. The silence of Mendoza's family and early editors is, however, no argument against his authorship, but rather the contrary. That they should have been chary of claiming for him a book full of Reformation ideas is not strange, but it is strange that they should not have denied, if they could, his reported connection with it.

Menelaus, in ancient Greek heroic history, was king of Lacedæmon, the younger brother of Agamemnon, and husband of the famous Helen (q.v.).

Menes. See EGYPT (*Chronology and History*).

Menevian, one of the subdivisions of the Cambrian System (q.v.).

Mengs, ANTON RAPHAEL, artist and writer on art, was born at Aussig, in Bohemia, March 12, 1728. His father, Israel Mengs, was himself a painter, and from him young Raphael received his first instructions in art. At the age of thirteen he went to Rome, where he remained three years. On his return to Dresden, in 1744, he was appointed court-painter to the king of Poland and Saxony, but was not prevented from living at Rome, where he became a Catholic and married. In 1754 he became director of the school of painting of the Capitol. After three years he visited Spain. To this period belongs his most celebrated effort; it represents the Apotheosis of the Emperor Trajan, and is executed on the dome of the grand saloon in the royal palace at Madrid. He returned again to Rome in 1776, where he died 29th June 1779. He was a learned and scholarly painter, but his works, though lofty in their subjects, seldom exhibit more than a correct and cultivated taste. His writings were edited in 1780.

Meng-tse. See MENCIUS.

Menhaden (*Clupea menhaden*), the name, especially in Massachusetts and Rhode Island, of a species of herring or shad, abundant off the eastern coast of the United States. Other local names are Whitefish and Hardhead (in Maine), Bony Fish and Mossbunker (in New York). It is much used for bait and is very rich in oil, while the refuse furnishes valuable manure. Economically it is one of the most important North American fishes. See G. B. Goode's *Natural History of the Menhaden* (Washington, 1879).

Menhir. See STANDING STONES.

Ménier, ÉMILE JUSTIN, French manufacturer and writer, was born at Paris on 18th May 1826, and died at Noisiel-sur-Marne, 17th February 1881. He established at Noisiel the celebrated chocolate factory, with a branch in London, chemical works at St Denis, and a sugar manufactory at Roze, besides a caoutchouc factory, and in Nicaragua a cocoa plantation. A warm advocate of free trade, he expounded his views in *Economie Rurale* (1875), *L'Avenir Économique* (2 vols. 1875-79), &c.

Menin, a town of West Flanders, Belgium, 7 miles by rail SW. of Courtrai, stands on the left bank of the Lys, which separates it from France. It was fortified by Vauban, but its works have been demolished. Pop. 12,513.

Meningitis (Gr. *mēninx*, 'a membrane') is the term employed in medicine to designate inflammation of the membranes investing the brain and spinal cord, of which in this relation the innermost—the *pia-mater*—is the most important. Far the most frequent form of meningitis in Britain is the tubercular, already described under *Hydrocephalus* (q.v.); and, as the main symptoms of other forms are similar, it is unnecessary to repeat them here.

Epidemic cerebro-spinal meningitis, or *Cerebro-spinal fever*.—Outbreaks have occurred from time to time during the 19th century in the northern hemisphere, less frequently in the British Islands than in most of the other countries where qualified observers are found, of an epidemic disease affecting chiefly the membranes of the brain and cord. It usually begins suddenly with fever and violent headache; vomiting, giddiness, stupor, delirium, and other nervous symptoms succeed, the most distinctive of which is a peculiar rigidity of the muscles of the neck and back. The disease is extremely variable in severity; sometimes it is fatal in less than twenty-four hours; sometimes so slight as only to confine the patient to bed for a few days. The majority lie between these extremes, improvement in favourable cases beginning after a week or two. Convalescence is often very slow. It occurs chiefly in children and young adults. It is not clearly distinguishable from other forms of meningitis except by its mode of occurrence, generally in somewhat localised and limited outbreaks. If contagious, it is only feebly so. Treatment must be conducted on general principles, as no specific is yet known.

Simple meningitis (i.e. not traceable to tubercle or to the epidemic form) is most often caused by injury, but may result from disease of the skull, pyæmia, and other diseases, and has even been caused by excessive exposure of the head to the sun. It usually begins, unlike the tubercular form, quite suddenly; and it too is an extremely fatal disease. But the outlook is not quite so hopeless in simple meningitis; and even cases which appear desperate do sometimes recover. The essentials of treatment are rest and quiet in a darkened room, and little food of the lightest kind. Ice to the head, blistering, blood-letting, local or general, and free purgation sometimes seem beneficial.

Meningocele. See ENCEPHALOCLE.

Menippus, a satirist who lived in the first half of the 3d century B.C., was born a Phœnician slave, and became a Cynic philosopher. His works in Greek have perished, and he is known only through the imitations of Marcus Terentius Varro (q.v.), whose own fragments bear the title of *Menippean Satires*.—The name was adopted as title for a famous French collection of political satires in prose and verse, the *Satire Ménippée*, which appeared in 1594 at the crucial period of the League.

Mennonites, a Protestant sect, combining some of the distinctive characteristics of the Baptists and the Quakers. Their principal tenet is the administration of baptism only upon confession of faith; consequently they do not baptise infants. They attach more importance to the ordering of the Christian life than to doctrinal points, ranking discipline and rectitude of life before learning and the scientific elaboration of dogmas. They refuse to take oaths, to bear arms, condemn every kind of revenge and divorce (except for adultery), and object to fill civic and state offices, holding all kinds of magistracy to be necessary for the present, but foreign to the kingdom of Christ. The church is the community of the saints, which must be kept pure by strict discipline. Grace they hold to be designed for all, and their views of the Lord's Supper fall in

with those of Zwingli; in its celebration the rite of feet-washing is retained in most congregations. They have bishops, preachers, and deacons. The first congregation to profess these principles was formed at Zurich in 1525 by three men, Grebel, Manz, and Blaurock. Thence the sect spread rapidly through Switzerland and the south of Germany and Austria, establishing itself in greatest strength at St Gall, Augsburg, and Strasburg. But a bitter persecution, in which 3000 persons perished, caused many to move into Moravia and into Holland. Contemporaneously with the formation of the Zurich congregation and its first years of propagandism was the appearance in Westphalia of the Anabaptists (q.v.), a sect professing some similar views, but guilty of most reprehensible fanatical excesses, in which the Swiss party had no share and with which they showed no sympathy. After the fanatical party had been suppressed, with much shedding of blood, in Münster, there arose a man of sound piety and great moderation, Menno Simons (1492–1559), who denounced the blasphemous zealots of Westphalia, and organised the scattered members and congregations of the more sober-minded throughout Holland and north Germany. His influence became so paramount that his name has been used ever since to designate the sect as a religious body. Dissentions broke out amongst them at a later time both in Switzerland and Holland, chiefly as to the degree of strictness of discipline to be enforced. In 1620 the stricter Ammanite or Upland Mennonites separated from the more tolerant Lowland Mennonites in Switzerland. In Holland the first disruption occurred in 1554; the more liberal section in North Holland were called Waterlanders, though they exchanged the name of Mennonites for Baptist Communities. The advocates for greater strictness showed much want of cohesion, the various parties being known by such titles as Old Flemings, Ukevallists, Dompelers, Jan Jacob Christians, Apostoolites, Galenists, &c. All the Dutch Mennonites were, however, reunited in 1801. At the present time they number about 32,000, divided among more than 100 congregations. The German and Swiss Mennonites probably number nearly 25,000. In 1783 Catharine of Russia introduced colonies of German Mennonites into south Russia; others joined them after 1867. But in 1871—at which time they numbered close upon 40,000—the Russian emperor decreed that they should be liable to conscription for the army, and should be deprived of certain others of their privileges. This caused many of them to emigrate to the United States, where they settled principally in Minnesota and Kansas; others have proceeded of late years to Brazil. But Mennonite refugees from Alsace, the Palatinate, and Holland had already reached America as early as 1683, in which year the first Mennonite church in the States was organised at Germantown in Pennsylvania. At the present time there are about 100,000 professing this form of religious life in the United States and Canada. The most important groups into which they are divided are known as Old Mennonites, Reformed Mennonites or Herr's People, New Mennonites, Evangelical Mennonites, and Amish or Omish Mennonites, also known as Hookers and as Buttonites. Nearly all Mennonites throughout the world are farmers; for culture, integrity, and philanthropic enlightenment they stand everywhere high in the regards of their neighbours.

in Herzog-Plitt's *Real-Encyklopädie* (new ed.), who gives a full bibliography.

Menopome (*Protonopsis horrida*), a large North American amphibian in the Salamander order. It is widely distributed in the rivers of the Mississippi basin, and is well known as the 'hell-bender,' 'alligator,' 'water-dog,' &c., names which suggest its fierce characteristics. It resembles the

Menopome or Hell-bender (*Protonopsis horrida*).

salamander in form, has four well-developed limbs, and a persistent gill-aperture. It attains a length of 18 inches to 2 feet, and has extraordinary powers of voracity and vitality.

Menshikoff, ALEXANDER DANILOVITCH, a Russian field-marshal and minister of state, was born at Moscow, 16th November 1672. Lefort, the favourite of Peter the Great, saw him selling tarts in the street, took him into his own service, and introduced him to the notice of his imperial master. Rising rapidly in the Czar's favour, he distinguished himself at the siege of Azov, and afterwards accompanied Peter in his travels to Holland and England. On the death of Lefort (1699) he was made chief favourite. During the years (1702-13) of the war with Sweden he played important parts at the siege of Schlüsselburg, the battles of Kalisch and Pultowa—on the field of Pultowa Peter made him field-marshal—the capture of Riga, in the occupation of Courland and Pomerania, and at the capture of Stettin. At the capture of Marienburg the woman who afterwards became the wife of Peter, Catharine I., fell into Menshikoff's hands, and was through him introduced to the czar. Towards the end of Peter's reign Menshikoff lost favour owing to his extortions and suspected duplicities. But when Peter died he secured the succession of Catharine, and during her reign and that of her successor, her youthful grandson, Peter II., he governed Russia with almost absolute authority. His ambitious schemes—he was about to marry his daughter to the young czar—and the dislike of the old nobility led to his overthrow by the Dolgoroukis, who banished him to Siberia (September 1727) and confiscated his immense estates and treasures. He died 2d November 1729.—His great-grandson, ALEXANDER SERGEIEVITCH, was born in 1789. He served in the campaigns of 1812-15, and rose to the rank of general. In the Turkish campaign of 1828 he took Anapa after a short siege, but before Varna received so severe a wound as compelled his retirement. After his recovery he was made head of the Russian navy, which he raised to a high state of efficiency. In March 1853 he was sent as ambassador to Constantinople, where his overbearing behaviour produced a speedy rupture between the Porte and the czar, and brought about the Crimean war. In this war he commanded at the battles of Alma and Inkermann, and displayed great energy in defending Sebastopol; but in 1855 he was recalled because of a severe attack of illness. Menshikoff was till

his death on 2d May 1869 one of the most prominent members of the old Russian party.

Menstruation is the term applied to the discharge of blood which issues every month from the generative organs of the human female during the period in which she is capable of procreation. The first appearance of this discharge, to which the terms *meneses* and *catamenia* (each having reference to the monthly period) are indiscriminately applied, is a decided indication of the arrival of the period of commencing womanhood, and is usually accompanied by an enlargement of the mammary glands and other less conspicuous changes. Among Teutonic races menstruation usually commences between the fourteenth and the sixteenth years, and terminates between the forty-eighth and fifty-second years. The interval which most commonly elapses between the successive appearances of the discharge is about four weeks, although it is often shorter; and the duration of the flow is usually three or four days, but is liable to great variations. The first appearance of the discharge is usually preceded and accompanied by pain in the loins and general disturbance of the system, and in many women these symptoms invariably accompany the discharge. As a general rule there is no menstrual flow during pregnancy and lactation, and its cessation is one of the first signs that conception has taken place. Anomalies and disturbances (retention, suppression, undue copiousness, &c.) of the menstrual discharge are a frequent cause or symptom of illness.

Mensuration, the name of that branch of the application of arithmetic to geometry which teaches, from the actual measurement of certain lines of a figure, how to find, by calculation, the length of other lines, the area of surfaces, and the volume of solids. The determination of lines is, however, generally treated of under Trigonometry (q.v.), and surfaces and solids are now understood to form the sole subjects of mensuration. To find the length of a line (except in cases where the length may be calculated from other known lines, as in trigonometry) we have to apply the unit of length (in the shape of a footrule, a yard measure, a chain), and discover by actual trial how many units the line contains. But in measuring a surface or a solid we do not require to apply an actual square board, or a cubic block, or even to divide it into such squares or blocks; we have only to measure certain of its boundary lines or *dimensions*; and from them we can calculate or infer the contents. For example, to find the area of a rectangle it is sufficient to measure two adjacent sides and find the product of these in terms of the unit of length chosen; 7 feet \times 3 feet = 21 square feet.

The areas of other figures are found from this, by the aid of certain relations or properties of those figures demonstrated by pure geometry; for instance, the area of a parallelogram is the same as the area of a rectangle having the same base and altitude, and is therefore equal to the base multiplied by the height. As a triangle is half of a parallelogram, the rule for its area can be at once deduced. Irregular quadrilaterals and polygons are measured by dividing them into triangles, the area of each of which is separately calculated. For the area of the circle, see CIRCLE. The volume of a rectangular parallelepiped is found in cubic inches by multiplying together the length, breadth, and depth in inches; and the oblique parallelepiped, prism, or cylinder, by multiplying the area of the base by the height.

Mentana, a small village 12 miles NE. of Rome, where, 3d November 1867, the Garibaldians were defeated by the papal and French troops.

Menteith, LAKE OF, a beautiful sheet of water in south-west Perthshire, 17 miles W. by N. of Stirling. Lying 55 feet above sea-level, it has an utmost length and breadth of $1\frac{1}{2}$ and 1 mile, and a depth in places of 80 feet. It sends off Goodie Water 9 miles east-south-eastward to the Forth, and contains three islets—Inchmahome, Inchtalla, and Dog Isle. Inchmahome has remains of an Augustinian priory (1238), the refuge in 1547–48 of the child-queen Mary Stuart before her removal to France; whilst on Inchtalla is the ruined tower (1427) of the Earls of Menteith. That title was borne by a Celtic line in the 12th century, and afterwards by a Comyn, Stewarts, and Grahams (1427–1694). See Dr John Brown's *Horæ Subsecivæ* (1858), and Sir W. Fraser's *Red Book of Menteith* (2 vols. Edin. 1880).

Menthol is a camphor obtained from oil of peppermint by cooling. It has been used by the Japanese for 200 years and is known by them as *Hakka-no-Hari*; indeed, native gentlemen always went about till recently with a medicine-box containing this drug. The chief source is the *Mentha arvensis purpureascens*, the oil of which yields more menthol than that of peppermint. In many nervous affections, such as neuralgia, toothache, headache, &c., menthol in the form of cones often gives instant relief. When the cone is rubbed on the skin a twofold action results. The menthol rapidly evaporates, giving a sensation of cold; but if evaporation be prevented it acts as a rubefacient, producing a feeling of warmth. Menthol has also antiseptic properties, and is used with success in solution in diphtheria, &c. It has an odour resembling but differing from that of oil of peppermint. It is liable to be adulterated with thymol, eucalyptol, &c., and then is often irritating to the skin.

Mentone (Fr. *Menton*), a town in the department of Alpes Maritimes, France, is pleasantly situated on the Mediterranean, $1\frac{1}{2}$ mile from the Italian frontier and 14 miles by rail N.E. of Nice. Owing to its southern exposure, and the fact that spurs of the Alps shelter it on the north and west, it enjoys a beautiful climate—average for the year 61°—and so has become a favourite winter-resort of invalids and health-seekers from England, Germany, and other countries. The town stands on a promontory that divides its bay into two portions; the native town clings to the mountain side, whilst the hotels and villas for the visitors extend along the water's edge. The harbour is protected on the south and west by a sea-wall (1889). There is a trade chiefly in olive-oil, wine, lemons, skins, which fluctuates between £75,000 and £211,000 a year. Great damage was done to the place by an earthquake in February 1887. Pop. 8433. In the 14th century it was purchased by the lords of Monaco, and, except during the period of the revolution and down to 1815, when France seized it, the princes of Monaco kept possession till 1848. In that year the inhabitants voluntarily put themselves under the protection of Sardinia, but that power yielded the town to France twelve years later. See Dr Bennet, *Winter and Spring on the Shores of the Mediterranean* (5th ed. 1874) and *Maritime Alps and their Seaboard* (1888).

Mentor, the son of Alcimus, and trusted friend of Ulysses, who, on setting out for Troy, left him the charge of his household. By him the young Telemachus was educated, and his name has become a synonym for an instructor and guide.

Menura. See LYRE-BIRD.

Menza'leh, LAKE, a coast lagoon of Egypt, extending east from the Damietta branch of the

Nile, is separated from the Mediterranean by a narrow strip of land, with several openings. Its surface, 460 sq. m. in extent, is studded with islands, the most interesting of which is Tennees, the ancient Tennesus, with Roman remains of baths, tombs, &c. Its waters are full of fish, and its shores abound in wild-fowl. The Suez Canal passes through the eastern portion. The lake has an average depth of not more than 3 feet, except when the Nile, mouths of whose delta reach it, is in flood; and it is being gradually drained.

Menzel, ADOLF, painter, lithographer, illustrator, and engraver, was born 8th December 1815, at Breslau, and is best known for his drawings and oil-paintings illustrative of the times of Frederick the Great and William I., emperor—pictures characterised by historical fidelity, strong realistic conception, originality, and humour. His 'Adam and Eve,' 'Christ among the Doctors,' and 'Christ expelling the Money-changers' are also notable pictures. See Life by Wessely (1873), and the critical work of Jordan and Dohme (1885 *et seq.*)

Menzel, WOLFGANG, an eminent German author, was the son of a medical practitioner, and was born at Waldenburg, in Silesia, 21st June 1798. He studied at Jena and Bonn, was for four years schoolmaster at Aarau in Switzerland, and in 1825 returned to Germany. He first made himself known in the literary world by his witty *Streckverse* (1823). He subsequently lived mainly in Stuttgart, where he died 23d April 1873. He edited and contributed to literary magazines, and wrote a very large number of works—poems, romances, histories, literary criticism, political polemics, and Christian theology. The most important were a history of Germany (1825; Eng. trans. 1848), of German literature (1827; Eng. trans. 1840), of German poetry (1858), of Europe (1853–57), and of the world (*Allgemeine Weltgeschichte*, 16 vols. 1862–72), on Prussia's place in Germany (1866 and 1870), mythological researches (1842), the pre-Christian doctrine of immortality (1869), and autobiographical *Denkwürdigkeiten* (1876). He was almost constantly involved in controversy, attacking with equal zeal theological rationalists and political radicals, all whose tendencies seemed 'dangerous' to the Christian religion or the German monarchies, such as 'the Young Germany party' after 1830. Börne (q.v.) retaliated in the *Franzosenfresser* ('Frenchman-eater').

Mephistopheles, the name of one of the best-known personifications of the principle of evil. The word has been very variously explained, but is probably of Hebrew origin, like most names of devils in the history of magic, confounded with, and approximated in form to, the Greek *μῆφιστοφίλης*, 'one who loves not light.' Mephistopheles owes all his modern vitality to Goethe's *Faust* (q.v.).

Meppel, a town in the Netherlands province of Drenthe, 18 miles N. by E. of Zwolle, has a trade in butter and linen manufactures. Pop. 8418.

Mc'quinez. See MIKNAS.

Meran, a town in the Tyrol, situated at the south side of the Alps, 100 miles by rail S. by W. of Innsbruck, is a celebrated winter-resort, especially for sufferers from chest diseases, has an old 15th-century castle, a 14th-century Gothic church, an English girls' school, &c. Pop. 5334, more than doubled in the season. See Fraser Rae's *Austrian Health-resorts* (1888).

Mercadante, SAVERIO, musical composer, was born at Altamura in Southern Italy, 26th June 1797, studied music at Naples, and began his career as a violinist and flutist. In 1818 he produced the first of some sixty operas, of which the

more noteworthy are *L'Apoteosi d'Ercole* (1819), *Anacreonte* (1820), *Elisa e Claudio* (1821), *Donna Caritea* (1826), *I Briganti* (1836), *Il Giuramento* (1837), and *La Vestale* (1842). From 1827 to 1831 he was in Spain; in 1833 he was appointed musical director in the cathedral at Novara, and in 1840 of the conservatory of music at Naples. He died in that city, 17th December 1870—blind since 1861.

Mercantile Law, the branch of municipal law which is similar, and in many respects identical, in all the trading countries of the world. An understanding was earliest established in the department of maritime law, the history of which begins with such codes as the *Consolato del Mare*, published at Barcelona in 1494, and includes such a series of regulations as the English Merchant Shipping Acts (1854 to 1888), which consolidate and amend the law as to seamen and their contracts with employers, desertion, provisions, unseaworthy ships, pilotage, signals, deck cargoes, the load-line, life-saving apparatus, &c. Mercantile and maritime law is dealt with in this work under a large number of heads, as

Apprentice.	Debt.	Master and Servant.
Bankruptcy.	Employers' Liability.	Partnership.
Bill.	Insurance.	Pilmsoll.
Company.	International Law.	Weights and Measures.

Mercantile System, that system in political economy which regards it as a government's chief end to secure a favourable balance of trade—to get the country to import as little as possible of the produce of other countries, and export as much as possible of its own, so that more money is received than is paid away. The policy of the Emperor Charles V. was regulated by this aim, as was that of Henry VIII. and Queen Elizabeth; and the Navigation Laws (q.v.) of Cromwell founded the English empire of the seas. Colbert (q.v.) was regarded as the most systematic mercantilist. Among English exponents of the system were Sir Josiah Child and Sir William Temple. See BALANCE OF TRADE, POLITICAL ECONOMY.

Mercator (the Latinised form of KREMER), a Flemish mathematician and geographer of German extraction, 1512-92. See MAP.

Mercedes, in Argentina, (1) a city 61 miles by rail W. of Buenos Ayres, with a free library and hospital, soap-factories and steam-mills, and 8000 inhabitants (many Irish); and (2) a town 55 miles by rail ESE. of San Luis city, with 6000 inhabitants. (3) Mercedes is also the name of the capital (4000) of Soriano province, in Uruguay.

Mercenaries, or STIPENDIARIES, men who received pay for their services as soldiers, especially as distinguished from the feudal and general levies owing military service to the crown. Such men were often foreigners, and the name has come to mean only foreign auxiliaries. Hired professional soldiers appear very early in the history of military organisation (see ARMY). Foreign mercenaries appear in the armies of Alexander the Great and the Romans. They were common in all armies, but generally engaged for a single campaign only. In England, Harold had a body of Danes in his army when he defeated the Norwegian king—the *huscarls*, a body originally established by Canute. William III. had for some time a body of Dutch troops in his pay after he became king of England; and throughout the 18th century Hessian and Hanoverian regiments were constantly in the pay of the British government for temporary purposes. Hessians fought for great Britain in the first American war; and the Landgrave of Hesse, who sold his troops at so much a head, received upwards of half a million for soldiers lost in that campaign.

During the Irish rebellion, again, in 1798, many Hessian troops were employed.

On the outbreak of the continental war in 1793 it was determined to increase the British army by the addition of a large body of foreigners; and accordingly in 1794 an act was passed for the embodiment of the 'King's German Legion,' consisting of 15,000 men. These troops, who were increased in the course of the war to nearly double that number, distinguished themselves in various engagements, and formed some of the most reliable regiments. It was common during the Peninsular war to enlist deserters and prisoners of war into the British army, but such recruits were not reliable when opposed to their fellow-countrymen. Corps of French *émigrés*, as the Chasseurs Britanniques, which served through the Peninsular war and in America, the York Chasseurs, in which some Turks were enrolled when at Malta, and others, were also organised. The whole of the foreign legions were disbanded in 1815, the officers being placed on half-pay.

During the Russian war in 1854 the British government again had recourse to the enlistment of foreigners. The numbers authorised were 10,000 Germans, 5000 Swiss, and 5000 Italians, with the same pay as British troops. About half were enrolled, and had become very efficient, when hostilities ceased, and they were disbanded at a great cost for gratuities, &c. Foreigners may enlist into the British army, but the Army Act of 1881 provides that the proportion of aliens in any corps at one time shall not exceed one to every fifty British subjects, except in the case of negroes and persons of colour, and that no alien shall be eligible to hold a commission as an officer. British-born soldiers have often served abroad. There was a famous Scots Guard (q.v.) in France from the days of Charles VI. down to 1759; many Scotsmen fought for Gustavus Adolphus; and Englishmen, Scotsmen, and Irishmen, singly and in bodies, have served during troublous times in most European countries; see GORDON (PATRICK), KEITH, HOBART PASHA. A British legion was raised in 1836 by Sir De Lacy Evans to support the queen of Spain against the Carlists (see EVANS).

The Swiss auxiliaries used to form a regular contingent in many of the armies of Europe, especially of France and Italy. Over 1,000,000 served in France from the time of Louis XI. to that of Louis XIV. (1465-1715). The Swiss usually served only on condition of being commanded by their own officers, and occasionally these officers obtained distinction and fame. But the privates returned home poor and often demoralised; and the cantons which supplied most mercenaries suffered severely by their absence. After the French Revolution the cantons ceased publicly to hire out their subjects; and after 1830 most of the cantons forbade foreign enlistment. In 1859 the Confederacy passed a severe law against recruitment for service abroad. There is still, however, a large contingent of Swiss mercenaries in the Dutch East Indian Colonies. The Papal Swiss troops have shrunk to a body-guard of about 100 men. See CONDOTTIERI, FREELANCES.

Merchandise Marks. See TRADE MARKS.

Merchant Taylors' School. This great London day-school, with 500 boys in 1890, was founded, and is still governed, solely by the master, wardens, and company of Merchant Taylors. The first school-house was built in 1561 in Suffolk Lane. This building was destroyed in the great fire of 1666, but it was in 1671-74 rebuilt on the same site. When the Charterhouse School was removed into the country, the Merchant Taylors bought land from the governors of the Charterhouse for

£90,000, and in 1873-74 erected, at a cost of £30,000, their present school-house on the site of the old gown boys' quarters of the Charterhouse. Richard Mulcaster was the first master of the school, and among its scholars have been Edmund Spenser, Bishop Andrewes, James Shirley, Archbishop Juxon, Titus Oates, Lord Clive, Charles Mathews, and Sir Henry Ellis. See the Rev. C. J. Robinson's *Register of the Scholars admitted to Merchant Taylors', 1562-1874* (2 vols. 1882-83).

Mercia, the great Anglian kingdom of central England. The name, originally limited to the district around Tamworth and Lichfield and the Upper Trent valley, refers to a 'march' or frontier that had to be defended against hostile Welshmen. The first settlements were most probably made in the second half of the 6th century, but Mercia first rose into real importance, and indeed grew into Middle England, under the vigorous rule of Penda (626-655). His nephew, Wulfhere (659-675), pushed back the Northumbrians, and extended the boundary southward to the Thames, and Ethelbald (716-755) spread his conquests round all the neighbouring states. But the mightiest kings of Mercia were Offa (757-795) and Cenwulf (796-819), and after their time its power rapidly declined before the invasions of the Danes on the one side, and the spread of the West Saxon kingdom on the other. At length it became one of the great earldoms, and Elfgar, Leofric, Edwin, and Morcar retained at least the shadow of past power. See *ENGLAND (History)*; also *DIALECT*.

Mercury. See HERMES.

Mercury, or QUICKSILVER (sym. Hg; atomic weight = 200; sp. gr. 13.6), one of the so-called noble metals, remarkable as being the only metal that is fluid at ordinary temperatures. It is of a silvery white colour, with a striking metallic lustre. When pure it runs in small spherical drops over smooth surfaces; but when not perfectly pure the drops assume an elongated or *tailed* form, and often leave a gray stain on the surface of glass or porcelain. Moreover, the pure metal, when shaken with air, presents no change upon its surface; while if impure it becomes covered with a gray film. It is slightly volatile at ordinary temperatures, and at 662° F. it boils, and forms a colourless vapour of sp. gr. 6.976. Hence it is capable of being distilled; and the fact of its being somewhat volatile at ordinary temperatures helps to explain its pernicious effects upon those whose trades require them to come much in contact with it—as, for example, the makers of barometers, looking-glasses, &c. At a temperature of - 39° F. it freezes, when it contracts considerably, and becomes malleable. In consequence of the uniform rate at which it expands when heated, from considerably below 0° to above 300°, it is employed in the construction of the mercurial thermometer.

All mercurial compounds are either volatilised or decomposed by heat; and when heated with carbonate of soda they yield metallic mercury. Native or virgin quicksilver only occurs in small quantity, usually in cavities of mercurial ores. Of these ores by far the most important is Cinnabar (q.v.). There are two means of obtaining the metal from the cinnabar: the ore may be burned in a furnace, in which case the sulphur is given off as sulphurous acid, and the mercury is collected in a condensing chamber; or the ore may be distilled with some substance capable of combining with the sulphur—as, for example, with slaked lime or iron filings. The mercury as imported is usually almost chemically pure. If the presence of other metals is suspected, it may be pressed through leather, redistilled, and then digested for a few days in dilute cold nitric acid, which exerts little action on the

mercury if more oxidisable metals are present; or better, in a solution of mercuric nitrate, which deposits mercury and takes up the more oxidisable metals. The mercury, after being washed with water, is chemically pure.

Mercury is first spoken of by Theophrastus (3d century B.C.); the name *hydrargyros* (whence comes the symbol Hg) dates from Dioscorides. Greeks and Phœnicians procured cinnabar from Almaden in Spain. After the discovery of the New World, the mercury of Peru was famous. California now produces the great bulk of the mercury of commerce, and most of it comes from the New Almaden mine. The total produce of California was 60,851 flasks (of 76½ lb. each) in 1881; in 1888 it had sunk to 33,250 flasks (value \$1,413,125).

There are two oxides of mercury, the black suboxide, Hg₂O, and the red oxide, HgO. Both of these lose all their oxygen when heated, and form salts with acids. The *black suboxide*, although a powerful base, is very unstable when isolated, being readily converted by gentle warmth, or even by mere exposure to light, into red oxide and the metal: Hg₂O = HgO + Hg. The most important of its salts is the nitrate, Hg₂(NO₃)₂ + 2Aq, from whose watery solution ammonia throws down a black precipitate known in pharmacy as *Mercurius solubilis Hahnemannii*, from its discoverer, and consisting essentially of the black suboxide with some ammonia and nitric acid, which are apparently in combination. Of the *red oxide* the most important salts are the nitrate, Hg(NO₃)₂ + 8Aq; the sulphate, HgSO₄, which is employed in the manufacture of corrosive sublimate; and the basic sulphate, HgSO₄.2HgO, which is of a yellow colour, and is known as *Turpeth Mineral*.

The haloid salts of mercury correspond in their composition to the oxides. Of the most important of these—the chlorides—there are the subchloride, Hg₂Cl₂, well known as Calomel (q.v.), and the chloride, HgCl₂, or corrosive sublimate.

The *chloride*, HgCl₂, when crystallised from a watery solution occurs in long white glistening prisms; but when obtained by sublimation it occurs in white transparent heavy masses, which have a crystalline fracture, and chink with a peculiar metallic sound against the sides of the bottle in which they are contained. This salt melts at 509° F., and volatilises unchanged at about 570°. It has an acrid metallic taste. It is soluble in sixteen parts of cold, and in less than three parts of boiling water, and dissolves very freely in alcohol and in ether. Corrosive sublimate enters into combination with the alkaline chlorides, forming numerous distinct compounds. (A double chloride of ammonium and mercury, represented by the formula CH₃NCl.HgCl₂ + Aq, has been long known as *sal alembroth*.) It combines with oxide of mercury in various proportions, forming a class of compounds of great interest in theoretical chemistry, termed *oxychlorides of mercury*. On adding a solution of corrosive sublimate to a solution of ammonia in excess, a compound, which from its physical characters is termed *white precipitate*, is thrown down, the composition of which is HgN₂H₂Cl₂. Chloride of mercury coagulates albumen, and combines with the albuminous tissues generally, forming sparingly soluble compounds. Hence, in cases of poisoning with the salt, the white of raw eggs is the best antidote; and for the same reason corrosive sublimate is a powerful antiseptic, and is employed to preserve anatomical preparations.

Amongst the most important tests for this substance, which is not unfrequently used as a poison, may be mentioned (1) iodide of potassium, which, when added to a crystal or to a watery solution of chloride of mercury, gives rise to the formation of

a bright scarlet iodide of mercury. (2) The galvanic test, which may be applied in various ways, of which the simplest is the 'guinea and key test,' devised by Wollaston. He placed a drop of the fluid suspected to contain corrosive sublimate on a guinea, and simultaneously touched it and the surface of the guinea with an iron key; metallic mercury was deposited on the gold in a bright silvery stain. (3) Precipitation on copper, and reduction. To apply this test we acidulate the suspected fluid with a few drops of hydrochloric acid, and introduce a little fine copper gauze, which soon becomes coated with mercury. On heating the gauze in a reduction tube the mercury is obtained in well-defined globules.

With iodine and bromine mercury forms two iodides and bromides, corresponding in composition to the chlorides. Both the iodides are used in medicine; the bromides are of no practical importance. The *subiodide*, Hg_2I_2 , is a green powder formed by triturating 5 parts of iodine with 8 of mercury, and is of far less interest than the *iodide*, HgI_2 , which is most simply obtained by precipitating a solution of corrosive sublimate by a solution of iodide of potassium. The precipitate is at first salmon-coloured, but soon changes into a brilliant scarlet crystalline deposit.

Sulphur forms two compounds with mercury—viz. a sub sulphide, Hg_2S , a black powder of little importance, and a sulphide, HgS , which occurs naturally as Cinnabar (q.v.). *Sulphide of mercury* is thrown down as a black precipitate by passing sulphuretted hydrogen through a solution of a persalt of mercury (corrosive sublimate, for example). When dried and sublimed in vessels from which the air is excluded, it assumes its ordinary red colour. The well-known pigment *vermilion* is sulphide of mercury, and is sometimes obtained from pure cinnabar, but is more frequently an artificial product.

Mercury unites with most metals to form Amalgams (q.v.), several of which are employed in the arts. Of the numerous organic compounds of mercury it is unnecessary to mention more than the Fulminate (q.v.) and the cyanide, HgCy , which may be prepared by dissolving the red oxide of mercury in hydrocyanic acid, and is the best source from which to obtain cyanogen.

The uses of mercury are so numerous that a very brief allusion to the most important of these must suffice. It is employed extensively in the extraction of gold and silver from their ores by the process of amalgamation. Its amalgams have been largely employed in the processes of silvering and gilding, and some (as those of copper and cadmium) are employed by the dentist for stopping teeth. It is indispensable in the construction of philosophical instruments, and in the laboratory in the form of the mercurial bath, &c. It is the source of the valuable pigment vermilion. The use of its chloride in anatomical preparations has been already noticed; it is similarly found that wood, cordage, and canvas, if soaked in a solution of this salt (1 part to 60 or 80 of water), are better able to resist decay when exposed to the combined destructive influence of air and moisture.

MEDICINAL USES OF MERCURY AND MERCURIALS.—Metallic mercury is used in medicine in a state of very fine division in the form of gray powder, blue pill, mercurial ointment, and other preparations. It is also used as mercurous and mercuric oxides and salts. As with other metals, the mercurial preparations have a local action and an action after absorption into the blood. The intensity of the local action varies, however, with the individual preparation; the persalts being soluble in water, and hence capable of precipitating albumen at once, are very irritating, while the mercurous

salts and uncombined mercury, being insoluble in water, exert an effect only in so far as they are dissolved in the secretions. These differences in local action have a very great influence in determining their applications in medicine.

Locally, the various ointments, liniments, and plasters are used as stimulants, astringents, antiseptics, and parasitocides, the persalts are used as antiseptic lotions, while the protosalts are little employed locally, except Calomel (q.v.) in powder.

Absorption of mercurial preparations from the intestinal canal or skin takes place very readily, and in an hour or less the mercury may be detected in most of the secretions. After absorption into the blood all the preparations have the same action. In minute doses they act as alteratives, improving nutrition. In larger doses, such as are ordinarily used, they also exert profound alterative effects; but care must be exercised in their administration, otherwise symptoms of chronic poisoning are apt to ensue. These consist in excessive salivation, inflammation of the mouth and gums, and dyspepsia, while in severer cases caries of bone, nervous symptoms, a watery condition of the blood, albuminuria, cachexia, and other serious complications may occur. The mercurial preparations are given internally in syphilis, in serous inflammations, and in dropsy as diuretics. Certain of them, such as gray powder, blue pill, and calomel, are used as purgatives and as intestinal antiseptics.

The doses of the different preparations vary greatly, those of the persalts being very much smaller than in the case of the other preparations. Some persons are peculiarly susceptible to the action of mercurials, and show symptoms of chronic poisoning after very small amounts.

With regard to acute mercurial poisoning, this is due to irritation of the intestinal canal, and is only seen with the soluble salts when taken in over-doses. The perchloride (corrosive sublimate) has been most frequently employed for the purpose of poisoning. The symptoms come on immediately, with a burning pain in the throat and violent pain in the abdomen, with severe vomiting and purging. There is always a good deal of collapse. Albumen, in the form of white of egg, is the best antidote.

Mercury, Dog's (*Mercurialis*), a genus of plants of the natural order Euphorbiaceæ. The Common Dog's Mercury (*M. perennis*) is very common in woods and shady places in Britain. It has a perfectly simple stem, about a foot high, with rough ovate leaves, and axillary loose spikes of greenish flowers. It turns a glaucous black colour in drying, and the root contains two colouring substances, one blue and the other carmine. It is very poisonous. The mercury which some old writers mention as a potherb is not this plant, but English Mercury, or Wild Spinach (*Chenopodium bonus-Henricus*). Annual Dog's Mercury (*M. annua*) is a much rarer British plant, and less poisonous. The leaves are indeed eaten in Germany as spinach. A half-shrubby species (*M. tomentosa*), found in the countries near the Mediterranean, has enjoyed an extraordinary reputation from ancient times; the absurd belief mentioned by Pliny being still retained, that if a woman after conception drink the juice of the male plant she will give birth to a boy, and if of the female plant her offspring will be a girl.

Mercy, SISTERS OF. See SISTERHOODS.

Mer de Glace. See ALPS, GLACIER.

Meredith, GEORGE, novelist and poet, was born in Hampshire, 12th February 1828, and made his first appearance as a poet with 'Chillianwallah' in *Chambers's Journal* for July 1849. This was followed in 1851 by a little volume of *Poems*, and in

1855 by *The Shaving of Shagpat: an Arabian Entertainment*, a highly original tale, in burlesque imitation of the manner of the Eastern story-teller. It shows a rich and brilliant imagination, and abounds in passages of tender feeling as well as of boisterous humour, but the incidents are involved and the machinery complicated, and reading is also made difficult by tantalising suggestions of hidden meanings which constantly elude one's grasp. In 1857 appeared *Farina: a Legend of Cologne*, a short story, reflecting the influence of German romance, which it partly imitates and partly parodies. The series of Mr Meredith's greater and more characteristic works began in 1859 with *The Ordeal of Richard Feverel: A History of a Father and a Son*, a tragic romance, dealing with the larger problems of education, especially in its ethical aspects. The novel of *Evan Harrington*, an amusing comedy of social ambitions, followed in 1861. *Modern Love*, and *Poems of the English Roadside, with Poems and Ballads*, was published in 1862, 'Modern Love' being the title of a sequence of fifty sonnet-like poems which tell their story in a somewhat dark and fragmentary manner, but with great truth of observation and strength of pathos. *Emilia in England* (1864), now known as *Sandra Belloni*, has for its subject one of Meredith's most fascinating and original characters; it is continued in *Vittoria* (1866), the scene of which is laid in Italy at the time of the political risings of 1848. In 1865 had appeared *Rhoda Fleming*, like *Richard Feverel* a tragedy; the romantic *Adventures of Harry Richmond* followed in 1871. *Beauchamp's Career* (1875) is perhaps the most perfectly constructed of all the series. *The Egoist* (1879) is a searching and remorseless study of a single aspect of refined selfishness. *The Tragic Comedians* (1881), originally published in the *Fortnightly Review*, is a somewhat close rendering of the well-known painful story of Lassalle's tragic end, founded upon the reminiscences of the Countess Racowitza. *Diana of the Crossways* (1885), also based on actual history, is by general consent the most charming of Mr Meredith's novels. A new novel, entitled *One of our Conquerors*, was begun in the *Fortnightly Review* in October 1890. Mr Meredith's recent poetry is to be read in three small volumes entitled *Poems and Lyrics of the Joy of Earth* (1883), *Ballads and Poems of Tragic Life* (1887), and *A Reading of Earth* (1888).

Though it be admitted that Meredith is the foremost novelist of the day, and one of the most invigorating and stimulative thinkers of his generation, it can by no means be said that he is the most widely read, or that the voice of the great public has as yet been unanimously given in his favour. This distinction, however, he has, that 'among the crowd of persons of taste and understanding who agree to crown Meredith a royal writer, his most resolute partisans are those of his own household—journalists, poets, and novelists, students of the art of fiction and practitioners of the noble English tongue.' Among the elements of his power may be enumerated his wide, accurate, and sympathetic observation both of nature and of life, his inventive resource, his analytic and synthetic power, and his mastery of words. His descriptions of scenery are varied, vivid, and full of poetry, his delineations of phases of feeling, and especially of tender feeling, those of a master. Few writers have created so many characters of ideal beauty, who are at the same time so thoroughly human and marked by the strongest individuality—real, breathing, talking personalities, whom the reader feels it a joy to have known. Among the 'defects of his qualities' may be mentioned a certain intricacy of plot, or rather perhaps want of clearness in working it out,

arising from an exaggerated reticence; also a frequent over-elaboration of style and strainedness of wit that fatigues rather than exhilarates. And, though he is never 'sensational,' there is often a certain disregard of probability in the situations he invents. It is believed that Mr Meredith is, for the present at least, more extensively read by men than by women; and this, if a fact, may perhaps be partly accounted for by the purpose which he has so deliberately expressed, and so consistently, carried out, of bringing philosophy into the domain of fiction. Much of his writing deals more or less directly, in a serious manner, with the most important problems of politics, sociology, and ethics. It is in his poetry that his deepest views of life really find their directest and most elementary expression. There is a study by Le Gallienne, *George Meredith: some Characteristics*, with a bibliography by John Lane (1890).

Merganser (*Mergus*), a genus of birds of the family Anatidae, having a long, rather slender, straight bill hooked at the tip and notched at the edges. The genus embraces six species, nearly all inhabitants of the seas and coasts, and distributed over the northern regions of the Old and New World, and in Brazil and the Auckland Islands. The Goosander (q.v.) is the largest and best-known British species. The Red-breasted Merganser (*M. serrator*) is resident in Scotland, where it breeds not only on the coasts of Ross, Sutherland, and the Hebrides, where it is abundant, but also on inland lochs and rivers. Its migrations extend southward to the lakes of Algeria and to Egypt. The Hooded Merganser (*M. cucullatus*), a smaller species, is a very rare visitor of Britain. It is found in North America, from the St Lawrence to Alaska, where it migrates as far south as Mexico, Cuba, Bermudas, and the Carolinas. The Nun or Smew (*M. albellus*) is a smaller species, passing the summer in the northern parts of the Old and New World, and ranging in winter as far south as India. Another species (*M. australis*) has as yet been found only in the Auckland Islands.

Mergui, a seaport of Burma, on an island in the Tenasserim River, 2 miles from its mouth, with a harbour admitting vessels drawing 18 feet of water. Its trade is worth altogether close upon £100,000 a year. Exports, rice, timber, dried fish; imports, cotton goods, silk, and tea. Pop. 8633. —The district of Mergui, 200 miles long by 40 wide, is the southernmost in Burma. Area, 7810 sq. m.; pop. (1881) 56,559.

Mergui Archipelago, a group of islands in the Gulf of Bengal, lying off the southern provinces of Burma; they are mountainous, some rising to 3000 feet, of picturesque beauty, and sparsely inhabited by a race called the Selungs, who barter edible birds'-nests with the Burmese and Malays for rice and spirits. Caoutchouc abounds. Snakes and tigers, rhinoceros, deer, &c. are plentiful.

Merida (anc. *Augusta Emerita*), a decayed town of Spain, on the right bank of the Guadiana, 38 miles by rail E. of Badajoz. It is remarkable for its Roman remains, which include a bridge of 81 arches, 2575 feet long and 26 feet broad, erected by Trajan; the ruins of half a dozen temples, of an aqueduct, a circus, a theatre, a naumachia, a castle, and the Arch of Santiago, 44 feet high, built by Trajan. There is also an old Moorish palace. Merida was built in 23 B.C., and flourished in great splendour as the capital of Lusitania. In 713 it was taken by the Moors, who lost it to the Spaniards in 1229. Pop. 7390.

Merida, (1) capital of the Mexican state of Yucatan, is situated on a barren plain, 25 miles S. of Progreso, on the Gulf of Mexico, and 95 miles

NE. of Campeachy. It occupies the site of a former native city, and was founded by the Spaniards in 1542. Merida has a cathedral and thirteen churches, a university, seminary, girls' high school, and conservatory of music, an antiquarian museum, a public library, hospital, almshouse, and foundling asylum. Its trade is not extensive. Pop. 32,000.—(2) A town of Venezuela, capital of Los Andes state, lies 5290 feet above sea-level, at the foot of the Sierra Nevada de Merida, and 70 miles S. of the lake of Maracaybo. Founded in 1558, it was almost wholly destroyed by an earthquake in 1812. It is the seat of a bishop, contains a university and several higher schools, and has manufactures of carpets and woollen and cotton stuffs. Pop. 10,750.

Meriden, a city of Connecticut, 19 miles by rail N. by E. of New Haven, with a number of manufactories of metal wares, cutlery, firearms, woollens, &c. Meriden contains the state reform school. Pop. (1880) 15,540; (1890) 21,652.

Meridian (Lat. *meridies*, 'mid-day'), the name given to the great circle of the celestial sphere which passes through both poles of the heavens, and also through the zenith and nadir of any place on the earth's surface. Every place on the earth's surface has consequently its own meridian. The meridian is divided by the polar axis into two equal portions, which stretch from pole to pole, one on each side of the earth. It is mid-day at any place on the earth's surface when the centre of the sun comes upon the meridian of that place; at the same instant it is mid-day at all places under the same half of that meridian, and midnight at all places under the opposite half. All places under the same meridian have therefore the same longitude (see LATITUDE AND LONGITUDE, where the question of the First Meridian is discussed). Stars attain their greatest altitude when they come upon the meridian; the same thing is true approximately of the sun and planets; and as at this point the effect of refraction upon these bodies is at a minimum, and their apparent motion is also more uniform, astronomers prefer to make their observations when the body is on the meridian. The instruments used for this purpose are called *meridian circles*. See MURAL CIRCLE.

Meridian Measurement.—Two stations, having nearly the same longitude, are chosen; their latitude and longitude are accurately determined (the error of a second in latitude introduces a considerable error into the result), and the direction of the meridian to be measured ascertained; then a base line is measured with the greatest accuracy, as an error here generally becomes increased at every subsequent step; and then, by the method known as Triangulation (q.v.), the length of the arc of the meridian contained between the parallels of latitude of the two stations is ascertained. As the previously found latitudes of its two extremities give the number of degrees it contains, the average length of a degree of this arc can be at once determined. This operation of meridian measurement has been performed at different times on a great many arcs lying between 68° N. lat. and 38° S. lat., and the results show a steady though irregular increase in the length of the degree of latitude as the latitude increases. On the supposition that this law of increase holds good to the poles, the length of every tenth degree of latitude in English feet is as follows:

Degree of Latitude.	Length of Degree in English Feet.	Degree of Latitude.	Length of Degree in English Feet.
0°	362,732	50°	364,862
10°	362,843	60°	365,454
20°	363,158	70°	366,937
30°	363,641	80°	368,252
40°	364,233	90°	368,361

This result shows that the earth is not spherical, as in that case the length of all degrees of latitude would be alike, but of spheroidal form—its curvature becomes less as we go from the extremity of its greater or equatorial diameter to the pole. See EARTH.

Meridian, capital of Lauderdale county, Mississippi, 135 miles by rail N. by W. of Mobile, contains a foundry and machine-shop, a cotton factory, and manufactories of blinds and sashes, furniture, &c. Pop. (1890) 10,624.

Mérimée, PROSPER, a great French writer, was born at Paris, 28th September 1803, the son of a well-known painter. He was educated at the Collège Charlemagne, and tried law, but soon abandoned it. He was in Spain during the revolution of 1830, and after his return became attached to the government, and held office successively in the ministry of Marine, of Commerce, and of the Interior, becoming finally Inspector of Historical Documents, in which capacity he visited the south and west of France, Auvergne, and Corsica. He had been long an intimate friend of the Countess Montijo, mother of the Empress Eugénie, and consequently enjoyed the closest intimacy with the imperial family at the Tuilleries, Compiègne, and Biarritz, yet without surrendering his independence of spirit and frankness of speech. Admitted to the Academy in 1844, he became a senator in 1853, and in 1858 president of the committee for reorganising the Bibliothèque Impériale. His last years were clouded by ill-health and melancholy, and the misfortunes of his country and the downfall of the imperial house hastened on his death, at Cannes, 23d September 1870.

Mérimée began his career as a writer at twenty-two by an audacious literary *espéçlerie*, entitled *Théâtre de Clara Gazul*, a collection of Spanish plays of singular maturity, represented as translated by Joseph L'Estrange, with his own portrait in female dress as frontispiece. A volume of pretended translations of Illyrian folk-songs, by an imaginary Hyacinthe Maglanovitch, followed in 1827, under the title *Guzla*. His more important works embrace novels and short stories, archaeological and historical dissertations, and travels, all of which display wide and exact learning, keen observation, strong intellectual grasp, grave irony and real humour, and withal a style that attains an exquisiteness of perfection rare even among the best French writers. Ever the refined and elegant scholar, he wrote, rather than affected to write, as a dilettante—'le gentleman auteur' as he was styled by his own countrymen. Of his more erudite works it may here be enough to name his *Histoire de Don Pedro I., Roi de Castille* (1848; Eng. trans. 1849); *Études sur l'Histoire Romaine* (1844); *Les faux Démétrius* (1852); *Monuments historiques* (1843); and *Mélanges historiques et littéraires* (1855). But his greatest work is his tales, about twenty in number, some of which are among the rarest masterpieces of the story-teller's art: *Colomba*, *Mateo Falcone*, *Carmen*, *La Venus d'Ille*, *Lokis*, *Arsène Guillot*, *La Chambre Bleue*, and *L'Abbé Aubain*. One of the most remarkable merits of some of these stories, as *La Venus d'Ille* and *Lokis*, is the dexterous manner in which an uncanny superstition is turned to artistic use.

Mérimée's character remains somewhat of an enigma, with its outward mask of cynicism, its inward capacity for the most tender and devoted friendship, its longing for the love of little children. In his constant struggle against impulse and enthusiasm he succeeded, but, as he himself says of Saint-Clair in the *Vase Étrusque*, the victory cost him dear. Few lives have been more solitary and unhappy than Mérimée's, at once from a

paralysing distrust of himself and of others, and from the constitutional melancholy of the sceptic to whom the world is only a series of incomprehensible and fleeting images, and who mistrusts life and death alike. He was one of the few men who have drawn their unbelief from mother and father alike. No great writer has left a more remarkable monument than the famous *Lettres à une Inconnue* (1873; Eng. trans., edited by R. H. Stoddard in Scribner's 'Bric-a-Brac' series), the revelation of a heart throughout an acquaintance, first of love, then of friendship, extending over thirty years. Here we find no selfish cynic, but a man gracious, affectionate, delicate, touched with poetry despite his scepticism, faithful and loyal unto death—his last words were written but two hours before the end. The unknown lady's actual existence has been questioned, and she has been doubtfully identified with the Countess Lise Przedzrska, sister of the Marquis de Noailles. What professed to be her letters in reply were published in 1888, but without any explanation being offered; an English translation of these followed in two volumes in 1889. Only less interesting than the first series are the *Lettres à une autre Inconnue* (1875), and the *Letters to Panizzi* (edited by Louis Fagan, 2 vols. 1881), full of lively gossip and clever criticism.

See the *Studies* by Tamisier (Mars. 1875) and Haussonville (1888); also *Tourneaux, Prosper Mérimée, ses Portraits, ses Dessins, &c.* (1879).

Merino (Span.), an important breed of Sheep (q.v.). See also WOOLLEN MANUFACTURE.

Merioneth, a triangular county of Wales, with a maximum length and breadth of 45 miles by 30, a seaboard of 38 miles, and an area of 602 sq. m., or 385,219 acres, is bounded on the N. by the counties of Carnarvon and Denbigh, E. and S. by Montgomeryshire and the river Dovey, and W. by Cardigan Bay. Pop. (1801) 27,506; (1841) 39,332; (1891) 49,204. Cliffs alternating with low-lying sands skirt the coast, which at some distance out to sea is fringed by dangerous sandbanks. Inland, the surface, although nowhere attaining such an altitude as that of Carnarvonshire, is rugged and mountainous in the extreme, interspersed in places with picturesque valleys, lakes, and waterfalls. Aran Mowdddy (2970 feet), Cader Idris (q.v., 2914), and Aran Benllyn (2902) are the highest peaks; Bala the largest lake; whilst of rivers the principal are the Dee, which flows north-east, and the Dovey and Mawddach, which reach the sea after a south-west course. The soil generally is poor, and large tracts are unfit for profitable cultivation, the total extent of land in crop in 1889 only amounting to 160,817 acres, of which 128,021 acres were in permanent pasture. Great numbers of sheep are bred, and flannels and woollens to some extent manufactured, but the principal wealth of the county arises from its mineral products. Slate and limestone are largely quarried, much manganese ore is produced, and from mines in the vicinity of Dolgelly and Bala 3890 oz. of gold of the value of £13,227 were in 1889 obtained. Merioneth, which contains no municipal boroughs, is divided into five hundreds, and thirty-three civil parishes, partly in the diocese of Bangor, and partly in that of St Asaph. For judicial purposes it is in the North Wales circuit, Dolgelly being the assize town, and it sends one representative to the House of Commons. The County Council numbers fifty-six members, and the principal towns, other than the foregoing, are Bala, Barmouth, Corwen, Festiniog, Harlech, and Towyn.

Meristem, the formative tissue of plants, is distinguished from the permanent tissues by the power its cells have of dividing and forming new

cells. Meristem forms the tissue of embryo plants, and of apexes of stems and roots.

Merivale, JOHN HERMAN, an English scholar and translator, was born at Exeter in 1779, the grandson of Samuel Merivale (1715-71), a worthy Presbyterian minister at Tavistock. He was sent to St John's College, Cambridge, and was called to the bar in 1805. He contributed largely to Bland's *Collections from the Greek Anthology* (1813), and brought out a second edition himself in 1833. From 1831 to his death in 1844 he held the office of Commissioner of Bankruptcy. Works of no little merit were his *Poems, Original and Translated* (1841), and *Minor Poems of Schiller* (1844).—CHARLES, son of the preceding, was born in 1808, and educated at Harrow, Haileybury, and St John's College, Cambridge, where he took his degree in 1830, and became in due course fellow and tutor. He was successively select preacher at Cambridge (1838-40) and at Whitehall (1839-41), Hulsean lecturer (1861), and Boyle lecturer (1864-65). From 1848 to 1869 rector of Lawford in Essex, he was chaplain to the Speaker from 1863 to 1869, when he was appointed dean of Ely. His chief works are the *Fall of the Roman Republic* (1853), a brilliant sketch, marred only by its over-indulgence to imperialism, the sole fault of his admirably learned and eloquent *History of the Romans under the Empire* (7 vols. 1859-62). Later books are a serviceable *General History of Rome* (1875), *Early Church History* (1879), and *The Contrast between Pagan and Christian Society* (1880).—Another son, HERMAN, born in 1806, was educated at Harrow and Trinity College, Oxford, elected Fellow of Balliol, called to the bar in 1832, and appointed professor of Political Economy at Oxford in 1837, and, later, permanent Under-secretary of State first for the colonies, next for India. In 1859 he was made C.B. He died on February 8, 1874.—His son, HERMAN CHARLES, born in 1839, has written a number of successful plays, including *Forget-Me-Not*, *The Butler* and *The Don*, and *The Master of Ravenswood*. Besides a novel, *Faust of Balliol* (1882; in its stage form, *The Cynic*), he has published *The White Pilgrim and other Poems* (1883), and other works. See the privately printed *Family Memorials*, compiled by Anna W. Merivale (1884).

Merle D'Aubigné. See D'AUBIGNÉ.

Merlin, the name of an ancient British prophet and magician, who is supposed to have flourished during the decline of the native British power in its contest with the Saxon invaders. The prophetic child Ambrosius first mentioned by Nennius in his *Historia Britonum* was confounded with Ambrosius Aurelianus, the conqueror of Vortigern, and subsequently the resulting Merlin Emerys or Ambrosius was confounded with the Merlin called Silvestris or Caledonius. It is as the subject of one of the cycle of Arthurian romances that Merlin's name has survived. The Cambrian Merlin is said by Geoffrey of Monmouth, in his *Historia Britonum* and *Vita Merlini*, to have lived in the 5th century, to have sprung from the intercourse of a demon with a Welsh princess, to have been rescued from his malignant destiny by baptism, and to have displayed the possession of miraculous powers from infancy. The adventures of Merlin were taken, with additions from Armorican and other sources, from the Latin of Geoffrey, and made popular in the French language by Robert Wace and Robert de Borron. Henry Lonelich's English verse translation is in the library of Corpus Christi College, Cambridge. The analysis of the romance of Merlin in Ellis's *Specimens of Early English Metrical Romances* was made from the MS. in Lincoln's Inn Library. There is a MS. in the Advocates' Library,

Edinburgh, and one in Bishop Percy's folio MS. (printed in 1867). The prose romance is longer and more important than the metrical one. *Merlin, Roman en Prose du XIII^e Siècle*, was published by the Société des Anciens Textes Français in 1886, and the Early English Text Society published under the editorship of the present writer in 1865-69 *Merlin, or the Early History of King Arthur about 1450-60*, printed from the MS. in the Cambridge University Library. Merlin is frequently alluded to by our older poets, especially by Spenser, and his story occupies a prominent position in Tennyson's *Idylls of the King*. A collection of prophecies attributed to Merlin appeared in French (Paris, 1498), in English (Lond. 1529 and 1533), and in Latin (Venice, 1554); and their existence is traceable at least as far back as the middle of the 14th century. The Strathclyde, or—if we may be allowed an expression which anticipates history—the *Scottish Merlin*, called Merlin the Wyllt, or Merlin Caledonius, is placed in the 6th century, and appears as a contemporary of St Kentigern, Bishop of Glasgow. His grave is still shown at Drummelzier on the Tweed, where, in attempting to escape across the river from a band of hostile rustics, he was impaled on a hidden stake. A metrical life of him in Latin, extending to more than 1500 lines, professedly based on Armorican materials, and incorrectly ascribed to Geoffrey of Monmouth, was published by the Roxburghe Club in 1833. His prophecies—published at Edinburgh in 1615—contain those ascribed to the Welsh Merlin.

Merlin. See FALCON.

Mermaids and **Mermen**, in the popular folklore of Europe, a class of beings more or less like men, living in the sea, but in some circumstances capable of social relationships with men and women. The typical mermaid has the head and body of a lovely woman to the waist, ending in the tail of a fish with fins and scales. She has long and beautiful hair, and is often seen above the surface of the water, combing it with one hand while in the other she holds a mirror. She often discloses what is about to happen, and not seldom gives supernatural knowledge and powers to a favoured mortal—a thing in perfect keeping with primitive notions of sorcery, which easily attributed exceptional powers to beautiful women, as Lilith and Circe. Again, she sometimes exercises a special guardianship over an individual, and avenges his wrongs; but her relation to man most often brings with it disaster. There are many stories of mermaids who have fallen in love with men, or been detained through the possession of the skin which they had stripped to dance on the shore, and who have been faithful wives and mothers until they found an opportunity to return to the sea. And there are examples of the converse case of a mermaid falling in love with a man and enticing him to go and live with her under the sea, as well as of a merman bewitching and carrying off a mortal maiden.

Such are the principal forms of mermaid stories found everywhere, with more or less artistic elaboration. The Danish *Hafmand* or *Maremind*, the Irish *merrrow* or *merruach*, the Breton *Marie-Morgan*, the Russian *rusalka* or stream-fairy and *vodyany* or water-sprite, some forms of the Teutonic *nixies*, and the enchanting Sirens of classical mythology have all close affinities with each other in the dangers they bring to men, the beauty and joyousness of their lives, and yet the gloom of sadness that overhangs them. In their malignant aspect they touch the general doctrine of Demonology (q.v.), and may be explained on an animistic theory of its origin. To the beauty of

the conception and the elaborations of which it is capable in the popular imagination we owe some of the loveliest of our folk-tales as well as such delightful artistic tales as *Undine* and many fine poems of the ages of literary culture. One of the most detailed stories of this class is that of Melusine (q.v.). The mermaid had a firm hold of the imagination of our fathers, and, besides the witness of heraldry, we have stories supported by excellent evidence of their appearance and capture. One caught at Edam in 1403 was carried to Haarlem and kept there many years. She learned to spin and showed a becoming reverence for the cross. See Baring-Gould's *Popular Myths of the Middle Ages*, and Sébillot's *Contes des Marins* (1882).

Mermaid's Purse, the popular name of the egg-case of the skate (or of some other cartilaginous fish), which is often cast up empty on the shore.—*Mermaid's Gloves* is a very common British sponge, *Chalina oculata*.

Merodach. See BABYLONIA, Vol. I. p. 637.

Meroë. See ETHIOPIA.

Meropidae. See BEE-EATER.

Merovingians, or **MERWINGS**, the first dynasty of Frankish kings in Gaul. The name is derived from Merwig or Merovech, king of the western or Salian Franks from 448 to 457. His grandson Clovis (q.v.) established the fortunes of the dynasty which gave way to the Carolingians (q.v.) in 752. See FRANCE, FRANKS.

Merrimac, a river rising among the White Mountains of New Hampshire, flowing south into Massachusetts, and falling into the Atlantic Ocean near Newburyport, after a course of 150 miles. It has numerous falls, affording immense water-power. The principal manufacturing towns on its banks are Manchester, Nashua, and Concord in New Hampshire, and Lowell and Lawrence in Massachusetts. It is navigable to Haverhill.

Merseburg, a town of Prussian Saxony, on the Saale, 8 miles S. of Halle. Its Domkirche is a four-towered pile, with Romanesque choir (1042), transept (circa 1274), and 16th-century nave—the whole restored in 1884-86. The organ (1666) has 4000 pipes; and there is a very early bronze effigy in low relief of Rudolph of Swabia, who here was defeated and slain by Henry IV. in 1080. The castle, a picturesque edifice, mostly of the 15th century, was once the bishop's palace, and afterwards (1656-1738) the residence of the dukes of Sachsen-Merseburg. Beer, iron, paper, &c. are manufactured. Pop. (1875) 13,664; (1885) 16,828. Henry the Fowler in 934 gained his great victory over the Hungarians near Merseburg, which suffered much in the Peasants' War and in the Thirty Years' War.

Mersenne, MARIN, a constant friend of Descartes, was born in 1583, and died at Paris in 1648. He was a fellow-student of Descartes at the Jesuit college of La Flèche, and took the habit of a Minim Friar in 1611; his life thereafter was spent in study, teaching in convent-schools, and travel. He did valiant battle with numerous clerical controversialists on behalf of the orthodoxy of the philosophy of Descartes, and wrote vigorously against atheists and other unbelievers. His profound knowledge of mathematics is seen in a number of books, and in his *Harmonie Universelle* (1636), an invaluable contribution to the science of music.

Mersey, an important river of England, separates, in its lower course, the counties of Chester and Lancaster, and has its origin in the junction of the Etherow and Goyt, on the borders of Derbyshire, east of Stockport. It flows in a west-south-west direction, and is joined on the right

by the Irwell 6 miles below Manchester, from where it was made navigable to Liverpool for large vessels in the year 1720, and has had great influence on the subsequent progress of the two towns. Besides the Irwell the chief affluents are the Bollin and the Weaver from Cheshire. At its junction with the Weaver the Mersey expands into a wide estuary which forms the Liverpool channel. The estuary is about 16 miles long and from 1 to 3 miles broad; opposite Liverpool it is a mile and a quarter in width, with a considerable depth at low-water. In this estuary on the Cheshire side is the entrance to the Manchester Ship-canal. The estuary is much obstructed by sandbanks, but the excellent system of pilotage in practice, combined with the skilful and admirable construction of the sea-walls, renders the navigation comparatively secure. Entire length, with the estuary, 70 miles. A tunnel connecting Liverpool and Birkenhead by railway carried beneath the estuary has been in successful operation since January 20, 1886. The alluvial meadows on the banks of the Mersey are famous for their fertility, and in recent years, by embanking the river at points where it overflowed after heavy rains, many thousands of acres of the most valuable land in the two counties have been reclaimed. The basin of the Mersey extends over an area of 1706 sq. m., which includes the larger portion of Lancashire and Cheshire.

Merthyr-Tydvil or **Tydfil** (so called from the martyrdom here of a Welsh princess of that name), a parliamentary borough and market-town of South Wales, on the confines of the counties of Glamorgan and Brecknock, 24 miles N. by W. of Cardiff, its port, and 178 W. of London. Pop. (1801) 7705; (1891) 58,080. Surrounded by lofty and bleak hills, the town stands on the banks of the river Taff, and is partly built on slag foundations, the refuse of mines in the vicinity. Its streets are for the most part narrow and irregularly built, and the public buildings of little architectural interest, but of late years—since the formation of a Local Board of Health in 1850—great improvements have been effected in the widening of thoroughfares, the supply of pure water, and the construction of effective sewage-works: previously all sanitary arrangements were entirely neglected, and as a result epidemics of great severity were of frequent occurrence. The civil government of the town (which extends over the outlying districts of Dowlais and Penydarren) is vested in a high constable, who is elected annually. The sole industries, upon which the whole population is more or less directly dependent, arise from the numerous collieries and iron and steel works in the vicinity; Merthyr being the centre of the Glamorganshire coalfield, and as such having excellent railway communication with all parts. With Aberdare it is noted for the excellence of its steam coal, and the quantity of iron and steel annually turned out from the great works of Dowlais, Cyfarthfa, and Plymouth is enormous. In 1816, and again in 1831, the town was the scene of severe riots, on the latter occasion the disturbance not being quelled by the military without a loss of twenty-three lives. For the parliamentary borough (1867), which embraces Aberdare and two other outlying districts, and in 1891 had a population of 104,008, two members are returned.

Merton, LOWER, a village of Surrey, 10 miles SW. of London by rail, stands on the Wandle, and has several factories. Only a fragment remains of the Augustinian priory (1115) in which the parliament met which passed, in 1235, the Statute of Merton (see LEGITIMATION). Here were educated Thomas Becket and Walter de Merton, Bishop of

Rochester and Chancellor, who in 1264 founded Merton College, at Oxford. The church is mainly of the same date as the priory. Pop. of parish, 2480.

Meru, in Hindu Mythology, a fabulous mountain in the centre of the world, 80,000 leagues high. It is the most sacred of all mythical mountains, and the abode of Vishnu.

Merv, an oasis of Turkestan, lying between Bokhara and the north-eastern corner of Persia, 512 miles by rail (opened in July 1886) from the Caspian and 118 from the Oxus. The oasis consists of a district 60 miles long by 40 broad, watered by the river Murghab, grows wheat, sugar grass, cotton, and silk, has a hot, dry climate, and is inhabited by half a million (O'Donovan; the Russians say less than a quarter million) Tekke Turkomans. The people live scattered over the country. But there is an old citadel, Kaushid Khan Kala, and adjoining it a new Russian fort garrisoned by nearly 3000 men; on the opposite bank of the Murghab a new Russian town is growing up, several Armenian merchants having settled on the spot and monopolised the trade, worth about £150,000 a year. The men are clever workers in silver, and breed horses, camels, and sheep; the women weave silk and make carpets. Merv or Mouru is mentioned in the *Zend Avesta*. There Alexander the Great built a town. The oasis was held successively by the Parthians and the Arabs, who made the city of Merv capital of Khorassan. It was the seat of a Nestorian archbishop in the 5th century, and of a Greek archbishop in the 14th; and in the 8th it was the headquarters of Mokanna (q.v.), the 'Veiled Prophet of Khorassan.' Under the Seljuk Turks Merv enjoyed its period of greatest splendour, especially under Sultan Alp Arslan. It began to fall into ruin after being taken and sacked by the Mongols in 1221. From the Uzbeks it passed in 1510 to the Persians, who lost it in 1787 to the emir of Bokhara. In 1856 the Turkomans made themselves masters of the oasis; but they in turn submitted to the Russians in 1883, who built the railway from the Caspian to the Oxus, passing through the oasis. Merv occupies an important strategic position at the intersection of the routes Bokhara-Meshhed and Khiva-Herat.

See Marvin, *Merv* (1880); O'Donovan, *Merv Oasis* (2 vols. 1882); Lansdell, *Russian Central Asia* (1885), and *Russians at Merv and Herat* (1883).

Méryon, CHARLES, etcher, was born at Paris, the son of an English physician, in 1821, and died insane at Charenton Asylum, 13th February 1868. His sombre and imaginative etchings of streets and buildings in Paris are highly esteemed by connoisseurs, especially the 'Abside de Notre Dame,' 'Rue des Mauvais Garçons,' and 'Stryge.' See Wedmore in *Nineteenth Century* (1878) and *Art Journal* (1881), and Burty's monograph (1879).

Mesagna, a town in Southern Italy, 12 miles SW. of Brindisi, grows good olive-oil. Pop. 9601.

Mesembryaceæ, or FICOIDEÆ, a natural order of calycifloral dicotyledonous plants, comprising succulent shrubs, herbaceous perennials, and annuals with opposite leaves. In many species the latter are of curious and fantastic shape, especially in those of the typical genus *Mesembryanthemum*. The order contains sixteen genera and over 400 species, the larger number of the latter belonging to *Mesembryanthemum*. They are inhabitants of warm regions chiefly, most of them being found at the Cape of Good Hope and in the South Sea Islands. The typical genus is also the most important in regard to utility and beauty. It furnishes the Ice Plant (q.v.) of our gardens, and many other beautiful and curious

species are to be met with in our greenhouses. *M. nodiflorum* is employed in the manufacture of Morocco leather, and furnishes abundance of alkali. The Kou of the Hottentots is *M. emarcidum*, the roots, stems, and leaves of which they collect and beat and twist together, and then ferment, for the purpose of chewing to allay thirst. If chewed immediately after fermentation it is narcotic and intoxicating. It is the Canna Root of the Cape colonists. The Hottentot's Fig (*M. edule*) is abundant on the sandy plains of the Cape of Good Hope, and the fruit is eaten when ripe. The leaves are eaten also when young and fresh, and when somewhat older are pickled in vinegar. The juice of the plant has some reputation as a cure for dysentery and thrush in children, and as an external application for burns. The fruit of *M. equilaterale* is named Pigs'-faces in Australia, and is eaten by the natives; that of *M. geniculiflorum* is ground into flour in Africa and made into bread, as is that of the Ice Plant. The Flower of Crete is the seed-vessel of *M. tripolium*, which in the rainy season expands in the form of a star, allowing the seeds to escape. The name should be spelled Mesembriaceæ, as it is from the Gr. *mesēmbria*, 'mid-day,' because the flowers bloom usually at mid-day.

Mesentery (Gr. *meson*, 'middle;' *enteron*, 'the intestine') is the broad fold of peritoneum (the great serous membrane of the abdomen) which attaches the intestines (strictly the small intestine; for special names have been given to the corresponding structure in connection with the different parts of the large intestine) posteriorly to the vertebral column. It serves to retain the intestines in their place, while it at the same time allows the necessary amount of movement, and it contains between its layers the blood-vessels and nerves which pass to them, the lacteal vessels, and mesenteric glands. These glands are 100 to 150 in number, and are about the size of an almond. They exert an organising action on the contents of the lacteals, the chyle being more abundant in fibrine and in corpuscles after it has passed through them. The only disease of any importance affecting these glands is Tubercle (q.v.), which, when extensively developed in them, is sometimes called *tabes mesenterica*.

Meshhed ('the place of martyrdom,' also spelt *Meshe*d and *Mashhad*), the principal city of north-eastern Persia, the capital of Khorassan, and the centre of important trade routes. The city stands on a tributary of the Hari-Rud, 460 miles E. by N. from Teheran and 200 NW. of Herat, and has a beautiful appearance when seen from a distance. Above the walls, which are of great circuit, shine the gilded dome and minarets of one of the most splendid mosques of the East, that built above the tomb of Imam Riza, a follower of Ali, and the eighth imam of the Shiite sect. Meshhed is the sacred city of the Shiites, and is held in as much veneration by them as Mecca is by the Sunnite Moslems; it is visited every year by nearly 100,000 pilgrims. The city is bisected by a wide tree-shaded street, down the middle of which flows a muddy current between low stone walls. There is another handsome mosque, and several colleges and caravanserais. The people make excellent felt-rugs, carpets, swords, turquoise jewellery, velvet, and cotton and silk goods. Opium (£37,200), woollens and cottons, dried fruits, turquoises (£17,200) are exported to Russia, India, and Afghanistan, to the total value of £169,000. The imports consist of textiles, sugar, &c. from Russia (£110,400), textiles, &c. from Britain (£84,300), tea (£142,850), &c. from India (total, £184,600), and

miscellaneous goods from Afghanistan (£17,300) and from Turkey (£18,000). The Transcaspiian Railway *viâ* Merv is giving Russia the predominance in trade with Meshhed. The fixed population is about 50,000. Owing to its elevated situation (3055 feet), the city has a cold climate in winter; the summer temperature ranges from 76° to 92° F. Close by are the ruins of Tus, the old capital of Khorassan, where the celebrated poet Firdausi, Haroun-al-Raschid, and the Imam Riza were buried. See O'Donovan, *Merv Oasis* (1882), and J. Bassett, *Persia* (1886).

Meskoutin, or HAMMAM MESKOUTIN ('the Accursed Baths'), a place in Algeria, 48 miles (77 by rail) E. by N. of Constantine, with remarkable hot baths (203° F.), known to the Romans as *Aquæ Tibilitinæ*. They and the adjoining ferruginous and sulphureous springs (170°) are still used medicinally. The incrustations of carbonate of lime and clouds of steam, &c. give the region a very singular appearance.

Mesmer, FRIEDRICH ANTON or FRANZ, the founder of the doctrine of Animal Magnetism (q.v.), was born near Constance, 23d May 1734. He was bred for the priesthood at Dillingen and Ingolstadt, but took up the study of medicine at Vienna, and took his doctor's degree in 1766 with a treatise *De planetarum influxu*. About 1772 he began with a Jesuit, Hell, to investigate the curative powers of the magnet, and was led to adopt the opinion that there exists a power, similar to magnetism, which exercises an extraordinary influence on the human body. This he called animal magnetism, and published an account of his discovery, and of its medicinal value, in 1775. In 1778 he went to Paris, where he created a great sensation. His system obtained the support of members of the medical profession, as well as of others; but he refused an offer of an annual pension of 20,000 livres (about £800) to reveal his secret; and this, combined with other circumstances, gave rise to suspicion, and induced the government in 1785 to appoint a commission, composed of physicians and scientists (Bailly, Franklin, Lavoisier, &c.), whose report was unfavourable to him. He now fell into disrepute, and, after a visit to England, retired to Meersburg, in Switzerland, where he spent the rest of his life in complete obscurity. He died 5th March 1815. See his Life by J. Kerner (Frankf. 1856), and P. Anderson Graham's *Mesmer the Magnetiser* (1890).

Mesoderm. See EMBRYOLOGY.

Mesolonghi. See MISSOLOGHI.

Mesopotamia ('between the rivers'), the district between the rivers Tigris and Euphrates, extending from the foot of the Armenian mountains south-eastwards to near the neighbourhood of Bagdad. The name is the Greek equivalent of the old Aramaic (Syrian) Aram-Naharaim, and became current after Alexander's Asiatic conquests; the Arabs call the district El-Jezira ('the island'). It has an area of about 55,000 sq. m.; the surface is level and falls from an altitude of 1100 feet in the north-west to 160 feet in the south-east, where the alluvial region of Babylonia (Iraq) begins. The soil is sandy, but, when well watered or, as it was in ancient times, well irrigated, it develops extraordinary fertility. Yet since the Turks (Seljuks) made themselves masters of the region (1515) it has fallen more and more a prey to barrenness and neglect. Having been in the possession successively of the Assyrians, Babylonians, Persians, Greeks, Romans, Arabs, and Turks, and many a time and oft the battle-ground between the armies of these mighty empires, its records are full of stirring events and great changes and vicissitudes. Amongst the cities of

historic fame may be quoted Harran, Serug (Seruj), Apamea, Edessa, Nisibis, Nicephorium (Rakka), Hit (Is), Mardin, Mosul (Nineveh), Amid (Diarbekr), and Thapsacus. In biblical times this region was inhabited by prosperous Aramæan agriculturists. At the present time the population consists chiefly of semi-nomad Arabs and Kurds, who keep herds of camels, sheep, and goats, and grow wheat, barley, rice, millet, sesamum, besides cotton, tobacco, safflower, hemp, cucumbers, melons, and other fruits. There is little timber on the plains. Wild hogs, jackals, hyænas, foxes, and cheetahs, antelopes and gazelles, are common; but lions and wild asses, so numerous in antiquity, are now scarce. In summer excessive heat (up to 122° F.) prevails, whilst the winter is comparatively cool—the thermometer may go down to 14° F. A brief summary of the work of exploring ancient sites, and of sites still to be excavated, is given in the *Academy*, 12th June 1886. See articles on the empires and towns mentioned above; also TIGRIS, EUPHRATES, and works quoted there.

Mesozoa, a term applied by Van Beneden to a number of extremely simple animal parasites, found in cuttle-fishes, brittle-stars, and some worms. Their cells are in two layers, the inner forming reproductive elements; they have no mouth or gut, and are sometimes very like the larval forms (*planule*) of some jelly-fish and other stinging animals. The name refers to their apparent median position between the single-celled Protozoa and the many-celled Metazoa. See DICYEMIDÆ.

Mesozoic (Gr., 'middle-life'), a term introduced by Professor Phillips to designate the group of geological systems, the fossil remains of which differ equally from those of the Palæozoic ('ancient-life') and Cainozoic ('newer-life') eras. It is synonymous with the term Secondary, and includes the Triassic, Jurassic, and Cretaceous systems.

Mess (Fr. *mes*, Old Fr. *mes*, Ital. *messo*, 'a dish,' from Lat. *missum*, 'sent,' or 'served up') originally signified a dish or portion of food. In the British army and navy the men are divided into 'messes' of whatever number is most convenient for taking their meals together. Officers and sergeants also have their 'messes,' which, in addition to being 'common rooms' in which they take their meals, are much of the nature of clubs, having smoking, billiard, and reading rooms attached to them, and often libraries.

In the army each man, unless married, or for other reasons allowed to live out of mess, pays a daily rate of 5d. a day to his mess, which is managed by a non-commissioned officer under the supervision of an officer. For this sum he is provided with groceries, vegetables, puddings, and plates and mugs. A knife, fork, and spoon is part of his kit which he must always have with him. His rations ($\frac{1}{2}$ lb. of meat, including bone, and 1 lb. of bread per day) are given him free, but are drawn in bulk for the whole mess, the meat rations being cooked together and only distributed at dinner, which is eaten in the barrack-room where usually the members of the mess live. Tea and breakfast are similarly served. The men's washing is also managed by messes, and charged in the monthly mess accounts. One of the mess is told off as cook each day. He cleans the room, sets the table, and carries up and divides the dinner, but the actual cooking is done by trained cooks. *Sergeants' Messes* are managed by one of themselves under a committee of sergeants supervised by an officer, the adjutant if possible. There is a small entrance fee (usually three days' pay) and a monthly subscription for newspapers, &c. Some furniture is provided by government, but kitchen

and table requisites, carpets, pictures, &c. are purchased out of the mess funds.

Officers' Messes are very similar, but on a larger scale. Every officer on joining is charged an entrance fee of thirty days' pay towards the maintenance of the mess, and thirty days' difference of pay on promotion. Unless married or specially exempt, he must be a 'dining' member of the mess of his regiment—i.e. he pays the regulated price for his dinner whether he eats it or not; other meals, as well as wine, cigars, &c., are only charged if taken. All officers also pay a monthly subscription of two-thirds of a day's pay for single, and half that amount for married officers, towards keeping up the mess establishment, such as furniture, liveries, wages of servants, table-linen, &c. The only assistance received from government is £25 a year for each troop, battery, or company connected with the mess; but this is only at home and in some colonies. This sum was originally intended to allow each officer a glass of wine a day, but may be applied towards reducing the general expenses of the mess. The affairs of the mess are managed by a committee of officers presided over by the senior member. The usual cost of the meals is 2s. 4d. for dinner, without wine, 1s. for lunch, and 1s. for breakfast. The bills are paid monthly, and will generally amount to some £7 or £8, without wine, for each officer.

In the British navy there are in all ships as a rule, except in the smaller ones, four messes for officers: the ward-room, the gun-room, the engineers' mess, and the warrant-officers' mess. The ward-room includes all officers, below the captain (who messes by himself), who are above the rank of sub-lieutenant. The gun-room comprises the sub-lieutenants, midshipmen, cadets, junior assistant-paymasters, and clerks; the engineers' mess, all engineers not entitled to mess in the ward-room; the warrant-officers' mess, the gunner, boatswain, and carpenter. In troopships there is one general mess for all officers, naval and military, including the captain of the ship. The system of having one general mess has been tried in other ships, but it has been found impossible so far to arrange for a mess-place sufficiently large to allow of all the officers sitting down to their meals together. The separate mess-place for the engineer officers is, however, being gradually done away with, those engineers not entitled to mess in the ward-room messing in the gun-room. Among the ship's companies the chief petty-officers, first-class petty-officers, and the engine-room artificers have respectively their own mess-places, while the rest of the crew are divided off into messes, according to their numbers, the marines and stokers forming messes by themselves. Flag-officers and officers in command of ships can draw all their plate, glass, china, and linen from the dockyard, paying the Admiralty a percentage for the use of it. The officers of the other messes are supplied on commissioning with a complete set of mess-traps, linen, &c. free of charge, which they have afterwards to keep up at their own expense. All officers and men, admiral and second-class boy alike, are entitled to the same daily rations. Officers, however, are not compelled to take up their rations, but can take up as much or as little of it as they please, receiving instead a money allowance, which is paid into the mess-fund. The men, however, must take up two-thirds of their rations, but they can receive money in lieu of the remaining third. Rum is no longer served out to the officers, but the men still continue to receive their half-gill.

Messageries Maritimes, or in full, 'La Compagnie des Services Maritimes des Messageries,' a great French shipping company of Mar-

seilles, its headquarters, trading with the Levant and Black Sea, with eastern Asia and Australia, by way of the Suez Canal, and with Spain and Algiers.

Messalina, VALERIA, the daughter of Marcus Valerius Messala Barbatius, and wife of the Roman emperor Claudius, a woman infamous for her avarice, her lust, and her atrocious cruelty. Taking advantage of the weakness and stupidity of the emperor, she played the harlot without restraint, and murdered all who murmured at her gilded shame. The best blood of Rome flowed at her pleasure: among her victims were the daughters of Germanicus and Drusus, Justus Catonius, M. Vinicius, Valerius Asiaticus, and her confederate Polybius. During a temporary absence of the emperor she went so far in open shamelessness as publicly to marry C. Silius, one of her favourites. The blinded emperor's eyes were at last opened by his freedman Narcissus, and he was persuaded to give orders for her execution. She was put to death by Euodius, a tribune of the guards, in the gardens of Lucullus, 48 A.D.

Messapians. See APULIA, INSCRIPTIONS.

Messengers, KING'S (QUEEN'S), officers employed by secretaries of state to convey valuable and confidential despatches at home and abroad.

Messenia, in ancient Greece, the western of the three peninsulas that project southwards from the Peloponnesus, was bounded on the E. by Laconia, and on the N. by Arcadia and Elis. It was composed chiefly of fertile plains, separated by mountain-chains and watered by the Pamisus and other streams, and yielded abundant corn and wine. The original Pelagic inhabitants were conquered by the Dorians, but soon absorbed their conquerors and rose to great prosperity. This excited the envy of the Spartans, who waged two long wars (743-724 and 685-668) against the brave Messenians. Most of those who survived the second war emigrated to Sicily, where they took possession of Zancle, and changed its name to Messina, the present Messina. Those who submitted to Sparta were made helots; but they revolted and waged a third war of ten years' duration (from 464). The survivors settled in Naupaktos. After the battle of Leuctra (370) Epaminondas invited the descendants of the Messenians back to Greece, and they joyfully responded to his invitation. Their independence continued till the Roman conquest in 146 B.C. Messenia is the name of a nomarchy of the modern kingdom of Greece.

Messiah (Heb. *Mashiach*, equivalent to the Greek *Christos*, 'the Anointed') designates, in the Old Testament, the great Deliverer and Saviour, whom the Jews expected to be sent by God, not only to restore their country to the power and splendour which it exhibited in the days of David, but even, by compelling the Gentiles to acknowledge the supremacy of the theocratic people, to raise it to the summit of universal dominion. See BIBLE, Vol. II. p. 118; and for the New Testament Messiah, see BIBLE, p. 123, and CHRIST, and JESUS. See also JEWS, and MAHDI.

Messina, the second city of Sicily, stands on the western shore of the straits of the same name, 110 miles E. by N. of Palermo and 195 SSE. of Naples. The city occupies a narrow strip of coast between the harbour and the hills behind; the opposite or eastern side of the harbour is formed by a sickle-shaped tongue of rock, that only leaves a narrow entrance on the north. Although a very ancient city, Messina possesses few antique buildings or remains. The destructive hands of enemies, and the still more destructive agency of earthquakes, are responsible for this. The greater part

of the city was laid out, regularly, with handsome houses, after the earthquake of 1783. The cathedral was begun by Count Roger the Norman in 1098, but has been almost wholly rebuilt since then. This and the churches of St Gregory and St Nicolo are adorned with magnificent mosaics. The cathedral has also a gorgeous high-altar and *baldacchino*, and a venerated treasure in a reputed letter of the Virgin to the townsmen. The citadel was built by Charles II. of Spain in 1680, the Gonzaga Castle in 1540, and another castle in 1547-57. The handsome theatre, the palaces, and official buildings are for the most part modern. There are here a university, founded in 1549, with fifty teachers and two hundred students, a college of the fine arts, an academy of the sciences and arts, scientific collections, and technical schools. Messina is an archbishop's see. The industry is confined chiefly to muslin, linen, and silk goods, the working of coral, and the preparation of fruit essences. The harbour, which is very deep and well protected, is entered annually by some 3370 vessels of 1,277,000 tons burden, bringing imports (wheat, cottons, flour, hides, coals, dried fish, woollens, iron, &c.) to the annual value of £1,094,280. The exports, embracing principally fruits and their manufactured products, such as wine, essences, olive-oil, seeds, &c., average £1,264,720 annually. More than half the shipping is Italian, and about one-third British. Pop. (1881) of the city, 78,438, and of the commune, 126,497.

Founded in 732 B.C. by the people of Cumæ, the place was first called Zancle (i.e. a sickle), and through the commercial enterprise of its people rapidly grew in prosperity. In 495 Anaxilas of Rhegium seized the town and changed its name to Messana (Messene). The Carthaginians conquered it and destroyed it in 396, and in 288 it fell into the hands of the Mamertines, who again changed its name to Mamertina. The intestinal quarrels of these people gave occasion to the outbreak of the Punic war between Carthage and Rome, on the conclusion of which (241 B.C.) the city became Roman, and in due time passed to the Eastern Empire. The Saracens took the city in the 9th century, and were only expelled in the 11th century by the Normans. Here the Sicilian Vespers' massacre raged in 1282, and from that year down to 1713 Messina belonged to Spain. The people revolted in 1671 and were backed up by France, but were reduced to submission in 1678, and at the same time deprived of their privileges of self-government. Then in 1743 the plague, and forty years later an earthquake, came to complete the ruin of the city. It was, moreover, bombarded by the Neapolitans in 1848, and in 1861 it was the last place in Sicily to yield to the Sardinian (Italian) troops. The province of Messina has an area of 1246 sq. m., and a pop. (1881) of 460,924 and (1889) 511,315.

Messina, STRAIT OF (Lat. *Mamertinum fretum*, or *Fretum Siculum*), separates Italy from Sicily, is 24 miles in length, and varies from 2½ to 14 miles in breadth. Since 1879 a scheme for making a railway tunnel under the strait has been under discussion, but as yet it has come to no practical result. See SCYLLA AND CHARYBDIS.

Message, the legal term used in English law to describe a dwelling-house and piece of land adjoining.

Metabolism, a general term for the chemical changes of living matter. See FUNCTION, PHYSIOLOGY, PROTOPLASM.

Metallurgy. A brief account will be given here of ancient metallurgy and of that department of modern metallurgy relating to the mechanical treatment of ores.

Ancient Metallurgy.—From an ethnological point of view one of the most interesting questions connected with the origin of the industrial arts is when, and under what circumstances, man first began to work metals by softening or melting them by means of a high heat. The art of smelting ores was probably discovered by observing the effect of a big fire on some rich ore that happened to be in the way. Gold is always found native, and silver and copper sometimes. The ancient Egyptians worked in gold, silver, and bronze with a degree of skill that could only have been reached by gradual steps extending over thousands of years. In the notes to his edition of *Wilkinson's Ancient Egyptians*, Dr Birch says that it is uncertain whether metallic tin was known to them, as Bronze (q.v.) may have been made by the use of tin ore along with copper. He also states that the question of the use of iron among them has been rendered doubtful by the few specimens of that metal found in the monuments and sepulchres. Some examples, however, have been met with, although only in one case apparently is the approximate age of the object known. It is iron wire in a bronze statue of the time of the Ramesids. In India and some other parts of Asia malleable iron is made directly from rich ores in furnaces scarcely bigger than chimney-cans, by a process in use from time immemorial; and by a similar process savages in some parts of Africa also smelt iron. It is supposed by some archaeologists that most parts of Africa passed directly from the stone to the iron age, but there seems to be evidence that in some places on that continent the making of various articles of the copper of the country has been long practised by aboriginal tribes.

Among the remains found in the lake-dwellings of central Europe are crucibles for melting metals, ingots of copper and tin, and in one crucible traces of gold were found. Bronze implements are abundant, but the considerable number of copper hatchets which have now been discovered has raised the question as to whether in prehistoric times a copper age has not preceded those of bronze and iron. Copper is more easily smelted than iron; and bronze, being an alloy of copper and tin, must somewhere have been preceded in its application to hatchets or other articles by unalloyed copper, although this may not have been the case in Europe. Some copper hatchets, and other implements of this metal, are the only evidence we have that the ancient Mexicans made any use of metal tools; though their artificers were skilled in casting gold and silver, and in hammered work and chasing, and tin as well as copper ore was mined, and the two combined as bronze. The early tribes inhabiting the country about Lake Superior, where native copper is plentifully found, made knives and ornaments of the metal by hammering it cold, in some cases, it is believed, with stone implements. Small chisels, rings, idols, and other objects made of gold and of ancient date, some of which are of thin, flat beaten plates, have been obtained in the republic of Colombia, South America. Silver articles of a rude archaic character appear to be rare. It is likely that the working of these native metals in the cold state in certain limited areas preceded the art of manipulating any metal by heat.

See Lubbock's *Prehistoric Times*, Munro's *Lake-dwellings of Europe*, Nadailac's *Prehistoric America*, and various papers in the volumes of *Contributions to Knowledge* published by the Smithsonian Institution.

Modern Metallurgy.—As now understood this is the art of extracting metals from their ores. The operations are partly mechanical and partly chemical. Those processes which depend principally on chemical reactions for their results have reference chiefly to the roasting and smelting of ores, and are described under the heads of the different metals.

But there are certain preliminary operations of a mechanical kind which metallic ores undergo, such as crushing, jigging, washing, &c., which we shall describe here, as they are essentially the same for the ores of lead, copper, tin, zinc, and indeed most of the metals. Until comparatively recent times ore, or rather ore-gangue, as it came from the mine was in the first instance broken by hammers before being passed on to crushing-rollers or stamps to be reduced to smaller pieces or grains. In the year 1858 Mr E. W. Blake of New Haven, Connecticut, invented a stone or ore crusher which has become so extensively used that it has, except in special cases, superseded hand-labour for breaking up large pieces of ore. Fig. 1 shows in section a modification of Blake's ore-crusher, made by Marsden of

Fig. 1.

Leeds. The shaded portion shows the fixed jaw, A, and the movable jaw, B, between which the ore or stone is crushed. To the movable jaw a rapid biting movement (reaching 250 strokes per minute) is given by means of an eccentric lever and toggle-joints. C is the rod connecting the eccentric with the toggle-plates, DD. The machine is driven by a shaft and pulley, and has a balance-wheel. A spring or lever near the base of the machine aids the return movement of the jaw, B.

The vein-stuff or impure ore is next taken either to the crushing-rollers or to the stamping-mill. Fig. 2 shows a section of a crushing-mill of German

Fig. 2.—Ore-crushing Mill:

End view of the crushing-rollers, sieves, and bucket-wheel.

design, but nearly resembling that in use in Cornwall for treating copper, lead, and zinc ores. The ore, already reduced by the Blake jaw-crusher to

pieces roughly $1\frac{1}{2}$ inch in diameter, is raised to the floor or platform, *b, b*, and by means of an opening at *c* passed down to the crushing-rollers, *r, r*. These are usually from 10 to 30 inches in diameter and at least 10 inches long, made of chilled cast-iron or steel, and with a lever at *d* to keep them in position. Below the rollers a shoot conveys the crushed ore to a series of sieves increasing in fineness from the top to the bottom, and what is separated by each sieve falls into a separate pit. Such pieces of ore-stuff as are too large to go through the top sieve or riddle fall into the raff-wheel or bucket-wheel, and are by it raised again to the floor to be recrushed. In Cornwall a sieve or riddle cylindrical in shape is used, and it slopes so that stuff too large to go through its meshes is raised by the raff-wheel to get a second crushing. Only about 13 per cent. of the ore-stuff crushed in the Cornish mill exceeds $7\frac{1}{2}$ millimetres in size.

For pulverising some ores—tinstone and auriferous quartz, for example—a stamping-mill is used. It consists of a series of upright shafts with a weighty piece of iron at the bottom of each. They are raised by means of an axle with projecting cams, and then falling by their own weight act like hammers. Except in chlorination and amalgamation works (see GOLD), the wet process of stamping is generally adopted—that is, the cast-iron or steel shoes of the stamps work upon cast-iron or quartz bottoms placed in stamp-troughs filled with water.

Sizing apparatus or sorting machines are employed for dividing the crushed ore-stuff into grains of several sizes. A common hand-riddle is the simplest form of sizing implement. One kind of apparatus in use consists of a series of flat-bottomed sieves with graduated meshes placed on different levels and mechanically agitated so as to pass the stuff across the perforated bottoms. The first sieve separates the largest grains, the second the next in size, and so on. A rotating drum-sieve or trommel is, however, more frequently employed. It is placed horizontally, and is to some extent conical in shape. Sometimes it is one long continuous trommel in sections, in which case the finest stuff passes through the first section, the next larger through the second, and so on through, say, five or six divisions to the largest grains. In other cases a system of separate conical trommels, in which the sizing takes place from large to small grains, is employed. With the trommel water is used, and, although its axis may be quite level, the falling angle of its shell together with its motion impels the ore-stuff from the smaller to the larger end. Trommels are used for clearing off earthy matter and for draining off water from ore as well as for sizing.

After the ore-stuff has been sorted according to the size of the grains, the next step is to separate by specific gravity the pure ore from the gangue or non-metallic minerals associated with it. If the reduced particles be those of vein-stuff containing more than one kind of ore, these are also separated by gravity. If equal-sized grains of galena, blende, and quartz, whose respective densities are 7.5, 4, and 2.7, are allowed to fall freely in some depth of water, the three substances will separate into layers at the bottom, in which case the lead ore (galena) will form the lowest, the zinc ore (blende) the middle, and the quartz the top layer. But in hydraulic jiggers (some are pneumatic) the column of water, at most under 3 inches, is too shallow to admit of separation by simply dropping the grains. Consequently these are placed in a sieve immersed in water, and subjected to a repeated up-and-down motion, in which the ascent of the jiggling stuff takes place by jerks, but in the descent it falls freely. In this way the pure ore, or at least the best ore, accumulates at the bottom, and is usually sufficiently rich for smelting. The gangue on the

surface is skimmed off or otherwise removed. In hand-jigging the sieve is vigorously jerked in a tub of water; in the brake-jigger the jerking motion is produced by a hand-lever and connecting rod; and in continuous jiggers mechanical contrivances are used to carry into different receptacles the mineral grains separated upon the sieve in layers without interrupting the jiggling process.

The dressing of fine sandy, mealy, or slimy ore-stuff, which is not suitable for jiggling, is effected on buddles or sloping tables. Buddles are inclined planes, often circular, or rather conical in shape, over which the fine stuff suspended in water descends. In doing so the heavier metallic particles fall at the top of the table or cone while the lighter waste is carried down to the foot.

For detailed descriptions and illustrations of ore-dressing machines, see Hunt's *British Mining* (1884), and an exhaustive report on the 'Mechanical Dressing of Ores,' by E. F. Althaus, in the *Reports of the Philadelphia Exhibition*, 1876.

Metal Mountains. See ERZGEBIRGE.

Metals. Although each metal is considered in a separate article, there are various points regarding the general physical and chemical characters of these bodies, and the method of classifying them, which require notice. A metal, from the chemical point of view, is an element which can replace hydrogen in an acid and thus form a salt. Hydrogen itself is, chemically, considered to be a metal. Those elements which are non-metallic in this sense are called *metalloids*.

Amongst the chief *chemical* properties of metals we notice their strong affinities to certain of the non-metallic elements. All the metals, without exception, combine with oxygen, sulphur, and chlorine, and often in several proportions, forming oxides, sulphides (formerly termed sulphurets), and chlorides. Many of them combine with bromine, iodine, and fluorine. The other compounds of this nature, excepting carbide (formerly carburet) of iron, or steel, and the hydrides of arsenic and antimony (commonly known as arseniuretted and antimoniu-retted hydrogen), which are of importance in toxicology, may be passed over without notice. The metallic oxides are, without exception, solid bodies, white or coloured, and usually present an earthy appearance. Hence the old name of *metallic calx* applied to these oxides. Those oxides which are termed basic possess the property of directly uniting with the so-called oxy-acids (such as sulphuric, nitric, carbonic, and silicic acid), and of forming new chemical compounds of the second order, termed Salts (q.v.). The compounds of the metals with chlorine, iodine, bromine, and fluorine—such, for instance, as chloride of sodium, or common salt, ClNa —are termed haloid salts. The same metal may often combine both with chlorine and with oxygen in more than one proportion. For example, we have subchloride of mercury, Hg_2Cl_2 ; suboxide of mercury, Hg_2O ; chloride of mercury, HgCl_2 ; oxide of mercury, HgO . For the compounds of the metals with sulphur, see SULPHUR.

The following are the most important of the *physical* properties of the metals: (1) All metals, unless when they are in a finely-pulverised form, exhibit more or less of the characteristic lustre termed metallic. Two of the non-metallic elements, iodine and carbon, in some forms also present a metallic lustre. (2) All metals are good conductors of heat and electricity, although in very unequal degrees. (3) With the exception of mercury, all the metals are solid at ordinary temperatures. With the exception of gold, copper, calcium, and strontium, the metals are, when light is only once reflected from them, more or less white,

with a tendency to blue or gray. Most of them have been obtained in crystals, and probably all of them are capable of crystallising under certain conditions. (4) Metals are remarkable for their opacity, except when they are chemically reduced to extremely thin films. (5) All the metals are fusible, although the temperatures at which they assume the fluid form are very different (see **MELTING-POINT**); and some of them, as mercury, arsenic, cadmium, zinc, &c., are also volatile. (6) Great weight, or a high specific gravity, is popularly but erroneously regarded as a characteristic of a metal; while platinum, osmium, and iridium (the heaviest bodies known in nature) are more than twenty times as heavy as water, lithium, potassium, and sodium are actually lighter than that fluid. (7) Great differences are observable in the hardness, brittleness, and tenacity of metals. While potassium and sodium may be kneaded with the finger, and lead may be marked by the finger-nail, most of them possess a considerable degree of hardness. Antimony, arsenic, and bismuth are so brittle that they may be easily pulverised in a mortar; while others, as iron, gold, silver, and copper, require great force for their disintegration. Taking iron and lead as representing the two extremes of tenacity, it is found that an iron wire will bear a weight twenty-six times as heavy as a leaden wire of the same diameter. See **DUCTILITY**, **MALLEABILITY**.

Metals enter into combination with one another when they are fused together, and such combinations are termed *Alloys* (q.v.), unless when mercury is one of the combining metals, in which case the resulting compound is termed an *Amalgam* (q.v.). It is doubtful whether all alloys are true chemical compounds. Definite compounds of the metals with each other do, however, certainly exist, and are sometimes found native, as, for example, the crystallised silver and mercury compound represented by the formula Ag_2Hg .

In consequence of their strong affinities for the metalloids the metals are seldom found in a free or uncombined state, even in the inorganic kingdom, and never in animals or plants. The more common metals, in consequence of their strong affinity for oxygen and sulphur, are very rarely met with in the uncombined state; but some of those which are less abundant, such as gold, silver, and platinum, are found uncombined, in which case the terms *native* and *virgin* are applied to them; and other metals, as mercury and copper, occur both in a free and in a combined state. Many native alloys are found, but the ordinary sources of the metals are oxides, sulphides, chlorides, and carbonates, sulphates, and other salts. These are termed the *ores* of the metals. The methods of obtaining the metals from their various ores fall under the head of **METALLURGY**.

Various classifications of the metals have been suggested by different chemists. The following is probably one of the most convenient:

(I.) The *Light Metals*, subdivided into—

(1) The metals of the alkalis—viz. potassium, sodium, cesium, rubidium, lithium.

(2) The metals of the alkaline earths—viz. barium, strontium, calcium, magnesium.

(3) The metals of the true earths—viz. aluminium, glucinum, zirconium, yttrium, erbium, terbium, thorium, cerium, lanthanum, didymium.

(II.) The *Heavy Metals*, subdivided into—

(1) Metals whose oxides form powerful bases—viz. iron, manganese, chromium, nickel, cobalt, zinc, cadmium, lead, bismuth, copper, uranium, thallium.

(2) Metals whose oxides form weak bases or acids—viz. arsenic, antimony, titanium, tantalum,

niobium (or columbium), tungsten, molybdenum, tin, vanadium, osmium.

(3) Metals whose oxides are reduced by heat—noble metals—viz. mercury, silver, gold, platinum, palladium, iridium, ruthenium, rhodium, osmium. (Several of the rare metals are here omitted.)

Another classification is that by which the metals are arranged in six groups, each group being named after a metal which possesses the common characters in a well-marked degree: viz. (1) the sodium group, (2) the calcium, (3) the iron, (4) the copper, (5) the platinum, and (6) the antimony groups.

Metal-work, ARTISTIC. Leaving celebrated statues and groups cast in bronze to be described under the head **SCULPTURE**, we shall briefly notice here a few important examples of artistic work in metal which are rather classed as specimens of decorative art than of pure sculpture. Of early gold and silver work one of the most renowned objects is the altar made of these two metals in the church of St Ambrose at Milan. It was executed by Wolvinus in the 9th century, and contains figures in relief of Christ and the Apostles with ornamental borders in enamel. Another very fine example of work in gold and enamel is the *Pala d'Oro* (altar front) of St Mark's, Venice, by Byzantine artists of the 10th or 11th century. Some specimens of Celtic art, partly in precious metal, such as the Tara Brooch and the Ardagh Chalice—the latter supposed to be of the 10th century—are of exquisite beauty (see **BROOCH**). The shrine of the Magi in Cologne Cathedral is a magnificent reliquary of the 12th century, in which the figures are of gold and the architectural decorations covered with enamels and precious stones. A considerable number of specimens of ecclesiastical gold and silver work of the 13th century remain, including a few of great interest. Of 14th-century examples—a time when the goldsmith's art ceased to be employed exclusively in the service of the church—the splendid silver reliquary in the church of Orvieto, by Ugolino of Siena, is very remarkable. Perhaps the two most important monuments of the goldsmith's art made in the middle ages are the altar of St James, Pistoia, and that of the Baptistery of St John at Florence. They were begun in the 14th century, and a number of the most famous Italian artists were in succession engaged upon them for a period of 150 years. Both are of silver, one of them being decorated with subjects from the life of St James, and the other with scenes from the life of St John. Giglio of Pisa, Pietro Tedesco, Ricciardi, Cipriano, and Filippo were among the artists engaged on the St James' altar; and Cioni, Ghiberti, Cenni, Verrocchio, and Pollaiuolo worked at that of St John. Some of the greatest artists in Italy in the 14th and 15th centuries practised to some extent the goldsmith's art, including Lucca della Robbia, Ghiberti, Brunelleschi, Donatello, and Jacopo della Quercia. In the 16th century Cellini's is the greatest name, although well-authenticated works by him in the precious metals are few in number. There are some very artistic productions in pewter by the French artist François Briot, who lived in the 16th century.

Bronze is a metal in which many fine works have been executed, and these are often of large size. Few early examples exist of which the artists are known. Stanracius of Constantinople cast in the 11th century the bronze gates of St Paul's-without-the-Walls at Rome, destroyed in 1823, but of which drawings exist. A century later an artist named Barisanus made the fine bronze door of the cathedral of Monreale in Sicily. One of the most artistic productions in this metal of the 13th century is the candelabrum in Milan Cathedral, 15 feet high. The east door of the Baptistery at Florence,

upon which Ghiberti was engaged from 1425 to 1452, is considered a marvellous work of art. Another door in this building, by A. Pisano, completed in 1430, after being in progress for twenty years, is also an admirable production. P. Vischer's shrine of St Sebald at Nuremberg is a beautiful monument which, though quite different in form from the objects named above, resembles them in the design being an intimate combination of small works in sculpture and architectural ornament. A fountain in the Maximilian-strasse, Augsburg, executed by H. Gerhard in 1593, has been much admired. For want of space we can only name two more bronzists—B. Morel, who did the great candelabrum in Seville Cathedral, and L. Bernini, who in the 17th century executed many clever works in Italy.

There is perhaps no class of metal objects in which artistic skill is more marvellously displayed than in some of the rich suits of armour made in the end of the 15th, but chiefly in the 16th century. These are for the most part of iron or steel, with ornament in *repoussé* or engraved; sometimes with both combined, and occasionally with damascening in gold and silver. Among those who practised the armourer's art in Italy the most famous names are Michelagnolo, Filippo Negrolo, Romero, and some members of the Piccinini family. In Germany Kollman of Augsburg, and in France Antoine Jacquard stood high. Some of the finest suits of armour made at this period are in the Museum of Arms at Dresden, and in the Louvre and Musée d'Artillerie, Paris.

Wrought-iron work, rude but effective, appears on the wooden doors of some Romanesque churches of the 12th century. In the 13th and 14th centuries the work in this metal became more refined, and among admirable examples of the latter period may be mentioned the screens round the tombs of the Scala family at Verona, and a screen in the church of Santa Croce, Florence. Screens, grilles, and other objects with open wrought-iron ornament, beautifully designed, and ranging over a period from the 13th to the 16th century, but especially those made during the 15th and 16th, are found in many churches in Germany, Spain, France, and England. In the latter country the early grille over Queen Eleanor's tomb, Westminster, and the later screen to Edward IV.'s at Windsor are fine examples; so also are the still later (18th century) railing-panels made for Hampton Court Palace by Huntington Shaw. The canopy of a draw-well at Antwerp by Quentin Matsys is one of the best works of its kind in hammered iron. Many of the elaborately chiselled iron locks and hinges made at Nuremberg and Augsburg in the 15th and 16th centuries are wonderfully beautiful. The National Museum at Munich is especially rich in specimens of these.

Pollen; Hefner-Altenek, *Serrurerie* (1870); Raschdorf, *Abbildungen Deutscher Schmiedewerke* (1878); *Œuvres de Richard de Lalonde*; E. Plon, B. Cellini, *Recherches sur sa Vie et sur son Œuvre* (1883); G. W. Yapp, *Metal-work* (chiefly modern).

Metamorphosis, a term applied in ancient mythology to the frequent transformation of human beings into beasts, stones, trees, and even into fire, water, or the like, which are essential parts of popular folklore everywhere. These metamorphoses afforded a subject to Greek poets and writers of the Alexandrine period, and to Ovid among the Romans. See BEAST-FABLES and FOLKLORE.—In Zoology the term Metamorphosis is applied to such marked changes as those from caterpillar to insect, or from tadpole to frog, where the young form or larva

is strikingly different from the adult. See the articles on Amphibia, Caterpillar, Crustacea, Echinoderms, Frog, Insects, &c.; and for Metamorphosis in Botany, see MORPHOLOGY and FLOWER.—In Geology the term *metamorphism* is applied to the alteration undergone by rocks under heat, pressure, and other influences, so that they assume a crystalline or semi-crystalline structure. See GEOLOGY, Vol. V. p. 151.

Metaphor (Gr. *metaphora*, 'a transference'), a figure of speech by means of which one thing is put for another which it only resembles. Thus, the Psalmist speaks of God's law as being 'a light to his feet and a lamp to his path.' The metaphor is therefore a kind of comparison implied but not formally expressed, in which the speaker or writer, casting aside the circumlocution of the ordinary similitude, seeks to attain his end at once, by boldly identifying his illustration with the thing illustrated. It is thus of necessity, when well conceived and expressed, graphic and striking in the highest degree, and has been a favourite figure with poets and orators, and the makers of proverbs, in all ages. Even in ordinary language the meanings of words are in great part metaphors; as when we speak of an *acute* intellect, or a *bold* promontory. The metaphor is false if the simile involved cannot be intelligibly evolved from it; and, to avoid what are often called *mixed* metaphors, it is well that the implicit simile should be conceived objectively, as in a picture. Such cases of confusion as Cromwell's 'God has kindled a seed in this nation' are obvious enough, but most often the *mixed* metaphor is wrapped up in a cloud of rhetoric, as in De Quincey's sentence: 'The very recognition of these or any of them by the jurisprudence of a nation is a *mortal wound* to the very *keystone* upon which the whole vast arch of morality reposes.' Ruskin in his *Præterita*, describing Rogers's cold reception of him as a boy, says: 'The cultivation of *germinating* genius was never held by Mr Rogers to be an industry altogether delectable to genius in *its zenith*.'

Metaphysical Poets, a term first applied by Dr Johnson in his life of Cowley to the group of which Donne is the most outstanding example. They were men of learning, and to show their learning was their whole endeavour; they neither copied nature nor life, hence their thoughts are often new but seldom natural; the most heterogeneous ideas are yoked by violence together, nature and art being ransacked for illustrations, comparisons, and allusions; they failed, as might have been expected, in moving the affections or attaining the sublime, but what they wanted they endeavoured to supply by hyperbole—their amplifications had no limits, they left not only reason but fancy behind them, and produced combinations of confused magnificence that not only could not be credited but could not be imagined. Yet, if they frequently threw away their wit upon false conceits, they likewise sometimes struck out unexpected truth: if their conceits were far-fetched, they were often worth the carriage. Such is Johnson's explanation of the phrase and its meaning, and it must be admitted that the name is to a certain extent appropriate enough, for the philosophising and analytic spirit pervades the works of the whole school, and intellect rather than emotion is ever the stuff out of which their phantasies are framed. Their constant weakness is the tendency towards conceits and similes that are merely fantastic and ingenious, which mars a modern reader's pleasure in almost every poem of Donne and Cowley.

Metaphysics, a word first applied to a certain group of the philosophical dissertations of Aristotle, containing what Aristotle (q.v.) called 'first philosophy,' and Plato 'dialectics.' The phrase *meta*

ta physika means probably 'the books after the physics,' but has been interpreted 'the matters above or beyond physics.' The branch of philosophy so called is the highest department, and deals with speculative questions as to the nature and limit of human consciousness and the possibility of establishing truths beyond empirical consciousness. The term has been sometimes used, as by Mansel, to comprise Psychology along with metaphysics proper or Ontology. See PHILOSOPHY.

Metaphyta, many-celled plants, in contrast to the single-celled Protophytes.

Metastasio, the Greek form of the surname of PIETRO TRAPASSI, an Italian poet, who was born of humble parents at Rome, on 6th January 1698. A precocious boy, he improvised verses and recited them to crowds on the street. This gift gained him a patron in his ninth year, one Gravina, a celebrated Roman lawyer, who educated him, and on his death (1718) left him his fortune. In 1722 Metastasio wrote his first libretto at Naples, which so charmed the great Roman singer Bulgarini, called La Romanina, that she took him into her house, and launched him on his successful career as a writer of opera-libretti—libretti which possess some real poetic qualities. These dramas, all with classical subjects, were set to music by some of the greatest composers then living, as Pergolese, Scarlatti, Durante, Hasse, Paesello, Marcello, and others, and sung by some of the greatest singers who have ever lived, Farinelli and Caffariello. In 1729 Metastasio was appointed court-poet to the theatre at Vienna, for which he wrote several of his best pieces. His reputation spread rapidly and stood high throughout Europe, but from 1825 to 1865 his name was anathema in Italy. He died in Vienna on 12th April 1782, having for nearly forty years suffered from 'mental and moral ennui.' Good collected editions of his dramas were published at Genoa (1802) and at Padua (1811); and his Letters were edited by Carducci (Bol. 1883). See Vernon Lee's *Studies of 18th Century in Italy* (1880), and Lives by Burney (1796), Mussafia (1882), and Falconi (1883), the first in English, the last two in Italian.

Metaurus, a river of Central Italy, still called the Metauro or Metro, emptying into the Adriatic near Fano. On its banks the Romans defeated the Carthaginians under Hasdrubal in 307 B.C.

Metayer System, or MÉTAIRIE. See LAND LAWS, Vol. VI. p. 505.

Metazoa, many-celled animals, in contrast to the single-celled Protozoa (q.v.).

Metellus, the name of a Roman family of the plebeian gens Cæcilia, which rose to be one of the first families of the Roman nobility.—One of the most distinguished members of the family was Quintus Cæcilius Metellus Macedonicus, who received his surname from his victory over Andronicus, an aspirant to the throne of Macedonia (148 B.C.). His life was considered by ancient writers an example of the greatest felicity: before his death in 115 three of his sons had been consuls, one censor, and one was a candidate for the consulship. Another was Quintus Cæcilius Metellus Numidicus, who twice defeated Jugurtha in Numidia (109 B.C.), and was celebrated for his integrity of character, but was superseded in his command by Marius. His son, Quintus Cæcilius Metellus, surnamed *Pius*, joined Sulla in 83 B.C., but sought to moderate the severity of his proscriptions. Quintus Cæcilius Metellus Creticus conquered Crete, and reduced it to a Roman province (67 B.C.). Quintus Cæcilius Metellus Pius Scipio, sometimes called Quintus Scipio, and some-

times Scipio Metellus, was a son of Scipio Nasica, who was adopted by one of the Metelli, and became the father-in-law of Pompey, and his zealous partisan. He commanded the centre at Pharsalia, maintained war on his behalf for some time in Africa, and, after the battle of Thapsus (46 B.C.), died by his own hand.

Metempsychosis. See TRANSMIGRATION.

Meteorology (Gr. *meteōra*, 'meteors, or atmospheric phenomena') was originally applied to the consideration of all appearances in the sky, both astronomical and atmospheric; but the term is now confined to that department of physics which treats of the phenomena of the atmosphere as regards weather and climate. Owing to the complexity of the phenomena, meteorology is the most difficult and involved of the sciences, and may seem, at first sight, almost incapable of being reduced to a science at all. On this account, the only procedure admissible in the first place is a faithful recording of facts by long and patient observation.

From the nature of the subjects which make up the science, it may be inferred that they occupied men's minds from a remote antiquity. From the time spent in the open air in the early ages, and from the imperfect protection afforded against the inclemency of the seasons, those appearances which experience proved to precede a change of weather would be eagerly recorded and handed down. In this way many valuable facts were ascertained and passed current from hand to hand; and perhaps there is no science of which more of the leading facts and inferences have been from so early a period incorporated into popular language. Aristotle was the first who collected, in his work *On Meteors*, the current prognostics of the weather. Some of these were derived from the Egyptians, while a considerable number were the result of his own observation. Theophrastus, one of Aristotle's pupils, classified the opinions commonly received regarding the weather under four heads—viz. the prognostics of rain, of wind, of storm, and of fine weather. The subject was discussed only in its popular and practical bearings, and no attempt was made to explain phenomena whose occurrence appeared so irregular and capricious; but still the treatise of Theophrastus contains about all that was known down to comparatively recent times. No real progress was made till instruments were invented for making observations with regard to the temperature, the pressure, the humidity, the purity, and the electricity of the air. The discovery of the weight or pressure of the atmosphere made by Torricelli in 1643 was undoubtedly the first step in the progress of meteorology to the rank of a science. As this memorable discovery discloses what passes in the more elevated regions of the atmosphere, it follows that the elevations and depressions of the barometric column largely extend our knowledge of the subject. Indeed, nearly all of the more important of the discoveries of modern meteorology have been made through the barometric observations.

The invention and gradual perfecting of the thermometer in the same century formed another capital advance; as without it nothing beyond vague impressions could be obtained regarding temperature, the most important of all the elements of climate. Fahrenheit constructed small and portable thermometers, which, being carried by medical men and travellers over every part of the world, furnished observations of the most valuable description. By such observations alone the comparative temperature of different countries became known, and the exaggerated accounts of travellers with regard to extreme heat and cold were reduced

to their proper significance. Scarcely less important was the introduction of the hygrometer, first systematically used by De Saussure (died 1799), and subsequently improved by Dalton, Daniell, August, and Regnault. From the period of the invention of these instruments the number of meteorological observers greatly increased, and a large body of well-authenticated facts of real value was collected. The climates of particular parts of the earth were approximately determined, and the science made great and rapid advances by the investigations into the laws which regulate the changes of atmospheric phenomena.

The theory of the trade-winds was first proposed by George Hadley in the *Philosophical Transactions* for 1735; and it may be mentioned as a remarkable fact that for about half a century it remained unnoticed, and then was independently arrived at by Dalton. The publication of Dalton's *Meteorological Essays*, in 1793, marks an epoch in meteorology. It is the first instance of the principles of science being brought to bear on the explanation of the intricate phenomena of the atmosphere. The idea that vapour is an independent elastic fluid, and that all elastic fluids, whether alone or mixed, exist independently; the great principles of motion of the atmosphere; the theory of winds, their effect on the barometer, and their relation to temperature and rain; observations on the height of clouds, on thunder, and on meteors; and the relations of magnetism and the aurora borealis—these are some of the important questions discussed in these remarkable essays, with singular acuteness, fullness, and breadth of view.

One of the most interesting and fruitful subjects of inquiry that engaged the attention of meteorologists was *dew*. The observations on this subject were first collected and reduced by Dr Wells, and the theory he advanced, supplemented by the recent researches of Mr John Aitken, gives a complete explanation of the phenomenon (see *Dew*).

In 1823 Daniell published his *Meteorological Essays and Observations*, which, while adding largely to our knowledge in almost every department of the subject, are chiefly valuable as bearing on the hygrometry of the atmosphere. Though the practical advantages which he anticipated to flow from it have not been realised, yet this difficult department of meteorology still stands indebted to him perhaps more than to any other physicist. The law of the diffusion of vapour through the air, its influence on the barometric pressure, and its relations to the other constituents of the atmosphere are among the least satisfactorily determined questions in meteorology. Since this element is so important in originating changes of weather and as an indicator of storms, and since so much remains still to be achieved, it is to be hoped that it will soon be more thoroughly investigated, particularly in its relations to solar and terrestrial radiation. As the humidity to some extent obstructs solar and terrestrial radiation, it follows that if the air were quite drained of its aqueous vapour the extremes of heat and cold would be so intense and insufferable that all life would perish, as there would be no screen shielding the earth from the scorching heat of the sun by day, and from the equally scorching and blighting effects of its own radiation by night.

Electrical observations have been, of all meteorological observations, perhaps the least productive of results advancing the science, partly owing to their scantiness, and from the expense and trouble attending them.

Humboldt's treatise on *Isothermal Lines* (1817) constitutes a notable epoch in practical meteorology. Döve and, more recently, the present writer have continued the investigation, and given charts

of the world, showing the temperature for each month and for the year. In 1868 another series of important charts were published by the writer, showing, by isobaric lines, the distribution of the mass of the earth's atmosphere, and by arrows the prevailing winds over the globe for the months and the year. These charts, since revised by him, and published in one of the *Challenger* reports, show the movements of the atmosphere and their immediate cause. It is thus seen that the prevailing winds are the simple result of the relative distribution of the mass of the earth's atmosphere; or that the direction and force of the prevailing winds are simply the flow of the air from a region of higher towards a region of lower pressure, or from where there is surplus to where there is a deficiency of air. On this broad and vital principle meteorology rests, and it is of universal application throughout the science in explanation not only of prevailing winds, but of all winds, and of weather and weather changes generally. Further, it supplies the key to the climatologies of the globe; for climate is determined by the temperature and moisture of the air, and these in their turn by the prevailing winds. In 1882 Loomis published a map representing in colours the mean rainfall of the globe. This map and others that have been constructed for separate countries show that the rainfall is everywhere determined by the prevailing winds, considered with respect to the regions from which they have immediately come, and the physical configuration and temperature of the part of the earth's surface over which they blow. The highest rainfalls are precipitated by winds which, having traversed a large breadth of ocean, come up against and blow over a high ridge lying across their path; and the amount is still further increased if the winds pass at the same time into regions the temperature of which constantly becomes colder. Of this the winter rains of north-western Europe and the summer rains of Japan are good examples. On the other hand, the rainfall is very small, or *nil*, where the prevailing winds have not previously traversed some extent of ocean, but have crossed a high ridge and now advance into lower latitudes, or into regions the temperature of which is markedly higher. Good examples of this are the summer rains of California and adjoining regions, and those of the Indus valley.

The establishment of meteorological societies during the last half of the 19th century must also be commemorated as contributing in a high degree to the solid advancement of the science which, more than any other, must depend on extensive and carefully conducted observation. A special object of meteorological societies is to ascertain the degrees of temperature and moisture in various localities, and the usual periods of their occurrence, together with their effects on the health of the people and upon the different agricultural products; so that, by a knowledge of the laws by which the growth of such products is regulated, it may be ascertained with some degree of certainty whether any given article can be profitably cultivated. But perhaps none of the arts have benefited to so large an extent by the results arrived at by meteorologists as navigation. The knowledge thus acquired of the prevailing winds over the different parts of the earth during the different seasons of the year, the regions of storms and calms, and the laws of storms has both saved innumerable lives, and, by pointing out the most expeditious routes to be followed, shortened voyages to a remarkable degree. In this department the name of Maury (q.v.) deserves special commendation.

Another fruit of the multiplication of meteorological stations is the prediction of storms and

'forecasts' of weather, first suggested in the United States about the middle of the 19th century. As regards the British Islands these 'forecasts' are based on telegrams which are received every morning from about sixty selected stations in Great Britain and Ireland, and on the Continent, which give the exact state of the barometer, thermometer, hygrometer, and rain-gauge, with the direction and force of the wind, and appearance of the sky, at each of these stations at eight in the morning. In the event of there being any storm or other atmospheric disturbance at one or more of these places, a full and accurate description of it is thus conveyed to London; and it is the duty of the officials there to consider the direction in which the storm is moving and is likely to move, so as to enable them to give warning of its approach at different ports by special signals. But in addition to warnings of storms, daily 'forecasts' of the weather likely to occur in the different districts of Great Britain for the following two days are also issued. As regards storms the problem to be practically worked out is this: Given telegrams showing the exact meteorological conditions prevailing over the area embraced by the stations, with indications of a storm approaching in a certain direction, to determine, not the probable area over which the tempest will sweep, but the precise localities which will altogether escape, the places where the storm will rage, its continuance, its violence, and the particular directions from which the wind will blow at places visited by the storm. Weather-registers extending over long periods give no countenance to the notion that there are regularly recurring cycles of weather on which prediction sufficiently precise and particular to be of service to agriculture and navigation may be based. The manner in which good and bad seasons occur in different places with respect to each other shows clearly that they have little *direct immediate* dependence on any of the heavenly bodies, but that they depend directly on terrestrial causes. Owing to its proximity to the Atlantic, Great Britain is not so favourably situated for the issue of warnings as the countries of Europe to the eastward. Since 1870 this branch of science has been prosecuted with remarkable energy and success by General Myer (familiarily known as 'Old Probability') and his successor in charge of the signal service of the United States War Department. American meteorologists were the first to undertake the representation of isothermals over the ocean; and to the United States science is also indebted for magnificent contributions and researches in international meteorology.

The study of meteorology has of late benefited largely by the establishment of high-level meteorological stations in the United States, France, Italy, Switzerland, Austria, India, Australia, Scotland, and many other countries. The nine arctic expeditions in 1882-83 devoted themselves largely to meteorological observations. Many first-class meteorological observatories are now established in all civilised countries at which hourly observations are made.

On the diurnal phenomena the more important principles of the science are based. Of the sun's rays which arrive at the earth's surface, those which fall on the land are wholly absorbed by the thin surface layer, the temperature of which consequently rises. A wave of heat is thence propagated downward through the soil, the intensity of which rapidly lessens with the depth at a rate depending on the conductivity of the soil, till at a depth of about 4 feet it ceases to be measurable. Part of the heat of this surface layer is conveyed upwards into the atmosphere by convection currents. But

as regards the surface of the ocean the case is totally different. Here comparatively little of the heat is arrested at the surface, but it penetrates, as shown by the observations of the *Challenger* expedition, to a depth of about 500 feet. Hence in deep waters the temperature of the surface is but little heated by the direct rays of the sun, though in shallow waters, owing to the heating of the bottom, the water has a considerable daily range of temperature. Thus, in mid-ocean, from 30° N. lat. to 30° S. lat., the temperature of the surface of the sea does not vary during the day quite so much as one degree Fahrenheit. Off the coast of Scotland the daily variation is only 0·3°, and in higher latitudes still less. On the other hand, the daily variation of the upper layer of the surface of the land is frequently 50°, and in many cases very much greater. Hence the enormously different results which large masses of land and sea respectively exercise on climate. The temperature of the air over the ocean is about three times greater than that of the surface of the open sea over which it lies; but on nearing land it is nearly five times greater. The least daily variation on land is in insular situations, being at Rothsay about 5°; and the greatest in the Sahara regions of tropical and subtropical countries, where it is in many places 30°, rising on occasions to 40° and upwards. The daily minimum temperature occurs some time before dawn; and as regards the maximum, it occurs from 1 to 4 P.M., according to season and geographical situation, the earlier hour obtaining in arid climates and at true high-level observatories, and the later in climates characteristically humid.

The *absolute humidity* of the air, or, as it is usually termed, the elastic force of vapour, is seen in its simplest form on the open sea, as disclosed by the *Challenger* observations. The minimum occurs at 4 A.M. and the maximum at 2 P.M., thus approximating closely to the diurnal march of the temperature; on nearing land a secondary minimum prevails from 10 A.M. to 4 P.M., due doubtless to the drier descending aerial currents which take the place of the currents that ascend from the heated surfaces of the land. The *relative humidity* is widely different from the vapour pressure, and presents features of the simplest character. The maximum occurs from midnight to 4 A.M.; or when the temperature is lowest the air is nearest to saturation. On the other hand, the minimum is about 2 P.M.; or when temperature is highest the air is furthest from saturation. This feature of the humidity characterises all climates. When the air is by terrestrial radiation cooled below the dew-point *dew* is deposited, and when the temperature is below 32° *hoar-frost* is the result.

The *diurnal oscillations of the barometer* show two maxima and minima—the maxima occurring about 9 to 10 A.M. and 9 to 10 P.M., and the minima from 3 to 4 A.M. and 3 to 4 P.M. Since the temperature of the surface of the sea does not vary quite one degree during the day, and since these oscillations occur equally over the open sea as on land, it conclusively follows that they are independent of the temperature of the part of the surface of the globe on which the air rests. Generally speaking, the amount of the oscillations decreases with latitude. Taking latitude with latitude, the amounts are greatest over land surfaces which are greatly heated during the day and cooled during the night, and least over the anticyclonic regions of the great oceans lying to the westward of the continents from about 20° to 40° N. and S. lat. The characteristics of these anticyclonic regions is a vast descending current down their central spaces. This air necessarily increases in temperature with its descent, and consequently is further removed from saturation; and it is prob-

ably due to this circumstance that the amount of the barometric oscillation is here reduced to the minimum for the latitude over all anticyclonic regions.

It has been further shown from the *Challenger* observations that the force of the winds on the open sea is subject to no distinct and uniform diurnal variation, but that on nearing land the force of the wind gives a curve as pronouncedly marked as the ordinary curve of temperature; the minimum occurring from 2 to 4 A.M. and the maximum from noon to 4 P.M. Each of the five great oceans gives the same result—the differences between the hours of least and greatest force being Southern Ocean, 6½ miles; South Pacific, 4½ miles; South Atlantic, 3½ miles; and North Atlantic and North Pacific, 3 miles. This diurnal peculiarity of the wind's force is even still more pronounced over all tolerably open and extended surfaces of the land. But at true high-level observatories, situated on peaks, such as Ben Nevis, the reverse everywhere holds, so that the daily minimum velocity occurs during the warmest hours of the day, and the maximum at night during the coldest hours.

Thunderstorms have well-marked periods of diurnal variation over land and over the open sea respectively. In climates where rain falls equally at all seasons they are of most frequent occurrence during the hottest portions of the day and of the year, so far as concerns the land surfaces of the globe. Taking Ekaterinburg in the Urals as representing inland climates, observations show that there, during the twelve hours from 9 A.M. to 9 P.M. when temperature is above the daily mean, 717 occurred, but only 139 during the other twelve hours when temperature is under the mean. Thus the great majority occur during the time of the day when the ascensional movement of the air from the heated ground takes place, and attain the absolute maximum when the temperature and this upward movement are also at the maximum. On the other hand, the *Challenger* observations on the open sea show that the maximum occurrence is from 10 P.M. to 8 A.M., 22 having been observed during these ten hours and only 10 during the other fourteen hours of the day. This remarkable result suggests that over the ocean terrestrial radiation is more powerful than solar radiation in causing those vertical disturbances in the equilibrium of the atmosphere which give the thunderstorm.

Atmospheric vapour and ascending currents, and the descending currents which necessarily accompany them, play an important part in the development, course, and termination of thunderstorms. Where the climate is dry and rainless, like that of Jerusalem in summer, thunder is altogether unknown; and where an anticyclone with its descending currents rests over a region, as happens over the centre of the European-Asiatic continent in winter, thunder is equally unknown during that season. The diurnal periods of *hail*, *whirlwinds*, *waterspouts*, *dust-storms*, and *tornados* have their origin in substantially the same atmospheric conditions as the thunderstorm, and occur approximately at the same hours of the day.

Meteors are small bodies travelling in vast numbers, and in various directions, through space. Our earth continually encounters them in its orbital path, and they are then revealed to our observation as *aërolites*, *fireballs*, and *shooting or falling stars*. Every night, if the sky be clear, some may be observed, on the average five to seven every hour, while on certain occasions they are so numerous as to present the spectacle of a perfect rain of fire. Besides those visible to the eye, there are numbers unseen, some of which are occasionally noted in the course of telescopic observation. The total number encountered by the earth in one day has been estimated by Professor Newton, of Yale College, United States, at 7,500,000. Their total mass, however, he estimates at only 100 tons, so that individually they must in general be exceedingly minute. They dissipate, however, a quantity of dust in the upper regions of the air, which in its slow descent and fall upon the earth is easily detected by proper means. Our air in this case acts as a shield, so that, instead of frequent showers of stones descending with deadly force, we have this quiet falling of impalpable dust. Our conclusions regarding meteors are reached by a proper interpretation of various phenomena, long considered as having no mutual connection, but now grouped coherently under one simple explanation. In order to appreciate the reasoning which has led to this result, it will be convenient to consider first the observed facts regarding (1) *aërolites*, (2) *fireballs*, and (3) *shooting-stars*.

The first group, *aërolites*, includes all stony or metallic masses actually falling to the earth from the sky. They have been classed as (1) *aërosiderites*, or *siderites*, chiefly consisting of meteoric iron; (2) *aërosiderolites*, or *siderolites*, conglomerates of stone and iron; (3) *aërolites*, almost entirely consisting of stone. The common title *aërolites* embraces, however, all kinds. The descent of such bodies, though rare, has occurred with greater frequency than would be imagined. The British Museum alone has specimens of more than three hundred, of which nearly two hundred were seen to fall. Some sacred stones, as the black stone worshipped at Emesa in Syria, the holy Kaaba of Mecca, and the great stone of the pyramid of Cholula in Mexico, owed their sanctity to a report, probably true, that they had fallen from heaven. It has been suggested that the earliest image of Diana of the Ephesians, which 'fell down from Jupiter,' had taken the place of an actual meteorite. Livy mentions the falling of a shower of stones on the Alban Mount near Rome, about 654 B.C. A Chinese catalogue records the fall of an *aërolite* on January 14, 616 B.C., which broke several chariots and killed ten men. Plutarch and Pliny mention a great stone, as large as a wagon, the latter says, and of a burnt colour, the fall of which, at *Ægospotamos* on the Hellespont about 467 B.C., is recorded in the Parian Chronicle. In 1492 A.D., 'on Wednesday, November 7,' a stone weighing 280 lb. was seen to fall near Ensishem in Alsace: part of it is still preserved in the village church there. In 1510 about 1200 stones, one weighing 120 lb., another 60 lb., fell near Padua in Italy. We are told that the Emperor Jehangir caused a sword to be forged from a mass of meteoric iron which fell at Jullunder in the Punjab in 1620. On November 27, 1627, the astronomer Gassendi witnessed the fall of a stone weighing 59 lb. at Mount Vasier in Provence. At Wold Cottage, Yorkshire, December 13, 1795, a ploughman saw a stone of 56 lb. weight fall near him in a field. But the most interesting of such modern observations was made on April 26, 1803, near L'Aigle, in Normandy. About 1 P.M. a brilliant fireball was seen traversing the air at great speed. A violent

explosion followed, apparently proceeding from a small, lofty, and motionless cloud, followed by the fall of a perfect shower of stones, nearly three thousand being picked up afterwards, the largest more than 8 lb. weight.

On April 20, 1876, a mass of meteoric iron more than 7 lb. weight fell at Rowton in Shropshire, accompanied also by an explosion. On September 4, 1887, a large *aërolite* fell at Krasnoslobodsk, in the government of Penza. It was accompanied by a loud explosion, and in it (as in some others) were found crystals having all the chemical properties of the diamond. In nearly every one of these and other cases are noticed the following features—(1) a noise, often an explosion; (2) cloud or smoke; (3) partial fusion of the mass or masses, especially *on the surface*. These indicate that the *aërolite* by some means is brought to a very high temperature, at least above the melting-point of iron, which often causes it to burst into fragments. Pieces of one which fell in India in 1861, though picked up miles apart, were found by Maskelyne to fit together into one whole, the fractures coinciding. This high temperature, on the *surface* of the mass, would easily be produced by the compression and friction of the air in the case of a body moving with sufficient velocity. There is no observed connection between *aërolites* and volcanoes, nor can volcanic agency account for their velocity, and so this simple explanation of aerial friction is now universally accepted. A sufficient velocity is at once guaranteed when we consider *aërolites* as simply *fireballs* whose mass and course are such as to bring them entirely through our atmosphere into contact with the earth. Meteoric iron is also alloyed with nickel, cobalt, manganese, magnesium, copper, carbon, and tin, in a manner in which it is not yet found alloyed in terrestrial minerals; and this also points to its cosmical origin. Altogether twenty-four of the terrestrial chemical elements have been found in *aërolites*—viz. oxygen, hydrogen, chlorine, sulphur, phosphorus, carbon, silicon, iron, nickel, cobalt, magnesium, chromium, manganese, copper, tin, antimony, aluminium, calcium, potassium, sodium, lithium, titanium, arsenic, and vanadium. No new element not found on earth has been found in them.

The second class of meteors form *fireballs*, which appear as brilliantly luminous bodies, traversing the sky, often with noise, and always with great velocity. *Aërolites* before their fall have often been seen as *fireballs*, and the substantial unity of the two classes is now almost universally accepted. *Fireballs*, then, are regarded as *aërolites* whose mass and course are such that they escape actual contact with the earth. They are much more numerous than *aërolites*, and are of great variety in velocity, size, and brilliance. On August 18, 1783, one of great size traversed the air over Europe, from Shetland to Rome, at a height of 50 miles and with a speed of 30 miles per second, giving off a greater light than the full moon. More recently, on November 17, 1887, a splendid specimen, seen first over the Irish Sea, crossed westwards over Ireland, at a height of probably about 20 miles, and disappeared above the Atlantic. Many hundreds of such, though usually less brilliant, have been observed. Arago enumerates 813. More are constantly being seen. Their height is obtained by comparison of observations at stations widely separated, and from it and their observed speed the actual velocity is computed. From a careful comparison of many observations made by a committee of the British Association it appears that in general they appear at a height of between 20 and 130 miles, and have a velocity of between 17 and 80 miles per second, with an average of 34·4 miles per second. Their actual

size has been enormously overestimated, at 12,000 to 100 feet in diameter. The effects of irradiation and the luminous gases discharged during their course no doubt give them an *apparent* diameter enormously greater than the reality. It is probable that in most cases they are much smaller than *aërolites*. They generally leave behind them in their track a luminous train or 'tail' which sometimes disappears at once, and at other times persists for some minutes after the fireball itself disappears. These 'tails' are variously coloured, according probably to the different chemical constitution of the 'heads.'

That these bodies originate altogether beyond our earth is evident from several considerations. First, no sufficient terrestrial cause has been assigned. It has never been shown that volcanic explosions can communicate to ejected masses the necessary velocity. No proof has been advanced of the theory that *aërolites* and *fireballs* are condensed in the atmosphere itself. There is no volcanic activity on the moon, which might project such masses beyond the influence of her feeble gravity so as to enable them to fall upon our earth. Even if there were such activity in our satellite, the velocity of projection required is so great as to place such a cause outside consideration. Secondly, no good reason can be advanced *against* the theory of cosmical origin. That numerous masses, of various sizes, are in motion through interplanetary space is not in itself improbable, and is established by the investigation of the paths and velocities of shooting-stars. Thirdly, the velocity of *fireballs*, averaging 34·4 miles per second, is only comparable with such velocities as that of the earth in its orbit, which is 18·2 miles per second, or of Sirius (see STARS) in its orbit, and those of other planets and stars. It is a velocity not on the terrestrial but on the cosmical scale. Fourthly, there is no special line to be drawn between *fireballs* and meteors, luminous bodies of all degrees of size between the smallest meteor and the *fireball* having been observed. It is in fact sometimes a matter of doubt to the observer to which class he should relegate an observed example. To regard all as of common extra-terrestrial origin is then reasonable, and this view is now adopted almost universally.

We are then led onwards to the consideration of *shooting-stars*, as both the most numerous class of these appearances, and that class by observing which a satisfactory explanation of them all has ultimately been reached. On any fine night a watcher who is careful and patient for a sufficient time will see some of these, but occasionally they are much more numerous. On these occasions they are noted as originating all in one or more distinctly marked parts of the sky. From their point of origin they appear to radiate, and if it be overhead, and the meteors very numerous, the appearance is like an 'umbrella of fire' above the earth. But this point may not be overhead. It may even be below the horizon. In the latter case the meteors appear to come up over the horizon like rockets and *ascend* into the sky. This 'radiant,' as it is technically called, remains fixed among the stars, so that if at the beginning of an observation it be overhead, it will perhaps be below the horizon before the observer ceases his work. It is either named from the *constellation* in which it is placed, or indicated by its north polar distance and declination on the sphere of the heavens. Meteors from more than one radiant are frequently passing at the same time, but usually each radiant sends forth a particular kind. *Leonids* (i.e. the meteors whose radiant is in *Leo*), or the famous November meteors, are bright and swift, leaving very durable tracks of light. The *Taurids* (from constellation Taurus) give us many *fireballs*. Other

radiants give meteors of special tints, or more or less disposed to giving off sparks in their course, so that each radiant is evidently the source of a family of meteors, whose characteristics are recognised at each period of activity.

Such a radiating motion implies that the meteors from one radiant move all in *parallel* courses, the curvature and radiation of their tracks being due to perspective and to projection on the *sphere* which the eye naturally assumes as the background of all celestial appearances. On the occasion of a meteoric shower the earth, therefore, is passing through a crowd of small bodies, themselves in motion, meeting or passing it on a *definite track*. We have then to ask what is the form of this meteor track—whence come and whither go the meteors we encounter in such numbers. Usually there is a tolerably definite time, recurring annually, during which a radiant is active. This was the first broad fact impressed upon observers. Although at such yearly periods the number of meteors may be very large or very small, there are at least a *few* almost always seen. From this it was early seen that certain parts of space, through which the earth passed every year, were occupied, at the date of such passage, by meteors travelling past with planetary velocities. That the meteors, as well as the earth, were in orbital movement round the sun, was soon noted (in 1834) by Professor Olmsted of Yale. He considered that the November meteors (or *Leonids*) revolved in a narrow ellipse in a period of about 182 days, and that each November the earth in its orbit passed across the outer end of this ellipse, encountering there what meteors might be in that part of their path. This theory, however, though possible in perhaps *one* case, could hardly be applied to the great number of meteor tracks which the earth crosses, as it is exceedingly improbable that so many meteor orbits would just touch the earth's orbit at their aphelion.

It was proposed, then, to regard the meteors as travelling in a *ring* round the sun, which ring the earth crossed in two parts of its annual track in August and November. Both these theories regarded the meteors as gathered into a cloud or swarm at one particular part of their orbit. When the earth chanced to cross the place of intersection at the same time as the main swarm of meteors, then a vivid display was produced, but a difference in period between the earth and main swarm caused such meetings to take place only at long intervals. Meteors, however, being distributed all along the meteor track, the earth encountered some at least in August and November every year.

This investigation received its impetus from the great display of Leonids in 1833, chiefly noted in America, and for some time remained the 'text-book explanation.' Professor H. A. Newton of Yale, showed, however, in 1864 that other great Leonid displays had taken place on twelve occasions between 902 A.D. and 1833, separated by periods of either 33·24 years or multiples of that number. He therefore predicted a grand display on November 13-14, 1866, which was duly observed. But the date of the earliest display in 902 A.D. was October 13 (o.s.), so that it was evident that the earth encountered the main swarm of Leonids about three days later in each century. From these facts Professor Newton deduced for the meteors an elliptic orbit, with a period of 354·57 days. Other explanations were possible, and that given by Schiaparelli of Milan in 1866 finally satisfied all the conditions. He treated the Leonids as revolving round the sun in a period of 33½ years, the earth passing their orbit every year, but only encountering the main swarm when it also was passing the point of intersection. He also noted a

remarkable coincidence between this orbit and that of Tempel's comet seen in 1866. In fact, they were identical, within the errors of calculation. Other similar cases were soon discovered. The Lyraids of April 20 move in the track of a comet of 1861; Biela's comet agrees with the Andromeda meteors of November 28; the August Perseids agree with the bright comet of 1862; and now more than *seventy* such cases of agreement are known, which led Professor Tait of Edinburgh to publish the theory now generally accepted which regards comets as *consisting* of meteoric swarms (see COMET). Lockyer in 1887 showed by experiment that the fragments of fallen meteors, glowing in a very rare atmosphere given off by themselves when heated, give spectra closely resembling those of comets. It has also been shown by the same observer that what are practically the spectra of nebulae can be obtained from the same source. So that he regards the feeble meteors of our nights as the material of nebulae and stars—as the earliest known form of matter (see STARS). This assumes that our meteoric swarms are either remnants of the original material of the Solar System (q.v.), or portions of the greater swarms of which all space is full, which have been drawn within our solar system by planetary influence. Leverrier has shown that this latter explanation probably applies to the August and November meteors already referred to, and that the planet Uranus has most likely captured these bodies and added them to our system. The action of gravity would tend to draw out a meteor swarm so that it would gradually spread backwards and forwards until finally it would be distributed all along its track and form a closed elliptic ring. As, then, the August meteors form such a ring, while the November Leonids are a marked swarm, Leverrier concluded that the former had entered our system through the action of Uranus much earlier than the latter.

Some hundreds of 'radiants' are now known, a few of which we name, and the dates on which they are active: (1) The *Lyraids*, April 19-20; (2) the *Pegasids*, August 10; (3) the *Perseids*, August 9-11; (4) the *Aurigids*, September and October; (5) the *Orionids*, October and November; (6) the *Taurids*, November 1-15; (7) the *Leonids*, November 13-14.

Methodists, the name originally given, about the year 1729, by a student of Christ Church to the brothers Wesley and several other young men of a serious turn of mind, then members of different colleges of Oxford, who used to assemble together on particular nights of the week chiefly for religious conversation. The term was selected, it is believed, in allusion to the exact and *methodical* manner in which they performed the various engagements which a sense of Christian duty induced them to undertake, such as meeting together for the purpose of studying Scripture, visiting the poor, and prisoners in Oxford gaol, at *regular* intervals. Subsequently it came to be applied to the followers of Wesley and his coadjutors, when these had acquired the magnitude of a new sect; and though their founder himself wished that 'the very name,' to use his own words, 'might never be mentioned more, but be buried in eternal oblivion,' yet it has finally come to be accepted by most, if not all of the various denominations who trace their origin mediately or immediately to the great religious movement commenced by John Wesley. For an

account of the origin and earlier development of Methodism, see articles on the brothers WESLEY and on WHITEFIELD; we confine ourselves here to a brief notice of its organisation, doctrine, and present condition.

(1) *Organisation.*—This appears to have been partly improvised by Wesley to suit the exigencies of his position. It was not a theoretical and premeditated, but a practical and *extempore* system. In the *Rules of the Society of the People called Methodists*, drawn up by himself, he says: 'In the latter end of the year 1739 eight or ten persons came to me in London, who appeared to be deeply convinced of sin, and earnestly groaning for redemption. They desired (as did two or three more the next day) that I would spend some time with them in prayer, and advise them how to flee from the wrath to come, which they saw continually hanging over their heads. That we might have more time for this great work, I appointed a day when they might all come together, which from thenceforward they did every week—viz. on Thursday, in the evening.' This he calls 'the first Methodist Society.' Its numbers rapidly increased, and similar 'societies' were soon formed in different parts of England where the evangelistic labours of the Wesleys had awakened in many minds 'a desire to flee from the wrath to come, and be saved from their sins'—the only condition required of any for admission into these societies. In order to ascertain more minutely how the work of salvation was progressing in individual cases, Wesley subdivided the societies into 'classes,' according to their respective places of abode, each class containing about a dozen persons, under the superintendence of a 'leader,' whose duties are partly religious and partly financial. He has (1) to see each person in his class once a week, 'to inquire how their souls prosper, and to encourage, comfort, or censure, as the case may require; and (2) to collect the voluntary contributions of his class, and pay them over to the 'stewards' of the society. Each society has its stewards, who take charge of the moneys contributed in the classes and congregation, and who see to their proper distribution. The leaders and stewards are the local church-council, which is invested with disciplinary functions. A circuit is an aggregate of the societies for a particular neighbourhood; and, according to its size, having from one to five ministers appointed for a period of not less than one or more than three years. The senior minister is superintendent of the circuit. The administration of the spiritual affairs of each society is vested in the leaders' meeting, and that of the general business of the circuit in the quarterly meeting, composed of the ministers, stewards, local preachers, leaders, and trustees. These bodies invite the ministers, fix their stipends, approve or reject candidates for the ministry, review all the interests of the circuit, send memorials to the district meeting or Conference, have the right to appoint a court of appeal from the findings and verdicts of a leaders' meeting in certain cases of discipline, and to suspend for one year the operation of any new Conference law intended to be binding on the circuit or societies, until it shall have been reconsidered by the Conference. The annual assembly which governs the whole Connection is called the Conference. Down to 1784 it consisted of such of Wesley's preachers as he chose to call together to take counsel with himself; but in that year he gave it a legal constitution defining its rights over the chapels, the disciplinary control of the ministers, and their appointments. Until 1877 the Conference was composed of ministers only; but in that year a scheme of lay representation was adopted, and was brought into operation the year following. So now the Conference is in part an

assembly of co-pastors, exercising mutual discipline and taking mutual counsel on all subjects specifically pastoral, and in part an assembly of 240 ministers and 240 laymen convened to deliberate on the general interests of the Connection. The pastoral session extends over a fortnight, while the mixed session finishes its business in a week. 'The legal Conference' is a body of one hundred ministers constituted and perpetuated by Wesley's Deed of Declaration, which as a matter of necessary legal form adopts and endorses all that has been done in the general Conference.

Intermediate between the Conference and the circuit are the district meetings, which are in effect provincial synods. Like the Conference itself, during the transaction of pastoral business they are composed of ministers only, while for all other business they are mixed assemblies, the ministers being joined by the circuit stewards and the laymen who have charge of foreign missions, home missions, education, chapel, and temperance affairs. In the district meeting a searching inquiry is made by the pastors into the character and administration of each, candidates for the ministry and probationers are examined, the spiritual and financial condition of the circuits is considered, and suggestions or recommendations on the points which come under review are sent up to Conference. All new legislation is sent down by the Conference to the district meetings, nor can it become law for the Connection till it has been ratified by a majority of the district meetings. The district meetings are also courts of appeal from the circuits.

(2) *Doctrine and Worship.*—Under this head not much requires to be said. Methodism is regarded by its friends as a revival of primitive Christian doctrine, fellowship, and discipline. In the beginning it set itself to combat Calvinism on the one hand, and the doctrine of baptismal regeneration on the other. Its founders held that the predestinarian element in Calvinistic divinity is opposed to the experimental theology of primitive Christianity. The Methodist preachers taught a full, free, and present salvation as the glorious privilege of every man—a theology at once experimental and evangelical, quite unlike the theology of the decrees. They taught, moreover, this conscious renewal and sanctification through faith alone in Jesus Christ. The Methodist doctrine of regeneration is through 'repentance towards God and faith towards our Lord Jesus Christ' (not through baptism); sanctification is through the saving truth spiritually received and applied by faith and obedience. The Wesleyan Methodists are evangelical Arminians. Holding the freedom of the human will, and the responsibility of man, they also maintain his total fall in Adam, and his utter inability to recover himself. They believe in the universality of the atonement, and that a dispensation of the Spirit is given to enlighten every man that cometh into the world. They insist on the necessity of men who profess to be Christians feeling a *personal interest* in the blessings of salvation—i.e. the assurance of forgiveness of sins and adoption into the family of God. This, however, is not to be confounded with a certainty of *final salvation*. They believe the Spirit of God gives no assurance to any man of that, but only of *present pardon*. In harmony with this view, they reject the doctrine of the necessary perseverance of the saints, and hold that it is fearfully possible to fall from a state of grace, and even to perish at last after having 'tasted of the heavenly gift,' and having been 'made partakers of the Holy Ghost.' They also maintain the perfectibility of Christians, or rather the possibility of their entire sanctification as a privilege to be enjoyed in this life. But Wesley 'explains'

that 'Christian perfection does not imply an exemption from ignorance or mistake, infirmities or temptations; but it implies the being so crucified with Christ as to be able to testify, "I live not, but Christ liveth in me."' He regards the sins of a 'perfect' Christian as 'involuntary transgressions,' and does not think they should be called 'sins' at all, though he admits that they need the atoning blood of Christ. The mode of worship is elastic, ranging from the full and stately liturgical service of the Church of England, and Wesley's abridgment, to the free, spontaneous utterance of extempore prayer, the singing of four hymns, and a sermon. The more elaborate services are found principally in the large cities, the more simple in the country towns and villages. The 'love-feast' is for members only, and is held in each society once a quarter; it is a narration of vivid and inspiring experience, mingled with praise and prayer. The Covenant Service is held on the first Sabbath of the New Year. In this service the members of the church solemnly reconsecrate themselves to God, 'heartily contented that He appoint them their work and station;' covenanting to endeavour to order and govern their whole life according to the divine direction, and not to allow themselves in the neglect of anything they know to be their duty. The service concludes with the Lord's Supper.

(3) *History*.—The history of Methodism is for many years the history of Christian effort to evangelise the neglected 'masses' of England. The labours of Wesley, and of those whom he inspired to imitate his example, were of the noblest description, and met with remarkable success. The reformation of life which his preaching produced, for example, among the Kingswood colliers and the Cornwall wreckers, is a testimony to the power of religion which cannot be too highly estimated. The zeal which has inspired the body in regard to foreign missions, although in the highest degree honourable, is only the logical development of their efforts at home—for they originally regarded their society in England as simply a vast 'home mission,' and neither Wesley nor his followers desired to consider themselves a 'sect,' a new church, in the common usage of the term, but were warmly attached to the old national church, and considered themselves among her true children. When Wesley died (1791) his 'societies' had spread over the United Kingdom, the continent of Europe, the States of America, and the West Indies, and numbered 80,000 members. Since then they have largely increased (see below).

The Wesleyan Methodists have four theological colleges for the training of ministers—at Richmond Hill, Surrey; Didsbury, South Lancashire; Headingley, in Yorkshire; and Handsworth, Birmingham. They have, besides, numerous secondary schools, and also (in 1889) 841 day-schools, with 179,578 scholars; the total income of the schools being £246,478. The Methodist Book-room is situated in the City Road, London, and issues hundreds of thousands of religious publications (tracts, &c.) monthly. The newspapers and other periodicals professedly in connection with the body include four quarterlies, and about 150 journals in English and other languages. Among the more eminent Methodist authors may be named the two Wesleys, Fletcher, Benson, Clarke, Moore, Watson, Drew, Edmondson, Sutcliffe, Jackson, Treffry, Rule, Nichols, Smith, Etheridge, Rigg, Pope, Gregory, Beet, and Pearse.

THE METHODIST EPISCOPAL CHURCH is the society of Wesleyan Methodists in the United States of America, where the first members of that body—immigrants from Ireland—established themselves as a religious society in New York in the year 1766. In the course of a year or two their

numbers had considerably increased, and they wrote to John Wesley to send them out some competent preachers. Two immediately offered themselves for the work, Richard Boardman and Joseph Pilmoor, who were followed in 1771 by Francis Asbury and Richard Wright. The agitations preceding the war of independence, which soon afterwards broke out, interrupted the labours of the *English* Methodist preachers in America, all of whom, with the exception of Asbury, returned home before the close of the year 1777; but their place appears to have been supplied by others of native origin, and they continued to prosper, so that at the termination of the revolutionary struggle they numbered 43 preachers and 13,740 members. Up to this time the American Wesleyan Methodists had laid no claim to being a distinct religious organisation. Like Wesley himself, they regarded themselves as members of the English Episcopal Church, or rather that branch of it then existing in America, and their 'preachers' as a body of irregular auxiliaries to the ordained clergy. 'Episcopal churches,' we are informed, 'are still standing in New York and elsewhere, at whose altars Embury, Pilmoor, Boardman, Strawbridge, Asbury, and Rankin, the earliest Methodist preachers, received the holy communion.' But the recognition of the United States as an independent country, and the difference of feelings and interests that necessarily sprang up between the congregations at home and those in America, rendered the formation of an independent society inevitable. Wesley became conscious of this, and met the emergency in a manner as bold as it was unexpected. He himself was only a presbyter of the Church of England, but having convinced himself that in the primitive church a presbyter and a bishop were one and the same order, differing only as to their official functions, he assumed the office of the latter, and, in September 1784, with the assistance of some other presbyters who had joined his movement, he set apart and ordained the Rev. Thomas Coke (q.v.), of Oxford University, bishop of the infant church. Coke immediately sailed for America, and appeared with his credentials at the Conference held at Baltimore in December of the same year. He was unanimously recognised by the assembly of preachers, appointed Asbury coadjutor bishop, and ordained several preachers to the offices of deacon and elder. Wesley also granted the preachers permission (which shows the extensive ecclesiastical power he wielded) to organise a separate and independent church under the Episcopal form of government. Nevertheless, there were not a few who were dissatisfied with the Episcopal form of government. This feeling grew stronger and stronger, until in 1830 a secession took place, and a new ecclesiastical organisation was formed, called the 'Methodist Protestant Church.' In 1842 a second secession took place, chiefly on the question of slavery—the seceders pronouncing all slave-holding sinful, and excluding slave-holders from church membership and Christian fellowship; and in 1843 a meeting was held at Utica, New York, where a new society was constituted and named the 'Wesleyan Methodist Connection of America.' It has continued up to the present a small and unimportant body. But in 1844 a far larger and more important secession took place on the same question, when the whole of the Methodist societies in the then slave-holding states, conceiving themselves aggrieved by the proceedings instituted at the general Conference of New York (1844) against the Rev. James O. Andrew, D.D., one of the bishops, and a citizen of Georgia, who had married a lady possessed of slaves, resolved to break off connection with their northern brethren. Hence originated the Methodist Episcopal Church, South. In 1869 a movement (unsuccessful) began

in favour of the re-union of the northern and southern Methodist Episcopal Churches, slavery, the main obstacle in the way, having been finally abolished. There are now 10 theological schools, nearly 50 colleges and universities, and a great number of other educational institutions belonging to the body in America, with some 30,000 students. The publications of the church, managed by a General Book Committee, extend to far above 200,000,000 pages of books and tracts in a year; while in its foreign missions more than 3000 American missionaries are employed.

Returning to the English Wesleyan Methodists, we mention the various secessions from the parent body in the order of time. (1) *The Methodist New Connection*.—This society detached itself from the older one in 1797. Its doctrines and order are the same, the only difference being that it admits one layman to each minister into the Conference, and allows them to share in the transaction of all business, both secular and spiritual. These laymen are chosen either by the circuits or by 'guardian representatives' elected for life by the Conference. (2) *Primitive Methodists*, vulgarly designated *Ranters*, were first formed into a society in 1810, though the founders had separated from the old society some years before. The immediate cause of this separation was a disagreement as to the propriety of camp-meetings for religious purposes; and also upon the question of women being permitted to preach. A third point of difference is the admission to their conference of two lay delegates for every minister. (3) *Independent Methodists*, who separated in 1810. They are chiefly distinguished by their rejection of a paid ministry. (4) *Bible Christians*, also called *Bryantites*, were formed by a local preacher named Bryan, who seceded from the Wesleyans in 1815. The only distinction between them and the original body appears to be that the former receive the eucharistic elements in a sitting posture. (5) *United Free Church Methodists* have been formed by the amalgamation of two sects of nearly equal numerical strength. The older of these, called the Wesleyan Association, originated in 1836 in the removal of one or two influential ministers from the original Connection. Points of difference subsequently appeared with regard to the constitution of the Conference.—The younger sect, called the Wesleyan Reform Association, took its rise in 1849 through the expulsion of several ministers from the parent body on a charge of insubordination, and, being founded on the same principles as the last-mentioned community, arrangements were entered into for their union, which was subsequently effected in 1857. Church independency and freedom of representation in the annual assembly are two of the most prominent distinctive traits in the organisation of the United Methodist Free Church.

The WELSH CALVINISTIC METHODISTS are not a secession from the followers of Wesley, but originated partly in the preaching of his friend and fellow-evangelist, Whitefield, and partly in that of Howel Harris. Whitefield was a Calvinist; Wesley, as we have seen, was on some points decidedly Arminian. A difference arose between them on the subject of election. Henceforward their paths lay in different directions. Whitefield, however, did not form a religious sect; and after his death (1770) his followers, being left without any distinct bond or organisation, either followed the leading of the Countess of Huntingdon (q.v.), or became distributed among other denominations, a large portion, especially in Wales, becoming absorbed in the new society gradually forming itself through the preaching of Howel Harris and his coadjutors. They became a separate body in 1810, and have now about 130,000 communicants.

The total number of members and adherents of Methodist churches is estimated at 25,000,000; the following table shows the distribution of ministers and members in 1889:

	Ministers.	Members.
Wesleyan Methodists—		
Great Britain.....	1,975	514,790
Ireland.....	224	25,960
Foreign Missions.....	875	37,778

Methodius. See CYRIL.

Methuen Treaty, a commercial treaty negotiated in 1703 by Paul Methuen, the English ambassador in Portugal, with that country, to admit Portuguese wines to England at a duty one-third less than that on French wines, the Portuguese undertaking in return to admit English wool, imposing on it, however, the old duty of 23 per cent. *ad valorem*. It was annulled in 1835.

Methyl is an organic radical homologous with Ethyl (q.v.). Its formula is CH_3 , but, as it cannot exist in the free state, two such groups of atoms unite together to form ethane, $\text{CH}_3\text{—CH}_3$. As in the case of ethyl, methyl is the centre of a whole group of substances known as the methyl-group. Thus, the hydride of methyl, CH_3H , known as light carburetted hydrogen, marsh-gas, or fire-damp, is well known as the cause of explosions in coal-mines. It is a light, inodorous gas, half as heavy as air; non-poisonous and very inflammable, forming an explosive mixture with seven volumes of air. Methyl alcohol, CH_3OH , is obtained as a by-product in the manufacture of beet-root sugar, and also by the dry distillation of wood. It is a colourless, mobile liquid, resembling ordinary alcohol in many of its properties. Methyl oxide or methyl ether, $(\text{CH}_3)_2\text{O}$, corresponding to ethyl ether or common ether, is a gas at ordinary temperatures, very soluble in water and alcohol, and capable of being condensed to a liquid by pressure and cold. It is largely prepared for use in freezing-machines, owing to the intense cold which results when the liquefied gas is allowed to evaporate. It is prepared by the action of sulphuric acid on wood spirit.

Besides the above, methyl enters into the constitution of many ethereal salts and amines, such as methyl chloride, acetate, and salicylate, as well as methyl amine, dimethyl amine, &c. (see AMINES). The salicylate, $\text{CH}_3\text{C}_6\text{H}_4\text{O}_2$, is interesting as being the ethereal oil of *Gaultheria procumbens*, from which pure methyl alcohol and pure salicylic acid can both be made. For Methyl Violet, see DYKING; and for Methylene, see ANÆSTHESIA.

Methylated Spirit consists of a mixture of 9 parts of alcohol, of specific gravity 0.920, with 1 part of Pyroxylic (q.v.) or wood-spirit. This addition of wood-spirit renders it unfit for drinking, although it scarcely interferes with its power as a solvent. It is allowed by the excise to be sold duty-free for manufacturing purposes, and for preserving specimens in museums.

Metonic Cycle. See CHRONOLOGY, GOLDEN NUMBER.

Metope. See ENTABLATURE.

Metre is that regulated succession of certain groups of syllables in which Poetry (q.v.) is usually written. A greater or less number of groups forms a *line* or *verse*, and in modern languages the verses usually rhyme with one another; but this is not at all essential to the notion of metre. In the classic languages metre depended upon the way in which long and short syllables were made to succeed one another. English metre depends, not upon the distinction of long and short, but upon that of *accented* and *unaccented* syllables. Thus, in the lines,

The cur' few tolls' | the knell' | of part'ing day'—
Warriors and | chiefs', should the | shaft' or the | sword'—

the accents occur at regular intervals; and the groups of syllables thus formed constitute each a metre or measure. The groups of long and short syllables composing the metres of classic verse were called *feet*, each foot having a distinctive name. The same names are sometimes applied to English measures, an accented syllable in English being held to be equivalent to a long syllable in Latin or Greek, and an unaccented syllable to a short. Every metre in English contains one accented syllable and either one or two unaccented syllables. As the accent may be on the first, second, or third syllable of the group, there thus arrive five distinct measures, two disyllabic and three trisyllabic, as seen in the words—1, com'fort (corresponding to the classic Trochee); 2, agree' (Iambus); 3, mur'muring (Dactyl); 4, confu'sion (Amphibrach); 5, colonnade' (Anapaest). These measures are arranged in *lines* or *verses*, varying in length in different pieces, and often in the same piece. The ending measure of a line is frequently incomplete, or has a supernumerary syllable; and sometimes one measure is substituted for another. All that is necessary is that some one measure be so predominant as to give a character to the verse. Constant recurrence of the same measure produces monotony. The following lines exemplify the five measures:

- (1) Rich' the | treas'ure.
Bet'ter | six'ty | years' of | Eu'rope | than'a' | cyc'le | of Ca|thay'.
- (2) Aloft' | in aw'ful state'.
The prop' | er stud'y of | mankind' | is man'.
- (3) Bird' of the | wil'derness.
Bright'est and | best' of the | sons' of the | morning.
- (4) The dew' of | the morn'ing.
O young' Loch | invar' has | come out' of | the west'.
- (5) As they roar' | on the shore'.
The Asayr' | lan came down' | like a wolf' | on the fold'.

It is instinctively felt that some of these measures are better suited for particular subjects than others.

Thus, the first has a brisk, abrupt, energetic character, agreeing well with lively and gay subjects, and also with the intensity of such pieces as *Scots wha ha'e*. The second is by far the most usual metre in English poetry; it occurs, in fact, most frequently in the ordinary prose-movement of the language. It is smooth, graceful, and stately; readily adapting itself to easy narrative, and the expression of the gentler feelings, or to the treatment of severe and sublime subjects. The trisyllabic metres, owing to the number of unaccented syllables in them, are rapid in their movement, with a tripping lightness that suggests the analogy of music in triple time. They are all less regular and monotonous than the disyllabic metres. One of them is frequently substituted for another, as in the opening of Byron's *Bride of Abydos*:

Know' ye the | land' where the | cy'press and | myr'tle
Are em'blems | of deeds' that | are done' in | their clime';
Where the rage' | of the vul'ture, the love' | of the tur'tle—

where each of the three lines is in a different metre, the first dactylic, the second amphibrachic, the third anapaestic. In addition to this irregularity, one of the unaccented syllables is often wanting; as in Mrs Hemans' poem, *The Voice of Spring*:

I come', | I come'! | ye have called' | me long';
I come' | o'er the moun'tains with light' | and song'—

the first line has only one measure of three syllables, although the general character of the versification is trisyllabic.

In a kind of verse introduced by Coleridge, and used occasionally by Byron and others, the unaccented syllables are altogether left out of account, and the versification is made to depend upon having a regular number of accents in the line:

There is' not wind' enough' | to twirl'
The one' red leaf', the last' of its clan';
That dance' as oft'en as dance' it can';
On the top'most twig' that looks up' at the sky'.

Here there are four accents in each line, but the number of syllables varies from eight to eleven.

The variety of combinations of metres and rhymes that may be formed is endless; but a few of the more usual forms of English versification have received special names, and these we may briefly notice.

Octosyllabics are verses made up each of four measures of the second kind of metre, and therefore containing eight syllables:

With fruit' | less la' | bour, Cla' | ra bound'
And strove' | to stanch' | the gush'ing wound'.

Scott's and Byron's romantic poems (save *Lara* and the *Corsair*) are mostly in octosyllabics, and so are *Hudibras*, *Lalla Rookh*, and many other pieces.

Heroic is a term applied to verses containing five metres of the second kind, or ten syllables. Heroics either rhyme in couplets, or are without rhymes, constituting blank verse. Many of the chief narrative and didactic poems in the English language are in rhyming heroics; as those of Dryden, Pope, Cowper, &c. Milton's two great poems, Young's *Night Thoughts*, Thomson's *Seasons*, Cowper's *Task*, Wordsworth's *Excursion*, and many others are written in blank heroics. Metrical dramas are almost always in blank verse; in which case there is frequently a supernumerary syllable, or even two, at the end of the line:

To be, | or not | to be, | that is | the ques'tion:
Whether | 'tis nob'ler in | the mind | to suf'fer.

Two trochaic measures are in use in English, the fifteen-syllable and the seven-syllable. Of the former the best example is Tennyson's *Locksley Hall*; the latter was a favourite form with Keats, as in the *Ode on the Poets* and *Mermaid Tavern*, and of Shelley, as in the *Lines Written in the Euganean Hills*.

In *Elegiacs* the lines are of the same length and

the same measure as in heroics, but the rhymes are alternate, and divide the poem into quatrains or stanzas of four lines, as in Gray's *Elegy*. The Spenserian stanza, popularised by Spenser in the *Faerie Queene*, and much used by Byron, differs from common heroics only in the arrangement of the rhymes, and in concluding with an Alexandrine which gives it a sonorous cadence particularly pleasing to the ear. The Chaucerian heptastich is a seven-line decasyllabic stanza called also *rime royal*, having three rhymes, one connecting the first and third; another, the second, fourth, and fifth; and the third, the sixth and seventh.

The octosyllabic quatrain, the quatrain in eights and sixes, and the quatrain in sixes, with the third line octosyllabic, are commonly called long measure, common measure, and short measure. The second has been also called *service metre*, being the form of versification adopted in the metrical Psalms, in many hymns, and other lyrical pieces. From being frequently employed in old romances and ballads, this metre is also called *ballad metre*. A familiar example is Chaucer's *Rime of Sir Thopas*. The first and third lines often rhyme, as well as the second and fourth.

In triple measures the most important are the quatrain, the six-line and the eight-line stanzas. Each may be dactylic, anapestic, or amphiambic, but the last is the most common; of the first an example is Byron's *Song of Saul before his last Battle*; of the second, Wolfe's *Burial of Sir John Moore*; of the third, in many ballads and songs, as in the line:

I saw from the beach when the morning was shining.

The unrhymed metres are hexameters, blank verse, and choral metres, sometimes, as in *Queen Mab*, iambic; in the *Strayed Reveller*, trochaic.

Such are some of the more usual and definite forms of versification. In many poems, especially the more recent ones, so much licence is assumed that it is difficult to trace any regular recurrence or other law determining the changes of metre, or the lengths of the lines; the poet seeks to suit the modulation at every turn to the varying sentiments. But it may be questioned whether much of this refinement of art is not thrown away, upon ordinary readers at least, who, failing to perceive any special suitableness, are inclined to look upon those violent departures from accustomed regularity as the results of caprice.

See also the special articles in this work on ACCENT, ALLITERATION, BLANK VERSE, HEXAMETER, ODE, POETRY, QUANTITY, RHYME, and SONNET; Edwin Guest's *History of English Rhythms* (2d ed. revised by Prof. Skeat, 1882); Prof. J. B. Mayor's *Chapters on English Metre* (1886); Dr Gunmore's *Handbook of Poetics* (Boston); and Prof. Schipper's *Englische Metrik* (Bonn, 1881-89).

Mètre, the basis of the 'metrical' or modern French system of weights and measures, and the unit of length. The first suggestion of a change on the previous system dates as far back as the time of Philip the Fair; but up till 1790 no important change had been effected. On the 8th May 1790 proposals were made by the French government to the British, for the meeting of an equal number of members from the Academy of Sciences and the Royal Society of London, to determine the length of the simple pendulum vibrating seconds in N. lat. 45° at the level of the sea, with the view of making this the unit of a new system of measures. The British government, however, did not give this proposal a favourable reception, and it fell to the ground. The French government, impatient to effect a reform, obtained the appointment by the Academy of Sciences of a commission composed of Borda, Lagrange, Laplace, Monge, and Condorcet, to choose from the following three, the length of the pendulum, the fourth part of the equator, and

the fourth part of the meridian, the one best fitted for their purpose. The commission decided in favour of the last—resolving that the $\frac{1}{4}$ of a quadrant of the Meridian (q.v.) be taken for the basis of the new system, and be called a 'mètre.' Delambre and Mechain were immediately charged with the measurement of the meridian between Dunkerque and Barcelona; and the result of their labours was referred to a committee of twenty members, nine of whom were French, the rest having been deputed by the governments of Holland, Savoy, Denmark, Spain, Tuscany, and the Roman, Cisalpine, Ligurian, and Helvetic republics. By this committee the length of the mètre was found to be 443·296 Parisian lines, or 39·3707904 English inches; and standards of it and of the kilogramme (see GRAMME) were constructed, and deposited among the archives of France, where they still remain. If we call the mètre 3 feet 3½ inches our error will be $\frac{1}{15}$ inch only. The 'metrical system' received legal sanction 2d November 1801. The following are the fractions and multiples of the mètre:

	English Inches.		English Feet.	English Yards.
Millimètre,	·088707904			
Centimètre,	·88707904			
Decimètre,	8·8707904			
MÈTRE,	39·3707904	=	3·2808992	= 1·093633
Decamètre,	393·707904	=	32·808992	= 10·93633
Hectomètre,	3937·07904	=	328·08992	= 109·3633
Kilomètre,	39370·7904	=	3280·8992	= 1093·633
Myriamètre,	393707·904	=	32808·992	= 10936·33

The term 'metric system' is also extended to the French square measure based on the Arc (q.v.), which is a square the side of which is a mètre; to the measure of weight based on the Gramme (q.v.), which is the weight of a cubic decimètre of distilled water; to the measure of capacity based on the Litre (q.v.), the volume of a cubic decimètre; and to the cubic measurement based on the Stère (q.v.), which is a cubic mètre. See DECIMAL SYSTEM.

Metronome, a small machine for indicating the correct time or speed at which a musical composition should be played. It is essentially an inverted pendulum moved by clockwork. The time is regulated by a weight which can be pushed up and down the pendulum rod, on which is a graduated scale. The metronome as we have it was patented by Mälzel in 1816, but was really invented by Winkel of Amsterdam.

Metropolitan. See ARCHBISHOP, COLONY.

Metternich, CLEMENS WENZEL NEPOMUK LOTHAR, Prince von Metternich and Duke of Potella, an eminent Austrian diplomatist, was born at Coblenz, 15th May 1773. His ancestors had obtained distinction in the wars of the empire against the Turks; his family had supplied more than one elector to the archbishoprics of Mainz and Treves; and his father, Franz Georg Karl, Count von Metternich, had secured a high reputation as a diplomatist and as the associate of Kaunitz. Young Metternich therefore entered the service of his country under the most favourable auspices, of which he was not slow in taking advantage. At the age of fifteen he matriculated at the university of Strasburg, where he had for his fellow-student Benjamin Constant, and from which he removed, two years afterwards, to Mainz to complete his education. In 1794, after a short visit to England, he was attached to the Austrian embassy at the Hague, in the following year marrying the granddaughter and heiress of his father's friend Kaunitz. He first came into notice at the congress of Rastadt, where he represented the Westphalian nobility, after which he accompanied Count Stadion to St Petersburg. From this point his rise was very rapid, as he added to the advantages of his birth and connections a more than

ordinary share of diplomatic ability, with the most graceful and winning manners. At twenty-eight he was appointed Austrian minister at the court of Dresden, and after the lapse of two years he was sent as ambassador to Berlin, where he took a leading part in the well-known coalition which was dissolved by the battle of Austerlitz. After the peace of Presburg young Metternich was selected for the most important diplomatic appointment in the gift of the emperor—that of minister at the court of Napoleon. When he presented himself before the emperor, he was greeted with the remark, 'You are very young to represent so powerful a monarchy.' 'Your majesty was not older at Austerlitz,' replied Metternich, with a slight exaggeration which could not make the compliment less acceptable; and, indeed, young as he was, he exhibited an address and a knowledge before which Napoleon might bluster, but of which he never could get the better. Without much ardour, with very limited sympathies, with no deep convictions, he had a clear head and a firm hand; he could keep his own secret, and he could worm out the secrets of others; and, making himself the most agreeable man in the world, he plotted with a smiling countenance, manoeuvred in a dance, and struck the hardest when he seemed to yield the most.

In 1807 he concluded the treaty of Fontainebleau, very favourable to the interests of Austria; and on the outbreak of the war between France and Austria in 1809 he was detained some time before he could obtain his passport. In the course of that year he succeeded Count Stadion as minister of Foreign Affairs, and it was during his tenure of office that he conceived the idea of a marriage between Napoleon and an Austrian archduchess as a means of purchasing a respite for the empire. Metternich escorted Marie Louise to Paris. Amidst the difficulties of 1812-13 Metternich maintained at first a temporising policy, but the obstinacy of Napoleon at length led him to resolve upon the declaration of war with France made in August 1813. In the autumn of that year the grand alliance was signed at Teplitz, and Metternich, in recognition of his great ability in connection with the negotiations, was raised to the dignity of a prince of the empire. In the subsequent conferences and treaties the newly-created prince took a very prominent part, and he subsequently signed on behalf of Austria the second treaty of Paris on 20th November 1815. He afterwards paid a visit to England, and was made an LL.D. by the university of Oxford—the only honour this man of countless orders ever received from Britain. After this he still continued to conduct the diplomacy of Austria; in 1821 he was appointed chancellor of the empire, and in 1826 succeeded Count Zichy as president of ministerial conferences on home affairs. His efforts were now earnestly directed to the maintenance of peace in Europe and the preservation of the existing state of things in the Austrian dominions by the strictest measures of police and severe despotism. In the mildest expressions of individual opinion he saw symptoms of dangerous agitation, and his supreme object was to combine what he called the conservative forces of society against anarchy. Then came the French Revolution of 1848, and Metternich's hatred of revolution was fanatical. The shock, which overthrown for a time half the thrones of Europe, was felt at Vienna, and the government fell, in spite of the resistance of Metternich, who maintained his policy of 'thorough' to the last. Leaving Vienna with an escort of cavalry, he fled to England, and there he remained till 1851, in the autumn of which year he made a sort of royal progress to his castle of Johannisberg on the Rhine. From this time,

although the advice of the old statesman was occasionally asked by the emperor, he was never again requested to assume office. He died at Vienna on 11th June 1859. The *Autobiography* of Metternich (French, 1879-82; German, 1880-84; Eng. trans. 1880-83), edited by his son, throws valuable light on the stirring times in which he lived. In these volumes also appears the diary of his third wife, Countess Melanie Zichy-Ferraris, whom he married in 1831, when he was about fifty-eight years of age. She was a clever and beautiful woman, and gave her husband much effective aid. From many entries in her diary it is evident that, if her husband was stern and harsh in political strife, he was not without warm and genial affections. To her Prince Metternich was as good and great a man as ever lived, and she expresses more than once her opinion that he alone 'could save the world.'

There are works on Metternich by Binder (1836), Groos-Hoffinger (1846), Schmidt-Weissenfels (1861), Beer (1877); and see *Metternich*, by Colonel Malletson ('Statesmen' series, 1888).

Mettray, a village of France, 5 miles N. of Tours by rail, noted for its great agricultural and industrial Reformatory (q.v.), the parent of all such institutions. It dates from 1839, and in 1896 had 537 inmates.

Mettrie. See LAMETTRIE.

Metz, the strongest fortress of German Lorraine (before 1871 the principal bulwark of the north-eastern frontier of France, and capital of the department of Moselle), stands on the river Moselle at the influx of the Seille, 216 miles E. of Paris. The strength of the place consists in its exterior defences, of which the principal are a cordon of forts, some greatly strengthened and improved since the German annexation, and some entirely new. The cathedral, a Gothic edifice (14th to 16th century), is remarkable for its vast size and its architectural lightness, and has a beautiful spire of open work, 363 feet in height. Of other seven Catholic churches, the most interesting is St Vincent's. There are two Protestant churches and a synagogue. The city has a library, a museum, a military academy, a music school, art and numismatic collections, &c. Apart from tanning and the making of saddles and shoes, there are few industries, though there are several iron-works in the vicinity. The trade is chiefly in wine, brandy, preserved fruits, leather, &c. Pop., which in 1869 was 48,325, had in 1875, by reason of emigration into France, decreased to 37,925, or with garrison, 45,856; (1890) 59,723, including a large garrison. The Protestants are less than half as numerous as the Catholics. Metz, known to the Romans as *Divodurum*, was afterwards called Mettis (corrupted from *Mediomatrici*, the name of the people), hence the present form. Under the Franks it was the capital of Austrasia, and in 870 passed to the empire; it was afterwards made a free city of the empire. In 1552 it was treacherously taken possession of by the French; and, although Charles V. besieged the place from October 1552 to January 1553, they kept it till it was formally ceded to them in 1648. The fortifications, already strong, were completely reconstructed by Vauban in 1674; they were added to at various dates, and after 1830 thoroughly restored. In August 1870 Bazaine was compelled to retire with his army into Metz, which after a long siege was taken by the Germans (see FRANCE, Vol. IV. p. 782); by the treaty of Frankfurt it was annexed to Germany.

See histories of the town by Coster (1871) and Westphal (3 vols. 1875-77); and the account of the warlike operations of 1870 by the German staff (1872). Compare also BAZAINE.

Meudon, a village 5 miles W. of Paris by the railway to Versailles. The château, rebuilt by Mansard for the Dauphin in 1695, and fitted up for Marie Louise by Napoleon in 1812, was reduced to ruin during the bombardment of Paris in 1871. The Forest is a favourite holiday resort. A chapel, dedicated to Notre Dame des Flammes, commemorates the terrible railway accident of May 1842, in which over 100 persons were burned alive. Rabelais was curé of Meudon. Pop. 7570.

Meulebeké, a town in the Belgian province of West Flanders, on the Mandel, a tributary of the Lys, 24 miles SW. of Ghent. Pop. 9063.

Meulen, ADAM (not ANTOINE) FRANÇOIS VAN DER, Flemish painter, born at Brussels, 11th January 1632 (not 1634), was appointed by Colbert in 1666 battle-painter to Louis XIV., and thenceforward accompanied that king in his military expeditions. A long series of Van der Meulen's battle-pictures hang in the Louvre. He died in Paris, 15th October 1690.

Meung, JEAN DE, or Jean Clopinel, a French satirist, the Voltaire of the middle ages as Gaston Paris calls him, was born at Meun-sur-Loire about 1250. He flourished under Philip the Fair, translated many books into French, became rich and prosperous, and died before November 1305. His *Testament*, in single-rimed quatrains, with all its raillery, reveals a genuine piety. But his great work is his continuation to the length of 22,817 lines of the *Roman de la Rose*, left unfinished in 4670 lines by William of Lorris before 1260. He preserved the original metre, but completely altered the treatment, substituting for its tenderness, refinement, and elaborate allegorising, sharp satirical pictures of actual life, forming an invaluable mirror of the middle ages. See *Hist. Litt. de la France*, vol. xxviii.

Meursius, JOHANNES, the elder (properly Jan de Meurs), a learned scholar, was born at Loosduinen near the Hague, 9th February 1579, studied philology at Leyden, next travelled through Europe with the son of the Grand-pensionary Barneveldt, and became in 1610 professor of History, and next year of Greek, at Leyden, and afterwards Historiographer to the States-general. In 1625 he became professor of History in the academy at Sorø in Denmark, and here he died, 20th September 1639. His industry was portentous, and his works are a storehouse of materials for students, especially in Greek antiquities. He edited Cato's *De Re Rustica*, Plato's *Timæus*, the *Characters* of Theophrastus, and a long series of the writings of the later Greek writers, as Lycophron, Constantinus Porphyrogenitus, Philostratus, Aristoxenus, Constantinus Manasses, Theophylact, Theodorus Metochites, Antigonius Carystius, Apollonius Dyskolus, and Phlegon. Other works are the useful *Glossarium Græco-Barbarum* (1614), *Res Belgicæ* (1612), *Athenæ Batavæ* (1625), *Historia Danica* (1630), and a long series of monographs on questions of Greek antiquities which may be found in the *Thesaurus Antiquitatum Græcarum* of Gronovius. A collected edition of his works was prepared by Lami (12 vols. Flor. 1741-63).—His son, JOHANNES MEURSIUS, the younger, was born at Leyden in 1613, and died in Denmark in 1654. He wrote several antiquarian works of value, but his name by a singular misfortune survives in connection with the filthy *Elegantiz lingue Latine* (best ed. Leyden, 1757), with which it is certain that he had nothing to do. The original edition bears neither place nor date, but was most probably printed about 1680 at Lyon or Grenoble. It contains a little poem by Chorier (1609-92), hence his name has been too easily connected with the book, the origin of which still remains an unsolved puzzle.

Meurthe-et-Moselle, a department in the north-east of France, formed, after the treaty of 1871 with Germany, out of what remained of the former departments of Moselle and Meurthe. It has four arrondissements—Briey, Lunéville, Nancy, and Toul—an area of 2020 sq. m., and a pop. (1872) of 365,137; (1886) 431,693. The capital is Nancy. The department belongs to the plateau of Lorraine, has very fertile soil, producing corn, wine, potatoes, fruit, beet-root for sugar, hops, &c., and is drained by the Moselle and its tributaries. It has valuable iron-mines, and is the first department in France for iron and steel, and the third for glass; there are also important manufactures of pottery, woollens, cottons, chemicals, tobacco, paper, beer, artificial flowers, and embroidery-work. Rock-salt is mined in large quantities. In point of popular education it ranks second amongst the French departments, Doubs being first.

Meuse (Dutch *Maas*), an affluent of the Rhine, rises in the French department of Haute-Marne, flows in a northerly direction in a deep, narrow, winding valley, past Verdun and Sedan, entering Belgium just below Givet, on to Namur, whence it makes a huge curve to the east, then flows north past Liège and Maastricht, and, bending abruptly to the west, finally joins the Waal, one of the mouths of the Rhine, from the left opposite Gorkum. The united streams take the name of the Maas, which soon divides again. The southern branch passes through the Biesbosch and Hollandsche Diep, and, again dividing, reaches the sea in two wide estuaries, Haringvliet and De Krammer. The northern branch, called the Merwede as far as Dordrecht and to the west of that town the Old Maas, likewise reaches the sea in two channels, the Old and the New Maas. On this last stands Rotterdam. The entire river is 500 miles in length; it is navigable from Verdun. Area of basin, 18,530 sq. m. Its principal affluents are the Sambre on the left and the Ourthe on the right.

Meuse, a department in the north-east of France, touching Belgium in the north. Area, 2404 sq. m.; pop. (1872) 284,725; (1886) 291,971. The surface is traversed from south-east to north-west by the wooded Argonne ranges, which form the right and left bank of the river Meuse, and separate it from the basin of the Seine on the west and from that of the Moselle on the east. The soil in the valleys is fertile and well cultivated. Wheat, oats, beet-root (for sugar), hemp, oil-plants, and wine (nearly 9,000,000 gallons annually) are the principal products. Iron is mined and manufactured; glass and paper are the chief branches of industry. The four arrondissements are Bar-le-Duc, Commercy, Montmédy, and Verdun. The capital is Bar-le-Duc.

Mexico, the most southerly country of North America, is a federal republic, embracing twenty-seven states, a federal district, and two territories. It extends between the United States and Guatemala, with an extreme length of nearly 2000 miles; its breadth varies between 1000 and (in the Isthmus of Tehuantepec) 130 miles. It has a coast-line of almost 6000 miles, but with scarcely a safe harbour beyond the noble haven of Acapulco; on the Atlantic side, with its sandbanks and lagoons, there are only open roadsteads, or river-mouths closed to ocean vessels by bars and shallows; harbour-works, however, were in active construction at Vera Cruz and Tampico in 1890. From the south-eastern and north-western extremities of the republic there extend the peninsulas of Yucatan and Lower California, enclosing the Gulfs of Campeche and California respectively. The islands of Mexico are few and of no importance.

In area Mexico almost equals Great Britain and Ireland, France, Germany, and Austria-Hungary together. The figures given in the following table are official, but in most cases they can be accepted only as approximate: large sections of Michoacán and Guerrero, and also of Sonora, have not yet been explored; and there are still many Indians that have never even come in contact with the white man. Of the entire population the whites are estimated to form 19 per cent., the Indians 38, and the half-castes (*mestizos*) 43 per cent.

There are separate articles in this work on most of the states and chief towns.

Surface.—For the most part Mexico consists of an immense tableland, which commences in the United States as far north as Colorado, and gradually rises to over 8100 feet at Marquez (the highest point touched by the railway), 76 miles N. by W. of Mexico city; and a mean elevation nearly as great is maintained in all the south central plateau: at El Paso, on the northern frontier, the elevation is only 3717 feet. The prevailing formations are metamorphic, but partly overlaid by igneous rocks of every geologic epoch, rich in metalliferous ores. In the highest ranges granites and other igneous rocks prevail, with deposits of sulphur and pumice, and other recent volcanic discharges. In the north chalk and sandstones become prevalent. The escarpments of this plateau form most of the so-called Cordilleras; Humboldt's theory of a continuous chain extending from Patagonia to Alaska has now been abandoned. The most important range is the Sierra Madre (over 10,000 feet, and extending from Tehuantepec into the United States); parallel with this run the sierras of the east coast and of Lower California. The surface of the country is also much broken up by short cross-ridges and detached peaks, the principal being the Cordillera de Anahuac (q.v.), culminating in Nevado de Toluca (19,454 feet), the highest point on the North American continent, and Popocatepetl (17,523). The Pico de Orizaba, east of Popocatepetl, is 18,205 feet high. Most of the Mexican volcanoes are extinct or quiescent, and violent earthquakes are of rare occurrence. No disturbance so remarkable

has occurred since the upheaval of Jorullo (q.v.) in 1759. On the Atlantic side the plateau descends abruptly to the narrow strip (about 60 miles) of gently sloping coast-land; towards the Pacific, where the coast-lands vary in width from 40 to 70 miles, the descent is more gradual. Of the present lakes the only one of great size is Chapala (q.v.), which is traversed by the Rio Grande de Santiago; but considerable bodies of water collect in depressions in the uplands during the heavy rains, and even flood the surrounding country for a time. The rivers of Mexico are of little use for navigation. South of the Rio Grande del Norte, on the Texan frontier, they are mostly impetuous mountain-torrents, or flow through rocky gorges (*barancas*), sometimes 1000 feet deep. Only in the narrow strips between the plateau and the coast are they available as channels of trade and communication; and in this respect perhaps Arabia alone is less favoured than Mexico.

Climate and Agriculture.—In the plateau region, or *tierras templadas*, the climate is almost that of perpetual spring, and the atmosphere remarkably free from moisture. It is to this peculiar dryness that the city of Mexico, the soil of which has been soaked with the filth of centuries and never properly drained, owes its immunity from pestilence; but, on the other hand, throughout the plateau agriculture is dependent on the use and control of water for irrigation purposes, and an immense desert tract extends between Chihuahua and Zacatecas. Wood in all this upland region is scarce and dear, though there are valuable forests in the extreme north and south. On the coast-lands wood and water are abundant, and the soil fertile, but the climate is such that white men cannot work as labourers there. Yet Mexico contains as fine agricultural land as any in the world, and in most parts two crops a year are grown; while already a score of agricultural colonies, drawn from various nationalities, have been established in the country. Northern Mexico is the original home of the 'cattle-range' business, and there vast herds of horses, cattle, and sheep form the principal wealth of the people. The coast-belt and the terraces up to 3000 feet constitute the *tierras calientes*, where the temperature ranges from 60° to 110° F., and, in the south at least, the magnificent tropical vegetation and the yellow fever and *vémto* reign with equal vigour. Two or three hours by the Vera Cruz Railway carries the traveller from Esperanza, at the very edge of the plateau, down into the heart of the tropics. The cold lands, or *tierras frias*, embrace all the country above about 8000 feet, including the few highest peaks covered with perpetual snow. South of about 28° N. there are only the wet and the dry season, the former from June to October. Farther north there are four seasons; but in the highest zone the rainfall is very scanty, and northern Mexico and the Californian peninsula especially are exposed to seasons of drought. The vegetation of Mexico has the same wide range as the climate. In the lowlands dye-woods and valuable timbers abound in the virgin forests, as well as medicinal plants, india-rubber, palms, &c.; and oranges and bananas, many varieties of cactus, olives, sugar, coffee, cocoa, rice, indigo, cotton, and tobacco, besides the omnipresent maize, all thrive. Many of these products, including the palms, oranges, cacti, olives, tobacco, and of course the maize, grow as readily over a great part of the temperate zone, where the characteristic vegetation embraces pines, evergreen oaks, the maguey or *Agave americana* (q.v.), and the henequen (*Agave sisilana*, see FIBROUS SUBSTANCES). The last two are nearly as frequent also in the *tierras frias*. The vine flourishes in some districts, especially near El Paso, Durango, and Parras in Coahuila,

where a good wine is made; and mulberry plants have been imported from Europe to develop the silk industry. In Lower California a good deal of Archil (q.v.) is collected, and *chicle* gum is extracted and prepared in the forests along the coast. But agriculture in Mexico is very poorly developed. Primitive methods are followed by the people generally, and the American plough has only in a few localities displaced the crooked stick, sometimes shod with iron, and lashed by raw-hide thongs to the oxen's horns. There is, however, some agricultural machinery in use on the larger *haciendas*, or great landed estates. To their absentee owners such estates, in spite of the expense of irrigation and the shiftless methods in use, are said to return large incomes; but the difficulty and cost of transport are so great that in many parts of Mexico no more corn is grown than suffices to meet the wants of the immediate neighbourhood. Of maize 128,222,000 bushels were raised in 1888. The other principal crops for the same year were wheat, 11,114,000 bushels; beans, 7,547,000 bushels; barley, 5,787,000 bushels. The value of the cotton crop averages £1,645,000, of sugar-cane £1,323,000, of hemp and coffee above a third as much, and of tobacco a fourth. In 1889 henequen was exported from Yucatan to the value of over a million sterling.

Minerals.—Mexico is rich in minerals, many of which have been worked from a very early date. Silver-mining, especially, has been an important industry ever since the conquest, and a considerable number of the mines are still worked at a profit. Gold, though to a greatly less value, is also produced. The coinage records, which date from 1537, and may be taken as substantially accurate, show the production of the precious metals, from that year to 1884, to have been: gold, 114,384,204 dols.; silver, 3,105,979,022 dols.—total, 3,220,363,226 dols. Copper is largely mined in some sections, being found in a pure state in Chiapas and Guanaajuato, and elsewhere associated with gold. Other important minerals are iron, including enormous masses of meteoric iron ore, and the mountain a mile from Durango, the Cerro de Mercado, a solid mass of magnetic iron ore; lead, found associated with silver; and sulphur, zinc, quicksilver, platinum, cinnabar, asphalt and petroleum, besides salt, marble, alabaster, gypsum, and rock-salt in great quantities. There are also said to be large deposits of coal, some of excellent quality, in various localities; but as yet little of it has been mined. Throughout Mexico over 100,000 workmen are employed in the various mining enterprises—above 350 in number, and largely supported by American and British capital. Formerly the Mexican ores, especially argentiferous lead, were sent for smelting to the United States; but as the American tariff became prohibitive, establishments were set up on Mexican soil, to which in 1890 some American foundries and works also were transferred.

Manufactures and Trade.—In all Mexico the number of factories using steam power does not greatly exceed one hundred. Very little labour-saving machinery of any kind has been introduced, owing partly to the scarcity of fuel and water, and partly to the difficulty of repairing expensive and complicated machinery, usually—on the *haciendas* at any rate—broken on purpose by the peons, who are obstinately opposed to any change. In 1888 there were 98 cotton and 16 woollen factories in Mexico, besides 7 paper-mills and 2 potteries employing steam. Flour and unrefined sugar are also prepared, and a large sugar refinery was erected at Linares in 1890; while there are smaller special manufactures, such as candles, glass, porcelain; and the extraction of henequen fibre, too, is an important industry. Bounties are offered by some

states for the establishment of factories within their bounds. But the handicraft production of such articles as pottery, saddles, sandals, many coarser textiles, the national hat, the sombrero, and the national drinks, pulque, mescal, and tequila, all from the various plants of the maguay family, is much more considerable. The great bulk of the Mexican exports is always formed by the precious metals—coin, bullion, and ores; yet the amount of agricultural products and other merchandise has greatly increased since the construction of railways. Of these in 1860 there were none; in 1880 there were 655 miles, in 1890 over 5500 miles open for traffic. The rapid construction of these lines, most of which are in English hands, has saddled the country with heavy responsibilities; the subventions payable to the several companies in the year 1890 amounted to £697,000—about one-seventh of the government's total income—and the sum increases yearly, in accordance with agreements entered into with the companies. Moreover, the spread of the railways has been made an excuse for the almost utter neglect of the roads, which throughout Mexico were bad enough before. The fine highways constructed by the Spaniards were allowed to fall into destruction during the long civil wars, and their present deplorable condition makes them rather a hindrance than a help in the development of the country. A still more serious obstacle to internal commerce is the crushing system of interstate customs—the *alcabalas*—a heritage from the days of Spanish rule; they were abolished by a decree of 1886, but in 1890 the British minister reported that they still existed under various names in the territories and federal district, and in most of the states. Under the excise system, moreover, nearly every possible product, every branch of industry, every social function, even, is taxed; and a swarm of petty officials in every city, town, and hamlet see that nothing escapes its tax, from a bag of seaweed or shavings to a funeral or a fandango. In 1890 the fiscal *gendarmaria* alone cost four-fifths as much as the foreign office and the judicial power together. Still, in spite of these impediments, the trade of Mexico within recent years has steadily increased. During the period 1884–89 the imports advanced from 35,819,000 to 44,500,000 dols., and the exports from 46,553,380 to 60,158,423 dols. (6·60 dollars = £1 sterling). Of the exports in 1889 the precious metals represented 38,785,275 dols.; henequen, coffee, hides, woods, tobacco, and vanilla came next. Nearly two-thirds of the total trade is with the United States, and one-fourth with Great Britain; France follows at some distance, and Germany yet further behind. Home manufactures and the distribution of merchandise are largely in the hands of foreigners. Of late years a large number of French merchants have settled in Mexico, and have nearly everywhere superseded the Germans, who controlled most of the trade from 1850 to 1870. In 1888 there were 12,300 French in the republic, and only 800 Germans, and the former had practically monopolised the dry-goods business of the country, and were pressing their rivals closely in other departments, such as hardware, in which the Germans had secured the lead. Great Britain imports from Mexico mainly mahogany, logwood, and silver ore, and exports thither cottons, woollens, and linens, iron, machinery, and coal; in 1885–89 the value of the former decreased steadily from £724,847 to £465,994, while that of the latter increased from £866,671 to £1,621,106.

Government, Finances, &c.—The Mexican constitution is closely modelled upon that of the United States. The president, who is assisted by six secretaries of state, is elected for four years,

and can be re-elected for a second term; the senators (two for each state) and representatives (one for every 40,000 inhabitants) receive a salary of 3000 dols. a year; the judicial system occupies the same position as that of the United States; and the several states have elective governors and legislatures. It must be added, however, that neither government nor opposition is conducted on any principle: the government is a personal, and often a tyrannical one; and the opposition also is personal—it rises and falls with its leader, and in the past has found its favourite and safest expression in revolution, which either lifts the pretender into power or leaves him before a firing-party. Either event dissolves the opposition, for no principle has been involved. A strong government, in these circumstances, is most necessary in Mexico, and the cost of the army (27,000 men) swallows up one-third of the annual receipts. As for the navy, it consists of some revenue cutters, a steam-tug, and a training ship (built 1890), and costs £75,000 a year. The receipts of the Mexican federal government advanced in 1885-89 from £4,066,192 to £4,961,512: about five-eighths of this is derived from customs. Within the same period the expenditure ranged from £4,798,914 to £5,876,351. Both in the republic and abroad, however, it is recognised that the government is straining every nerve to meet its obligations, and the general confidence has increased of late years; while the individual states, as a whole, succeed in keeping their expenditure within their income. The interest on the national debt has been punctually paid since 1886, in which year an arrangement was come to between the Mexican government and the English bondholders, under which the various debts were converted and redeemed (in 1889) at 40 per cent. The entire foreign debt of Mexico was in 1890 returned at £10,500,000. In the same year banking facilities were greatly extended, charters being granted for banks of issue and others in various towns; whereas previously banking had been confined almost entirely to two large banks at the capital, and their branches. In 1890 there were 32,437 miles of telegraphs and 4349 of telephones in operation in the republic.

Social Aspects.—Nearly half of the population of Mexico are *mestizos*, who are the farmers and rancheros, the muleteers and servants. Many of them are intelligent and skilful, but the lower orders among them—the so-called *leperos*—are hopelessly idle and vicious. The Indians, who constitute over one-third of the population, lead a life of their own, mingling but not mixing with the other races. From them chiefly are drawn the peons, or agricultural labourers, who, through a system that keeps them permanently in debt, to-day are scarcely less slaves than were their ancestors under the Spaniards. On every hacienda there is a *tienda*, or store; there everything must be purchased by the employés, whose wages (9d. to 1s. a-day) are sometimes paid in 'tallies' on it. The Indian is a poor workman and unreliable, though as a rule tractable if well treated, and easy to manage; his wants are few, and his small surplus earnings usually find their way in a few hours into the pockets of the priest, the pulque sellers, or the proprietors of the bull-ring, cockpit, or *monte* table. He has no idea of honesty, however; he does not steal on a large scale, but tools, saddlery, and crops must be constantly watched. The Indians who are not employed on the estates usually live in communities resembling the old village communities of Europe. Little has been done to ameliorate the degraded condition of the labouring classes. The staple food everywhere is maize, either in the form of a moist paste or as thin cakes (*tortillas*), with black beans

(*frijoles*) and red and green peppers. The houses in Mexico are mostly of *adobe* (sun-dried bricks), one story high. Education, as might be expected, is in a very backward condition: only 9 per cent. of the population can read and write. However, efforts are being made to remove this reproach. There are national free schools in every considerable town, a school of agriculture near the capital, and an efficient military school at Chapultepec, besides the institutions mentioned under Mexico city. Even the priests have opened a number of schools, generally as rivals to the national schools. The great mass of the people are Roman Catholics, but there is no established church. In 1867 the church property was confiscated; convents and religious houses were suppressed, and now no longer openly exist; nor are religious processions permitted. Civil marriage alone is valid, though the church ceremony in addition is not prohibited. Besides the Protestant missionary churches, some of which have made considerable progress, there is a Mexican branch of the Church Catholic of Jesus Christ, which was founded here in 1861, and within twenty years had fifty congregations established, and many schools, orphanages, and seminaries. Among some of the Indians pagan emblems and ceremonies still survive; and in 1889 Lieutenant Schwatka found in Chihuahua cliff and cave-dwellers who were sun-worshippers.

History of Mexico.—The history of ancient Mexico exhibits two distinct and widely differing periods—that of the Toltecs and that of the Aztecs. Both were Nahua nations, speaking a language which survives in Mexico to this day. The 8th century is the traditional date when the Toltecs are related to have come from the north, from some undefined locality, bringing to Anahuac its oldest and its highest native civilisation. Their capital they established at Tula, north of the Mexican valley. Their laws and usages stamp them as a people of mild and peaceful instincts, industrious, active, and enterprising. They cultivated the land, introduced maize and cotton, made roads, erected monuments of colossal dimensions, and built temples and cities, whose ruins in various parts of New Spain still attest their skill in architecture, and sufficiently explain why the name Toltec should have passed into a synonym for architect. They knew how to fuse metals, cut and polish the hardest stones, manufacture earthenware, and weave various fabrics; and to their invention are assigned the Mexican Hieroglyphics (q.v.) and calendar. It is related that a severe famine and pestilence all but destroyed the Toltec people in the 11th century, and drove the survivors southward to Guatemala and Yucatan, carrying their arts of civilisation with them; and near the end of the next century, after their place had been taken by the rude Chichimecs, a fresh migration brought, among other kindred nations, the Aztecs into the land. Within two centuries and a half this last people had become predominant. But their rule was, in a great degree, a reversion to savagery. They were a ferocious race, with a religion gloomy and cruel, and they grafted upon the institutions of their predecessors many fierce and sanguinary practices. Thus they produced an anomalous form of civilisation, which astonished the Spaniards by its mingled character of mildness and ferocity. After wandering from place to place, the Aztecs founded about 1325 the city of Tenochtitlan, or Mexico; a hundred years later they had extended their sway beyond their plateau-valley, and on the arrival of the Spaniards their empire was found to stretch from ocean to ocean.

Their government was an elective empire, the deceased prince being usually succeeded by a brother or nephew, who must be a tried warrior;

but sometimes the successor was chosen from among the powerful nobles. The monarch wielded despotic power, save in the case of his great feudal vassals; these exercised a very similar authority over the peasant class, below whom, again, were the slaves. Taxation appears to have been heavy in Mexico even then. The laws were severe, nearly every crime being met with capital punishment in some form; but justice was administered in open courts, the proceedings of which were perpetuated by means of picture-written records. The Mexicans apparently believed in one supreme invisible creator of all things, the ruler of the universe; but the popular faith was polytheistic, with a number of chief and many more inferior divinities, each of whom had his sacred day and festival; whilst a crowd of nature-spirits peopled the hills and woods. At the head of the Aztec pantheon was the frightful Huitzilopochtli, the Mexican Mars. His temples were the most splendid and imposing; in every city of the empire his altars were drenched with the blood of human sacrifice, to supply victims for which the emperors made war on their neighbours or on any revolted territory, and levied a certain number of men, women, and children by way of indemnity. The victims were borne in triumphal processions, and to the sound of music, to the summit of the great pyramidal temples, where the priests, in sight of assembled crowds, bound them to the sacrificial stone, and, slashing open the breast, tore from it the bleeding heart and held it up before the image of the god, while the captor carried the carcass off to feast on it with his friends. In the years immediately preceding the Spanish conquest not less than 20,000 victims were annually immolated, including infants, for the propitiation of the rain-gods. These atrocities, originally referable to the entire absence of live-stock, were incongruously blended with milder forms of worship, in which fruits, flowers, and perfumes were offered up amid joyous outbursts of song and dance. According to the tradition, Quetzalcoatl, who delighted in these purer sacrifices, had once reigned among the Toltecs in the golden age of the world, but, being obliged to retire from earth, he departed by way of the Mexican Gulf, promising to return. This tradition accelerated the success of the Spaniards, whose light skins and long dark hair and beards were regarded as evidences of their affinity with the long-looked-for divinity. The Mexican priesthood formed a rich and powerful order of the state, and were so numerous that Cortes found as many as 5000 attached to the great temple of Mexico. The education of the young of both sexes was entrusted to the priests and priestesses; and the sacerdotal class were thus able to exercise a widely-diffused influence, which, under the later rulers, was almost equal to that of the emperor himself. The women shared in all the occupations of the men, and were taught, like them, the arts of reading, writing, ciphering, singing in chorus, dancing, &c., and even initiated in the secrets of astronomy and astrology.

Cortes landed at Vera Cruz in 1519; the history of the conquest of the Aztec land is told at length in the article on that greatest of the *conquistadores*, who gave to Spain what for centuries remained her richest province. Before his energy, and the superior civilisation of his followers, the power of the native empire crumbled away. In 1540 Mexico was united with other American territories—at one time all the country from Panama to Vancouver's Island—under the name of New Spain, and governed by viceroys (57 in all) appointed by the mother-country. The intolerant spirit of the Catholic clergy led to the suppression of almost every trace of the ancient Aztec nationality and civilisation, while the commercial system enforced crippled

the resources of the colony; for all foreign trade with any country other than Spain was prohibited on pain of death. The natives were distributed as slaves on the various plantations, though they were also christianised and looked after by the Inquisition, whose last *auto-da-fé* was held in Mexico city as late as 1815. Mexico was regarded as simply a mine to be worked by the labour of its people for the benefit of Spain. Yet, notwithstanding these drawbacks, it ranked first among all the Spanish colonies in regard to population, material riches, and natural products. For nearly three centuries it may be said to have lain in sullen submission beneath its cruel conquerors' heel, till in 1810 the discontent, which had been gaining ground against the viceregal power during the war of the mother-country with Napoleon, broke into open rebellion under the leadership of a country priest named Hidalgo. After his defeat and execution in 1811 Morelos, another priest, continued the struggle till he shared the same fate in 1815; and a guerilla warfare was kept up until, in 1821, the capital was surrendered by O'Donoju (a Spaniard of Irish descent), the last of the viceroys. In the following year General Iturbide, who in 1821 had issued the *plan de Iguala*, providing for the independence of Mexico under a prince of the reigning house, had himself proclaimed emperor; but the guerilla leader Guerrero, his former ally, and General Santa-Anna raised the republican standard, and in 1823 he was banished to Italy with a pension. Returning the following year he was taken and shot, and the federal republic of Mexico was finally established.

For more than half a century after this (till 1876) the history of Mexico is a record of nearly chronic disorder and civil war. Within that period the country had fifty-two presidents or dictators, another emperor, and a regency; and in nearly every case the change of administration was brought about with violence, a respectable proportion of these great men being ultimately shot by some opposing faction. In 1836 Texas secured its independence, for which it had struggled for several years, and which Mexico was compelled to recognise in 1845. In that year Texas was incorporated with the United States; but its western boundary was not settled, and the Americans coveted a particular strip of territory, and sent troops to seize it. The war thus wantonly provoked was continued with great energy by both parties until 1848, when peace was finally concluded after several bloody engagements had been fought, and the city of Mexico had been stormed and taken by the Americans under General Scott. As the result of this war Mexico was compelled to cede half a million square miles of territory to her powerful enemy. For the details of the war, see UNITED STATES, and SANTA-ANNA. Under the latter also falls to be told so much as is necessary of the history of the next few years. After his fall in 1855, down to 1867, great confusion prevailed. In 1858 Benito Juarez (q.v.) became president, but his claims were contested by General Miramon—the head of the reactionary or clerical party—and the country was plunged in civil war. The acts of wanton aggression and flagrant injustice perpetrated on foreigners in Mexico during this period of internal disorder, in which the cortes passed an act suspending all payments to foreigners for two years, could not fail to draw upon the Mexican government the serious remonstrance of those European powers whose subjects had just cause of complaint; and the result was to bring a fleet of English, French, and Spanish ships into the Mexican Gulf for the purpose of enforcing satisfaction. In 1861 the Spaniards disembarked a force at Vera Cruz; and this step was soon

followed by the arrival before that city of the allied fleet. Preparations to advance at once upon the capital alarmed the provisional government, and brought about an armistice, with a view of negotiating a treaty for the future regulation of commercial intercourse between Mexico and the great European powers. This treaty was drawn up and provisionally ratified by the different commanders, but not confirmed on the part of France, and consequently the French troops retained occupation of the Mexican territory after the English and Spaniards had declined to join in further hostile demonstrations. In April 1862 the French emperor formally declared war against the government of Juarez; but the French never met with the welcome they expected from the people, and had ultimately to withdraw, without permanent success, in 1867—mainly because of the jealousy of their action shown by the United States. Maximilian, Archduke of Austria, who had become emperor of Mexico under French auspices, was executed in the same year, and Juarez returned to practically absolute power. For this period, see

Cathedral, City of Mexico.

JUAREZ and MAXIMILIAN. On the death of Juarez in 1872, the chief justice, Lerdo de Tejada, assumed the presidency, in which, after a revolution, he was succeeded in 1876 by Porfirio Diaz, one of the ablest of Mexican rulers. He was re-elected in 1884, and again in 1888; and under him the position of the republic, with regard both to security and to development of its resources, has steadily improved.

Mexico (CITY), the capital of the republic, is situated 7347 feet above the sea, at the lowest level of the great lacustrine basin (1400 sq. m.) of the Anahuac plateau. Lake Tezcuco, the largest of the six lakes that occupy this hill-girt valley, and amid whose waters, Venice-like, the city first rose, has now retired $2\frac{1}{2}$ miles to the north-west—partly filled up by drainage deposits. In the Aztec city the principal thoroughfares radiated from an immense central square, in which towered the great temple of Huitzilopochtli; and this arrangement is yet preserved in the modern capital. All

the main streets converge on the Plaza Mayor, where the site of the old *teocalli* is occupied by the no less famous cathedral (1573-1657). The walls of this imposing building, forming a cross 426 by 203 feet, alone cost nearly £400,000, and the interior, with its twenty chapels and elaborate ornamentation, much more. Built into the foot of one of the two open towers (218 feet) is the famous 'Aztec' (Toltec) calendar stone. Facing the cathedral is the Municipal Palace, and on the sides of the plaza are the National Palace (the old vice-regal residence), the national Monte de Piedad, the post-office, and the national museum. Other noteworthy buildings are the national picture-gallery and library, the school of mines, the mint, the Iturbide hotel, and the former palace of the Inquisition, now a medical college; and, mostly in secularised ecclesiastical edifices, there are also schools of law and engineering, a conservatory of music, and an academy of fine arts. There are still left fourteen parish and a number of other churches, including the cathedral of the American Episcopal mission. The principal streets are broad, clean, and well paved and lighted, with houses of stone gaily painted in bright colours. Among the monuments of the city are the noble Columbus monument (1877), the statue of Cuauhtemotzin, the last of the Aztec emperors, and that of the engineer Martinez (1883). In addition to the *alameda*, with its stately beeches, Mexico is remarkable for the extent and beauty of its *paseos*, or raised paved roads, planted with double rows of trees, which diverge far into the country from every quarter; and there are still on Lakes Chalco and Xochimilco, where a line of steamers runs, a few of the floating gardens for which the ancient city was so celebrated. Attempts have long been made to drain the valley of Mexico. A tunnel through the lowest hills to the Tula River (5 miles), cut in 1607-8 by Martinez, proved insufficient, and the city was flooded from 1629 to 1634; and even an open cut through the mountains (1637-67), now 10 miles long and with a greatest breadth of 361 and a greatest depth of 197 feet, has never entirely fulfilled its purpose. Consequently, in the city, with a temperature that never ranges beyond 70° and 50° F., from one-

eighth to one fifth of the deaths are due to consumption and pneumonia, and one-third to typhoid and other fevers. It is only the extreme dryness of the atmosphere that renders the site habitable at all. New works, on a very large scale, intended to drain the valley, were begun in 1890 by two English companies. The trade of Mexico is chiefly a transit trade, although it has a few manufactures, as cigars, gold and silver work, paper, pottery, religious pictures, hats, saddlery, &c. It is unlikely, however, that it will long remain in this condition. Foreign enterprise is already working great changes, and there are now railways to Vera Cruz (263 miles), to El Paso (1224), Laredo (840), and Ciudad Porfirio Diaz (1089)—the last three on the Texan frontier—as well as other points. Pop. 350,000.

Mexico, GULF OF, a basin of the Atlantic Ocean, is closed in by the United States on the north, by Mexico on the west and south, and its outlet on the east is narrowed by the jutting peninsulas of Yucatan and Florida, which approach within 500 miles of each other. Right in the middle of this entrance is planted the island of Cuba, dividing the strait into two—the Strait of Florida and that of Yucatan, the former connecting the gulf with the Atlantic Ocean, the latter with the Caribbean Sea. Dr John Murray calculates the area of the gulf at 716,200 sq. m. Over a fourth of this area the ocean-floor lies at a depth of between 1000 and 2000 fathoms, while 58,000 sq. m. is deeper still. The shores, however, are very shallow—as it were, the broad rim of this central cauldron; the portion less than 100 fathoms deep exceeds 400,000 sq. m. The extreme length from SW. to NE. is more than 1100 miles. Of the numerous bays, the largest is the Bay of Campeachy (Campeche). The coasts are mostly low and sandy or marshy, and are lined with numerous lagoons; the best of the few good harbours are those of New Orleans, Pensacola, and Havana. The gulf is visited from September to March by violent north-easterly gales called *nortes*. There are very few islands. The principal rivers it receives are the Mississippi and the Río Grande del Norte. See GULF STREAM.

Meyer, CONRAD FERDINAND, Swiss poet and novelist, was born on 12th October 1825, at Zurich, near which he finally settled in 1877. His style is graceful, and he excels in character-drawing and in genre-pictures of descriptive work. His chief novels are *Jörg Jenatsch* (1876; 7th ed. 1889), a story of Switzerland in the 17th century, and *Der Heilige* (1880; 9th ed. 1889), two of the best historical novels of modern German literature. His power is also well shown in *Das Amulet* (3d ed. 1882), *Der Schuss von der Kanzlei* (3d ed. 1882), *Die Leiden eines Knaben* (3d ed. 1889), *Die Hochzeit des Mönchs* (4th ed. 1889), *Die Richter* (1885), and *Die Versuchung des Pescara* (1887). His poetical skill is best displayed in the idyllic epic poem *Huttens letzte Tage* (1872; 7th ed. 1889), in *Gedichte* (1882; 3d ed. 1887), and in *Engelberg* (2d ed. 1886). There is a Memoir of him by Reitler (1885).

Meyer, HEINRICH AUGUST WILHELM, commentator, was born at Gotha, 10th January 1800, studied at Jena, was pastor at Harste, Hoya, and Neustadt, retired in 1848, and settled in Hanover, where he died 21st June 1873. His name survives in his Commentaries on the New Testament—a monument of exegetical science (commenced 1832). Later editions showed constant improvements, and since his death this work has been continued by Weiss, Wendt, Beyschlag, and others. The English translation in Clark's series is in 20 vols. (1873–82).

Meyer, JOSEPH, publisher and industrial organiser, was born at Gotha, 9th May 1796, and died on 27th June 1856. A man of great energy

and liberal ideas, he started several industrial enterprises, the most important being the issue of great serial works by subscription at low prices, such as the German classics, the *Konversationslexikon* (see *ENCYCLOPÆDIA*), *People's Library of Natural Philosophy*, *Historical Library*, &c. His publishing business, the 'Bibliographical Institute,' was founded at Gotha, but in 1828 was transferred to Hildburghausen, in 1874 (by his son) to Leipzig.

Meyerbeer, GIACOMO, operatic composer, was born at Berlin, September 5, 1791. The son of Herz Beer, a wealthy Jewish banker, his name was originally Jakob Beer; the name Meyer was afterwards adopted from a benefactor, and the whole consolidated and Italianised. His musical genius was first shown on the pianoforte; at the age of seven he played in public Mozart's D minor concerto. He was received, when fifteen, into the house of the celebrated musician, the Abbé Vogler, at Darmstadt; with his fellow-pupil Weber he was on terms of the most intimate and lasting friendship. His earlier works, produced at Munich and Vienna, were unsuccessful, but in the latter city he obtained fame as a pianist, which might have stood against that of any rival had he chosen to rely on this talent. His ambition, however, was to succeed as a composer; and on the advice of Salieri he proceeded to study vocal composition in Italy. There Rossini's music had just taken the public by storm; and Meyerbeer, with his remarkable adaptability, after three years was able to produce operas in the new style, which at once gained a cordial reception; the last of these, *Il Crociato*, brought out at Venice in 1824, was received with acclamation, and the composer was presented on the stage with a laurel crown. From 1824 to 1831 he lived mostly in Berlin, married, and had two children, whose loss in infancy he keenly felt. He also applied himself, with the unremitting industry he evinced from boyhood, to a minute and comprehensive study of French opera. The result of this was seen in the production at Paris in 1831 of *Robert le Diable* (libretto by Scribe), in which a totally new style was evident. It had unparalleled success over all Europe, and made the fortune of the Paris opera—even Rossini was thrown rather into the shade. It was followed in 1836 by the *Huguenots*, which, with the assistance of a magnificent cast, almost eclipsed its predecessor. He was soon after appointed by the king of Prussia as his Kapellmeister at Berlin. Here he wrote the opera *Ein Feldlager in Schlesien*, the success of which was signalled by the first appearance of Jenny Lind. After long preparation, *Le Prophète* appeared at Paris in 1849, also with success, though it was not altogether to the mind of even friendly critics. The composer now ventured into a fresh field, the Opéra Comique; *L'Étoile du Nord*, given in 1854, carried the day in spite of the prognostications of French critics, and was succeeded in 1859 by *Le Pardon de Ploermel*, known in England as *Dinorah*. He was subsequently occupied with a musical drama, *La Jeunesse de Goethe*, the setting of which M. Blaze de Bury, the author of the work, says he saw complete, but which has not hitherto come to light. In 1861 he set to work with his usual anxiety and fastidiousness on the production of *L'Africaine*, which had been in hand since 1838. But his delicate health gave way before his ceaseless labours, and he died at Paris, May 2, 1864. The opera had a triumphant reception a year later.

Scarcely any composer has been so variously estimated as Meyerbeer. The magnificent praise of Fétis and Blaze de Bury is counterbalanced by the emphatic condemnation of Schumann and the savage and ungrateful attacks of Wagner. There seems to be truth in the main charge of the latter,

that Meyerbeer, inspired by no deeply rooted artistic principle, made everything subsidiary to theatrical effect. His successive adoption of widely-different styles bears this out; and Heine, an enthusiastic admirer, mentioning his admitted mastery of instrumentation, slyly extends it to his never-resting efforts to make everything and everybody concerned in his operas instrumental towards his success. But even opponents concede the power and beauty of such a piece as the famous duet in the fourth act of the *Huguenots*. Endowed with a considerable native talent, he had by unceasing labour mastered the effects of all the different schools, and was able to utilise his knowledge to brilliant purpose. Written *ad captandum*, his grand operas, unique rather than original, have accurately hit the taste of the public, and to this day these splendid melodramatic spectacular works are the *pièces de résistance* of the Paris Opéra. See Bennett's biography in Novello's series; or Fétis, *Biographie Universelle des Musiciens*.

Mezières, the capital of the French department of Ardennes, on a bend of the Meuse, opposite Charleville (q.v.), 155 miles by rail N.E. of Paris. Strongly fortified by Vauban, and protected by a citadel, in 1521 it was successfully defended by the Chevalier Bayard, with 2000 men, against 40,000 Spaniards under Charles V.; in 1815 held out for two months against the Allies, who besieged it after the battle of Waterloo; and in the Franco-German war of 1870-71 capitulated after a frightful bombardment. The principal building is the Flamboyant church, restored in 1884, in which Charles IX. was married in 1570. Pop. 6550.

Mező-Túr, a town of Hungary, 40 miles by rail S.E. of Budapest. Pop. 21,213.

Mezquite, the name of two trees or shrubs, of the natural order Leguminosæ, sub-order Mimosæ, bearing pods filled with a nutritious pulp, and found in Mexico, Texas, Arizona, &c. The Common Mezquite (*Prosopis glandulosa*, formerly *Algarobia*) is usually a large shrub (though sometimes 40 feet high), with stems often decumbent, and armed with strong straight spines. In dry seasons it exudes a great quantity of gum (*Gum Mezquite*), similar in quality to gum-arabic. The Curly Mezquite, Screw Bean or Tornillo (*Prosopis pubescens*, also *Strombocarpa*), although only a shrub or small tree, is of great value in the desert regions of the western part of North America, where it occurs along with willow-bushes near springs of water. Its wood is used as fuel, and its pods are much liked by cattle and horses; the Indians, too, use them as an article of food.

Mezzanine. See ENTRESOL.

Mezzofanti, GIUSEPPE, Cardinal, a remarkable linguist, was born at Bologna, 17th September 1774. He was ordained priest in 1797, and appointed to the chair of Arabic at Bologna; soon after he was deprived because of his inability to take the oath to the Cisalpine Republic, but was reinstated later. In 1831 he settled in Rome with the rank of Monsignore, and two years after succeeded Cardinal Mai as Keeper of the Vatican Library. In 1838 he was raised to the dignity of cardinal. He died 15th March 1849, at Rome. Mezzofanti's European reputation was founded, not on his writings, but on the almost miraculous extent of his linguistic acquirements. Towards the end of his life he understood and spoke fifty-eight different tongues. As early, indeed, as 1820 Lord Byron called him 'a walking polyglot, a monster of languages, and a Briareus of parts of speech.' Yet he was not in the strict sense a critical or scientific scholar, or even otherwise a man of great intellectual power. See his Life by Russell (1857).

Mezzo-soprano. See SOPRANO.

Mezzotint. See ENGRAVING.

Mfumbiro, a mountain of Central Africa, 10,000 feet high, situated in 1° 30' S. lat. and 30° 30' E. long., and west of Victoria Nyanza, just within the borders of the British East Africa Company's territories.

Mhow (*Mhau*), a British cantonment in Indore state, Central India, 13 miles by rail SW. of Indore city. It is 1919 feet above the sea. Pop. (1881) 27,227, mostly Hindus.

Miako. See KYOTO.

Miall, EDWARD, an apostle of disestablishment, was born in 1809, and served as an Independent minister at Ware, and afterwards at Leicester, down to 1840, when he founded the *Nonconformist* newspaper. In 1844 he helped to establish the British Anti-state Church Association, known later as the Liberation Society, and sat in the House of Commons for Rochdale, 1852-67, and for Bradford, 1869-74. On retiring he was presented with ten thousand guineas. He died at Sevenoaks, 29th April 1881. See the Life by A. Miall (1884).

Miasma. See MALARIA.

Miautsé, an aboriginal hill-tribe of southern China, who have contrived to maintain a practical independence and many curious local usages. They consist of numerous clans, still occupying large portions of Kwang-se, Kwei-chow, Kwang-tung, and Yun-nan. Some of them own Chinese sway; other tribes are absolutely independent. They are smaller than the Chinese, and unlike in features as in character. Physique and language indicate their affinity with the Annamese, Siamese, and various other inhabitants of the Indo-Chinese peninsula.

Mica (Lat. *micare*, 'to glitter'), the name given to an important group of rock-forming minerals, which have all a hardness of about 2, and are characterised by their perfect cleavage in one direction—the laminae being flexible and elastic. They are essentially aluminous silicates containing potash, or soda, or lithia, and in some species magnesia along with potash. They all crystallise in monoclinic forms which approximate closely to hexagonal and rhombic crystals. *Muscovite* or potash mica is a silicate of alumina and potash, with some of the latter occasionally replaced by soda and small quantities of magnesia, ferrous oxide, and fluorine. It is seldom colourless, but usually yellowish, brownish, or greenish. The lustre is pearly or almost metallic. The thin plates into which it divides are generally transparent, and were formerly much used in setting objects for the microscope, but for this purpose thin glass is now preferred. It is still useful for the mounts of natural history objects which are to be put in spirit, being more easily bored than glass. Plates of muscovite often a yard across are found near Lake Baikal, at Acworth in New Hampshire, and in China. Large plates also occur in Sweden and in Norway, and masses of the mineral are met with in Cornwall. In Siberia, China, Peru, and elsewhere it is used as a substitute for glass in windows. It is sometimes preferred to glass for lanterns, and especially for the fronts of stoves, as not being liable to break with sudden changes of temperature. In India small pictures are frequently painted in distemper on mica. *Muscovite* occurs as one of the essential constituents of ordinary granite, gneiss, and mica-schist. It is also an ingredient of many other plutonic rocks and crystalline schists, but is not a primary constituent of volcanic rocks: where present in the latter it is as an alteration-product. *Sericite* is a talc-like variety of muscovite, not uncommonly met with as a constituent of certain schistose rocks,

to which it imparts a silky lustre on the planes of foliation. *Damourite*, somewhat like sericite, is also a variety of muscovite which occurs occasionally in schistose rocks. *Lepidolite* or lithia mica is a silicate of alumina with potash and lithia; white, rose-red, or violet as a rule, but sometimes greenish; does not occur in measurable crystals but in irregular plates and tables, and now and again in scaly, granular, or compact aggregates. In Moravia a massive granular lepidolite is found with a fine reddish-violet colour. Like jasper, lapis-lazuli, &c., lepidolite is made into ornaments; as a rock-forming mineral it is of small account. Another lithia mica containing iron is called *Zinnwaldite*. *Biotite* or magnesia mica embraces several varieties which in addition to potash contain magnesia, the latter being generally replaced in part by ferrous oxide. When ferrous oxide entirely replaces magnesia we have *iron mica*. The most important of the biotites is *Meroxene*, which occurs in fine crystals on Vesuvius and in other volcanic regions. It was from a study of the fine specimens of meroxene occurring in ejected blocks at Vesuvius that mineralogists were able to determine the crystalline form of mica. Formerly the micas were assigned either to the hexagonal or to the orthorhombic system. Meroxene is met with also in such rocks as granite, gneiss, &c., in scaly granules and plates, often associated with muscovite, and sometimes forming scaly aggregates. It is dark green or brown, sometimes yellowish, but generally very dark or even black, hence it is often called *black mica*. In volcanic rocks (basalt, trachyte, &c.) it occurs sparingly in the form of small scales or plates. Altered forms of meroxene are the red *Rubellane*, occurring in many volcanic rocks, and the black *Voigtite*, met with in granitic rocks. *Phlogopite* is a biotite of a reddish-brown, but sometimes yellow or even greenish colour. It contains a larger proportion of silica than meroxene. *Anomite* is another biotite only to be distinguished from meroxene by some optical characters. *Lepidomelane* is a magnesia mica rich in ferrous and ferric oxides; many of the magnesia micas occurring in granite, gneiss, &c. belong to this variety. The biotites are much more readily decomposed than the muscovites, being often altered into chloritic minerals with epidote and calcite. *Paragonite* or soda mica, an aluminous silicate of soda, occurs chiefly in certain crystalline schists, and is known only in the form of small white or colourless scales. It closely resembles muscovite, from which it can only be distinguished chemically.

MICA-SCHIST, next to gneiss, one of the most abundant of the crystalline schists. It consists of alternate layers of mica and quartz, but is sometimes composed almost entirely of the thin and shining plates or scales of mica, and from this it passes by insensible gradations into phyllite, as this in turn passes into clay-slate. The quartz occurs pure in thin layers like vein-quartz, thinning off and swelling out abruptly. Sometimes it appears as irregular swollen-shaped lumps round which the folia of mica are arranged. The mica is usually muscovite, but occasionally it is biotite. Many accessory minerals are found in mica-schist, especially garnets: others are schorl, kyanite, hornblende, andalusite, beryl, &c. In many places the mica-schist has a finely corrugated or wavy structure.

Micah, or MICAH, as the name is given in Jer. xxvi. 18 (*Micayah*—i.e. 'Who is like unto Jah?') Vulg. *Michæas*, the sixth in order of the twelve minor prophets (third in LXX., after Hosea and Amos), is described as 'the Morashtite'—i.e. a native of Moresheth Gath in the lowland of southwestern Judah near Eleutheropolis, and as having prophesied during the reigns of Jotham, Ahaz, and Hezekiah, more particularly during that of Heze-

kiah, and so as a younger contemporary of Isaiah, Hosea, and Amos. He is carefully to be distinguished from the Micah or Micaiah of 1 Kings, xxii. 8 *et seq.*, the son of Imlah, who was a prophet of the northern kingdom, contemporary with Elijah, in the reign of Ahab. The Book of Micah is described in the superscription as the word of the Lord that came to Micah which he saw concerning Samaria and Jerusalem. It consists of a collection of detached prophecies the phraseology of which is in some cases extremely obscure; no chronological order or other method of arrangement is discernible. The opening passage (i. 2-8) contains a threatening of the divine judgment against Samaria on account of her idolatry; but the rest of the book, as might be expected in a Judean prophet, seems to relate entirely to the southern kingdom, and probably was not spoken or written until after the fall of the kingdom of Israel in 722 B.C. The oracle contained in i. 9-16, relating to Judah and Jerusalem, is best interpreted in connection with the Assyrian invasions, threatened and actual, of the Judean lowland, shortly after that date; it is rendered obscure for the English reader by a number of plays upon words which can be appreciated only in the original language. Micah was not, like his contemporary Isaiah, a politician, but he lived (though not in the capital) in the same religious and social environment, and took practically the same view of the position of the people of Jehovah. His whole activity was directed to a work of moral reformation; his book consists of unsparing denunciations of mercenary prophets, rapacious and corrupt priests, cruel and oppressive nobles, and a treacherous, fraudulent, godless people. He went beyond Isaiah in his threatenings, for he did not regard even the holy city as inviolable, but, anticipating Jeremiah by a hundred years, foretold the destruction of Jerusalem and the Temple (see iii. 12; iv. 9, 10; some critics regard iv. 11-13, a passage which seems to take the opposite view, as an interpolation). Like Isaiah Micah pointed the hopes of the people of Jehovah forward, in noble language, to the establishment of the kingdom of righteousness and peace based on the knowledge and fear of the Lord; he also looked forward to the kingship of a Messiah of the house of David, who (in this Micah was original) like his great ancestor should come forth from Bethlehem. In the opinion of some critics the 6th and 7th chapters of Micah are to be assigned to an anonymous author, writing in the reign of Manasseh, under circumstances similar to those described in 2 Kings, xxi. Wellhausen and others give a still later date to vii. 7-20, where the situation contemplated is in a marked degree similar to that of Isa. xl. *et seq.* The phrase in vii. 18 ('who is a god like unto thee?') may have suggested the attribution to Micah.

For commentaries on this book, see the works on the minor prophets cited under HOSEA; also the special works by Caspari (1862) and Rysel (1889), in German; Roorda, in Latin (1869); and Cheyne, in English (1882).

Michael. See ANGEL.

Michael, emperor of Constantinople. See BYZANTINE EMPIRE.

Michaelis, JOHANN DAVID, one of the most learned biblical scholars of the 18th century, was born on 27th February 1717 at Halle, the son of Christian Benedict Michaelis (1680-1764), a theologian and orientalist of some distinction. After completing his studies at his native university, he travelled to England, passing through Holland, where he made the acquaintance of the orientalist Schultens. In 1745 he began to teach at Göttingen, and in the following year was

appointed professor of Philosophy. He took an active part with Haller in the formation (1751) of the Göttingen Academy. In 1750 he had been elected to fill the chair of Oriental Languages in addition to that of Philosophy. He died on 22d August 1791. Michaelis was a man of vast attainments, especially in history, archaeology, and natural science; and to him belongs the credit of being one of the first to study the biblical narratives as an integral part of oriental history.

His chief works are *Einleitung in die göttlichen Schriften des Neuen Bundes* (2 vols. 4th ed. 1788; Eng. trans. by Marsh, 4 vols. 1802); *Mosaïches Recht* (2d ed. 5 vols. 1776-80; Eng. trans. by Dr Alexander Smith, 1814); *Spicilegium Geographia Hebræorum* (1769-80); *Orientalische und exegetische Bibliothek* (1775-85); *Supplementa ad Lexica Hebræica* (6 vols. 1784-92); and numerous others. See his autobiographic *Lebensbeschreibung* (ed. by Hassencamp, 1793).

Michaelmas Daisy. See **ASTER**.

Michaelmas Day. On this festival, which was instituted in the year 487 in honour of St Michael and all Angels, is elected the Lord Mayor of London. In England, too, Michaelmas Day is one of the four quarterly terms on which rents are paid; and among the curious manorial rites connected with this season may be mentioned the Lawless Court kept on King's Hill, near Rochford, in Essex, on the Wednesday morning following Michaelmas Day. The Michaelmas goose is an ancient institution. For Michaelmas term, see **TERM**.

Michel, FRANCISQUE, a learned French antiquary, was born at Lyons, 18th February 1809, became in 1839 professor in the Faculté des Lettres at Bordeaux, and died 19th May 1887. He earned a great reputation by his exhaustive researches in Norman history, French *chansons*, argot, the Basques, the history of mediæval commerce, and many more among the byways of learning; and among individual books may here be named *Histoire des Races maudites de la France et de l'Espagne* (2 vols. 1847); *Histoire des Hôtelleries, Cabarets, Hôtels garnis, &c.* (2 vols. 1851-54); *Œuvres choisies de Shakespeare* (3 vols. 1868); *Les Écossais en France et Les Français en Écosse* (2 vols. 1862); and *A Critical Inquiry into the Scottish Language, illustrating the Rise and Progress of Civilisation in Scotland* (Edin. 1882).

Michelangelo, often **MICHAEL ANGELO**. Michelangelo Buonarroti, the most distinguished sculptor of the modern world, was born on March 6, 1475. His father, Ludovico di Leonardo Buonarroti Simoni, was a poor gentleman of Florence, who, though bankrupt in fortune, did not lack the consideration which is paid to ancient lineage. When the sculptor was born, his father was *podestà* or mayor of Caprese and Chiusi, two townships in Tuscany. He returned to Florence when his term of office was expired, and the child was entrusted to the fostering care of a stonemason's wife at Settignano, where Ludovico owned a small property. The boy's enthusiasm for art revealed itself at an early age, and, though he was sent to the school of Messer Francesco di Urbino to learn the elements, his best energies were devoted to drawing. To his father's aristocratic prejudice sculpture seemed a calling unworthy of a gentleman. The lad, however, was resolute, and in 1488, while yet only thirteen years of age, he entered the *bottega* of Domenico Ghirlandajo, to whom he was bound apprentice for three years. None was ever more fortunate than Michelangelo in the time and place of his birth. From his boyhood he was familiar with the masterpieces of Donatello, and he joined his contemporaries in making a pilgrimage to the convent of the Carmine, where he studiously copied

the supreme examples of Masaccio's art. By Ghirlandajo he was recommended to Lorenzo de' Medici, and entered the school which the 'Magnifico' had established in his garden on the Piazza. Here was gathered together, under the care of Bertoldo, a priceless collection of antiques, and here Michelangelo encountered what proved the most enduring influence of his life. His talent was not long in arresting the notice of Lorenzo, who henceforth gave him a room in his house and a seat at his table; and to the beneficence of his patron he owed the acquaintance of Poliziano and many of the most learned of the day. To this period belong two interesting reliefs. In the 'Battle of the Centaurs' (now in the Casa Buonarroti at Florence) the classical influence of Lorenzo's garden is strikingly apparent. In truth it has little of the dignified calm which distinguishes the work of Phidias and his contemporaries; the style of a later period was its inspiration; but it reveals the lasting characteristics of Michelangelo's genius. The inexhaustible variety of pose, the straining muscles, the contorted limbs, which mark the artist's mature work, are already visible. A marvellous contrast to the 'Centaurs' is the 'Madonna,' conceived and executed in the spirit of Donatello, which without a suggestion of movement is quiet and harmonious in composition, and though not consciously antique is far more classical.

In 1492, when Michelangelo had spent some three years in his house, Lorenzo died, and the school which had conferred so great benefits upon art was straightway dissolved. Piero, Lorenzo's son and successor, it is true, retained for a time the services of Michelangelo, but he is said to have treated him with scant courtesy; and Michelangelo fled to Bologna. Nor did he here wait long for a patron; Gianfrancesco Aldrovandi commissioned him to execute a statue. In Bologna the sculptor lingered for a year; then he once more (in 1495) returned to Florence. It was during this sojourn in his native city that he fashioned the marble 'Cupid' to which he owed his first introduction to Rome. Baldassare del Milanese persuaded him to give the work the air of an antique by burial, and despatch it to Rome. Here it was purchased by Cardinal San Giorgio, who, though he speedily discovered the fraud which had been put upon him, was quick to detect the talent of the sculptor who had tricked him. He therefore summoned him to Rome, and on June 25, 1496 Michelangelo arrived for the first time in the Eternal City. The influence of Rome and the antique is easily discernible in the 'Bacchus,' now in the National Museum at Florence; it is modelled with an elegance and restraint which are evidence of the hold which the classical tradition, as interpreted by the Græco-Roman sculptors, had upon Michelangelo. To the same period belongs the exquisite 'Cupid' of the South Kensington Museum. The 'Pieta,' which is now in St Peter's, was executed in 1497, but presents an amazing contrast. There is in it a touch of the middle ages, a suggestion of realism which is wholly at variance with the antique ideal. But it is beautifully composed, the drapery is handled with a masterly breadth, and the body of the dead Christ is an epitome of anatomical research.

For four years the sculptor remained in Rome, perpetually urged to return to Florence by his father, who, though he objected to his son's craft as unbecoming his station, was nothing loth to profit by the wealth which was the reward of artistic success. Michelangelo went back; and Soderini, who was then gonfaloniere, permitted him to convert into a statue the colossal block of marble upon which Agostino d'Antonio had been at work many years before, and out of

the irregular block grew the celebrated 'David.' The sculptor was compelled to modify his composition on account of the shape and size of his material. Indeed, it is characteristic of this titan's impetuous genius that obstacles were ever an incentive. His 'David' is the Gothic treatment of a classic theme. The influence of the antique is obvious, but the personal touch of the sculptor is also apparent (especially in such details as the treatment of the hands). The figure is modelled with strength and simplicity; the surface is not furrowed by an endless series of lines; there is no parade of anatomical knowledge; in pose and composition there is a stately grandeur, a dignified solemnity, which do not for an instant suggest that the artist was hampered by material difficulties. Indeed, so far from being a *tour de force*, it is a complete, well-ordered achievement. In 1504 it was placed upon its pedestal in the Piazza de' Signori, whence it was removed in 1873 to the Academy of Arts. Michelangelo's sojourn in Florence was a period of great activity. A second 'David' (this time of bronze) was commissioned and sent to France, where all trace of it is lost. The sculptor also designed two marble reliefs, one of which passed into the possession of Sir George Beaumont, and is now at Burlington House. The 'Holy Family of the Tribune' and the 'Manchester Madonna' in the National Gallery belong to the same time, and prove that Michelangelo had not wholly neglected the art of painting. His genius, however, was essentially plastic. He had far more interest in form than in colour; indeed, in his hands pictorial art was but an opportunity for the vigorous modelling of the human form. The zeal of Soderini, the gonfaloniere, in the cause of art inspired the scheme of decorating the Great Hall of the Council. For one wall Leonardo da Vinci was commissioned to design a fresco; a second was entrusted to Michelangelo. The latter chose as his subject an incident in the war of Pisa, and executed a cartoon which Vasari with devout exaggeration proclaims to have been of divine rather than of human origin. A body of soldiers were represented bathing; their camp has been attacked by the enemy, and they are hastening to seize their arms and repulse the assault. The motive is admirable, and gave the artist scope for the variety of pose and the violent action in which he took peculiar delight. The fresco was never completed, and on the return of the Medici to Florence the cartoon was removed to the hall of their palace, to which painters were permitted unrestrained access. The result was that over-zealous admirers of Michelangelo cut the cartoon to pieces. The original is lost as irretrievably as the masterpieces of Zeuxis and Apelles; and our impression of it is obtained from literary sources, from the engravings of Marcantonio and Agostino Vueziano, who reproduced single groups, and from a suspicious copy at Holkham Hall.

In 1503 Julius II. succeeded to the pontificate, and, being not merely a warrior but a patron of the arts as well, he lost no time in summoning Michelangelo to Rome. In Michelangelo the sturdy pope met his match. The two men, indeed, were not unlike in temperament. Each was endowed with the extraordinary vigour of mind and body which was the best characteristic of the Renaissance. But both had the defects of their qualities; Michelangelo no less than Julius was violent and overbearing; the sculptor could as little brook opposition as the pope, and their dealings were continually interrupted by bitter quarrels and recriminations. It is impossible to accept Vasari's anecdotes as statements of the literal truth, but there is no doubt that they have solid foundation in fact. Had Michelangelo known the misery and disappoint-

ment which were in store for him, he might well have hesitated before obeying the summons of Julius. The pope commissioned the sculptor to design his tomb, and thus began what Condivi aptly calls *la tragedia della sepoltura*. For forty years Michelangelo clung to the hope that he would yet complete the great monument in honour of Pope Julius and his own genius. But intrigue and spite were too strong for him. Other demands were continually made upon his energy, and the sublime statue of Moses is the best fragment that is left to us of the tomb of Julius. However, at the outset both pope and sculptor were full of enthusiasm. The plans were approved and the work would have at once proceeded had not the sculptor one day asked audience of the pope in vain. In a sudden fit of temper Michelangelo left Rome, and the entreaties of the pope availed not to procure his return. After much fruitless negotiation they met at Bologna, and, with the generosity that was characteristic of both, were instantly reconciled. Michelangelo, as a pledge of renewed friendship, commenced a statue of Julius II., which was cast in bronze and placed over the gate of San Petronio (afterwards melted down and converted into a cannon). Michelangelo followed the pope to Rome, eager to resume his work upon the monument. In the meantime, however, Bramante, if Vasari's account be true, had poisoned the pope's mind against the sculptor; instead of being allowed to devote himself to the monument, which he deemed the work of his life, he was ordered to decorate the ceiling of the Sistine Chapel with paintings. In vain he protested that sculpture was his profession, in vain he urged Raphael's higher qualifications for the task; the pope was obdurate, and in 1508 Michelangelo began the work for which his training had ill adapted him. However, he set himself resolutely to the toil, and in four years achieved a masterpiece of decorative design. The flat oblong space of the ceiling is divided into nine compartments, each of which contains an incident drawn from the Old Testament. The lunettes above the windows, the spandrels, as well as the ressaunts between the lunettes, are filled with heroic figures. The designs are admirably accommodated to the space they are intended to fill, and the broad effect is one of harmony and homogeneity. It is only when you analyse the composition and examine each compartment by itself that you realise the superhuman invention, the miraculous variety of attitude and gesture, which place this marvellous work among the greatest achievements of human energy. Michelangelo, however, had not forgotten the monument of Pope Julius, and no sooner had he finished his work in the Sistine Chapel than he returned with eagerness to the tomb. But once again his favourite project was interrupted. In 1513 Pope Julius II. died, and, though he had commanded the cardinals Santi Quattro and Aginense to see that his monument was completed in accordance with his expressed wishes, the cardinals were thrifty men, and demanded of Michelangelo another and a more modest design. This was furnished, but before the work could be undertaken Pope Leo X. had despatched Michelangelo on business of his own to Florence. Leo was of the Medici family, and professed no interest in the tomb of his predecessor; his whole anxiety was to do honour to his ancestors by the adornment of Florence. He therefore commissioned Michelangelo to rebuild the façade of the church of San Lorenzo and enrich it with sculptured figures. The master reluctantly complied, and set out for Carrara to quarry marble. Even here the pope would not permit Michelangelo to work his will, but urged him to leave Carrara and seek what material he needed at Serravezza, which lay in Leo's own territory. In vain the sculptor

insisted that the marble was of inferior quality, and that to convey it to Florence roads must be cut through mountains and laid upon stakes over marshland and swamp. Leo X. was deaf to reason, and for eight years Michelangelo was forced to devote himself to toil as idle as that of Sisyphus; from 1514 to 1522 his artistic record is a blank. Nor were the next years fruitful of achievement. The sculptor remained in Florence still working on the tomb of Julius and building the Sacristy of San Lorenzo. In 1528 the unsettled state of his native city turned him again from the practice of his art. He devoted himself heart and soul to the science of fortification, and when in 1529 Florence was besieged Michelangelo was foremost in its defence. The city was forced to surrender in the following year, and for some time Michelangelo, fearing treachery, lay in concealment. His safety, however, being assured, he resumed his work upon the tombs of the Medici, and completed the monuments to Giuliano and Lorenzo de' Medici, which are among the greatest of his works. In 1533 yet another compact was entered into concerning Pope Julius's ill-fated sepulchre; it was at last determined to reduce it to a mere façade, and Michelangelo would doubtless have carried it to completion had he not been once again commissioned to adorn the Sistine Chapel with frescoes. After a delay of some years he began in 1537 to paint 'The Last Judgment.' The design was finished and displayed on the Christmas-day of 1541, and was the master's last pictorial achievement. In the following year he was appointed architect of St Peter's, and devoted himself to the work with loyalty and devotion until his death, which took place on the 18th February 1564.

Michelangelo is by far the most brilliant representative of the Italian Renaissance. He was not only supreme in the arts of sculpture and painting, but was learned in all the learning of his age, a poet of powerful individuality, an architect and military engineer. From an artistic point of view his was by far the greatest personality, his the most potent influence, the modern world had seen. His debt to the antique was immense, yet it must be remembered that he knew only the decadence of classical art; had he seen the masterpieces which have since been brought to light, it is possible that his style might have been largely modified. But, though in the finest examples of his art classical influence is conspicuous, he was rarely able to exclude his personality. As he was violent in his life, so there is ever a touch of violence in his art. He is making, as it were, an emphatic protest against the dark ages which lay behind him; he is discovering to the world the utmost possibilities of the reawakened arts. There is generally to be observed in his work a profound learning, an extraordinary knowledge of perspective and foreshortening, a firm conviction that there is nothing in heaven or on earth that art cannot express. At beauty Michelangelo does not aim. Grandeur, sublimity, power, these are his themes. And he recurs to them again and again with the persistence which characterises a man of transcendent genius. Both Donatello, who came before him, and Raphael among his contemporaries, were more richly endowed than he with the artistic temperament. Neither the one nor the other was wont to overstep the limits of art. Their ambition was to attain perfection; they did not chafe against the restraints imposed by beauty and simplicity. But Michelangelo, though their inferior in art, had a far greater, if less governable, genius. He was not content to model a perfect statue, to paint a perfect form; he was ever striving to throw himself and his intelligence into marble or on to canvas. And so, though his works will be

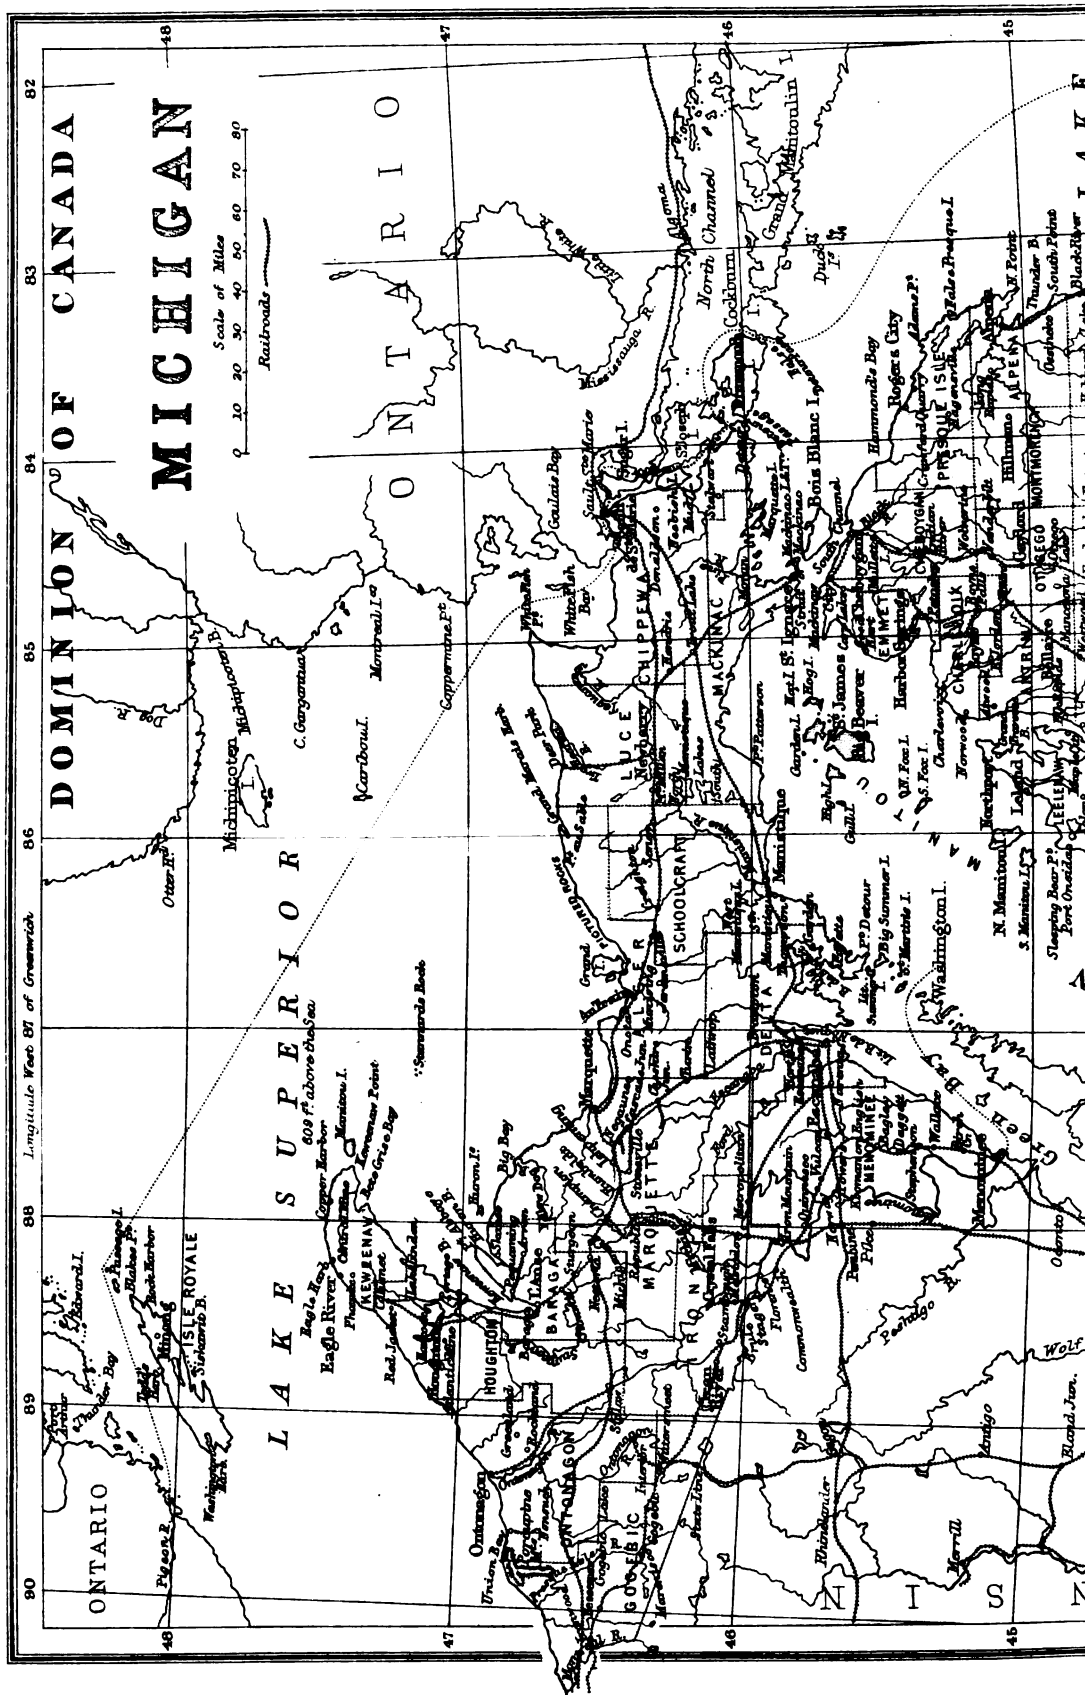

ranked till the end of time among the masterpieces of the world, he is neither for sculptor nor for painter the most valuable model. As an influence he was more potent than any of his contemporaries, and it can hardly be said that his influence was wholesome. The Flemish and Dutch painters, who visited Italy in the 16th century, carried home with them his love of distorted limbs and twisted draperies, but failed to catch a breath of his invention and vigour. It is easy, even for the mediocre, to parody a strongly-marked talent.

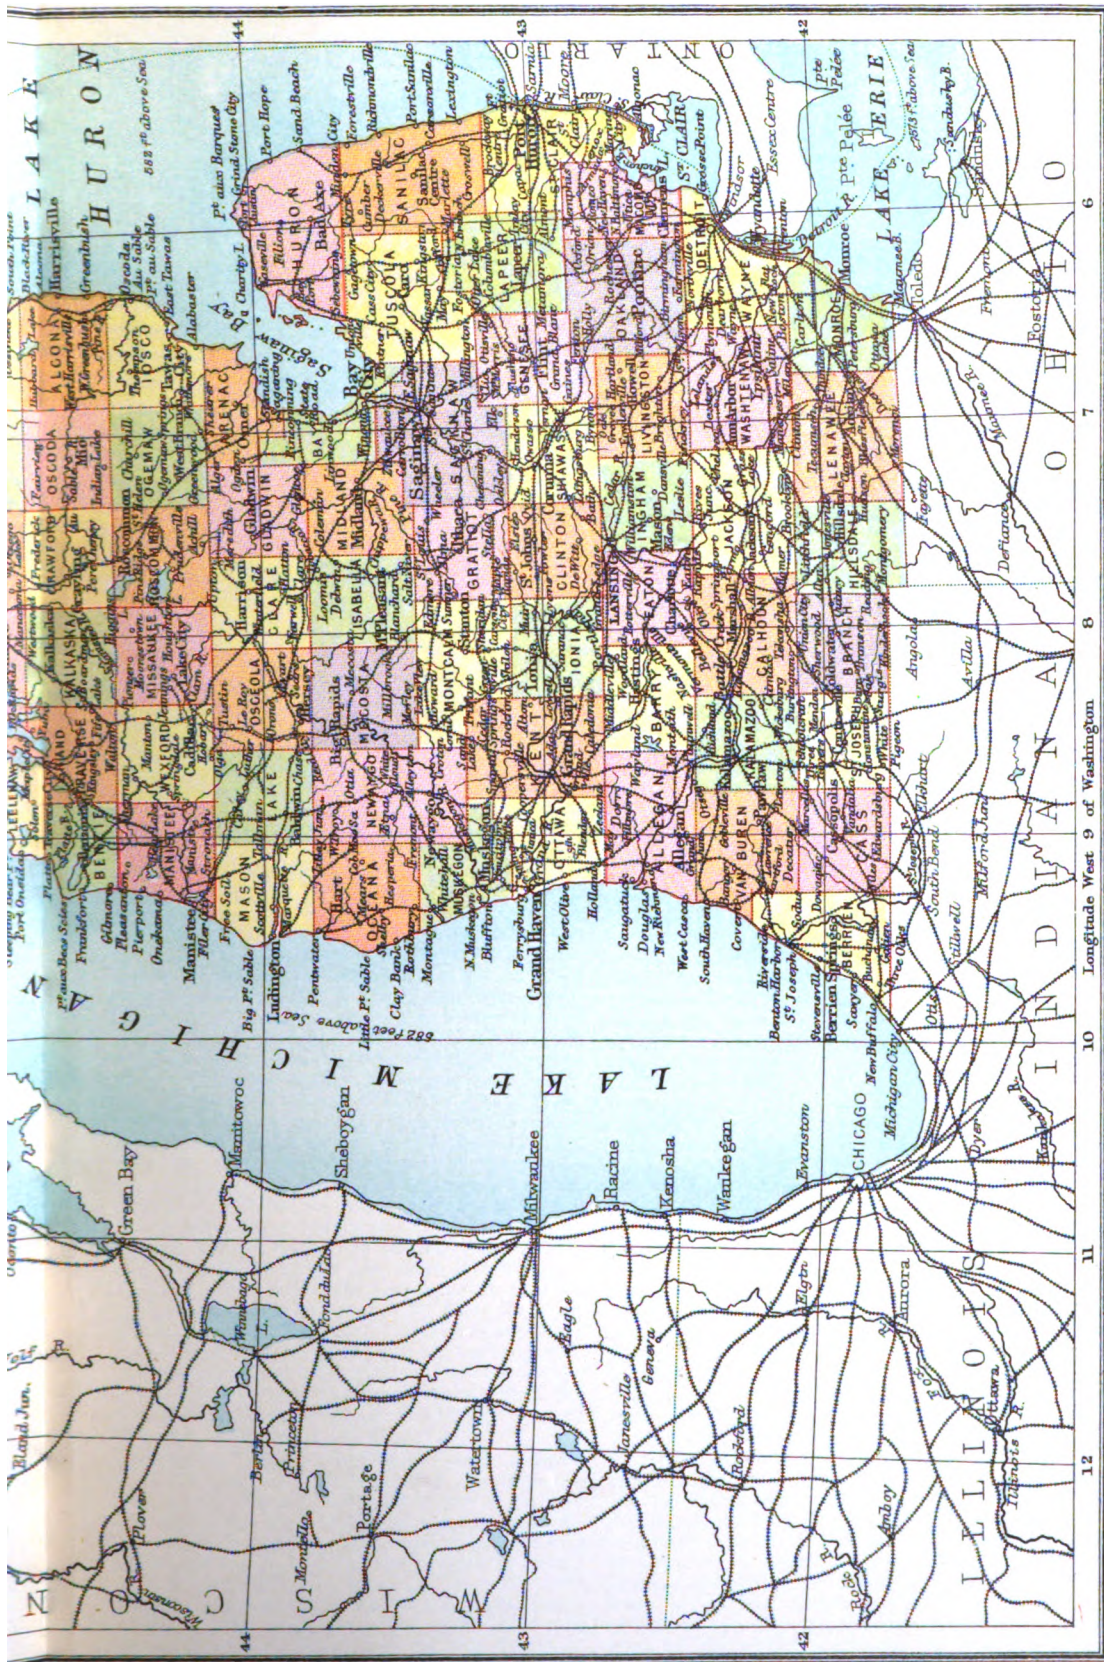

The master's career is not without irony. His genius was plastic; by temperament and training he was a sculptor, and yet frescoes were the only works he was destined to bring to fulfilment. He has left behind him, it is true, not a few grandiose statues, such as the 'Moses,' but none of his elaborate designs for sculptural monuments was ever completed. His career, indeed, was, until he came for the last time to Rome, a prolonged struggle against fate and his patrons. Time after time his own projects were set aside at the pleasure of a pope. For this his own waywardness and excitability were in some measure to blame, and throughout his life he seems to have been unable to attack any enterprise except at fever-heat. His sonnets, the composition of which he, unlike the rest of mankind, reserved for his old age, possess the same qualities as his statues. Just as his 'David' was torn from the marble, so his verses are rough-hewn out of the language. In all of them it is meaning rather than form that is sought after. Dr Johnson's criticism of a production of Bentley's is precisely applicable to them. 'They are the forcible verses of a man of a strong mind, but not accustomed to write verse.' The best of them were inspired by his friendship for the accomplished Vittoria Colonna, the widow of the Marchese di Pescara. Michelangelo's life was untouched by the passion of love, and his one romance belongs to his old age. He is said to have met Vittoria for the first time in 1538, and until her death, which took place in 1547, the closest ties of friendship bound them. Her loss was the severest blow which ever fell upon him. He painted her portrait, and this honour he conferred on none other save Tommaso Cavalieri, for whom he cherished a romantic attachment and to whom also he addressed sonnets.

Michelangelo's character was a strange medley of conflicting qualities. Though kind and loyal to those who depended on his care—as is proved by his untiring interest in his nephew and his devotion to Urbino, his faithful servant—he showed himself resentful and even suspicious to his enemies. He could brook no opposition to his wishes, and he mercilessly attacked those who dared to withstand him. But he lived in an age of treachery and intrigue, and much may on this count be forgiven him. He loved solitude and a simple life. From his earliest youth he was an eager student of literature, and applied himself with peculiar devotion to Dante and Petrarch. Though feared and attacked by the envious among his contemporaries, he earned his full meed of praise during his lifetime, and at his death universal honour was paid to his memory.

See *Lives* by Vasari and Condivi. The best edition of the letters is Milanese's *Lettere di Michel Angelo* (1873). The sonnets have been edited by Cesare Guasti, *Rime di Michelangelo Buonarroti* (1863), and translated into English by J. A. Symonds. Of modern and critical biographies there is no lack. The best and most compact is that contained in Anton Springer's *Raffaël und Michelangelo* (2d ed. 1883); Hermann Grimm's *Leben Michelangelo's* (5th ed. 1879) includes much that is valuable, but it is diffuse and not a little sentimental.

Michelet, JULES, a great French historian, was born a printer's son at Paris, 21st August 1798. After a brilliant course of study under Villemain

John Bartholomew & Co. Edin.

PHILADELPHIA: J. B. LIPPINCOTT COMPANY.

and Leclerc, he became at twenty-three a professor of History in the Collège Rollin. Later he lectured at the Collège Sainte-Barbe and the École Normale, and after the revolution of 1830 was given an important post at the Archives, became assistant to Guizot at the Sorbonne, and tutor to the Princess Clémentine. In 1838 he was elected to the Academy, and at the same time became professor of History at the Collège de France. Already he had made his name known by admirable hand-books on French and on modern history, and commenced the monumental work which was to give him an illustrious place among great historians, his *Histoire de France* (18 vols. 1833-67; new ed. 19 vols. 1879), the labour of about forty years. Other works were *Origines du Droit Français cherchées dans les Symboles et Formules du Droit Universel* (1837), *Mémoires de Luther* (1845), and *Procès de Templiers* (1841-51). Michelet had a great dislike for priests, but especially for the Jesuits, and he now plunged into controversy with all the impetuosity of his nature and eloquence, bringing to bear upon the enemy at once all his powers of sarcasm and all his unrivalled knowledge of history. Three books were the fruits of his polemic: *Des Jésuits*, written in conjunction with Edgar Quinet (1843); *Le Prêtre, la Femme, et la Famille* (1845); and *Le Peuple* (1846). Next followed his famous *Histoire de la Révolution* (7 vols. 1847-53; centenary ed. 5 vols. 1889), which is not a good history with all its eloquence and enthusiasm. Before its conclusion Michelet had lost his office by refusing to take the oath of allegiance to Louis Napoleon. Henceforth he lived mostly in Brittany and in the Riviera, buried in his gigantic literary labours. A series of books of a novel kind, full of rhapsodic eloquence and more valuable as literature than as science, were *L'Oiseau* (1856), *L'Insecte* (1857), *La Mer* (1861), and *La Montagne* (1868). Other books of unusual interest were *L'Amour* (1858), *La Femme* (1860), *La Sorcière* (1862), and *La Bible de l'Humanité* (1864). The little book, *Nos Fils* (1869), was a plea for compulsory education. Michelet's great history brings down the story of France to the outbreak of the great Revolution. The second instalment continues it to the close of the Revolution. In the last years of his life he set himself to complete his task, and thus bequeath a great continuous history to France, but he did not live to carry it beyond Waterloo (3 vols. 1872-75). He died at Hyères, 9th February 1874.

Michelet ever treats history from a personal point of view, and his imagination is prone to bring into undue relief striking figures and dramatic scenes and incidents. Thus his work is a series of tableaux, as these were visible to the eyes of a man of genius, full of prejudices for and against his puppets, and destitute of the sense for historical perspective. Yet the whole stands out a masterpiece of genius, instinct with life, and the wide range of historical literature must be ransacked for episodes surpassing his treatment of Joan of Arc or the Templars, or the luminous geographical survey of France with which the work opens. See the books by G. Monod (1875), Noël (1878), Corréard (1886), and Jules Simon (1889).

Michigan (Chippewa-Indian *Mitchi Sawgwe-gan*, 'Great Lake,' originally applied to both Lakes Huron and Michigan), the third in size of the five great fresh-water lakes of North America, and the only one lying wholly in the United States, having Michigan on the N. and E., and Wisconsin on the W. It is about 335 miles long, and from 50 to 88 broad; the mean depth is 325 feet, the maximum 870. It has the same elevation as Lake Huron (with which it is connected by the Strait of Mackinaw)—581½ feet above the sea-level; this

is 20½ feet lower than Lake Superior, and 8½ feet above Lake Erie. Its surface area is 22,450 sq. m., or 1350 less than that of Lake Huron; but its drainage area—37,700 sq. m.—is 6000 sq. m. greater than its neighbour's. There is a neap-tide of 1½ inch, and a spring-tide of about 3 inches. The shores of Lake Michigan, which are guarded by a number of lighthouses, are for the most part low; the annual erosion amounts to about 5 feet. Its principal harbours are those of Chicago, Milwaukee, and Racine. See Crosmann's *Chart of the Great Lakes* (Milwaukee, 1888).

Michigan, one of the northern tier of states of the American Union, the seventeenth in area and ninth in population, is in 41° 42' Copyright 1881 in U.S. to 48° 20' N. lat., and 82° 25' to by J. B. Lippincott 90° 32' W. long. It has an area Company.

of 58,915 sq. m., or more than that of England and Wales; 1114 sq. m. are occupied by 5173 small lakes, while the surface of 179 islands and islets, from one acre upwards, measures about 633. The coast-line in navigable lake waters is 1624 miles. The state is bounded on the S. by Indiana and Ohio; on the E. by Lake Erie, Detroit River (properly Strait), Lake St Clair, St Clair River, Lake Huron, and St Mary's River, beyond all which lies the province of Ontario, Canada; on the N. by Lake Superior, on the SW. (upper peninsula) by Wisconsin, and on the W. by Lake Michigan. From its north-western point at the mouth of Montreal River to the extreme south-east on Maumee Bay is about 500 miles. It is sometimes called the Peninsular State, from its formation in two great peninsulas, the upper and lower, or northern and southern. The upper has an extreme length of 318 and width of 164 miles, the lower of 277 and 197 miles; the latter includes the Huron Peninsula, or the 'thumb' of the 'mitten,' in eastern Michigan, and the small Leelenaw Peninsula in the north-west. The eastern part of the other, looking toward St Mary's River, is sometimes called St Mary's Peninsula. Keweenaw Peninsula, bearing the great copper-mines, stretches far north into the waters of Lake Superior; and on the south, near Mackinac Island, is the little but picturesque St Ignace Peninsula. The upper region is mostly rugged, broken, rocky, and comparatively barren, though teeming with mineral wealth; but hopeful beginnings of agriculture have been made in the eastern half of it. In the north-west, near Lake Superior, is the highest land in the state, among the hills known as the Porcupine Mountains (1830 feet above the sea). The famous Mineral range passes south of this, from Keweenaw Point southwestward into Wisconsin; but it is merely a gentle swell from both sides, nowhere really mountainous. No part of the lower peninsula is more than 1780 feet above sea-level; and the mean height is only 160 feet above the environing waters of the lakes. The highest part of Detroit is but 73 feet above the river at this point, and the uplift of a few feet in the adjacent river and lake beds would flood a thousand square miles of Michigan soil. This soil is mainly formed by the glacial drift, in alternated clay, sand, and gravel beds, supplying all the chemical constituents of a good soil, and enabling the growth of all crops adapted to this climate. The mean annual temperature of the state is 46·1° F. (summer, 68·5°; winter, 23·8°); the annual rainfall is 35·8 inches. Both peninsulas, with occasional exceptions of swamps or small prairies, were originally covered with dense forests, the products of which have proved exceedingly valuable. The geology of the state is highly interesting; it represents every rock series known, from the oldest strata to the top of the Carboniferous. In the west of the upper peninsula, on the Wisconsin border, are the Laurentian, and on either side and

eastward the Huronian formations, in which are the great deposits of iron ore. The Mineral range is of eruptive or volcanic rock, with older strata tilted upon its sides. Farther eastward are the long belts of the Lower Silurian, curving from Green Bay through the St Mary's Peninsula. The lower peninsula is compared, geologically, to a nest of wooden dishes. Its centre is a coal-bearing area of about 5000 sq. m., carrying, however, comparatively little coal of economic value in workable place and shape; though 58,099 tons were raised in 1889. In succession beyond, and in mighty sweeps around the central tract, are the upturned edges of other Carboniferous strata, then the Devonian formations, and finally the Lower Helderberg group of the Silurian. In the Michigan salt group are the rich brine wells of the Saginaw valley; in the Marshall or Waverley are the Huron grindstones, quarried on the shore of Lake Huron; and other groups yield valuable mineral products.

The output of salt for 1889 was 5,950,000 barrels, the number of wells 254. In salt and timber Michigan leads the United States, and in iron and copper the world. The great Calumet and Hecla copper-mines, the largest operated, with perhaps one exception, are on the Keweenaw Peninsula. The total copper output of 1889 was 43,613 tons, of a quality nowhere surpassed, and for certain purposes unequalled. In the same year 5,829,828 long tons of iron ore were mined, mainly in Marquette county. Some gold is found in the upper peninsula, and silver and lead in small amounts. Gypsum appears in immense deposits at Grand Rapids, in the lower peninsula, where 19,823 tons of land-plaster and 206,380 barrels of stucco were produced in 1889. Building-stones abound in both peninsulas, and in the upper there are also statuary and other marbles, and such ornamental stones as agates, jasper, chalcedony, chlorastolites, and others. Glass sand is found in the extreme south-east of the state; and lime, brick, tiles, and the like are made easily and cheaply in many parts. Of the many mineral springs nineteen have become popular resorts, and the waters of four have a commercial value.

Lumbering is the second great industrial interest of the state. The forests of northern Michigan are mostly pine, much of it, as the cork pine, of superior quality and greatly in demand; and for many years the lumber product has been enormous. In 1888 it was: lumber, 4,197,741,224 feet; shingles, 2,560,930,250. In places, however, this industry is beginning to decline, from the extensive destruction of the forests. Other leading manufactures, in order, are grist-mills, foundries and machine-shops, iron and steel works, and those of agricultural implements and of furniture. But agriculture remains the chief industry, employing about half the population. This is one of the greatest wheat states, its average yield per acre 19½ bushels. The next most important crops are maize, oats, and barley; and in the 'fruit belt,' a narrow strip of about 200 miles in length on the west shore of Lake Michigan, peaches, plums, grapes, and other fruits are grown in great quantity. It is the fourth state in the Union for wool, of which 11,898,047 lb. were marketed in 1888.

The commerce of the state is very great, and is promoted by three ship-canal—one among the shallows at the head of Lake St Clair, another near the head of St Mary's River, at the Sault de Ste Marie, and another on the Keweenaw Peninsula, known as the Portage Lake Canal. For the year ending June 30, 1889, the imports at Detroit amounted to \$3,002,557; domestic exports, \$5,922,664; foreign exports, \$49,223. There are three other ports of entry, at Port Huron, Grand Haven, and Marquette. The railways in the state

have about 8000 miles of track, and reach nearly every one of the eighty-four counties. Popular and higher education has been liberally developed, and the illiterates form only 4 per cent. of the population. Besides the state university at Ann Arbor, there are nine denominational colleges, a state normal school at Ypsilanti, a mining-school at Marquette; the agricultural, the school for the blind, and reform school for boys at Lansing; the deaf and dumb institute at Flint, an industrial home for girls at Adrian, and a school for neglected and dependent children at Coldwater. Other principal state charities are four asylums for the insane, an asylum for insane criminals, and the Soldiers' Home at Grand Rapids. There are state prisons at Jackson and Marquette, and houses of correction at Detroit, Marquette, and Ionia.

History.—The Michigan country was probably visited by Jean Nicolet in 1634, at the Sault de Ste Marie, where the first permanent white settlement was made by Father Marquette in 1668 for a Jesuit mission. Detroit was founded in 1701 by a French colony under Cadillac. The country passed to the English in 1760, and to the United States in 1796; it was again occupied by Great Britain in 1812, but was recovered by the Americans the next year. It formed a part of the North-west territory, erected in 1787; became a part of the Indiana territory in 1802, was organised as Michigan territory in 1805, and admitted as a state in 1837. Pop. (1800) 551; (1840) 212,267; (1880) 1,636,937, including 7249 Indians; (1890) 2,093,889. Detroit (205,876) has remained the chief city from the beginning; Grand Rapids (60,278) is second, and Saginaw (46,322) third. Other cities, in order of population, are Bay City, Muskegon, Jackson, Kalamazoo, Port Huron, Battle Creek, Lansing (the capital), West Bay City, Manistee, Ishpeming, Menominee, Flint, Ann Arbor, Adrian, &c. See J. M. Cooley, *Michigan* (Boston, 1885).

Michigan City, a town of Indiana, on Lake Michigan, 38 miles by water (57 by rail) ESE. of Chicago. It has a good harbour, contains a college, a state prison, and railway-shops, and manufactures cars, refrigerators, furniture, boots, &c. Pop. (1860) 3320; (1890) 10,776.

Mickiewicz, ADAM, the greatest of Polish poets, was born near Novogrodek in Lithuania (Minsk), on 24th December 1798, and educated at Vilna. In 1822, whilst teaching Polish literature at Kovno, he published his first collection of poems, full of the inspirations of Polish national life. Two years later he was banished to the interior of Russia for being concerned in the formation of a students' secret society. In 1825 he paid a visit to the Crimea, whose beauties he celebrated in a series of exquisite sonnets. Before quitting Russia in 1829 he published three epic poems, *Dziady* (1823-27), on the religious commemorations of their ancestors by the Slav races, and *Konrad Wallenrod* (1828; Eng. trans. 1841) and *Grażyna* (1827), the last two drawn from the struggle between the Lithuanians and the Knights of the Teutonic Order, and both glowing with patriotic feeling. From Russia Mickiewicz passed through Germany (where he visited Goethe and awakened the old Olympian's warm admiration) and France to Italy and Rome. In 1834 appeared his masterpiece, the epic poem *Pan Tadeusz* (Master Thaddeus; Eng. trans. 1886)—a most admirable delineation of Lithuanian customs and manners, traditions, ideas, and beliefs, and Lithuanian character, including fine poetical descriptions of the gloomy primeval forests and of the scenery of the country. After teaching for a while at Lausanne, Mickiewicz was appointed professor of the Slavonic Literatures at Paris in 1840; but three

years later he was deprived of his chair, having given offence to the government of the day by political utterances in his lectures. For some years he lived a hard and unsettled life—in 1848 he was in Italy, helping to organise the Polish legion that fought side by side with the Italian republicans at Rome—until in 1852 Louis Napoleon appointed him a librarian in the Arsenal Library at Paris. He died 28th November 1855 at Constantinople, whither the French government had sent him to organise a Polish legion to fight against Russia. His body was taken to France and buried at Montmorency; but in 1890 his bones were transported to his native country and laid beside those of Kościuszko in the cathedral of Cracow. Mickiewicz is pre-eminently the national poet of the Poles, and next after Pushkin the greatest of all the poets of the Slavs. His collected works were issued at Paris in 11 vols. (1860–61), at Leipzig in 5 vols. (1862–69), and at Lemberg, a popular edition, in 4 vols. (1885 *et seq.*). See Life by his son Ladislas Mickiewicz (1888), Fontille (Mainard) (1862), both in French, and an anonymous one in German (1857); also the Memoirs of Herzen.

Mickle, WILLIAM JULIUS, translator of the *Lusiad*, was born in Langholm manse, Dumfriesshire, in 1734. He was educated at Edinburgh High School, failed in business as a brewer, and next went to London to make a living by writing. In 1765 he published his would-be Spenserian poem, *The Concubine* (in its next edition entitled *Syr Martyn*), and so prepared the way for his version rather than translation of the *Lusiad* of Camoens (1771–75), which he completed during four years' seclusion in a farmhouse. In 1779 he went to Lisbon as secretary to Commodore Johnstone, but his last years were spent in London, where he died in 1788. Of his other works none are now of importance. His ballad of *Cumnor Hall*, which suggested to Scott the romance of *Kenilworth*, is poor stuff, but the delightful song, 'There's nae luck about the house,' is long since safely assured of its immortality. An attempt has been made to ascribe this song to the ill-fated Greenock poetess, Jean Adam (1710–65), but her claim will not bear serious examination. See *Athenæum* for January 27, 1877. The best edition of Mickle's poems is that edited, with a Life, by the Rev. John Sim (1806).

Micmacs, a tribe of Algonquin Indians, the first with whom the English came in contact; they remained hostile to the English and their colonies till 1760. They now number from 3000 to 4000, and are mostly in Nova Scotia, Newfoundland, and New Brunswick. There is an *English-Micmac Dictionary* (Halifax, 1888), compiled by the late Dr S. T. Rand.

Microbe, MICROCOCCUS. See BACTERIA, GERM.

Microcline. See FELSPAR.

Microcosm and Macrocosm. The belief of the ancients that the world or cosmos was animated, or had a soul (see ANIMA MUNDI), led to the notion that the parts and members of organic beings must have their counterparts in the members of the cosmos. Thus, in a hymn ascribed to Orpheus, the sun and moon are looked upon as the eyes of the animating godhead, the earth and its mountains as his body, the ether as his intellect, the sky as his wings. The natural philosophers of the 16th century—Paracelsus at their head—took up this notion anew in a somewhat modified shape, and considered the world as a human organism on the large scale, and man as a world, or cosmos, in miniature; hence they called man a *microcosm* (Gr., 'little world') and the universe itself the *macrocosm* ('great world'). With this was associated the belief that the vital movements of the microcosm exactly corresponded to those of the

macrocosm, and represented them as it were in copy. From this it was an easy transition to the further assumption, that the movements of the stars exercise an influence on the temperament and fortunes of men (see ASTROLOGY). Heylin gave the title *Microcosmus* to a work on cosmography in 1621, and Lotze entitled his great work definitive of man's position in the universe *Mikrokosmos* (1856–64).

Microcosmic Salt is used in blowpipe analysis, and may be prepared by mixing concentrated solutions of phosphate of soda and chloride of ammonium. It has the composition $\text{NaNH}_4\text{HPO}_4 \cdot 4\text{H}_2\text{O}$.

Microlestes, the name given to the earliest known mammalian form—a marsupial; it is discovered in the Trias of England and of Württemberg. Only the teeth, which are of small size, have been met with.

Micrometer (Gr. *mikros*, 'little'; *metron*, 'measure') is an instrument used for the measurement of minute distances and angles. Its different forms, depending on different principles, may be divided into two sections, according as they are applied to physics or astronomy. Of the former section are the Vernier (q.v.) and the Micrometer Screw, the latter instrument being merely a screw with a very regular thread, and a large round head, which is carefully graduated, generally to sixtieths, and furnished with an index. It is easily seen that if a complete turn of the screw advance its point $\frac{1}{4}$ of an inch, a turn sufficient to pass the index from one graduation to another will only advance it $\frac{1}{60}$ of an inch, &c. This is the micrometer used in the construction and graduation of instruments. Of those applied to astronomical purposes the most simple is a short tube, across the opening of which are stretched two parallel threads, which are moved to or from each other by screws. These threads are crossed by a third perpendicularly, and the whole apparatus is placed in the focus of a lens. The distance of two stars is found by adjusting the two parallel threads, one to pass through the centre of each star, taking care that the threads are placed perpendicular to the line joining the stars, and finding how many turns and parts of a turn of the screw are required to bring the wires to coincide. The angle of position of two stars is also obtained by turning round the instrument till the third wire, which is normally horizontal, bisects both stars, and reading off on the circumference the arc passed over. *Fraunhofer's suspended annular micrometer* consists merely of a steel ring surrounded by a flat rim of glass, and the position of the star is deduced from the time when it crosses the ring and its path while within it. The Abbé Rochon substituted for the wire micrometer one made of two prisms of rock-crystal or Iceland spar, capable of double refraction.

Microphone. This instrument, invented in 1878 by Professor Hughes, does for faint sounds what the microscope does for matter too small for sight; the fall of a bit of tissue-paper or the tread of a fly being rendered audible at many miles' distance. One of the most sensitive substances for microphonic action is willow-charcoal, plunged in a state of white heat into mercury. The theory is that in a homogeneous conductor of electricity the compressions and dilations of the molecules balance each other, and no variation of current ensues; while, with a state of fine grained non-homogeneity of the conductor, variations of pressure in the conductor produce variations in its conducting power, and thus induce variations in the strength of the electric current traversing it; and these variations of current, when the current passes through a second similar conductor, induce corresponding variations in its molecular stresses,

which may act upon the surrounding air and give rise to sonorous waves; or the variations in the current may be detected by the Telephone (q.v.). One form of microphone consists of a piece of mercury-tempered carbon, an inch long, placed vertically between two carbon-blocks hollowed to receive its ends; wires connect the blocks with the battery and with the receiver by which the sounds are to be heard. 'A piece of willow-charcoal,' says the inventor, 'the size of a pin's head is sufficient to reproduce articulate speech.' Two nails laid parallel, with wire connections, and a third nail laid across them, make a simple form of microphone. A few cells of any form of battery may be used. Many useful applications of the microphone have been made or suggested.

Microscope (Gr. *mikros*, 'small;' and *skopeo*, 'I see') is an instrument for enabling us to examine objects which are so small as to be almost or quite undiscernible by the unaided eye. Its early history is obscure; but, as it is quite evident that the property of magnifying possessed by the lens must have been noticed as soon as it was made, we are quite safe in attributing its existence in its simplest form to a period considerably anterior to the time of Christ. It is generally believed that the first compound microscope was made by Zacharias Jansen, a Dutchman, in the year 1590, and was exhibited to James I. in London by his astronomer, Cornelius Drebbel, in 1619. It was then a very imperfect instrument, colouring and distorting all objects. For many years it was more a toy than a useful instrument, and it was not until the invention of the achromatic lens by Chester Moor Hall (1729) and John Dollond (1752-57), and its application to the microscope by Lister and others, that it reached the advanced position it now occupies among scientific instruments.

An object to be magnified requires simply that it be brought nearer to the eye than when first examined; but as the focal distance of the eye ranges from 6 inches to 14 inches—10 inches being the average focal distance—it follows that a limit to the magnifying power of the eye is attained whenever the object to be examined is brought too near. If, however, we blacken a card, and pierce a hole in it with a fine needle, and then examine a minute object, as, for instance, the wing of an insect held about an inch from the card, we shall see it distinctly, and that, too, magnified about ten times its size. This is explained by the fact that the pin-hole limits the divergence of the pencil of rays from each point of the object, so that the eye can converge it sufficiently on the retina to produce a distinct impression, which is faint; and did not the blackened card exclude all other light it would be lost. If we now remove the blackened card without either moving our eye or the object under examination, it will be found that the insect's wing is almost invisible, the unassisted eye being unable to see clearly an object so near as one inch; thus demonstrating the blackened card with the needle-hole in it to be as decided a magnifying instrument as any set of lenses.

In fig. 1 AB is a double convex lens, in front of which, between it and its focus, K, but near that focus, we have drawn an arrow, EF, to represent the object under inspection. The cones drawn from its extreme points are representative rays of light, diverging from these points and falling on the lens. These rays, if not interrupted in their course by the lens, AB, would be too divergent for the eye to bring them to a focus upon the retina (see EYE). But after traversing the lens, AB, they travel, if the object be sufficiently near the focus, K, in lines which are nearly parallel, or which apparently diverge from points, such as C, D, not nearer to the

eye than the least distance of distinct vision, which is, for most individuals, about ten inches. Suppose the lens is as close as may be to the eye, and that the object, EF, is brought up to it to such a distance that the virtual image, CD, is at 10 inches' distance from the eye; and let us further suppose that the focal length of the lens is such (see LENS)

Fig. 1.

that the image, CD, is ten times, linearly, as great as EF; then the eye, instead of vainly striving to see the small object, EF, near K, will seem to perceive distinctly an image ten times as great linearly, and situated at the convenient distance, H. The magnification of the lens is independent of the eye, and is the relation between the size of the image and that of the object. When one of these is at an infinite distance and the other at a principal focus, the magnifying power depends on the position of the eye, and is the ratio between the apparent size of the object at any given distance and that of the virtual image as seen with the aid of the lens; this may be seen to increase as the eye is withdrawn to a greater distance, especially when the one eye is used to look at the object, say a page of print, and the other to look through the lens; but the greatest retinal image is formed when the lens is close to the eye.

We have supposed the whole of the light to enter the eye through the lens, AB (fig. 1); but so large a pencil of light passing through a single lens would be so much distorted by its spherical figure, and by the chromatic dispersion of the glass, as to produce a very indistinct and imperfect image. This is partly rectified by applying a stop to the lens, so as to allow only the central portion of the pencil to pass. But, while such a limited pencil would represent correctly the form and colour of the object, so small a pencil of light is generally unable to illuminate the whole of the magnified picture with any adequate degree of brilliancy, and is therefore incapable of displaying those organic markings on animals or plants which are often of so much importance in distinguishing one class of objects from another. Dr Wollaston was the first to overcome this difficulty, which he achieved by constructing a doublet (fig. 2), which consists of two plano-convex lenses, having their focal lengths in the proportion of 1 to 3, and placed at a distance best ascertained by experiment. Their plane sides are placed towards the object, and the lens of shortest focal length next the object. By this arrangement the distortion caused by the first lens is corrected by the second, and a well-defined and illuminated image is seen. Dr Wollaston's doublet was further improved by Mr Holland, who substituted two lenses for the first in Dr Wollaston's doublet, and retained the stop between them and the third.

Fig. 2.

This combination, though generally called a triplet, is virtually a doublet, inasmuch as the two lenses only accomplish what the anterior lens did, although with less precision, in Dr Wollaston's doublet. In this combination (fig. 3) of

Fig. 3.

lenses the errors are still further reduced by the close approximation of the lenses to the object, which causes the refraction to take place near the axis, and thus we have a still larger pencil of light transmitted, and have also a more distinct and vivid image presented to the eye.

Simple Microscope.—By this term we mean an instrument by means of which we view the object through the lens directly. These instruments may be divided into two classes—those simply used in the hand, and those provided with a stand or frame, so arranged as to be capable of being adjusted by means of a screw to the exact focal distance, and of being moved over different parts of the object. The single lens used may be either a bi-convex or a plano-convex. When a higher power is wanted a doublet, such as we have already described, may be employed, or a Coddington lens,

Fig. 4.

which consists (fig. 4) of a sphere in which a groove is cut and filled up with opaque matter. This is perhaps the most convenient hand lens, as it matters little, from its spherical form, in what position it is held. In the simple microscope single or combined lenses may be employed, varying from a quarter to two inches. There are many different kinds of stands for simple microscopes made, but, as they are principally used for dissection, the most important point next to good glasses is to secure a firm, large stage for supporting the objects under examination. When low powers alone are used the stage-movements may be dispensed with; but when the doublet or triplet is employed some more delicate adjustment than that of the hand is necessary.

Compound Microscope.—In the compound microscope in its simplest form the observer does not view the object directly, but an inverted real image or picture of the object is formed by one lens or set of lenses, and that image is looked at through another lens. The compound microscope consists of two lenses, an object and an eye lens; but each of these may be compounded of several lenses playing the part of one, as in the simple microscope. The eye-lens, or ocular, is that placed next the eye, and the object-lens, or objective, that next the object. The objective is generally made of two or three achromatic lenses, while the eye-piece generally consists of two plano-convex lenses, with their flat faces next the eye, and separated at half the sum of their focal lengths, with a diaphragm or stop between them. Lenses of high power are so small as to admit only a very small beam of light, and consequently what is gained in magnifying power is often worthless from deficient illumination. Various devices have been employed to overcome this difficulty. The light may be concentrated by achromatic condensers placed beneath the stage, or the curvature of the lens may be such as to allow as large a number of divergent rays as possible to impinge upon it. Such a lens is said to have a large 'angle of aperture,' the angle of aperture being that made by two lines converging from the margins of the lens to its focal point. Recently lenses, termed 'immersion lenses,' have been constructed, of such a curvature that when immersed in a drop of liquid placed over the object light is admitted on all sides. With an immersion lens there is high magnifying power with sufficient illumination.

The accompanying diagram (fig. 5) explains the manner in which the complete compound microscope acts. We have here represented the triple achromatic objective, consisting of three achromatic lenses combined in one tube, in connection with the eye-piece, which now consists of the field-glass, FF, in addition to the eye-glass, EE. The

function of the field-glass, FF, is that the rays of light from the object tend, after traversing the objective, to form an image at AA; but coming in contact with the field-glass, FF, they are bent, and made to converge at BB, where a real image is formed, at which place a stop or diaphragm is placed to intercept all light, except what is required to form a distinct image. From BB the rays proceed to the eye-glass, EE, exactly as they do in the simple microscope. The real image formed at BB is therefore viewed as an original object through the eye-glass, EE. The lens, FF, is not essential to a compound microscope; but as it is quite evident that the rays proceeding to AA would fall exterior to the eye-lens, EE, if it were removed, and only a part of the object would thus be brought under view, it is always made use of in the compound microscope.

A mirror is placed under the stage for reflecting the light through the object under observation. This method of illumination by transmitted light is used when the object is transparent. When opaque, light is reflected on the object by a bull's-eye lens, called a condenser. The best instruments are supplied with six or seven object-glasses, varying in magnifying power from 20 to 2500 diameters. The eye-pieces supplied are three in number, each of which

Fig. 5.

consists of two plano-convex lenses, between which a stop or diaphragm is placed, half-way between the two lenses. As the magnifying power of a compound microscope depends on the product of the magnifying powers of the object-glass and the eye-piece, it follows that its power may be increased or diminished by a change in either or both of these glasses. In the mechanical arrangements it is of importance to have the instrument so constructed that, while every facility is afforded for observation and easy adjustment, there should also be great steadiness. These ends are achieved in various ways, of which fig. 6 is one of the simplest: a, brass stand, supported on three feet; b, mirror supported on trunnions; c, diaphragm, pierced with circular holes of various sizes, to regulate the admission to the object of reflected light from the mirror; d, stage-plate, on which the object is placed; e, screw, with milled head for fine adjustment; f, the object-glass or objective; g, brass tube in which the body of the instrument is moved,

Fig. 6.

function of the field-glass, FF, is that the rays of light from the object tend, after traversing the objective, to form an image at AA; but coming in contact with the field-glass, FF, they are bent, and made to converge at BB, where a real image is formed, at which place a stop or diaphragm is placed to intercept all light, except what is required to form a distinct image. From BB the rays proceed to the eye-glass, EE, exactly as they do in the simple microscope. The real image formed at BB is therefore viewed as an original object through the eye-glass, EE. The lens, FF, is not essential to a compound microscope; but as it is quite evident that the rays proceeding to AA would fall exterior to the eye-lens, EE, if it were removed, and only a part of the object would thus be brought under view, it is always made use of in the compound microscope.

so as to effect the coarse adjustment; *h*, the eyepiece, or ocular.

For a more complete account of the different kinds of microscopes, and the various purposes to which they are applied, see Quekett *On the Microscope* (1885); Carpenter, *The Microscope* (1862; 6th ed. 1880); works on the microscope by Hogg and Beale; *The Microscopist*, by Wythe (3d ed. 1877).

Microtome, an instrument for cutting thin sections of portions of plants and animals preliminary to their microscopic examination. The objects to be cut are imbedded in some material such as paraffin or celloidin, or frozen in gum, which makes the slicing of minute or delicate objects readily feasible. The cutting used to be done by holding the prepared object in one hand and wielding a razor in the other, but this method, apt to yield sections of unequal or insufficient thinness, has given place to the use of some form of microtome, which is at once quicker and more effective. These instruments are quite simple devices by which a sliding razor slices a fixed but adjustable object, or by which the object is made to move up and down across the edge of a razor. As typical forms may be noted the freezing microtomes of Rutherford and others; the sliding microtomes common on the Continent; the ingenious 'Rocker' of the Cambridge Instrument Company—a favourite instrument in British laboratories; and more elaborate and automatic machines manufactured by the same company.

Midas, a common name of the ancient Phrygian kings, most famous of whom is Midas, son of Gordius and Cybele, and pupil of Orpheus. For his kindness to Silenus he was promised by Dionysus whatever he should ask, and in his folly he asked that everything he touched should become gold; but, as the very food he touched was at once changed into gold, he was soon fain to implore the god to take back his fatal gift. He was told to bathe in the sources of the Pactolus, and from that day to this its sands have yielded grains of gold. Once, when Apollo and Pan were engaged in a musical competition on the lyre and the flute, Midas was called in to decide between them. He gave the palm to Pan, whereupon Apollo changed his ears to those of an ass. He concealed the deformity under his Phrygian cap, but could not hide it from his barber, who felt so heavy the burden of a secret he dared not reveal that he dug a hole in the ground and whispered into it, 'King Midas has ass's ears.' He then filled up the hole, and his heart was lightened; but out of the ground sprung up a reed which ever whispered the shameful secret to the breeze.

Middelburg, capital of the Dutch province of Zeeland, in the island of Walcheren, and 4½ miles by rail N.E. of Flushing. In former times it was one of the leading mercantile cities of the United Provinces, sending many ships to the East and West Indies, and the Levant (Thomas Cromwell was one of its merchants); but its commercial importance has greatly declined, except for an active inland trade in corn, potatoes, and madder. Cotton-factories represent its only industry of note. The town-house, founded by Charles the Bold in 1468, is adorned with twenty-five statues of counts and countesses of Holland and Zeeland. A once celebrated abbey (founded in the 12th century) is now used as administrative offices. The museum of the Academy of Sciences contains one of the earliest telescopes made by Lippershey, a native of the town, who, there are good grounds for believing, was the original inventor of the instrument. The new church has marble monuments to the sea-heroes, J. and C. Evertsen, who were killed fighting against the English in 1666. Pop. (1888) 16,455.

Middle Ages is the collective term for the centuries that intervened between the close of classic times and the dawn of the modern epoch. The term does not apply to Asiatic history, except in part, in the Orient. By general acceptance, the middle ages are considered to begin after the overthrow of the Western Empire of Rome in 476, and to terminate at the Reformation, in the first quarter of the 16th century, or even earlier, in the last half of the preceding century, when printing was invented, America discovered, and the Renaissance of Learning was called forth by the Greek refugees from Constantinople.

Middle Level. See BEDFORD LEVEL.

Middlesborough, a great iron-manufacturing and shipping centre in the North Riding of Yorkshire, is a municipal, parliamentary, and county borough, and capital of the district of Cleveland. It is on the south bank of the Tees near its mouth, 15 miles by rail E.N.E. of Darlington, 50 N. of York, and 246 N. by W. of London. In 1829 the site was occupied by a solitary farmhouse surrounded by marshy land; the town owes its remarkably rapid growth partly to the extension thither (in 1830) of the Stockton and Darlington Railway, but mainly to the discovery of iron ore in the adjoining Cleveland hills (1850). Another industry—that of boring salt—was added in 1886. There are here iron and steel works, blast-furnaces, chemical works, wood and iron shipbuilding-yards, sawmills, marine engineering works, wire, nail, and tube works, salt and soda works, &c. Of the total produce of iron in the United Kingdom in 1889 (8½ million tons) Cleveland produced 2½ million tons. At the shipbuilding-yards over 3000 men are employed, and in 1889 47,092 tons of shipping were launched. The export of coal is extensive. Here are a spacious dock; a graving-dock, finished in 1875 at a cost of £120,000; and the South Gare break-water (1864-88), nearly 2½ miles long. There are, besides Anglican churches and Nonconformist chapels, a Catholic cathedral and a Jewish synagogue. The town-hall and municipal buildings were erected at a cost of £120,000, and were opened in 1889 by the Prince and Princess of Wales. Among other public buildings are a market-house, corporation baths, banks, workhouse, royal exchange, high school, &c.; and there are theatres, clubs, masonic and temperance halls. The Albert Park of 72 acres was given in 1868 to the borough by Mr H. W. F. Bolckow (1806-78), the first mayor and member of parliament; on the celebration of Middlesborough Jubilee in 1881 a monument to Mr Bolckow's memory was unveiled. There is also a monument in Exchange Place to Mr Vaughan, the founder of the Cleveland iron trade. The first governing body was established in 1841; the borough was incorporated in 1853; and since 1867 Middlesborough returns one member to parliament. The area of the municipal borough is 2813 acres; of the parliamentary borough, 4715 acres. Pop. of the township of Middlesborough (1801) 25; (1821) 40; (1831) 154; (1841) 5463; (1851) 7631; of municipal borough (1861) 18,892; (1871) 39,824; (1881) 55,288; (1891) 75,516. See H. G. Reid's *Middlesborough and its Jubilee* (1881).

Middlesex, a small county in the south of England, bounded on the N. by Hertfordshire, on the E. by Essex, on the W. by Buckinghamshire, and on the S. by the Thames and the county of London. The northern boundary is irregular, having been determined originally by the estates of the abbey of St Albans and the bishopric of Ely. On the east the river Lea and on the west the Colne and the Brent form the natural boundaries. Although small in extent the population is large, amounting (1891) to 3,251,703, which is accounted for

by the neighbourhood of the county and city of London. We first hear of Middlesex as a sub-kingdom dependent on Essex. Its position between the territory of the East Saxons and that of the West Saxons accounts for the name. The greater part of the surface was covered with a forest, of which Enfield Chase and Hampstead Heath are relics; but it was traversed by the great road which crossed the Thames, probably by a ford at Westminster, and led north-westward under the name of the Watling Street. The population was very sparse, and it has been remarked that no castle stood within its boundary, and no great abbey except that of Westminster. After the Conquest we hear little of the county until 1101, when Henry I. granted it in farm to the citizens of London. The position of Middlesex thenceforward until the passing of the Local Government Act in 1888 was wholly peculiar. For a rent of £300 per annum the citizens had the appointment of the sheriff and all other regal rights. It was usual for the sheriffs of the city to hold the office on alternate days, whence the legal form, 'the sheriffs of London and sheriff of Middlesex.' The whole body of citizens held the office, and their nominees were strictly speaking not high but sub-sheriffs, while the Lord Mayor was Lord-lieutenant. Under this régime, as is well known, the county shared in the prosperity of its great neighbour, and became at last so populous that by the act already named those portions of it which lay nearest the Thames and the city were severed from it, and, with certain districts of Kent and Surrey, were incorporated into a new 'county of London' (q.v.). At the same time a sheriff for Middlesex and a lord-lieutenant were appointed by the crown, and a singular usage which had subsisted for more than seven centuries ceased to obtain.

The geological features of Middlesex are of a simple character. It has no high hills, no great rivers, no picturesque valleys; but the low rolling undulations consist of what is known as London clay, topped here and there with river-drift, in which indications of early human life have been detected, as well as the fossil remains of elephants and other now extinct animals. There is but little tillage, except for market-gardens, and a great part of the county consists of grazing land, being occupied largely with villa residences, surrounded in many places with large parks. Brickfields occupy the western border, and the number of large suburban villages—without, however, any important town—is remarkable. Brentford, Uxbridge, and Ealing are to the west of London, and the first-named is usually reckoned the county town. Northward are Harrow, with its school, Enfield, and Tottenham. Eastward are Highgate and Hornsey. London, it may be well to note, was never in Middlesex.

Middlesex, and especially its eastern border, was the scene of many conflicts with the Danes. During the Wars of the Roses, Barnet on the northern verge gave its name to the battle on the neighbouring Hadley Common, where in 1471 the King-maker was defeated and slain. The principal mansions are Hampton Court (q.v.), Sion House (see ISLES-WORTH), and Osterley, near Hounslow, which belongs to Lord Jersey, and is a handsome building by Robert Adam.

Middle Temple. See INNS OF COURT.

Middleton, a town of Lancashire, on the Irk, 3 miles W. of Oldham and 6 NNE. of Manchester. Dating mainly from 1791, when it received a charter for a weekly market, it was incorporated as a municipal borough in 1886, the borough area including the townships of Middleton, Tonge, and Alkrington,

with parts of Hopwood and Thornham. It is chiefly dependent upon its manufactures of silk and cotton, and has an interesting parish church, a grammar-school (1572), public baths and libraries, &c. Pop. (1881) 18,953; (1891) 21,310.

Middleton, a town of Ireland, 13 miles by rail E. of Cork. At the college (1696) Curran was educated. Pop. 3358.

Middleton, CONYERS, a famous controversialist, was born at Richmond in Yorkshire in 1683. He studied at Trinity College, Cambridge, and in 1706 obtained a fellowship, which a prudent marriage soon enabled him to resign. About 1722 he became librarian to the university, and in his later years was presented to the living of Hascombe in Surrey. He died at his seat at Hildesham in Cambridgeshire in 1750. All his life through Middleton was busy in controversy, and in bitterness of tone and ferocity of temper he was a match for any of his contemporaries. His first antagonist was the redoubtable Bentley; but, though at first successful, he was afterwards obliged to apologise to him for libel. His later controversies were theological in character, and in these he gained great distinction, but left his own sincerity under grievous suspicion. His *Letter from Rome, showing an exact Conformity between Popery and Paganism* (1729), was a severe attack on the Catholic ritual, the method employed being the historical—so much more deadly than dogmatic arguments. He next assailed the orthodox champion Waterland, and startled the devout by giving up literal inspiration and the historical truth of the Old Testament stories. He professed to be giving an unassailable answer to Tindal and his school of Deists, but it is none too certain that he was not himself a freethinker, bent on dealing a secret stab to a religion the bread of which he ate. In 1747 and the following year he published his famous *Introductory Discourse* and the *Free Inquiry* into the miraculous powers claimed to have subsisted in the Christian church after the apostolic age. He attacked the ecclesiastical miracles, pointing out that their true source was in the general intellectual condition of the age that produced them, without needing to postulate either supernatural interference on the one hand or human imposture on the other. It is not a little interesting that Gibbon ascribes his boyish conversion to the Roman Catholic faith to the indirect influence of this work, which convinced him not that that church had preserved the gift of miraculous powers during the first four or five centuries, but that most of its distinctive doctrines were already formulated within that period. Middleton's best-known book remains his well-written and eulogistic *Life of Cicero* (1741). See Leslie Stephen's *English Thought in the Eighteenth Century*, chap. iv. part 6.

Middleton, THOMAS, dramatist, born about 1570, was the only son of William Middleton, gentleman, who settled in London and married Anne, daughter of William Snow. The earliest mention of Middleton in Henslowe's *Diary* is under date 22d May 1602, when he was engaged with Munday, Drayton, Webster, and others on a lost play, *Cæsar's Fall*. First on the list of his printed plays is *Blurt, Master Constable* (1602), a light, fanciful comedy. Two interesting tracts, *Father Hubbard's Tale* and *The Black Book*, exposing the practices of London rogues and sharpers, were published in 1604, to which year belongs the first part of *The Honest Whore* (mainly written by Dekker, but containing occasional scenes by Middleton). *The Phoenix* and *Michaelmas Term* (both published in 1607) are lively comedies; and even more diverting is *A Trick to catch the Old One* (1608). *The Family of Love* (1608) and *Your Five Gallants*,

n.d. [1608], are of slender merit; but *A Mad World, my Masters*, from which Aphra Behn pilfered freely in *The City Heiress*, is conducted with singular adroitness. All these early comedies of Middleton, even the poorest of them, are distinguished by smartness and buoyancy. *The Roaring Girl* (1611), written in conjunction with Dekker, describes the exploits of Mary Frith, a noted cut-purse and virago, who is turned into an attractive heroine by the kindly playwrights. In 1613, and frequently in later years, Middleton was employed to write the Lord Mayor's pageant. The highly amusing but somewhat indecorous comedy, *A Chaste Maid in Cheapside*, printed in 1630, was probably produced in 1613; and to that year may belong *No Wit, No Help like a Woman's*, first printed in 1657. *A Fair Quarrel* (1617), written with William Rowley, presents in the person of Captain Ager a noble example of blameless magnanimity. *The World Tost at Tennis* (1620), to which Rowley contributed, is an ingenious, well-written masque, contrived with more elaborate care than was usually bestowed on such compositions. On 6th September 1620 Middleton was appointed to the office of City Chronologer. A MS. City Chronicle compiled by him was extant in the 18th century, but has since disappeared. *More Dissemblers besides Women* (circa 1622, probably written in conjunction with Rowley), is more elaborate and substantial than the early comedies.

The dates of *The Witch*, *The Mayor of Quinborough*, and *The Old Law* are difficult to fix. *The Witch*, first printed in 1770, is interesting from the resemblance that it offers in the incantation scenes to the similar scenes in Macbeth, which was (probably) written earlier. Some of the songs from Middleton's play were foisted into Macbeth by the players. *The Mayor of Quinborough* (first printed in 1661) was supposed by Dyce to be one of Middleton's earliest plays; but a passage in iv. 3 is certainly imitated from *The Tempest*. The tragic scenes contain some of Middleton's most powerful writing; the broadly comic scenes may be safely assigned to Rowley. The delightful comedy, *The Old Law*, first published in 1656 as the work of Massinger, Middleton, and Rowley, bears some indications of having been originally produced in 1599. Massinger did no more than revise the play on its revival at the Salisbury Court Theatre; and there is more of Rowley in it than of Middleton.

In the three posthumously published plays, *The Changeling*, *The Spanish Gypsy*, and *Women beware Women*, Middleton's genius is seen at its highest. Rowley had a share in the first two and probably in the third. *The Changeling* (written circa 1623) has not the sustained tragic power of Webster's masterpieces, and is weighted with a cumbersome comic underplot (evidently managed by Rowley); but it contains one scene (the colloquy between De Flores and Beatrice after the murder of Alonzo) that for sheer intensity of passion finds no parallel outside Shakespeare's greatest tragedies. It was one of the first plays revived at the Restoration. *The Spanish Gypsy* (circa 1623), a rich romantic play, opens sombrely, leading us to expect a tragical issue, but ends cheerfully; the breezy Gypsy-scenes are doubtless by Rowley. *Women beware Women* has a blithe beginning, but closes in tragic gloom. As a whole it is even more powerful than *The Changeling*.

A very curious, interesting, and skilful play is *A Game at Chess*, which was acted for nine days continuously, with unbounded applause, in August 1624. The cause of its great popularity was that it gave expression to the general feeling of satisfaction at the failure of the negotiations for the Spanish marriage. Gondomar ('the Black Knight')

was satirised with scathing severity; and the Archbishop of Spalatro ('the Fat Bishop') was rudely handled. After the performance had continued for nine days a strong protest from Gondomar caused the withdrawal of the play; and both author and actors were summoned to appear before the Privy-council. Middleton shifted out of the way.

The Widow, a comedy of uncertain date, was published in 1652 as the work of Jonson, Fletcher, and Middleton; but it is difficult to assign any part to Jonson, and Fletcher's share was slight. The scene in act iv. where Latrocinio disguises himself as an empiric and dispenses his nostrums seems rather to be imitated from Ben Jonson than written by him. *Anything for a Quiet Life*, printed in 1662 and written circa 1619, may have been revised by Shirley.

In 1626 Middleton composed the city pageant, *The Triumphs of Health and Prosperity*. On 4th July 1627 he was buried at Newington Butts. He had married in 1602 or 1603 Mary, daughter of Edward Morbeck, one of the six clerks in Chancery; and his son Edward, the only child of the marriage, was born in 1604. The widow survived for about a year. Ben Jonson succeeded to the post of City Chronologer.

Middleton was concerned in the authorship of some of the plays included in the works of Beaumont and Fletcher. Mr Fleay plausibly assigns to him *A Match at Midnight* (usually attributed to Rowley) and the pseudo-Shakespearean *Puritan*.

Dyce's edition of Middleton's works was published in 1840 (5 vols.); an edition by the present writer appeared in 1885-86 (8 vols.). Selected Plays (2 vols.), with an Introduction by Mr A. C. Swinburne, are included in the 'Mermaid' series, edited by Mr Havelock Ellis.

Middletown, (1) a city and port of entry of Connecticut, on the right bank of the Connecticut River, 15 miles below Hartford, at the junction of three railway lines. It is a well-built town, dating from 1636, with wide, shaded streets and numerous handsome residences. Here are the Wesleyan University (1831), the Berkeley Divinity School (Episcopal), a large state hospital for the insane, and an industrial school for girls. The manufactures include sewing-machines, tape, webbing, Britannia ware, &c. Pop. (1890) 9013.—(2) A town of New York, 67 miles by rail NNW. of New York city. It contains the state homœopathic insane asylum, and has manufactures of iron, blankets, hats, &c. Pop. (1890) 11,977.—(3) A town of Ohio, on the Miami River and Canal, 35 miles by rail N. of Cincinnati, with several paper-mills and tobacco-factories. Pop. 4538.

Middlewich, an old-fashioned market-town of Cheshire, on the river Dane and the Grand Trunk Canal, 21 miles E. of Chester. Its salt-manufacture has declined. Pop. 3379.

Midge, a common name for many different kinds of delicate flies, more or less gnat-like in structure, but usually harmless in habit. The adults dance in great swarms in the air; the larvæ are usually aquatic. A common little brown midge, *Corethra plumicornis*, has beautifully transparent larvæ, frequent in stagnant water; while those of *Chironomus plumosus* are bright red, known as blood-worms, and much sought after by birds and fishes. The name is sometimes extended beyond the limits of the family Chironomidae to include such forms as the formidable Danubian gnat (*Simulium columbense*) or the allied buffalo gnat of the southern United States. See GNAT.

Midhurst, a market-town of Sussex, on the Rother, a navigable tributary of the Arun, 65 miles by rail SW. of London and 12 N. of Chichester. Cobden was born close by, and Lyell was educated

at the grammar-school (1672). Cowdray House, $\frac{1}{2}$ mile N.E., was built about 1530 by the Earl of Southampton, and for 239 years had been the seat of eight Viscounts Montague, when in 1793 it was reduced by fire to a beautiful ruin. Till 1885 Midhurst borough (35 sq. m. in area) returned a member to parliament. Pop. of parish (1851) 1481; (1881) 1615.

Midi. CANAL DU. See GARONNE.

Midianites, an Arab race, descended, according to Scripture, from Midian, the son of Abraham by Keturah. They occupied great part of the country between the Red Sea and the Plains of Moab, and had their headquarters east of what is now the Gulf of Akabah. They were at least partly nomadic, but their caravans brought gold and incense from the south to Palestine, and traded between Egypt and Syria. Some of them lived near Sinai; to them belonged Jethro, priest or sheik of Midian—the father-in-law of Moses. The Midianites were very troublesome neighbours to the Israelites till Gideon's victory over them. Their national god was Baal-Peor. In Midian proper, to the east and south-east of the Gulf of Akabah, the Romans had valuable mines. Sir Richard Burton was convinced that gold was still to be found there, and as an outcome of visits paid in this interest wrote his *Gold Mines and Ruined Cities of Midian* (1878), and *Midian Revisited* (1879). Later travellers have not confirmed his opinion; but petroleum seems to occur. Midian ceased to be Egyptian and became Turkish again in 1887.

Midlothian. See EDINBURGSHIRE.

Midnapur, capital of a district in Bengal, on the Kasai River, 68 miles W. of Calcutta by road and canal. There are some manufactures, and an American mission to the Santals. Pop. 33,560.

Midrash, the Hebrew exposition of the Old Testament. See EXEGESIS.

Midshipman, the second rank attained by combatant officers in the royal navy. As a cadet he remains two years in the *Britannia*, the cadet training ship. On passing out, if he obtains a first-class certificate, he is rated midshipman at once; if he only obtains a second-class certificate, he serves six months at sea as naval cadet and then passes for midshipman; if he only gets a third-class certificate, he cannot pass for midshipman until he has been twelve months at sea. A midshipman has to serve four years and six months in that rank, inclusive of the time allowed him on leaving the *Britannia*; then if he is nineteen years of age he can pass his examination as acting sub-lieutenant. He next joins the college at Greenwich, where he receives a nine months' course in mathematics, navigation, &c., at the end of which time he has to pass his final examination in those subjects to qualify him for the rank of lieutenant. From Greenwich he proceeds to the torpedo school for a three months' course before passing his final examination in that branch; then to the gunnery school for another nine months' course in gunnery before his final examination. Lastly, he has to go through a three months' course in pilotage. If he is lucky enough to obtain a first-class certificate in all five branches—viz. seamanship, mathematics, torpedo, gunnery, and pilotage—he obtains his lieutenant's commission at once as his reward; otherwise he has to wait two or three years, as a rule, as a sub-lieutenant before being promoted. A midshipman's time is principally devoted to his instruction, and he is undergoing a period of probation for his future career. He is examined every six months in all subjects to ascertain the progress he is making, and is liable to be summarily dismissed if he is

found not to be making satisfactory progress or to be not likely to make an efficient officer. There is no open competition for cadetships as for commissions in the army; but cadets are nominated, and there is a limited system of competition, three candidates being allowed to compete for every vacancy. Midshipman is the only naval title peculiarly English; from what it takes its origin it is difficult to say. He ranks with a second-lieutenant in the army. In France he is styled 'enseigne de vaisseau,' and in other navies he remains cadet until he becomes a sub- or under-lieutenant. A midshipman receives only 1s. 9d. a day (£31, 18s. 9d. per annum); he is consequently dependent on his friends for more or less pecuniary assistance until he becomes a sub-lieutenant.

Midsummer Day—24th June—is one of the four English quarter-days. For Midsummer Eve, see JOHN'S (EVE OF ST).

Midwifery. See OBSTETRICS.

Mieris, FRANS VAN, Dutch painter, born at Leyden, 16th April 1635, and died there, 12th March 1681, painted genre pictures and portraits, all of small size. He was a pupil of Gerard Dow, but, though a very able painter, scarcely rises to the level of his master. His son, Willem (1662-1747), and Willem's son, Frans (1689-1763), followed closely in his footsteps.

Miescher's Vesicles. See GREGARINIDA.

Migne, JACQUES PAUL, to whom Catholic theology owes a great debt of gratitude, was born at St Flour in Cantal, 25th October 1800, and died in Paris on his seventy-fifth birthday. He was educated at the seminary at Orleans, was ordained priest in 1824, and served some time as curate at Puiseaux in the diocese of Orleans. A difference with his bishop about a book on the liberty of the priests drove him to Paris in 1833, where he started *L'Univers Religieux*, afterwards called simply *L'Univers*. In 1836 he sold the paper, and soon after set up a great publishing house at Petit Montrouge, near Paris, which gave to the world, besides numerous other works of theology, *Scripturæ sacræ cursus completus* and *Theologiæ cursus* (each 23 vols. 1840-45), *Collection des Orateurs sacrés* (100 vols. 1846-48), *Patrologiæ cursus completus* (Latin series, 221 vols., 1844 et seq.; 2d ed. 1878 et seq.; 1st Greek series, 104 vols., 2d series, 58 vols., both since 1857), and the *Encyclopédie théologique* (171 vols. 1844-66). Unfortunately these editions were prepared too hastily, and moreover by superficial scholars, so that they do not possess critical value. The Archbishop of Paris, thinking that the Abbé Migne's great undertaking had become a mere commercial speculation, forbade it to be continued, and, when the indefatigable director refused to obey, suspended him. A great fire, more powerful than the veto of the archbishop, put an end to the work in February 1868.

Mignet, FRANÇOIS AUGUSTE ALEXIS, a great French historian, was born 8th May 1796, at Aix in Provence, studied at Avignon, and then law at Aix along with Thiers. Both were admitted to the bar at the same time (1818), but Mignet's true vocation was at once apparent in the no less solid than brilliant prize-essay for the Academy of Inscriptions on the institutions of France in the time of St Louis. In 1821 he went to Paris, and soon began to write for the *Courrier Français*, and to lecture with applause on Modern History at the Athénée. In the spring of 1824 appeared his *Histoire de la Révolution Française*, a sane and admirable summary—the first complete history by one other than an actor in the great drama. Mignet joined the staff of the *National*, and with

Thiers signed the famous protest of the journalists on July 25, 1830. After the revolution of 1830 he became Keeper of the Archives at the Foreign Office, but lost this in 1848. In 1833 he went on a confidential mission to Spain, and used the opportunity to explore the famous Simancas Archives. Elected to the Academy of Moral Sciences at its foundation in 1832, he succeeded Comte as its perpetual secretary in 1837, and was elected to fill Raynouard's chair among the Forty in 1836. He died 24th March 1884, within three months of Henri Martin. Mignet was the first great specialist in French history who devoted himself to the complete study of particular periods, and in his work he displayed a marvellous mastery of documents.

His works include *Négociations relatives à la Succession d'Espagne sous Louis XIV.* (1836-42); *Antonio Perez et Philippe II.* (1845); *Vie de Franklin* (1848); *Histoire de Marie Stuart* (1851); *Charles Quint, son Abdication, son Séjour et sa Mort au Monastère de Yuste* (1854); *Éloges Historiques* (1843 and 1864); and *Rivalité de François I. et de Charles V.* (1875). For a great projected history of the Reformation, he is said to have collected hundreds of volumes of manuscript correspondence. See Trefort, *Mignet und seine Werke* (Budapest, 1885); the Life by E. Petit (Paris, 1889); and Jules Simon, *Mignet, Michelet, Henri Martin* (1889).

Mignonette (*Reseda odorata*), a plant of the natural order Resedaceæ, a native of the north of Africa, in universal cultivation on account of the delicious fragrance of its flowers. Though usually cultivated as an annual, it is really a perennial, and assumes a sub-shrubby character when protected from cold and wet in winter. It is to be seen during summer in almost every garden, and during winter in almost every greenhouse in Britain; it is often cultivated in flower-pots in apartments, and no flower is so common in the boxes which are placed outside of windows in towns. Yet it was first introduced into England by Lord Bateman, who brought it from the Royal Garden at Paris in 1752; nor had it then been long known in France. It rapidly became a universal favourite throughout Europe. The French name mignonette, now its popular name everywhere, signifies *Little Darling*. What is called *Tree Mignonette* is not even a distinct variety, but merely the common kind trained in an erect form, and prevented from early flowering by pinching off the ends of the shoots.—Weld (q.v.) belongs to the same genus.

Migration of Animals. An animal is usually described as 'migrating' when it shifts its quarters at particular periods of the year. This, in the northern hemisphere, takes place in spring and autumn, the directions at these seasons being respectively north and south; in the opposite hemisphere the course taken by the migrants is reversed, while in most warm and temperate regions herbivorous mammals, to escape insects and to obtain fresher vegetation (and following them the predatory carnivora), ascend in summer to higher altitudes, descending again when the snow covers their grazing ground. Examples are afforded by the deer in North America and Scandinavia, the alpine hares in Scotland, the Himalayan monkeys, &c. But, just as in Hibernation (q.v.) there is every gradation between ordinary sleep and the long-continued dormancy so designated, so it is possible to trace numerous steps connecting the ordinary roaming about of an animal in search of food with the persistent flight or march in one definite direction at a date so determinate that it may be reckoned upon to within a few days. There are, however, in addition, migrations of an irregular character, stimulated by causes still imperfectly understood, though

in the majority of cases the necessity of seeking more abundant food-supplies—the *primum mobile* of all roaming—is at the bottom of what seems at first sight a whimsical movement.

Birds are the most marked migrants. The phenomena exhibited by them in this respect have been sufficiently described in Vol. II. p. 172. Various species (the robin and the song thrush, for example) which stay in Great Britain during winter are in various continental countries migrants. Again, all winter there is a drifting over from the mainland to the British shores of species which are not recognised as birds of passage, this shifting of quarters, in a manner akin to migration, except that it is indeterminate as to season, being probably due to a lack of food when continental Europe is covered with snow. This reason may also be assigned for those irregular appearances of the wax-wing and the nutcracker in the British Isles, and for those sudden arrivals from central Asia in Europe, on to the western limits of Great Britain, of the Pallas sand-grouse, which were the ornithological events of 1859, 1863, and 1888.

Mammals are less migratory, their movements being restricted by the impossibility of crossing the ocean. The reindeer, however, in many parts of the Arctic continent, moves north at the beginning of summer and south at the approach of winter, and in the Hudson Bay region the Arctic fox—the young more especially—often retreats southward in October, returning northward in spring, though in Greenland, Spitzbergen, and the Arctic regions generally both animals are winter residents, the fox shifting its quarters very little, and the reindeer only from one valley deeply covered with snow to another in which the lichens and the withered vegetation can be reached more easily. The polar and other seals and cetacea make regular migrations, the latter following the melting ice-fields, while each species of the former reaches the coast at different dates, though their winter haunts are still problematical. But most northern mammals are hibernators when they cannot find sufficient food-supply during winter. The irregular migrants are the most remarkable. Among these the Lemming (q.v., *Myodes lemmus*) is the best known. These animals, at intervals of five, twenty, or even a greater number of years, suddenly start from their home in Northern Scandinavia, in vast droves, followed by myriads of predatory birds and mammals, and steadily pursue a southward course until they meet the sea, when they boldly plunge in and are often drowned in enormous numbers. None ever return. The North American gray squirrel (*Sciurus migratorius*) will often remain for years in one district, and then suddenly migrate in millions. These two cases—and the lemmings of North America (*M. torquatus*, var. *hudsonius*) exhibit traits similar to their European congeners—may, like the corresponding influx of rats and mice in various districts, of the Hesperomys in Brazil, and of the flying foxes (gigantic bats of the genus *Pteropus*) in parts of Australia, be ascribed to the food-supplies in a particular area having suddenly failed or become unequal to the demands upon them; for it is hard to credit the theory that the southward incursions of the lemmings are stimulated by their instinctive eagerness to reach a long vanished 'Atlantis,' to which, in former days, their ancestors periodically resorted, and of the existence of which they possess an inherited though inaccurate remembrance. The American bison was also in the habit of migrating southward and northward after the fashion of the reindeer and Asiatic wild-ass (*Asinus Onager*), and no doubt for identical reasons. But the irregular migrations of the quagga and the South African antelopes, followed by herds of lions and other carnivora, are,

or were, due to a scarcity of water and naturally of food also. The occasional inroads of bears and wolves on settled districts are not migrations proper, for their boldness is stimulated solely by hunger through the scarcity of food during more than usually severe winters; and to an allied cause may be traced the long excursions of various monkeys (*Entellus* and *Rhesus*) at irregular periods.

Many fishes are regular migrants. The salmon, the shad, some smelts (the North-west American oolachan, *Omerus pacificus*, for example), eels, the sea lamprey, the sturgeon, the river trout, &c., all migrate from the sea up rivers at the spawning season, while the roach and the ide of Scandinavia migrate from lakes into the tributary streams for the purpose of depositing their ova. The herring, sprat, pilchard, and other Clupeidæ move from deep water in spring to shallower places more inshore, in order that the greater warmth of the water may hatch the spawn; while other species (e.g. the sudden arrival of the *Temnodon saltator* off the southern coast of Morocco in 1887, and succeeding seasons, after an absence for twenty-seven years) appear and disappear periodically, though in all probability most fishes are more or less migratory.

Among reptiles, turtles are the only known migrants, moving on shore at fixed periods to deposit their eggs in the sand, and disporting themselves in the sea during the rest of the year.

Among Invertebrata there are no regular migrants; but many of them perform irregular migrations of considerable interest. The destructive flights of various species of Locusts (q.v.) and Grasshoppers (q.v.) in search of green food, the occasional flights of butterflies, and the quasi-marches of the termites-ants are cases in point. In July 1890, near Romershof, in the Riga district, there was witnessed a flight of small beetles. The mass in motion was about 2 miles long, $\frac{1}{4}$ mile broad, and 7 yards thick. It moved in a northerly direction, obscuring the sun, and at times settling on the fields. The flights of the various species of locust (especially *Pachytylus migratorius*) are, however, not always impelled by hunger, for though they generally breed in a sandy district when food is scarce, and are therefore compelled to seek another where it is more plentiful, the reverse course is sometimes taken, as if the species was seeking the barren home of its ancestors. Temperature may also have something to do with locustal migrations, and there is a tendency for the flights to take particular directions. The nearest approach to periodical migration known is the curious movement of butterflies across the Isthmus of Panama and seaward in June and the beginning of July many years in succession. But it is not known where they go to, though butterfly showers have been met with in the Pacific several miles from land, and other flights have crossed Ceylon of such an extent that, though miles in breadth, they occupied several continuous days in their passage. It may be taken for granted that all marine animals, like all terrestrial ones, shift about in search of food, when not permanently fixed in their adult condition. Yet, with the exceptions mentioned, it is difficult to point to any which are migrants in the true sense of the term. A curious inroad of crustaceans—a species of *Sesarma*—has been noticed off Cuba, where, at Cape San Antonio, they invaded the houses and the light-tower. Land-crabs are sometimes migratory. The violet species of the West Indies (*Gecarcinus ruricola*) lives several miles inland, returning to the sea once a year to deposit its spawn. Other species are found at heights of 4500 feet, in the Deccan, though they do not appear to visit the sea,

being fresh-water spawners. But in Ascension land-crabs climb up Green Mountain and steal rabbits from their holes, and in Japan the crab *Telphusa* is found on the tops of mountains several thousand feet high, and in Greece and Italy by streams far inland.

Migration is, therefore, in the vast majority of cases, due (1) to the necessity of searching for food and (2), as in the case of fishes, crustacea, reptiles, &c., of finding a suitable place for depositing their eggs. The causes which impel birds to migrate are more complicated, though the two mentioned are the leading ones. With mammals, in all likelihood, this trait is of an origin so remote that it preceded the present distribution of land and water. This is shown by the range of various extinct groups. Thus, true horses of the genus *Equus* are of older-Pliocene date in Europe, but of Post-Pliocene, or even of later appearance, in America, into which they have migrated, though on that continent they expired comparatively soon. But tapirs, though now essentially an American group, being more abundant there than in Asia, are in the Old World Lower Miocene, while in the New World they do not extend further back than the Post-Pliocene epoch. Lastly—and the list might be largely extended—camelidæ, though now confined to Asia and South America, are really an American group, having been largely developed in the Miocene age of the northern part of the continent, whereas the true camels, according to Wallace, seem to have passed into Asia and the llamas into South America. We may, indeed, infer with confidence that in the most remote periods of the world's history migration existed; indeed, if we accept (though few palæontologists do) the conclusions of Barrande, they lend countenance to the belief that at a date incalculably distant by our methods of measuring time this animal trait was established among the trilobites and other palæozoic invertebrates. It is thus, in some instances, permissible to suggest that the habit is a 'survival', though it is difficult to point to a case in which it is at present practised without the animal benefiting thereby. For just as hibernation, by enabling an animal to live within its area, serves an important purpose in the struggle for existence, so migration, by enabling it to escape vicissitudes of climate and the revolutions of the globe which would be fatal to it or to its offspring, renders the species more likely to survive longer than it would otherwise be capable of doing.

Miguel, MARIA EVARIST, usurper of the throne of Portugal, was born at Lisbon, 26th October 1802, the third son of King John VI. A determined hater of all constitutional principles, he plotted (1824) to overthrow the constitutional form of government granted by his father: he caused the ministers to be arrested and his father to be closely watched in his palace; but the aged king escaped to an English man-of-war anchored in the estuary. Miguel and his mother, his principal abettor, were banished. At the death of John VI. in 1826, the

throne devolved upon Miguel's elder brother, Pedro, the emperor of Brazil; he, however, resigned it in favour of his daughter, Maria, but making Miguel regent till her majority. Miguel at once dissolved the constitutional cortes, summoned the cortes that had preceded it, and was on 30th June 1828 by it proclaimed king. But Pedro of Brazil gathered an army at the Azores, and in 1832 captured Oporto and Lisbon, and Charles Napier destroyed Miguel's fleet off Cape St Vincent (1833). Next year Maria was restored to the throne, and Miguel withdrew to Italy, protesting. He died on 14th November 1866 at Bronnbach, near Wertheim in Baden, having been a spoilt youth, a wildly dissolute man, and a tyrannical ruler.

Miklosich, FRANZ VON, the greatest of Slavonic scholars, was born at Luttenberg, in the Slovenian part of Styria, 20th November 1813. After studying law at the university of Gratz, he went in 1838 to Vienna to practise as an advocate, but was led by Kopitar to the study of philology, and in 1844 obtained a post in the Imperial Library. From 1850 to 1885 he was professor of Slavonic at Vienna, in 1851 being elected to the Academy of Sciences, and in 1869 made a 'Ritter.' His works, nearly thirty in number, include *Radices Linguae Palaeoslovenicae* (1845); *Lexicon Linguae Palaeoslovenicae* (1850); *Vergleichende Grammatik der Slavischen Sprachen* (4 vols. 1852-74), which has done for Slavonic what Grimm and Diez have done for the German and the Romance languages; *Die Bildung der Slavischen Personennamen* (1860); *Ueber die Mundarten und die Wanderungen der Zigeuner Europas* (12 parts, 1872-80); *Rumunische Untersuchungen* (1882); and *Etymologisches Wörterbuch der Slavischen Sprachen* (1886). D. 1891.

Miknas, Mequinez, or **MIKNASA**, a town of Morocco, 32 miles W. by S. of Fez and 70 miles from the coast, stands amidst olive groves on the slope of a hill. It is surrounded by walls, and is perhaps the best built town in Morocco. The palace is the summer residence of the sultan, and the mosque of Muley Ismail is the burial-place of the royal house. Pop. about 30,000. For the early history of the place, see *Journ. Asiatique* (1885).

Milan, the second in size of Italian cities, Naples ranking first and Rome third, stands in the great plain of Lombardy, 80 miles N.E. of Turin, 155 W. of Venice, and 25 S. of Lake Como at the foot of the Alps. The city, nearly circular in shape, is surrounded on three sides by walls, has a circuit of nearly 8 miles, and is entered by 14 gates. Although a place of great antiquity, it does not possess many very old buildings: it has been too greatly ravaged by war. The modern city is a busy, enterprising, and wealthy community. The streets are broad and regular, and the houses substantial and roomy. The principal church is the cathedral of the archbishop, the foundation of which was laid, on a site where already two cathedrals had stood, by Gian Galeazzo Visconti in 1386; it was completed by order of Napoleon I. in 1805-13. It is built entirely of marble, and in the

Gothic style, with an approach to Flamboyant in the ornamentation; but the windows and portals of the façade (16th century) are Italian. The

Milan Cathedral.

exterior is adorned with some 6000 statues in niches and a vast number of pinnacles. Other noticeable churches are St Ambrose, founded in 868, on the site of one dedicated by the saint himself in 387—it has early mosaics, an altar with clever goldsmith's work, and other antiquities; St Eustorgius, dedicated in 320, with interesting sepulchral monuments; St George, founded in 750, but greatly modernised, with pictures by Luini and Ferrari; St Maria delle Grazie (built 1463), on the walls of whose refectory is Leonardo da Vinci's 'Last Supper,' and St Maurice the Greater (1497-1506), adorned with paintings by Luini and his school. The principal secular building is the Brera Palace (12th century), formerly a Jesuit college, now the palace of arts and sciences, which shelters within its precincts a very valuable gallery of paintings by such masters as Raphael, Da Vinci, Luini, Mantegna, the Bellinis, Titian, Vandyck, &c., an academy of art, a collection of casts for modelling, the magnificent monument of Gaston de Foix, the national library (1770) of 162,000 vols. and 3650 MSS., an archaeological museum, and an observatory. In Frederick Borromeo's creation, the famous Ambrosian Library (1609), there are 164,000 vols. and 8100 MSS., besides collections of drawings, engravings, and pictures. The city is adorned with numerous palaces, as that of the archbishop (1570); the royal palace, with fine modern frescoes; the Late Renaissance municipal palace (1558); the former castle of the Visconti (15th century), with frescoes by Luini; the Poldi-Pezzoli palace, with a collection of paintings of Leonardo da Vinci's school, armour, and artistic objects; and several others. The arcaded colonnade of Victor Emmanuel (1865-67), lined with fine shops, forms a favourite promenade of the people. The Arch of Peace, built of white marble (1807-38), commemorates the exploits of Napoleon. The Della Scala opera-house (1778) is the second largest (next after San Carlo at Naples) in Italy. Beccaria, Manzoni, the popes Pius IV. and Gregory XIV. were natives of Milan. The principal of the scientific and artistic institutions

are an academy, a higher technical institute, several scientific societies, a museum of natural history, schools of veterinary practice, music, and a military geographical institute. The charitable institutions are numerous and splendidly endowed, having an aggregate property of £7,000,000 sterling; the Great Hospital (founded in 1448) can accommodate 2500 patients. Owing to its central situation in the upper valley of the Po, to the fact that it is the principal meeting-place of the north Italian railways and canals, and owing to its proximity to the Alpine passes, Milan has always been a place of much commerce. It now carries on a vast trade, much increased since the opening of the Gothard railway, in raw silk, cotton, grain, rice, and cheese, and manufactures silks, velvets, gold, silver, and iron wares, railway carriages, tobacco, porcelain, electric-light apparatus, and is an active centre of the printing-trade. Milan is the chief financial and banking city of North Italy. Pop. (1876) 283,225; (1881) 295,543. This is the pop. of the city (214,084 in 1881) and the suburbs; the commune had (1881) 321,839 inhabitants; (1890) 360,000.

Milan (Lat. *Mediolanum*) was originally a town of the Insubrian Gauls. It was conquered by the Romans, 222 B.C., and under them became a conspicuous centre of wealth and civic influence; its citizens were noted for their refined manners and literary tastes, and the public buildings for their beauty and elegance. In the beginning of the 4th century it was selected as the residence of the imperial court by Maximian. It was sacked by the Huns (under Attila) in 452, by the Goths in 539, and passed to the Longobards (569), and to the Franks previous to its subjection by the German empire. Here several of the German emperors were crowned with the Iron Crown. The city was in the 11th century the head of the Lombard League of towns that opposed Frederick I., who twice besieged it, and once razed it to the ground. Nevertheless it continued to prosper, notwithstanding that it was distracted by the intestine feuds of the Guelphs and Ghibellines. Supreme power became eventually (from 1277) vested in the Ghibelline Visconti, who extended the ascendancy of Milan over the whole of Lombardy, and in 1395 bought from the emperor the title of duke. The successors of the Visconti in the lordship of Milan were the Sforzas (1450-1535). From 1555 to 1713, Milan submitted to the predominance of Spain, and from Spain passed to Austria. Under Bonaparte it was declared the capital of the Cisalpine Republic, of the Italian Republic, and, finally, of the Kingdom of Italy. In 1815 Milan was restored to Austria, and continued the capital of the Austro-Italian kingdom until the annexation of Lombardy to Piedmont in 1859 by the peace of Villafranca. The 1848 troubles in Italy originated in a revolt of the Milanese against the tyranny of the Austrians. —The province has an area of 1213 sq. m. and a pop. (1881) of 1,114,991; and (1889) 1,228,218. See *Histories* by Rosmini (4 vols. 1820), Cantù (2 vols. 1844), and Cusani (7 vols. 1862-67).

Milazzo (anc. *Mylæ*), a fortified seaport of Sicily, on a promontory 21 miles W. of Messina. Off *Mylæ* in 260 B.C. the Romans won a great sea-fight over the Carthaginians; and here on 20th July 1860 Garibaldi, with 2500 men, defeated 7000 Neapolitans, and compelled the garrison to evacuate the fortress. Pop. 7971.

Mildew (A.S. *Meledæw*, 'honey-dew'), a general name applied to numerous diseases of plants caused by or associated with the parasitism of certain fungi. The name is obviously most appropriate in reference to those fungi which form white mealy patches on the plants. Some of the most important

are species of *Erysiphe*, and are common both on leaves and green stems of many Dicotyledons and a few Monocotyledons. The filaments of the fungus branch and spread over the epidermis of the plant, sending suckers every here and there into the cells. They multiply by the asexual formation of spores, and in most cases also from sexually produced fructifications. Among the common forms may be noted: *Erysiphe lamprocarpa* on Compositæ, Plantago, Verbascum, Labiatae; *E. graminis* on grasses; *E. martii* on Umbelliferae and Leguminosæ; *E. communis* on Polygonum, Rumex, Convolvulus, Teasel, Ranunculus, &c.; *E. (or Oidium) tuckeri* on the vine; *Podosphaera kunzei* on Prunus; *P. castagnei* on hops. These are all nearly related, but the mildew or rust of corn (*Puccinia graminis* or *Æcidium berberidis*), whose life is divided between barberry and cereal, belongs to a distinct series. See FUNGI.

Mile, a terrestrial measure of length, is derived from the Roman *milliare*, which contained 1000 paces (*mille passuum*) of 5 Roman feet each, the pace being the length of the step made by one foot. The Roman foot being between 11·65 and 11·62 English inches, the Roman mile was thus less than the present English mile by from 142 to 144 yards. The length of the modern mile in different countries exhibits a remarkable diversity not satisfactorily accounted for. Before the time of Elizabeth, scientific writers made use of a mile of 5000 English feet, from the notion that this was the Roman mile, forgetting the difference in value between the English and Roman foot. The present statute mile was incidentally defined by an act passed in the thirty-fifth year of the reign of Elizabeth to be '8 furlongs of 40 perches of 16½ feet each'—i.e. 1760 yards of 3 feet each; and it has since retained this value. The *geographical or nautical mile or knot* is the sixtieth part of a degree of the equator (= 1·153 English statute mile), and is employed by the mariners of all nations; but in Germany the geographical mile denotes $\frac{1}{4}$ th part of a degree in the equator, or 4 nautical miles.

Mileage, in the United States, signifies fees paid to officials—and in particular to members of congress—for their travelling expenses, at so much per mile. The system has in the past led to gross abuses, each senator and representative estimating for himself the distance he had travelled. Now, however, there is a fixed table of mileage, and the largest allowance paid is \$1440; the total annual cost, for both houses of congress, is nearly \$150,000. In all countries of Europe, except Britain, the same system prevails with regard to members of the popular chambers, at least, they being paid either their travelling expenses or a fixed annual sum.

Milesians, another name for the Scots, the last of the prehistoric invaders of Ireland (q.v., Vol. VI. p. 203); from an assumed eponymous ancestor *Milesius*, whose name is a modification of *Miles*, a Latin translation of the Celtic *Gulam*.

Miletus, anciently the most flourishing city of Ionia, in Asia Minor, situated near the mouth of the Mæander, was famous for its woollen cloth and carpets, and its furniture, and for its extensive trade. Before being forcibly colonised by the Ionians (q.v.) under Neleus, it appears to have been inhabited by Carians or by Leleges. Its people early founded nearly fourscore colonies on the Black Sea and in the Crimea—Abydos, Lampascus, Cyzicus, Sinope, Amisus, Olbia, Panticapæum, &c.—sent merchant fleets to every part of the Mediterranean, and even into the Atlantic, and maintained an obstinate war with the early Lydian kings, until Croesus was at length acknowledged as their master. They were believed to be the purest representatives of the Ionians in Asia.

After the conquest of Lydia by the elder Cyrus, Miletus submitted to Persia; but in 500 B.C. it was stirred up to rebellion against the Persians. Six years later Darius besieged the city, stormed it, plundered it, massacred most of its inhabitants, and banished the survivors to the mouth of the Tigris. Afterwards the city was rebuilt, but never reacquired its former importance, although its people frustrated the attempt of the Athenians to compel their allegiance, and dared to resist Alexander till he stormed the city. It kept the rank of a second-rate commercial town down to the time of Pliny, and was finally ruined by the Turks. Miletus was the birthplace of the philosophers Thales, Anaximander, and Anaximenes, and of the historians Cadmus and Hecataeus. Short tales, mostly in dialogue, and of a witty and obscene character, were greatly in vogue amongst the Greeks under the name of 'Milesian tales.'

Milfoil, a name applied to several kinds of plants as the Common Milfoil (*Achillea millefolium*), the Hooded Milfoil (*Utricularia*), and the Water Milfoil (*Myriophyllum*). The first-named is invariably understood by the term when it is used without any qualifying adjective. The plant belongs to the natural order Compositæ. It is one of the commonest of British plants, and is very abundant in Europe and Russian Asia from the Mediterranean to the Arctic Circle, and extends over a great part of North America. The plant is medicinal, being mildly aromatic, tonic, and stimulant; and yields tannin, a bitter extractive, a volatile oil, and an acid called *achilleic acid*. In Sweden the plant is employed as a substitute for hops in the making of beer.

Milford, a parliamentary borough (contributory to Pembroke) and seaport of South Wales, in the county of Pembroke, is pleasantly situated on the north side of Milford Haven, about 7 miles ENE. of St Ann's Head, and (by rail) 271 miles W. of London. The town itself, which, with 500 acres of adjoining land, has been acquired by a company as lessees for 999 years, presents no features of interest; the Haven, which as a natural harbour is unequalled both in area, complete shelter, and facility of entrance, being by far the greater attraction. Stretching inland some 10 miles, it varies in breadth from 1 to nearly 2 miles, and has a depth in most places of from 15 to 19 fathoms—even at low-water spring-tides there being a minimum depth of 8 fathoms—whilst commanding all its lower reaches are several batteries, all armed with heavy guns, thus securing Pembroke as well as Milford from any seaward attacks. In 1485 the Earl of Richmond (afterwards Henry VII.) disembarked here from Brittany shortly before the battle of Bosworth. Docks designed by Sir E. J. Reed, and capable of accommodating vessels of the largest size, were completed in 1882, but not opened to shipping until 21st September 1888: their total area is 60 acres, and the depth of water inside 28 feet. Despite their construction, however, the trade of the port has as yet, apart from the increasing passenger and cattle traffic with the Irish ports of Cork and Waterford, made but little progress; but a proposal to run a fast line of steamers between Milford and Labrador has met with some support. Pop. (1881) 3812; (1891) 4070.

Milford, a town of Massachusetts, 36 miles W. by S. of Boston, with boot-factories. Pop. 9343.

Military Frontier. See CROATIA.

Military Law. See MARTIAL LAW, COURT-MARTIAL, and MUTINY.

Military Orders, religious associations whose members united in themselves the double characters of monk and knight. These orders arose about the

period of the Crusades, the first to be formed being the Hospitallers (q.v.). Their primary duties were to tend sick pilgrims at Jerusalem, afterwards to protect them also on their way to the holy city. The order of the Templars (q.v.) soon followed; their purpose was to protect pilgrims, a duty to which was afterwards added that of guarding the Temple at Jerusalem. The orders of Alcantara, of Calatrava, and of Santiago of the Sword, in Spain, had for their immediate object the defence of their country and creed against the Moors. These orders, as well as that of St Bennet of Aviz in Portugal, which was instituted with a similar view, differed from the Templars and the Knights of St John (Hospitallers) in that their members were permitted to marry. The same privilege was enjoyed in the Savoyard order of Knights of St Maurice, and the Bavarian order of St Hubert. On the contrary, the Teutonic Knights (q.v.), who had their origin in the Crusades, but afterwards made the south-east and east shores of the Baltic the theatre of their activity, were bound by an absolute vow of chastity. These religious associations have mostly been abolished or have fallen into disuse, though some still subsist as orders of knighthood. See Bertouch, *Gesch. der geistl. Genossenschaften* (1888), and Lawrence-Archer, *The Orders of Chivalry* (1888).

Military Schools in connection with the British army are of three classes. First, the Royal Military Asylum (Duke of York's School) at Chelsea, and the Royal Hibernian Military School, Dublin, where the sons of soldiers who have died in the service receive a general education free of charge, and may or may not afterwards enter the army. The commandants of these establishments are officers of the army, but the masters are civilians. Secondly, the Royal Military Academy, Woolwich, the Royal Military College, Sandhurst, and the Army Medical School at Netley, where gentlemen qualify for commissions by undergoing special instruction. Thirdly, those establishments where officers, non-commissioned officers, or men, already in the service, receive technical instruction in various branches of military art—viz. the Staff College at Camberley, the School of Gunnery at Shoeburyness (the Artillery College), the School of Military Engineering at Chatham, the School of Musketry at Hythe, the School of Gymnastic Instruction, the Schools of Signalling and of Range-finding, the Army Veterinary School, and the School for Auxiliary Cavalry, all at Aldershot; a similar school for other auxiliary forces at Wellington Barracks, London; and the Royal Military School of Music at Kneller Hall, Hounslow. All are under officers of the army, and, with very few exceptions, the staff of instructors are also officers or sergeants. Those under instruction join the schools for periods varying from a month to two years, and then rejoin their regiments. The following is a description of the more important of these establishments: the Royal Military Academy, Woolwich, is described at ARTILLERY.

The Royal Military College at Sandhurst, in Berkshire, 5 miles SSE. of Wokingham, and 33 WSW. of London, was established in 1858 by a remodelling of the Junior Department of the Royal Military College (transferred hither from Great Marlow in 1812), in order to give a sound military education to youths destined to receive commissions in the British army. The age of admission was between sixteen and nineteen. On production of satisfactory certificates and references, a youth's name was permitted by the commander-in-chief to be placed on the list of candidates for the entrance examination. These examinations were held half-yearly, and the list of subjects included English composition, modern

languages, mathematics, history, geography, natural and experimental sciences, and drawing. The examination was competitive, and those who had the most marks were admitted as cadets as soon as vacancies occurred in the college. The course of study lasted two years, and embraced a variety of subjects connected with military science. The friends supplied clothing, books, and instruments, and paid annually for education, board, and lodging from £20 to £100. The highest sum was paid for 'the sons of private gentlemen,' the lowest for 'the sons of officers of the army or navy who had died in the service, and whose families were proved to be left in pecuniary distress.' Twenty were 'Queen's cadets,' sons of officers 'who had fallen in action, or had died from the effects of active service, and had left their families in reduced circumstances.' These were admitted on passing a qualifying examination, and educated gratuitously. In 1870 a different system was tried, but, the results not being satisfactory, it was very quickly condemned and the old system reverted to. The length of the course of study has, however, been reduced to one year, and the cadets have much more freedom than formerly, when they were treated in all respects like soldiers in barracks. See CADET.

Admission to the Royal Military College, Sandhurst, is obtained by open competition at examinations held each half-year under the direction of the Civil Service Commission. Candidates must first have passed the same 'preliminary' examination as for the Royal Military Academy, Woolwich, or one recognised as equivalent to it, and the medical examination. They must be between the ages of seventeen and twenty, unless graduates of the universities, when they may be as old as twenty-two. The number of trials is three for ordinary candidates, but only two for university graduates. The 'further' examination includes mathematics, classics, modern languages, English history and composition, experimental sciences, geology, and drawing—divided into twelve subjects, of which seven may be taken up. Successful candidates for the Royal Military College remain there for one year, and, subject to passing the half-yearly examinations in fortification, tactics, military administration, law, and topography, and becoming proficient in drills and exercise (including riding, gymnastics, and musketry), are then given commissions as second-lieutenants in the cavalry or infantry. They are liable, however, to removal for grave misconduct or incapacity.

At the Army Medical School, Netley, Southampton, medical candidates already professionally qualified are further instructed in pathology, military surgery, medicine, and hygiene. All invalid soldiers from abroad are sent to the hospital at Netley, to which the Army Medical School is contiguous. After passing the prescribed course and examinations, the candidates are commissioned as surgeons in the medical staff of the army.

Entrance to the Staff College, at Camberley, near Sandhurst, is obtained by competitive examination. The first twenty-eight officers who qualify at the annual examination are admitted, with certain limitations. These officers must all qualify at the examination, held every summer, in simple mathematics, one modern language, fortification, military topography, and tactics. A service of at least five years is also required, and candidates must be under thirty-seven years of age, be captains or have passed the qualifying examination for that rank, and have been selected by their commanding officers as fit for the staff in physical qualifications, military knowledge, conduct, habits, and temper. The college course commences in

February of each year, and includes the study of modern languages, military history and geography, fortification and artillery, tactics, staff duties, military administration, topography, and law. There is an examination at the end of each year, and officers must also pass in military equitation. If successful, they leave the college at the end of the second year, and, after being attached for a month to each of those branches of the service with which they have not hitherto served, rejoin their regiments until opportunities occur for appointing them to the staff.

At the School of Gunnery, Shoeburyness, officers and men of the Royal Artillery are put through a course of gunnery and artillery exercises, and experiments with new guns, shells, fuses, armour-plates, &c. are carried out in connection with the ordnance committee; while at the Artillery College, Woolwich, officers are instructed in the manufacture of ordnance, laboratory work, chemistry, metallurgy, electricity, &c.

The School of Military Engineering, Chatham, is for the instruction of engineer officers and men in construction and estimating, practical fortification, surveying, submarine and military mining, bridging, ballooning, electricity, chemistry, photography, &c. Young officers on appointment from the Royal Military Academy remain under instruction and 'on probation' at this school for two years. For officers of other branches of the service there are classes for instruction in 'field-works' and surveying; for cavalry soldiers, a 'cavalry-pioneers' course (hasty demolitions, obstructions, &c.); and a class for infantry pioneer-sergeants.

The School of Musketry at Hythe (q.v.) is for the other arms what the School of Gunnery is for the artillery. For the Royal Military School of Music, Kneller Hall, see BAND.

At the School of Gymnastic Instruction, Aldershot, officers qualify for the appointment of superintendent of gymnasiums, and non-commissioned officers or men for that of gymnastic-instructor. The course includes fencing with foil, sword, or bayonet. Recruits are put through a three months' course of gymnastics here and in every garrison where there is a gymnasium.

Army Schools (q.v.) are provided for the general education of soldiers and their children; and 'garrison classes' under specially qualified staff-officers, generally graduates of the Staff College, for the technical instruction of officers studying for the examinations which they must pass before promotion to the ranks of captain and major.

For the United States Military Academy, see WEST POINT. Other military schools in the United States include the Virginia Military Institute at Lexington (founded in 1839), the Kentucky Military Institute (1846) at Farmdale, and the school for subalterns of artillery at Fortress Monroe, in Virginia, for infantry and cavalry officers at Fort Leavenworth, Kansas, and for engineers at Willet's Point. Moreover, there are forty commissioned officers detailed to act as professors of military science and tactics at certain colleges which have received from the United States grants of land.—In Canada there is a Royal Military College at Kingston (1876).

Militello, a town of Sicily, 21 miles SW. of Catania. Pop. 10,505.

Militia (Lat. *miles*, 'a soldier') is the name sometimes given to the troops of the second line of a national army. Thus, an Italian or Russian soldier, after serving in the active army and its reserve, passes into the militia available as garrison troops or to form a field army. The corresponding troops in Germany and Austria are called *landwehr* and *landsturm*, and in France the *territorial army*.

Though at first intended for home defence only, those troops are freely used to reinforce the regular army if the exigencies of the campaign require it. In several respects the militia of Great Britain differs from that of other European nations. It can only be sent out of the country if it volunteers and with the consent of parliament, and with a few individual exceptions the men composing it have never served in the regular army.

It is a constitutional force raised under the sanction of parliament for the defence of the country against invasion. Organised by counties and cities, it is essentially a local force. Under the Anglo-Saxons all men were required to bear arms as a sort of body-rent for the land they held, but there was no special organisation until Alfred's reign. That great king organised the militia or *fyrð*, making land the basis of numbers, but the family system that of discipline: so many families were a tything, ten tythings a hundred, and hundreds were united into county powers, each under its *heretoga*, dux, or duke. Each section of the community had not only to furnish its quota in time of war, but also to provide arms, keep them in repair, and train its men for so many days every year. This arrangement subsisted in more or less vigour until the Conquest; then the feudal troops rendered the militia unnecessary; but it never ceased wholly to exist, and when the crown began to contend with the Norman barons it naturally found its most powerful instrument in the Saxon militia. Henry II. established 'an assize of arms,' at which every holder of land was bound to produce one or more men fully equipped, and capable of fighting in the national defence. This annual assembly of the *fyrð* or militia is first recorded after the Conquest in 1181. Further alterations to suit the advances in the art of war took place in 1558. In 1604 James I. abolished the *fyrð*, and substituted 'Trained (commonly called Train) Bands,' to the number of 160,000 men—a force partaking of the nature of both the militia and volunteers, but deficient in discipline and drill. During the Civil War the train bands for the most part sided with the Parliament. Up to that time the command had never by any law been definitely assigned to the crown, but after the Restoration the loyal parliament of Charles II. declared 'the sole supreme government, command, and disposition of the militia to be the undoubted right of his majesty and his royal predecessors.' As, however, the crown from this time began to depend for its support upon a mercenary army, the militia was much neglected until 1757, when, a large portion of the regular army being absent in the Seven Years' War, it was carefully organised for the defence of the kingdom. Several militia acts have been subsequently passed. In 1871 the control of the militia was transferred to the War Office from the lords-lieutenant, who may, however, still recommend gentlemen for commissions. Various laws for the consolidation of the national defences by bringing the army, militia, and other military forces into closer connection were completed in 1876, and the United Kingdom was divided into 69 infantry regimental districts. To each belongs a territorial regiment, consisting generally of two line battalions, and two to nine militia battalions, besides the regimental dépôt, volunteer battalions, and the men in the Army Reserve and Militia Reserve. The latter are militiamen who by taking a double bounty (£2) at the end of each training render themselves liable in time of emergency to be drafted into the regular army. The Militia Reserve numbers about 30,000.

The number of militiamen to be provided by each territorial district—known as its 'quota'—is fixed by government in proportion to the number of

battalions in each such district. These numbers are raised by voluntary recruitment, serve six years, and may re-enlist for six more; but should volunteering fail, a levy by ballot would be made upon all the inhabitants of the locality between the ages of eighteen and thirty to serve five years. The power of making this ballot always exists, and would have by law to be enforced, but for the annual Militia Ballot Suspension Act. Many classes are exempt from the ballot, as peers, soldiers, volunteers, yeomanry, resident members of universities, clergymen, parish schoolmasters, articulated clerks, apprentices, seafaring men, crown employés, free watermen of the Thames; in England any poor man with more than one child born in wedlock; in Scotland any man with more than two lawful children and not possessed of property to the value of £50; in Ireland any poor man not worth £10, or who does not pay £5 per annum for rent, and has more than three lawful children under the age of fourteen.

Large barracks have been built at the headquarters of regimental districts where there were none previously, so that militia when training need no longer be billeted. Camps are constantly formed for their occupation. The officers are often employed with regular troops, both infantry and artillery. Militia recruits are, if possible trained at the headquarters of the regimental district, and everything possible done to increase the efficiency of the force and assimilate it to the regular army. Young officers, after serving two trainings in the militia and passing an examination in tactics, fortification, military topography, and law, as well as a literary examination similar to that for cadetships at the Royal Military College (see MILITARY SCHOOLS), are given commissions in the line and cavalry, or, if they pass the entrance examination for the Royal Military Academy at Woolwich, in the artillery. Finally, in 1890 it was decided that the militia should no longer be styled part of the 'auxiliary' forces of the empire.

The militia assembles annually for not more than fifty-six days' training (recruits for not more than six months'), and the government can embody the whole or part of the force at any national crisis. In November 1813 a brigade of three militia battalions was formed, and embarked for France in March 1814, serving in the Marquis of Dalhousie's division till the peace. By 1815 the militia had been embodied for nearly twenty years; again, during the Russian war of 1854-56 several battalions served in garrison at Gibraltar and Malta; and many were embodied during the Indian Mutiny, 1857-59. The quota of the United Kingdom (including the Channel Islands) is 143,459 men, of which number 121,000 may be considered as effective, costing the country about 1½ millions.

A militiaman receives a bounty of £1 (£1 10s. if re-enlisted) after each training. When out for training or embodied, the officers and men receive the same pay as regular troops of corresponding arms of the service, and are then all under the Army Act of 1881. The officers rank with, but junior to, those of the regular army, and are at all times subject to military law. The only distinction in uniform is the letter M on the shoulder-strap.

The celebrated Local Militia is the old general levy; it was instituted in 1808, and suspended but not abolished in 1816. It consisted of a force for each county six times as numerous as the regular militia quota. The men were drawn by ballot from those between the ages of eighteen and thirty, served four years, and were not paid bounties or allowed to find substitutes. The counties were liable to a fine of £15 for every man short of the quota. These troops could only be marched beyond their respective counties in the event of actual invasion, but

were liable to be called out in case of rebellion. Their numbers reached in 1811 to 213,000 men.

The militia of Scotland was not organised until 1797, though before that year corps of fencibles had been embodied. It was to be raised by ballot among men between the ages of nineteen and thirty. In 1802 it was brought under the same rules as the English militia. The Irish militia dates from 1715, when all Protestants from sixteen to sixty were bound to serve or find substitutes. Several subsequent acts of parliament altered the conditions of service, introduced the ballot, &c., and finally in 1809 it was organised in a similar manner to the English force. Besides the infantry and artillery militia there are in England four companies of engineer militia, fortress troops, in Monmouthshire, and three in Anglesey; also six divisions of submarine miners (dating from about 1884) at Portsmouth, Plymouth, Chatham, Harwich, Milford Haven, and the Severn mouth.

The Channel Islands Militia, dating from 1201, consists of four corps of garrison artillery and six battalions of infantry (in all about 4000 men), and is recruited by conscription. All youths between the ages of sixteen and eighteen are liable to drill preparatory to being enrolled in the ranks of a regiment. Each man has to serve ten complete trainings, and then passes into the reserve, in which he remains up to the age of sixty years. A sum of £6570 is voted by parliament in aid of this force.

In Canada there are artillery and infantry militia for home defence, and similar troops in all important British colonies. The Royal Malta Fencible Artillery is declared by the Army Act of 1881 to be part of the regular army, though not liable to serve out of Malta except with their own consent. For the militia of the United States, see ARMY, Vol. I. p. 437, and UNITED STATES; see also LANDWEHR, and the articles on the several countries.

Milk is an opaque white fluid secreted by the mammary glands of the females of the class Mammalia, after they have brought forth their young, and during the period in which their offspring are too immature to live upon ordinary food. It is devoid of odour, except for a short time after its extraction; is of a slightly sweet taste, most commonly of a slightly alkaline reaction (except in the Carnivora, in which it is acid); and its average specific gravity (in the case of human milk) is 1032.

When examined under the microscope milk is found to consist of numberless transparent globules, of very minute size, floating in a clear colourless fluid, the milk plasma. These globules are composed of fat, and they are each enclosed by a thin envelope of an albuminous material termed *casein*. When milk has stood for some time, the larger globules rise to the surface and form a layer of *cream*, which is therefore rich in fat and poor in other nutritive substances (presently to be described) that are found in the milk plasma. When the cream is removed *skimmed milk* remains. If this, or better still the unskimmed milk, be agitated in a churn, the envelopes which surround the fat globules are broken, the fat runs together, and we have milk fat or *butter*. The albuminous casein, which according to some encloses the fat globules, but according to other observers exists in solution in the plasma, is an albuminous substance combined with calcium phosphate. This calcium phosphate is necessary for its solution, and if its union with the albumen be interfered with, as by the addition of an acid, the casein separates out in microscopic filaments which interlace, enclosing the milk globules, and forming a more or less solid clot. If milk be allowed to remain in an open vessel and in warm weather, a few hours will produce this result; the casein clots in little masses, and we say 'the milk has turned.' It is acid or sour to the taste, and contains micro-organisms (*bacterium lacticum*),

by whose agency these changes are brought about. These little microbes have the power of converting the milk sugar into lactic acid, which in its turn coagulates the casein. These microbes do not exist in milk freshly passed from the mammary glands; they must find their way into the milk, where they rapidly multiply; and, as their germs are very freely distributed, this occurs sooner or later. The dairy-keeper, by efficient ventilation and scrupulous cleanliness, endeavours to keep his dairy and his milk as free from these organisms as possible, and the careful nurse scalds out the infant's bottle in order that they may not multiply, as they will readily do, in any stale milk, rapidly infecting the fresh milk each time the bottle is used. The casein is not only clotted by acids, but a secretion of the stomach called rennet has a similar action. A teaspoonful of a commercial infusion of rennet will cause half a pint of milk, at a summer temperature, to form a beautiful white clot, which subsequently contracts, expressing the *whey*. This occurs in the stomach when we drink milk, and this is one reason why milk may disagree: in order to render it more digestible it may be 'sipped' or it may be taken with lime-water, for in this way the formation of large clots within the stomach may be avoided. The curds which form after the addition of rennet can be made into *cheese*. In cheese, therefore, we have a rich supply of nitrogenous matter (casein) together with fatty matter derived from the milk globules held fast in the curd.

Milk contains a sugar—milk sugar—in solution, and in addition a rather large proportion of inorganic salts. It contains all that a child requires for the growth and nourishment of its body, and is manufactured at great expenditure of the mother's strength. The first milk that flows from the breast at the beginning of a lactation period is termed the *colostrum*, and is rich in fat but poor in casein. After a few days, during which time the child feeds chiefly on its own tissues and loses weight, the secretion becomes thoroughly established. In a healthy, well-fed woman this continues for some months, after which time the drain upon the energy of the mother's body renders the milk poorer and less nutritious. The milk contains the salts, chiefly of lime, from which the infant builds its skeleton. Where the children are ill nourished and rickety, doctors often recommend the dilution of the milk with lime-water, ignorant of the fact that milk contains a considerably larger quantity of lime than the lime-water itself. The lime-water diminishes acidity, and renders the milk digestible, but hardly adds lime; rickets is generally due not to lack of lime-salts in the food, but to want in the child's system of the power to assimilate them. It is well known that many medicines taken by the mother are excreted in the milk, and this point must be borne in mind by mothers suckling their infants; much nonsense is, however, believed in regarding the fatal and sudden injury done to children as a result of severe mental excitement on the part of the wet-nurse. Owing to inability of the mother either to nourish her offspring herself or to provide it with a wet-nurse, it may be necessary to bring it up on the milk of an animal; see INFANT (FEEDING OF), BREASTS.

The following table, which is based on researches of Vernois and Becquerel, show the density and composition of 1000 parts of milk:

	Density.	Water.	Solids.	Extrac- tives.	Sugar.	Fat.	Salts.
Woman....	1032.67	889.08	110.92	39.24	43.64	26.66	1.38
Cow	1033.38	864.06	135.94	55.19	38.03	36.12	6.64
Mare	1033.74	904.30	95.70	33.35	32.76	24.36	5.23
Ass	1034.57	890.12	109.88	35.65	50.46	18.53	5.24
Goat.....	1033.53	844.90	155.10	35.14	36.91	56.87	6.18
Ewe	1040.98	832.32	167.68	69.78	39.43	51.31	7.16
Bitch.....	1041.62	772.08	227.92	116.88	15.29	87.96	7.80

It is preferable to use the milk of *one* animal and not the mixed milk of a dairy, as in that way we minimise the chances of infection. It should be diluted with about one-third of water, and perhaps a pinch of sugar added. It then forms a good substitute for the mother's milk. But disease is very frequently transmitted by milk, not only from using contaminated water for washing the milk cans and for adulterating it, but also from the cow itself (see TYPHOID FEVER, SCARLATINA). It is not improbable that many obscure tubercular conditions are thus acquired by children.

Condensed milk is generally prepared from that of the cow, sweetened by the addition of ordinary cane sugar, and evaporated to about $\frac{1}{4}$ th of its bulk. While hot it is poured into tins and sealed up. When used for food the milk may be diluted with six or seven times its volume of water, but in the case of infants the dilution must be more liberal. During the first month it may be diluted with twelve or fourteen volumes, and later on with ten volumes of water. It is often found to agree with children better than cow's milk, but it is a fatal mistake to rear an infant on condensed milk entirely, as the diet will suffer from too great uniformity. It is a safe rule when a child has to be brought up on animal milk, and when the household milk does not agree, to change the dairy. If this does not succeed, the ordinary cow's milk may be tried, say for the morning or afternoon feeding, with condensed milk at night. In all cases it is better to err in freely diluting milk, for nothing is so apt to disagree with a child as a surfeit of rich milk; dilution will do no particular harm.

Milk is frequently adulterated, chiefly with water (see ADULTERATION). In this case a given volume of milk will contain an abnormally small number of milk globules. As these milk globules are the cause of the opacity of milk, a thin layer of the adulterated milk will be less opaque than a similar layer of unadulterated milk. Many forms of lactoscopes have been invented for testing the opacity and consequent dilution of milk (see LACTOMETER). Unskimmed milk should yield in standing 12 to 24 parts per cent. of cream, and its specific gravity should be 1.028 to 1.034. Skimmed milk is heavier—1.032 to 1.040 (see also DAIRY).—Milkweed is a local name for the genus *Asclepias*; for Milk-tree, see COW-TREE.

Milk-fever. The establishment of the secretion of milk about two days after delivery is occasionally the cause of considerable constitutional disturbance, with all the symptoms of the feverish state. This occurs especially when the infant is not applied soon enough to the breast, and especially when the mother is kept on too low a diet; a fact which probably explains the much greater frequency of the condition in former times, when such treatment was considered necessary. The disturbance of health is not serious, and passes off when the breasts are emptied.

In the lower animals, also, milk-fever comes on within a few days after parturition. One variety, common to most animals, consists in inflammation of the membranes of the womb and bowels, and is produced by exposure to cold, overdriving, or injury during labour; it is best treated with oil and laudanum, tincture of aconite, fomentations to the belly, and antiseptics such as carbolic acid (largely diluted) injected into the womb itself. The other variety, to which alone the term 'milk-fever' should be applied, is almost peculiar to the cow. It attacks animals in high condition, that are good milkers, and have already borne several calves, and consists in congestion of the brain and large nervous centres, and impairs all the vital functions, leading to dullness, loss of sensation, stupor, and complete unconsciousness. Blood must be drawn

early, whilst the cow is still standing and sensible; later it only hastens death. A large dose of physic, such as a pound each of salts and treacle, a drachm of calomel, an ounce of gamboge, and two ounces of ginger, should at once be given, solid food withheld, clysters of soap, salt, and water thrown up every hour, cloths wrung out of hot water applied along the spine, the teats drawn several times daily, and the animal frequently turned. Although treatment is uncertain, prevention may be ensured by milking the cow regularly for ten days before calving, feeding sparingly on laxative, unstimulating food, giving several doses of physic before and one immediately after calving, and, when the animal is in very high condition and prone to milk-fever, bleeding her a day or two before calving.

Milkworts (so called from the milky juice) are various species of plants belonging to the natural order Polygalæ or Polygalacæ. The order comprises about 20 genera and 500 species which are widely distributed over the tropical and subtropical parts of the world; several species are natives of North America and of Europe. They are herbaceous plants or shrubby, occasionally in the latter case being of climbing habit. The leaves are usually simple and destitute of stipules; the flowers are irregular. Their qualities are generally tonic and slightly acid; and some, as *Krameria*, are very astringent.—The Common Milkwort (*Polygala vulgaris*) is a small perennial plant, growing in dry hilly pastures, with an ascending stem, linear-lanceolate leaves, and a terminal raceme of small but very beautiful flowers, having a finely-crested keel. It varies considerably in size, in the size and even shape of the leaves, and in the size and colour of the flowers, which are sometimes of a most brilliant blue, sometimes purple, pink, or white.—*P. Senega* is a North American species, with erect simple tufted stems, about one foot high, and terminal racemes of small white flowers. The root, which is woody, branched, contorted, and about half an inch in diameter, is the Senega Root, Seneka Root, or Snake Root of the United States, famous as an imaginary cure for snake-bites, but really possessing important medicinal virtues—stimulating, diuretic, diaphoretic, emmenagogue, and in large doses emetic and purgative—employed in catarrhs, pulmonary affections, rheumatisms, low fevers, &c. Its chief active principle is Polygalic Acid, $C_{22}H_{18}O_{11}$. The root of *P. Senega* has been employed as a cure for snake-bites by the American Indians from time immemorial, and it is a curious fact that *P. crotonioides* is employed in the same way in the Himalayas. *P. vulgaris* is tonic, stimulant, and diaphoretic; and *P. amara*, a very similar European species, possesses the same properties in a

Common Milkwort
(*Polygala vulgaris*).

higher degree, as does *P. rubella*, a small North American species. The root of *P. poaya*, a Brazilian species, with leathery leaves, is an active emetic, and in a fresh state is employed in bilious fevers. *P. tinctoria*, a native of Arabia, furnishes a blue dye like indigo. *P. venenosa* is by the natives of Java dreaded on account of its noxious heavy odour, which they say causes severe headache and violent sneezing. Another medicinal plant of the order is Rattany (q.v.) Root. The bark of the roots of *Monnina polystachia* and *M. salicifolia* is used in Peru as a substitute for soap; and *Mundia spinosa*, a South African shrub, produces an eatable fruit.

Milky-way. See GALAXY.

Mill. This word is now used in a general way as a name for almost all kinds of manufactories, as well as for machines used for grinding; but in this article we shall describe only a flour-mill. For other mills, see SPINNING, WEAVING, COTTON, FLAX, WOOL, &c.

From time immemorial, until quite recent times, wheat has always been ground between two stones. At first hand-mills were used such as are so often mentioned in the Bible, and are still met with amongst uncivilised peoples (see QUERN); but the mill subsequently passed through many mechanical developments up to the large merchant mills now found in every civilised country, some of which recently contained upwards of 100 pairs of large millstones. These were made of 'buhrr,' a very hard silicate, the best stones coming from the valley of the Seine. The millstones were circular, usually about four feet in diameter, formed of wedge-shaped pieces strongly cemented together, and bound by iron hoops. The surfaces were cut into a series of radiating ridges and furrows, by which means the wheat was pushed from the centre to the circumference of the stones, as well as broken between the edges of the ridges. Great care had to be taken that the surfaces of the two stones were perfectly level and perfectly parallel to each other. Only the upper stone or 'runner' revolved, the lower or 'bedstone' being fixed. The first successful steam flour-mill was erected in London in 1784.

Iron rollers in place of millstones were first practically tried at the roller mill in Pest, founded in 1840 by the patriot Count Szechenyi. This new system, called 'the high grinding or gradual reduction roller system,' ultimately spread throughout Hungary, and made Budapest for many years the greatest flour-milling centre in the world. By 1875 this system had been adopted by the millers of the north-western states of America, and has enabled them to outstrip their teachers: Minneapolis is now the largest flour-milling centre in the world, and its mills send a great quantity of flour to England. Since 1880 this system has been universally adopted by large mills, and is being gradually introduced into small mills also. The great advantage of rollers over millstones is found to be that the former avoid the rasping of the outside of the wheat berry which was inseparable from millstones, and produced a small quantity of very dark powder which necessarily mixed with the flour and greatly deteriorated its colour.

The following is a description of the different processes which together form the 'high-grinding' or 'gradual reduction' system of flour-milling. (1) The wheat is cleaned or 'smutted,' as it is termed, by means of sifting, winnowing, and being put through a cylinder of wire-cloth, with rapidly revolving arms inside, which combines the actions of sifting and polishing the wheat. A machine furnished with hard brushes is often employed to scrub the wheat. (2) The cleaned

wheat is sent to grooved chilled-iron rollers (see fig. 1), and slightly broken between them; the product is sifted by means of cylinders covered with wire-cloth or silk-gauze, by which means a proportion of flour is separated, mixed with a substance composed of small pieces of the floury part of the wheat berry, and called usually 'middlings,' sometimes 'semolina.' The pieces of broken wheat are sent to other rollers to be again broken, and the product sifted as before. This process is repeated from four to seven times, according to the ideas of the miller and the nature of the wheat, until, as far as possible, all the floury part has been scraped from the husk or 'bran,' which is sold for fodder.

Fig. 1.—Roller Mill.

We are thus left with the mixture of flour and 'middlings' from the four to seven breaking processes. The products from the different breaking processes are generally mixed together and then sifted as before described, in order to separate the flour which is then ready for use from the 'middlings,' which are then put through the process called 'purification.' It may here be mentioned that the making of a large quantity of 'middlings' is the principal difference between the former 'low-grinding' and the present 'high-grinding' system, and is the chief advantage of the latter. By the former process it was sought to reduce the wheat at one grinding as far as possible into flour and bran: it was, however, found to be impossible to keep the two separate, a portion of finely-powdered bran being inevitably mixed with the flour, greatly to the detriment of the latter. By high-grinding, the floury part is reduced in the first instance principally to a granular state, and, though bran particles are mixed with the flour granules, they may be almost entirely separated, owing to the difference in their specific gravity, by means of this process of purification. (3) The size of the granules of the middlings varies from that of fine sand to that of a pin's head. The middlings are therefore first separated by sifting into as many sizes as may be thought desirable, and each size is sent to one or more machines called 'middlings' purifiers. These are of two types, called 'gravity' and 'sieve' purifiers. In the first type, which is generally used for the large sizes of middlings, the material is directly acted on by a draught of air. The machine usually takes the form of a series of sloping boards, or of revolving discs, by either of which devices the middlings are caused to fall repeatedly in a thin even stream through a current of air produced by a revolving fan. As the specific gravity of the flour granules is greater than that of the bran particles, it is obvious that the current of air may be so regulated as to carry away the particles of bran, leaving the flour granules to fall to the bottom of the machine.

The sieve purifier generally takes the form of an oblong box, or case, of wood; occupying the centre

plane of this case a sieve formed of silk-gauze is suspended by springs from the top of the case, and is made to oscillate by means of a crank. A revolving fan is placed at the top of the machine, which draws air through the meshes of the sieve, the current of air being so regulated that the branny particles are either carried away by the draught to a suitable receptacle, or are kept suspended on the top of the sieve until they are carried over the end of it, while the heavier flour granules fall through the sieve. This type of machine is always used for the smaller sizes of middlings. It is the dust drawn from these machines by the fans that, when mixed in a certain proportion with air and accidentally ignited, has caused several very serious explosions in flour-mills. In consequence of this, whereas it was formerly usual to send this dust-laden air to a large chamber where the dust was allowed to settle by its own weight, and where the explosions generally occurred, within recent years many ingenious contrivances called 'dust collectors' have been invented for separating the dust in small quantities, and thus minimising the danger. These are now generally used. The middlings, after being thoroughly cleaned (by repetition of the process when necessary), are ground between smooth chilled iron rollers and the product sifted; the flour thus produced is of fine quality, and is usually called 'patent' flour. Millstones may still be profitably employed to grind the finest sizes of middlings, but this is the only use to which they are put in a modern mill.

Fig. 2 represents one type of cylinder used for sifting (technically, 'dressing') the products in flour manufacture, to which we have several times had to refer. These cylinders are of two kinds,

Fig. 2.—Centrifugal Dressing Reel.

the ordinary 'reel' or cylinder being a framework covered round with wire-cloth or silk-gauze, and made to rotate, thus setting in motion the enclosed material. The other type is called a 'centrifugal dressing' machine (see fig. 2). In this machine, in addition to the rotating cylinder, there is a frame with long pieces of wood or iron attached, made to revolve independently inside the cylinder. By this means the material is thrown against the circumference of the cylinder, so that a much smaller surface is required than in the ordinary reel to do the same amount of work. The 'Plansichter,' introduced in Budapesth in 1888, which, as its name implies, is a horizontal sieve, has a special contrivance for keeping the material in motion, and the meshes clear. This machine has made considerable progress in Hungary, but it is as yet too early to predict that it will supersede the cylindrical 'dressing' machines. Almost all modern mills are constructed on what is termed the automatic system, which means that all the conveyance of the material from one point in the mill to another is done by mechanical means; so that of

the great bulk of the flour it may be said that it is never stopped or touched on its journey from the time it leaves the wheat sack until it reaches the flour sack. The conveyer generally used to move material in a horizontal direction is a helical screw (sometimes called an Archimedean screw); and to lift to a higher level an Elevator (q.v.) is used.

See Fairbairn, *Treatise on Mills and Mill-work* (1878); Kick, *Flour-manufacture* (2d ed. 1878; Eng. trans. by Powles); Voller, *Modern Flour Milling* (1889).

Mill (Lat. *mille*, 'a thousand'), in the United States, is the tenth part of a cent, the thousandth part of a dollar. As a coin it has no existence.

MILL, JAMES, was the son of a shoemaker, and was born in Logie-Pert parish, near Montrose, Scotland, 6th April 1773. He studied, with a view to the church, at the university of Edinburgh, where he distinguished himself in Greek and in Moral and Metaphysical Philosophy. He was licensed to preach in 1798; but instead of following out the ministry, he went to London in 1802, where he settled as a literary man. He became editor of the *Literary Journal*, which after a time was discontinued; and wrote for various periodicals, including the *Eclectic* and the *Edinburgh Review*. In 1806 he commenced his *History of British India*, which he carried on along with other literary work, and published in the winter of 1817-18. The impression produced by this masterly history on the Indian authorities was such, that, in 1819, the Court of Directors of the Company appointed him to the high post of Assistant-examiner of Indian Correspondence, notwithstanding the then unpopularity of his well-known radical opinions. The business assigned to his care was the revenue department, which he continued to superintend till four years before his death, when he was appointed head of the examiner's office, where he had the control of all the departments of Indian administration—political, judicial, and financial—managed by the Secret Committee of the Court of Directors. Shortly after his appointment to the India House, he contributed the articles on Government, Education, Jurisprudence, Law of Nations, Liberty of the Press, Colonies, and Prison Discipline to the *Encyclopædia Britannica*. These essays were reprinted in a separate form, and became widely known. The powers of analysis, of clear statement, and of the thorough-going application of principles, exhibited in these articles, had probably never before been brought to bear on that class of subjects. In 1821-22 he published his *Elements of Political Economy*, a work prepared primarily with a view to the education of his eldest son, John Stuart Mill. In 1829 his *Analysis of the Human Mind* appeared. His last published book was the *Fragment on Mackintosh*, brought out in 1835. He was also a contributor to the *Westminster Review* and to the *London Review*, which merged in the *London and Westminster*.

Not long after he settled in London, he made the acquaintance of Jeremy Bentham, and for a number of years lived during the summer in Bentham's country-house. Although he must have derived much benefit from his intercourse with the great law-reformer, he was not a mere disciple of Bentham, but a man of profound and original thought, as well as of great reading, in all the departments of moral, mental, and political philosophy. His conversation was impressive to a remarkable degree, and he gave a powerful intellectual stimulus to a number of young men, some of whom (including his own son, and Grote, the historian of Greece) have since risen to eminence. He took a leading part in the founding of University College, London. He died at Kensington, 23d June 1836.

See the Autobiography of J. S. Mill; and Professor Bain's *James Mill* (1882).

MILL, JOHN STUART, the eldest son of James Mill, was born in London on 20th May 1806. He was educated by his father, by whom he was subjected from his earliest years to a careful and systematic training, which was to fit him to carry on the work and champion the opinions with which the elder Mill was identified. Almost from infancy his intellect was on the strain. He is said to have begun Greek at the age of three, and before he was fourteen he had read extensively in Greek, Latin, mathematics, and English, had begun logic and political economy, and already possessed the intellectual acquirements of a well-educated man. But he was secluded from companions of his own age. As he himself says, he 'never was a boy.' His nearest approach to recreation was the long walks—in reality peripatetic oral examinations—for which he was regularly taken by his father. In 1820 he went to France on a visit to the family of Sir S. Bentham (Jeremy Bentham's brother), and was thus removed for more than a year from his father's immediate influence. His studies were never intermitted. His residence in France not only gave him a keen interest in French politics and social conditions, but stimulated his botanical enthusiasm, and the love for scenery and travel, which became the chief relaxations of his arduous life. After his return home he worked at history and law, and read the English and French philosophers. His first published writings appeared in the *Traveller* newspaper in 1822. In the following year a career was secured for him by an appointment under his father at the India Office, from which he retired as head of his department in 1858, on the transfer of the Company's government to the crown. At the same time he declined a seat in the new India Council offered to him by Lord Derby. During the years 1823-26 he was a member of a small Utilitarian society which met for the purpose of discussion at Jeremy Bentham's house. The name 'Utilitarian' was suggested by an expression in one of Galt's novels, and seized upon by him 'with a boy's fondness for a name and a banner,' to describe himself and others of like opinions. In the Speculative Society, which was founded in 1825, and of which he remained a member till 1829, he met men of a greater variety of creeds, and formed an intimate friendship with Maurice and Sterling, Liberals of a different type from those he had met at his father's house, and influenced by Coleridge, not by Bentham.

Before he was twenty, Mill was recognised as the champion and future leader of what may be called the Utilitarian School in philosophy and politics, and had become the most frequent contributor to the newly-established organ of the party, the *Westminster Review*. But the 'mental crisis' through which he passed at this time (1826-27) led to a modification of his attitude. Bentham's *Treatise on Legislation*, which he had read four or five years before, formed the keystone of his previous position. It gave him 'a creed, a doctrine, a philosophy; in one among the best senses of the word, a religion; the inculcation and diffusion of which could be made the principal outward purpose of a life.' The crisis under which his enthusiasm for his old creed and opinions broke down was attributed by himself not merely to a dull state of nerves, but to the purely intellectual education which weakened his sympathies at the same time as it taught him to analyse and trace them to their origin. He ultimately emerged from the state of depression by discovering that feeling was not dead within him. The experiences of this period left, he tells us, two very marked effects on his opinions and character. In the first place, they led him to a new theory of life in relation to happiness. The conviction was forced upon him that

happiness—although the test of all rules of conduct and the end of life—was only to be obtained by not making it the direct end, but by having one's mind fixed on some such ideal end as the improvement of mankind, or even some art or pursuit. His 'mental crisis' further led him to see the necessity for human well-being of the internal culture of the individual. He ceased to attach almost exclusive importance to the ordering of outward circumstances, and to the forced training of the human being for thought and action. And soon after this time he found in Wordsworth's poems 'the very culture of the feelings' he was in quest of.

The wider appreciation of speculation and literature brought about by this new attitude may be seen in his reviews of Tennyson's poems (1835), and of Carlyle's *French Revolution* (1837), as well as in his article on Coleridge (1840). His article on Bentham (1838) made clear the extent of his divergence from his inherited creed, and gave rise to the 'admiration mixed with fear' with which Grote and others of the school regarded him. In this article can be traced the lines along which, in his subsequent writings, he modified the traditional creed of Bentham and James Mill. Perhaps the reaction from Benthamism would have gone further had it not been for the friendship with Mrs John Taylor (whom he first met in 1830, and whom he married in 1851), which formed the romance of his life. It is indeed hardly possible to estimate her influence so highly as Mill did himself. All his leading opinions were formed before he made her acquaintance, and some of his most important works were completed without her assistance. But she did exert great influence on the expression of his views, and apparently had a steadying effect on his philosophical position.

Mill never forsook, though he modified, the leading principles of the philosophy in which he was educated. He held that knowledge could be analysed into impressions of sense, and that the principle of association was the great constructive force which combined these sensations and their copies, or ideas, into systems of thought, modes of feeling, and habits of acting. His *System of Logic* (1843)—perhaps the most original and important of his works—traces, and gives a rationale of, the way in which the real, disjointedly given in sensation, is combined into scientific knowledge. Its treatment of the methods of inductive science—in which it owes much to Herschel, Whewell, and Comte—has become classical. His *Examination of Sir W. Hamilton's Philosophy* (1865), and edition of James Mill's *Analysis of the Phenomena of the Human Mind* (1869), contain a polemical defence and exposition of the association-psychology, notable for their clear recognition of the mental elements which that psychology assumes without explanation. His essay on *Utilitarianism* (1861) defends the greatest-happiness theory, but suggests modifications inconsistent with it (see *ETHICS*, p. 435 b.). He held that government was to be purified and made into a utilitarian instrument by means of representative institutions; but he had less confidence than Bentham and his father had in the effect of reason and argument upon men, disapproved of an equal suffrage, distrusted the ballot, and argued eloquently for individual liberty of thought and action against the tyranny of the majority (*Considerations on Representative Government*, 1861; *Thoughts on Parliamentary Reform*, 1859; *On Liberty*, 1859). His *Principles of Political Economy* (1848) is a systematic treatise, which does not depart in its main teaching from the theory laid down in abstract fashion by Ricardo; but it recognises more clearly the hypothetical character of this theory, and it discusses the social applications of economic doctrines. Mill was M.P.

for Westminster from 1865 to 1868. In parliament he voted with the advanced Radical party; and his advocacy of women's suffrage in the debates on the Reform Bill of 1867 led to an active movement for placing the legal and political rights of women on an equality with those of men. Mill died at Avignon, 8th May 1873, and was buried in the cemetery there.

In addition to the works already mentioned, Mill was the author of *Essays on some unsettled Questions of Political Economy* (1844), *Auguste Comte and Positivism* (1865), *England and Ireland* (1868), *Subjection of Women* (1869). After his death were published *Autobiography* (1873), and *Three Essays on Religion* (1874). His more important occasional writings are collected in four volumes of *Dissertations and Discussions* (1859-75). For his life and opinions, see the biographies by A. Bain (1882) and W. L. Courtney (1889).

MILL, JOHN, a New Testament critic, was born about 1645, at Shap in Westmorland, entered Queen's College, Oxford, as servitor in 1661, and was successively fellow and tutor of his college, rector of Blechingdon in Oxfordshire (1681), principal of St Edmund's Hall (1685), and prebendary of Canterbury (1704). He died 23d June 1707, just fourteen days after the publication of his great *Novum Testamentum Græcum*, with its thirty thousand various readings, the labour of thirty years.

MILLAIS, SIR JOHN EVERETT, R.A., painter, was born at Southampton, 8th June 1829, the descendant of an ancient Jersey family. In the winter of 1838-39 Millais began to attend the drawing academy of Henry Sass, passing, two years later, into the schools of the Royal Academy. At the age of seventeen he exhibited at the Royal Academy his 'Pizarro seizing the Inca of Peru,' ranked by competent critics of the day as on a level with the best historical subjects then shown. Till now his work had been upon the lines of art generally current in England at the time; but there followed a phase of revolt from accepted standards, a period of search for new paths. He became associated with the knot of young artists known as the Pre-Raphaelite Brotherhood, of whom the other chiefs were Dante Gabriel Rossetti and Holman Hunt; and undoubtedly he was markedly influenced by the powerful personalities of both of these men, and by Mr Ruskin their literary ally. From them, in particular, his art received an impetus towards imagination and symbolism, which—as has been proved by the curious absence of such qualities from his later and more independent productions—were to a great extent foreign to his native genius. His marvellous technical skill enabled him to embody in visible artistic form conceptions that were essentially those of others with far greater adequacy than their own less trained hands could possibly have done. His first Pre-Raphaelite picture, a scene from the *Isabella* of Keats, strongly recalling the manner of the early Flemish and Italian masters, figured in the Academy in 1849, where it was followed in 1850 by the striking 'Christ in the House of his Parents,' known as 'The Carpenter's Shop,' in 1851 by 'The Woodman's Daughter,' in 1852 by 'The Huguenot' and 'Ophelia,' and in 1853 by 'The Order of Release' and 'The Proscribed Royalist.'

In 1856 he was elected an Associate of the Royal Academy, and soon afterwards he exhibited three of the richest and most poetic of the productions of his Pre-Raphaelite period—the 'Autumn Leaves' in 1856, the 'Sir Isumbras at the Ford' in 1857, and 'The Vale of Rest' in 1859. In the finer of the works which followed, such as 'Charlie is my Darling' (1864)—the year in which the painter received full academic honours—'The Minuet' (1866), and 'Rosalind and Celia' (1868), the precision and

clear definition of Pre-Raphaelite methods still survive; but in the exquisite 'Gambler's Wife' (1869) there became visible a larger and freer method of handling, which is yet more fully established in 'The Boyhood of Raleigh' (1870), a picture which, retaining a measure of the imaginative charm of his earlier subjects, marks the transition of his art into its final and, technically, most masterly phase, displaying all the brilliant and effective colouring, the effortless power of brush-work, and the delicacy of flesh-painting, in which, when the artist is at his best, he is without a modern rival. The interest and value of his later works lie mainly in their splendid technical qualities. In great part they are actual or fancy portraits, varied by a few important landscapes, of which the first, and in many ways the finest, is 'Chill October' (1871), and by such an occasional figure-piece as 'The North-west Passage' (1873) and 'Effie Deans' (1877). Millais has executed a few etchings, and his innumerable illustrations, dating from about 1857 to 1864, and most of them published in *Good Words*, *Once a Week*, and the *Cornhill Magazine*, place him in the very first rank of woodcut designers. He is a D.C.L. of Oxford; in 1885 he was created a Baronet. A collection of nearly twenty of his works was brought together by the Fine Arts Society, London, in 1881, and 159 examples of his art formed the Winter Exhibition of the Grosvenor Gallery in 1886. See Ruskin's Notes on that exhibition, and the *Life and Work of Leighton, Millais, &c.* (1890).

MILLAN, a town in the French department of Aveyron, on the right bank of the Tarn, 52 miles NW. of Montpellier. During the 16th and 17th centuries it was one of the strongholds of the Calvinists. Leather and gloves are manufactured, and in wool there is a good trade. Pop. (1872) 13,879; (1886) 14,705.

MILLBANK PRISON, or *The Penitentiary*, 'demolished in 1891, was situated in the parish of St John's, Westminster, facing the Thames. It was erected at an enormous cost to carry out the plans of the philanthropists Howard and Bentham; the latter's contract with the Treasury was signed in 1794, but the building was not actually commenced till 1812, and not completed till 1821. It had accommodation for 1100 prisoners, and was so constructed that, from a room in the centre, the governor was able to view every one of the cells, in which solitary confinement was rigidly enforced. Convicts condemned to penal servitude used to undergo first a term of solitary confinement in Millbank; but the prison ceased to be a convict establishment in May 1886, and was finally closed in November 1890. See Griffiths, *Memorials of Millbank* (2d ed. 1884).

MILLBOARD is the name given to 'board' made of paper material, and varying in thickness from $\frac{1}{16}$ th to $\frac{1}{4}$ th of an inch. It is of a gray colour, as the various kinds of waste substances—viz. old ropes, old sacking, scraps of paper and of cardboard—from which it is usually made are not bleached either separately or when mixed and reduced to a pulp, as in the manufacture of white paper (see PAPER). The best millboard, such as that employed for binding ledgers, is made on moulds by hand; but by far the larger quantity of millboard put on the market is machine made. In the machine commonly used a revolving wire-cloth cylinder dips into a cistern containing the pulp, and takes on a layer of it about the thickness of stout brown paper. This pulpy layer is by pressure taken continuously off the wire cylinder by a felt blanket passing over a wood roller. The felt carries the single layer, in the wet state, to a pair of rollers 7 feet away from the wire cylinder. Here the layer is wound upon

the upper or wooden roller till the required thickness is made up. The lower or iron roller presses by means of a lever and weights against the upper one with sufficient force to consolidate the layers of pulp. The hollow cylinder of millboard on the wood roller is then cut longitudinally with a knife, and opened out into a flat sheet. It is afterwards dried by steam heat or otherwise, calendered by chilled iron rolls, and cut to size by strong circular cutters.

Millboard is used for bookbinding and for making boxes, but has been largely superseded by Strawboard (q.v.). It is still employed for jointing flanged pipes and other engineering work; but for this purpose asbestos millboard (see ASBESTOS) is now preferred. Millboard or thick cardboard made from straw or wood is used for many miscellaneous purposes. Mounting board consists of several layers of paper pasted together. A few years ago a mill on a large scale was in operation near London for the manufacture of millboard from stable manure, but the process was not a success commercially.

Millbury, Massachusetts, on the Blackstone River, is 39 miles by rail W. of Boston, and has several cotton and woollen factories. Pop. 4555.

Milledgeville, the former capital of Georgia (q.v.), 32 miles ENE. of Macon. Pop. 3800.

Millenary Petition. See HAMPTON COURT.

Millennium (Lat., 'a thousand years'), a long indefinite space during which the kingdom of the Messiah will, according to the belief of many Christians, be visibly established on the earth. The idea originated proximately in the Messianic expectations of the Jews; and the Christians' belief in the *Parousia*, or Second Coming of Christ, was developed by the oppression and persecutions to which they were long subjected. The chief basis of the millenarian idea, in Judaism as well as in Christianity, is the ardent hope for a visible divine rule upon earth, and the identification of the church with that of which it is merely a symbol. In the 1st century of the church, chiliasm (the Greek equivalent of millenarianism, from *chilioi*, 'a thousand') was a widespread belief, to which the books of Daniel and the Apocalypse (chaps. xx. and xxi.) gave authority; while various prophetic writings, composed at the end of the 1st and the beginning of the 2d century—such as the *Testament of the Twelve Patriarchs*, the *Christian Sibylline Books*, the *Epistle of Barnabas*—lent it a more vivid colouring and imagery. Not only the heretic Cerinthus, but even orthodox doctors—such as Papias of Hierapolis, Irenæus, and Justin Martyr—delighted themselves with dreams of the glory and magnificence of the millennial kingdom. The *Sibylline Books*, for instance, hold that the earth will be cultivated throughout its length and breadth, that there will be no more seas, no more winters, no more nights; everlasting wells will run honey, milk, and wine. Papias indulges in monstrous representations of the rebuilding of Jerusalem, and of the colossal vine and grapes of the millennial reign.

According to the general opinion, which was as much Christian as Jewish, the millennium was to be preceded by great calamities. The personification of evil appeared in *Antichrist* (q.v.), the precursor of Christ (identified during the 1st century with Nero), who would provoke a frightful war in the land of Magog (Ezek. xxxviii. and xxxix.) against the people Gog, after which the Messiah would appear, heralded by Elias, or Moses, or Melchizedek, or Isaiah, or Jeremiah, and would bind Satan for a thousand years, annihilate the godless heathen, or make them slaves of the believers, and overturn the Roman empire. From

its ruins a new order of things would spring forth, in which the 'dead in Christ' would arise, and along with the surviving saints enjoy an incomparable felicity in the city of the 'New Jerusalem,' which was expected to descend literally from heaven. With the innocence which was the state of man in Paradise there was associated, in the prevalent notions of the millennium, great physical and intellectual pleasures.

The lapse of time, chilling the ardour of the primitive Christian belief in the nearness of the *Parousia*, had without doubt also the tendency to give a more shadowy, and therefore a more spiritual aspect to the kingdom over which the expected Messiah was to reign. The influence of the Alexandrian philosophy contributed to produce the same result. Origen, for example, started the idea that, instead of a final and desperate conflict between Paganism and Christianity, the real progress and victory of Christianity would consist in the gradual spread of the truth throughout the world, and in the voluntary homage paid to it by all secular powers. Yet even in the Egypto-Alexandrian Church millenarianism, in its most literal form, was widely diffused. The Montanists (q.v.) generally were extreme millenarians or chiliasts, and, being considered a heretical sect, contributed largely to bring chiliasm into discredit, or, at all events, their own carnal form of chiliasm, which Tertullian himself attacked. Lactantius, in the beginning of the 4th century, was the last important Church Father who indulged in chiliastic dreams. In the 5th century, St Jerome and St Augustine expressly combated certain fanatics who still hoped for the advent of a millennial kingdom whose pleasures included those of the flesh. From this time the Church formally rejected millenarianism in its sensuous 'visible form,' although the doctrine every now and then made its reappearance, especially as a general popular belief, in the most sudden and obstinate manner. Thus, the expectation of the *Last Day* in the year 1000 A.D. reinvested the doctrine with a transitory importance.

At the period of the Reformation, millenarianism once more experienced a partial revival, because it was not a difficult matter to apply some of its symbolism to the papacy: the pope, for example, was Antichrist. Yet the doctrine was not adopted by the great body of the Reformers, but by some fanatical sects, such as the Anabaptists, as also by various theosophists in the next century. During the civil and religious wars in France and England it was also prominent; the Fifth Monarchy Men (q.v.) of Cromwell's time were millenarians of the most exaggerated type. The extravagances of the French Mystics and Quietists culminated in chiliastic views. During the Thirty Years' War enthusiastic and learned chiliasts flourished. Among the foremost chiliastic teachers of modern centuries are to be mentioned Ezechiel Meth and Bishop Comenius in Germany; Professor Jurieu of Sedan, and Poiret; Serarius in Holland; and in England Joseph Mede (*Clav. Apocal.* 1627), while Thomas Burnet and William Whiston endeavoured to give chiliasm a geological foundation. Most of the chief divines of the Westminster Assembly were millenarians; so were Sir Isaac Newton and Bishop Horsley. Bengel revived an earnest interest in the subject among orthodox Protestants. Spener and Joachim Lange held chiliastic views; and Swedenborg employed apocalyptic images to set forth the transfigured world of the senses. Bengel's millenarianism was adopted by the Swabian theosophist Oetinger (died 1782), and widely spread throughout Germany by Jung Stilling, Lavater, and Hess. Charles Wesley and Toplady were millenarians.

Modern millenarians or pre-millennialists (as

believing in the pre-millennial advent of Christ) differ in many minor points from one another, but agree in holding that the millennial age will be heralded by the personal return of the Lord Jesus, to establish a theocratic kingdom of universal righteousness, during which time sin will remain on earth but be greatly diminished. Immediately on Christ's appearing will take place the resurrection of the righteous dead and the translation of living Christians, who will be rewarded according to their works. The judgment work of Christ will occupy the whole millennial period. The Jews, restored to their own land, will repent and be converted. All the hosts of Antichrist will be destroyed, Satan bound, and the Holy Ghost poured out. At the end of the millennial age Satan released will make a last vain attempt to regain his power, but he and the wicked, who now have their resurrection, will be finally judged and cast into the lake of fire. The earth will be renewed by fire, and be the scene of the everlasting kingdom of Christ over all sanctified mankind. Attempts to fix the date of the advent are generally disapproved. Dates that have been fixed for the beginning of the millennium have been 1785 by Stilling, 1836 by Bengel, 1843 by Miller in America, 1866, 1867, and 1868 by Dr Cumming, and 1890 by the Mormon Church. Some adventists teach the doctrine of Apocatastasis (q.v.), others the final annihilation of the impenitent. See ADVENTISTS (SECOND), and HELL.

Many of the greatest modern German theologians have been more or less pronouncedly pre-millennialists; such as Rothe, Hofmann, Nitzsch, Ebrard, Lange, Delitzsch, Christlieb, Luthardt, as also Oosterzee, Gaussen, and Godet. The Free Church of Italy and the Plymouth Brethren collectively hold these views. The Irvingites expect the speedy appearance of Christ. Pre-millennial views appear in the works of many eminent Anglicans—such as Archbishop Trench, Bishops Ellicott and Ryle, Canons Fremantle and Hoare, Dean Alford. Amongst Presbyterians Dr John Cumming and Dr Horatius Bonar are conspicuous names. Great conferences of pre-millennialists were held in London and New York in 1878.

Millepede, a popular name for the members of one of the orders of Myriapods, of which Julus is a good type. See CENTIPEDE, MYRIAPOD.

Millepore. See CORAL.

Miller, HUGH, a distinguished self-taught geologist and journalist, was born at Cromarty, in the north of Scotland, October 10, 1802. He was descended from a family of sailors, and lost his own father by a storm at sea when he was only five years of age. In consequence of this misfortune he was brought up chiefly under the care of two of his mother's uncles, one of whom ('Uncle Sandy') imbued him with a taste for natural history, and the other ('Uncle James') for traditional lore. He acquired a good knowledge of English (the only language he knew) at the Cromarty grammar-school. Before his eleventh year he had read the usual romances of childhood, besides other works of higher literary pretensions. As he grew older he became extremely fond of the great English poets and prose-writers. From his seventeenth to

his thirty-fourth year he worked as a common stone-mason, devoting the enforced leisure of the winter months to writing and reading, to independent researches in natural history, and to the extension of his literary knowledge. In 1824–25 he worked at Niddrie, near Edinburgh. In 1829 he gained the friendship of Robert Carruthers, editor of the *Inverness Courier*, and published a volume entitled *Poems written in the Leisure Hours of a Journeyman Mason* (1829), which was followed by *Scenes and Legends of the North of Scotland* (1835). His attention was soon drawn to the ecclesiastical controversies which were agitating Scotland, and his famous *Letter to Lord Brougham* on the 'Auchterarder Case,' brought him prominently into notice. In 1834–39 he acted as bank-accountant; in 1839 he was invited to Edinburgh by Dr Candlish and Robert Paul, who had read his famous letter, as editor of the *Witness*, a newspaper started in the interest of the Non-intrusion party in the Church of Scotland; and in 1840 he published in its columns a series of geological articles, which were afterwards collected under the title of *The Old Red Sandstone, or New Walks in an Old Field* (1841). These articles were very remarkable, from both a scientific and a literary point of view. They contained a minute account of the author's discovery of fossils in a formation believed, until then, to be destitute of them, and were written in a style which was a harmonious combination of strength, beauty, and polish. At the meeting of the British Association in the same year (1840) he was warmly praised by Murchison, Agassiz, and Buckland. Agassiz proposed that one of the fossils should be named *Pterichthys Milleri*, and said that 'he would give his left hand to possess such powers of description as this man.' Miller's editorial labours during the heat of the Disruption struggle were immense, and educated the people for the climax in 1843. He used the term 'Free Church' before the Disruption. In 1847 he had to vindicate his position as editor in a private pamphlet against clerical interference, and may be said to have come off triumphant. But, after years of hard, earnest, fagging toil, his brain gave way, and, in a moment of aberration, he shot himself at Portobello, near Edinburgh, on the night of the 23d December 1856. Miller contributed several tales to the series known as Wilson's *Tales of the Borders* (1835), and was also a contributor to *Chambers's Journal*. He was not a ready writer; Chalmers said of him that when he did go off he was a great gun, but he required a deal of time to load. Yet he contributed at least a thousand articles to the *Witness*; Peter Bayne terms them 'complete journalistic essays, symmetrical in plan, finished in execution, and of sustained and splendid ability.' Miller's works, besides those already mentioned, are *First Impressions of England and its People* (1847), the record of a journey to England in 1845; *Footprints of the Creator, or the Asterolepis of Stromness*, in which he combated the evolution theory (1850); *My Schools and Schoolmasters, or the Story of my Education* (1854); and *Testimony of the Rocks* (1857), an attempt to reconcile the cosmogony of Genesis with the geology of nature, by the hypothesis that the days mentioned in the first chapter of Genesis do not represent the actual duration of the successive periods of creation, but only the time occupied by God in unrolling a panoramic vision of these periods before the eyes of Moses. To the above list was afterwards added the following posthumous volumes: *Cruise of the Betsey* (1858), being geological investigations among the islands of Scotland; *Sketch Book of Popular Geology*, with preface by Mrs Miller (1859); *Headship of Christ*, with preface by Bayne (1861); *Essays, Historical and Biographical*

(1862); *Tales and Sketches* (1863); *Edinburgh and its Neighbourhood* (1863); *Leading Articles*, with preface by Rev. John Davidson (1870).

Miller's services to science have undoubtedly been great, but he is even more distinguished as a man than as a savant. Honest, high-minded, earnest, and hugely industrious, he was a true Scot, a hearty but not a sour Presbyterian (for he loved Burns as much as he revered Knox); and there are few of whom Scotland has better reason to be proud than 'the stone-mason of Cromarty.' Miller was married to Lydia Mackenzie Fraser in 1837. She assisted him in literary work, and possessed good taste and ability. She wrote on *Cats and Dogs* (1856), and her eldest daughter, Harriet Miller Davidson, wrote several serial tales. Besides his autobiography quoted above, see the Life by Peter Bayne (2 vols. 1871).

Miller, JOAQUIN, the pen-name of Cincinnatus Hiner Miller, an American poet, born in Indiana, in 1841. Removing with his parents to Oregon in 1854, he became a miner in California, was with Walker in Nicaragua, and afterwards lived with the Indians till 1860. He then studied law in Oregon, and set up in practice in 1863, after a Democratic paper that he edited had been suppressed for disloyalty. He was a county judge from 1866 to 1870, and then visited Europe; in England his first volume of verse was published. He afterwards settled as a journalist in Washington, and in 1887 in California. In 1890 he revisited England.

His poems include *Songs of the Sierras* (1871), of the *Sunlands* (1873), of the *Desert* (1875), of *Italy* (1878), and of the *Mexican Seas* (1887); his prose works, *The Danites in the Sierras* (1881), *Shadows of Shasta* (1881), and *'49, or the Gold-seekers of the Sierras* (1884). He also wrote *The Danites*, a successful play, and *My Life among the Modocs* (1873).

Millet, a grain, of which there are several kinds, the produce of species of *Panicum*, *Setaria*, and allied genera. The genus *Panicum* contains many species, natives of tropical and warm temperate countries, and some of which, as Guinea Grass (q.v.), are amongst the largest fodder grasses. The flowers are in spikes, racemes, or panicles; the glumes very unequal, one of them often very minute; each spikelet containing two florets, one of which is often barren. The genus *Setaria* has a spike-like panicle, with two or more bristles under the glumes of each spikelet.—Common Millet (*Panicum miliaceum*) is an annual grass, three or four feet high, remarkably covered with long hairs, which stand out at right angles. It has a much-branched nodding panicle; the spikelets are oval, and contain only one seed. It is a native of the East Indies, but is extensively cultivated in the warmer parts of Europe and other quarters of the world. The grain, which is very nutritious, is only about one-eighth of an inch in length. It is used in the form of groats, or in flour mixed with wheat-flour, which makes a good kind of bread; but bread made of millet alone is brittle and full of cracks. Poultry are extremely fond of millet.—Other species, *P. miliare*, *P. frumentaceum*, and *P. ptilosum*, are cultivated in different parts of India, chiefly on light and rather dry soils, yielding very abundant crops. Millet of various species is the staple food-grain of India as a whole, and not rice, as is often thought.—German Millet, or Mohar (*Setaria ger-*

manica), and Italian Millet (*S. italica*)—regarded by many as varieties of one species, and probably originally from the East, although now naturalised in the south of Europe—are cultivated in many of the warmer parts of Europe, in India, and other countries. Italian millet is three or four feet in height; German millet is much lower, and its spike comparatively short, compact, and erect; it is less valuable as a corn-plant. The grains of both are very small, only about half as long as that of Common Millet; but they are extremely prolific, one root producing many stalks, and one spike of Italian millet often yielding two ounces of grain. The produce is estimated as five times that of wheat. The grain of these millets is imported into Britain for feeding cage-birds. It is used for soup in the south of Europe. To the same tribe of grasses belong the genera *Paspalum*, *Pennisetum*, *Penicillaria*, *Digitaria*, and *Milium*. *Paspalum exile* is common in Africa; and *P. scrobiculatum* is cultivated on poor soils in India. *Penicillaria spicata* or *Pennisetum typhoideum*, often called Egyptian Millet and Guinea Corn, is cultivated in Africa and India, and the south of Europe.—*Pennisetum distichum* causes much inconvenience to the traveller in Central Africa, the little bristles which are attached to its seeds making them stick to the clothes and pierce the skin.—*Digitaria sanguinalis*, or Polish Millet, is cultivated in Poland, where the grain is used like rice. It is a common grass in tropical and warm countries, and in many parts of Europe; in Britain it occurs in the south of England, where it is probably only an introduced weed of cultivation. The spikes in this genus are compound, and from their appearance give it the names *Digitaria* and *Finger-grass*.—The Millet Grass (*Milium effusum*) of Britain, occasionally found in shady woods, is a very beautiful grass, three or four feet high, with a spreading pale panicle of small flowers. Another species of the same genus (*M. nigricans*) is the *Maize de Guinea* of Peru, where its seeds are converted into a very white flour.—The name Indian Millet is sometimes given to Durra (q.v.).

a, Common Millet (*Panicum miliaceum*); *b*, German Millet (*Setaria germanica*).

Millet, JEAN FRANÇOIS, painter, was born in the village of Gruchy, near Greville, on the 4th of October 1814. The son of a farmer, he owed much in his childhood to his grandmother, a woman of great piety and individuality, and to her brother, who had been a priest; and he was taught enough Latin to enjoy the Vulgate and Virgil. For a time he aided his father as a farm-labourer; but, having manifested great taste for drawing, he was at length, in 1832, placed under Monchel, a painter in Cherbourg, whom he assisted in the execution of two sacred subjects now in the church of the Trinity there, and who induced the municipality

of Cherbourg to grant an annuity to aid his pupil in his studies, the sum being afterwards supplemented by the council of La Manche. In 1837 Millet came to Paris, and worked in the studio of Paul Delaroche, learning, however, more from his study of the works of Michael Angelo, Poussin, Correggio, and the Venetians. Next he painted and drew in pastels little subjects in the popular style of Boucher and Watteau, selling them to the dealers for a few francs; and in 1840 a portrait which he sent to the salon was accepted and hung. In the same year he returned to Normandy, where he painted portraits and even signboards. In 1841 he was again in Paris; and he struggled hard amid the revolutionary troubles that followed to maintain himself and his family by his art. In 1848 he fought at the barricades of the Quartier Roche-chouart; and in the following year he settled in Barbizon, near the Forest of Fontainebleau, along with Charles Jacque, and there made the acquaintance of Theodore Rousseau. At Barbizon, where he remained for the rest of his days, living much like the peasants around him, he began in good earnest to paint the life of rustic France, entering on his task with a sympathetic power such as no other painter has shown. Here the famous 'Sower' was completed in 1850, mainly, however, from recollections of Normandy. In 1855 his 'Peasants Grafting' won Gautier's praise, and was bought by an American for 4000 francs. It was followed by 'The Gleaners' in 1857, 'The Angelus' (1859), 'Waiting' and 'The Sheep-shearers' (1861), 'The Man with the Hoe' and 'Women Carding' (1863), 'Shepherdess and Flock' (1864), works in which, without any departure from the most absolute truth, he imparted a largeness and a pathetic dignity to his figures of the men and women who labour in the fields, and to their environments of ordinary nature. In addition to paintings, he produced many charcoal drawings of a very high quality, and he etched a few plates. All his life long he struggled against the pressure of poverty, though he was awarded medals at the salons of 1853 and 1864, and a first-class medal at the Paris International Exhibition of 1867, when he also received the ribbon of the Legion of Honour. He died at Barbizon, 20th January 1875. Since his death he has been fully recognised as one of the greatest of French painters; and the productions of his brush have realised very large prices. At the Secrétan sale in Paris, in 1889, his most celebrated picture, 'The Angelus,' sold—along with the government commission of 5 per cent.—for £23,226; it was afterwards exhibited for a year in the United States.

See works on Millet by Piedagnel (1876), Sensier (Eng. trans. 1881), Yriarte (1884); D. C. Thomson, *The Barbizon School* (1890); and Ménard, *Le Livre d'Or de Millet* (1890).

Milliard, the French collective name for a thousand millions; familiar in connection with the five milliards of francs (5000 millions of francs, or £200,000,000) paid by France as war indemnity to Germany in 1871-73 (see FRANCE, Vol. IV. p. 783).

Millom, a town of Cumberland, on the west side of the Duddon estuary, 30 miles SSE. of Whitehaven. It has mines and ironworks. Pop. (1851) 1070; (1881) 6228; (1891) 8895.

Milman, HENRY HART, dean of St Paul's, poet and ecclesiastical historian, was the youngest son of Sir Francis Milman (1746-1821), physician to George III., and was born in London, 10th February 1791. He was educated at Greenwich under Dr Burney, at Eton, and at Brasenose

College, Oxford, where in 1812 he won the Newdigate with his *Belvidere Apollo*, the best of all Oxford prize poems. In 1815 he was elected a fellow; in 1816 was ordained priest, and appointed vicar of St Mary's, Reading; from 1821 to 1831 was professor of Poetry at Oxford, where in 1827 he delivered the Bampton Lectures, on *The Character and Conduct of the Apostles considered as an Evidence of Christianity*; in 1835 became rector of St Mary's, Westminster, and a canon of Westminster; and in 1849 was promoted to the deanery of St Paul's. He died at Sunninghill, near Ascot, 24th September 1868, and was buried in St Paul's.

The collected edition of Dr Milman's *Poems and Dramatic Works* (3 vols. 1839) comprises *Fazio, a Tragedy* (1815), which, without his consent, was acted first at Bath, and then in 1818 at Covent Garden, with Charles Kemble and Miss O'Neil in the leading parts; *Samor, Lord of the Bright City, an heroic poem* (1818); *The Fall of Jerusalem* (1820), a beautiful dramatic poem, with some fine sacred lyrics interspersed; three other dramas, *The Martyr of Antioch* (1822), *Belshazzar* (1822), and *Anne Boleyn* (1826); and *Nala and Damayanti, with other Poems translated from the Sanskrit* (1834). Forgotten as a whole, the poems live, and will live, through three or four much prized hymns—'When our heads are bowed with woe,' 'Brother, thou art gone before us,' and 'Ride on, ride on in Majesty.' The complete edition of Dean Milman's *Historical Works* (15 vols. 1866-67) includes his *History of the Jews* (1829), *History of Christianity to the Abolition of Paganism in the Roman Empire* (1840), and *History of Latin Christianity to the Pontificate of Nicholas V.* (1854-56). The last—a complete epic and philosophy of mediæval Christendom—is Milman's masterpiece; it is really a great work, great in all the essentials of history—subject, style, and research. But, though vastly inferior, the *History of the Jews* was in a way more important. For 'it was,' in Dean Stanley's words, 'the first decisive inroad of German theology into England; the first palpable indication that the Bible "could be studied like another book;" that the characters and events of the sacred history could be treated at once critically and reverently.' Milman also edited Gibbon and Horace, and wrote much for the *Quarterly Review*. After his death appeared the delightful *Annals of St Paul's Cathedral* (1868), and *Savonarola, Erasmus, and other Essays* (1870). See an article by Dean Stanley in *Macmillan's Magazine* for January 1869.

Milne-Edwards, HENRI, naturalist, was born at Bruges, 23d October 1800. His father was an Englishman. Milne-Edwards studied medicine at Paris, where he took his degree of M.D. in 1823, but devoted himself to natural history. After having for many years taught natural history at the Collège de Henri IV., he was elected in 1838 member of the Académie des Sciences in the place of Cuvier. In 1841 he filled the chair of Entomology at the Jardin des Plantes, and in 1844 became also professor of Zoology and Physiology. He was a member of the Académie de Médecine, and of most of the learned academies of Europe and America, and held several orders—amongst others, since 1861, that of Commander of the Legion of Honour. He published numerous original memoirs of importance in the *Annales des Sciences Naturelles*, a journal he himself assisted in editing for fifty years. His *Eléments de Zoologie* (1834), when reissued in 1851 as *Cours Élémentaire de Zoologie*, had an enormous circulation at home and abroad, and long formed the basis of most minor manuals of zoology published in Europe. His *Histoire Naturelle des Crustacés* (1834-40) and *Histoire Naturelle des Coralliaires* (1857-60) were almost equally noteworthy. The *Lectures on the*

Physiology and Comparative Anatomy of Man and the Animals (14 vols. 1857-81) have a great permanent value for their immense mass of details, and copious references to scattered sources of information. He also had an important share in a splendid quarto of *Anatomical and Zoological Researches on the Coasts of Sicily*. Other works were researches on the natural history of the French coasts (1832-45) and on the natural history of the mammalia (1871). In some of his later works he was assisted by his distinguished son Alphonse. Milne-Edwards must always hold high rank amongst the naturalists of the 19th century. His researches in the distribution of the lower invertebrates led him to the theory of centres of creation; and to this he adhered throughout life, in spite of the general acceptance of the newer and larger views of Darwin by his fellow-scientists. He died on the 29th July 1885. His elder brother, Frederick William, was almost equally celebrated. He founded the Ethnological Society in Paris, and is considered the father of ethnology in France.

Milner, JOSEPH, an ecclesiastical historian, was born near Leeds in 1744. He studied at Catharine Hall, Cambridge, and afterwards became well known as head-master of Hull grammar-school. He was vicar of North Ferriby, 7 miles from Hull, and lecturer in the principal church of the town, and in 1797 became vicar of Holy Trinity Church. He died on 15th November of the same year. Milner's principal work is his *History of the Church of Christ*, of which he lived to complete three volumes, reaching to the 13th century; a fourth volume coming down to the 16th century, was edited from his MSS. by his younger brother, Dr Isaac Milner, dean of Carlisle, who also published a complete edition of his brother's works in 8 vols. 1810. The principles on which the history is written are of the narrowest kind; the scholarship, literary style, and critical insight are alike poor.

Milnes, RICHARD MONCKTON. See HOUGHTON.

Milngavie (pron. *Millguy*), a town of Stirling-shire, 7 miles NNW. of Glasgow. Pop. 2636.

Milo. See MELOS.

Milo, of Crotona, in Magna Græcia, an athlete famous for his great strength. He was six times victor for wrestling at the Olympic games, and as often at the Pythian, and commanded the army which defeated the Sybarites in 511. On one occasion he is said to have carried a live ox upon his shoulders through the stadium of Olympia, and afterwards to have eaten the whole of it in one day; and on another, to have upheld the pillars of a house in which Pythagoras and his scholars were assembled, so as to give them time to make their escape when the house was falling. In old age he lost his life through too great confidence in his own strength, in attempting to split up a tree, which closed upon his hands, and held him fast until he was devoured by wolves.

Milrei, or MILREA, a Portuguese silver coin and money of account, contains 1000 rees, and is valued at 4s. 5d. sterling. The coin is commonly known in Portugal as the *corôa*, or 'crown,' and is (since 24th April 1835) the unit of the money-system in that country. It is also used in Brazil. Coins of the values of a half-*corôa*, or half-milrei, as well as the one-fifth, one-tenth, and one-twentieth, are current in both countries as money of account.

Milt. See FISHES, Vol. IV. p. 654.

Miltiades, a celebrated Athenian general, who was tyrant of a colony in the Thracian Chersonesus, took part with Darius Hystaspes against the Scythians, and, when Attica was threatened by

the great Persian invasion, was chosen one of the ten generals. He prevailed upon the polemarch Callimachus to give his casting vote in favour of risking a battle, and when his turn came to command drew up his army on the famous field of Marathon. The victory of the Athenians and one thousand Plateans over the Persian host of Datis and Artaphernes is justly counted one of the decisive battles of the world. Miltiades, being entrusted anew with the command of an armament, made an attack on the island of Paros in order to gratify a private enmity, but, failing in the attempt, was on his return to Athens condemned to pay a fine of fifty talents as an indemnity for the expenses of the expedition. Being unable to do this, he was thrown into prison, where he died of a wound received at Paros. The fine was exacted after his death from his son Cimon.

Milton, JOHN, after Shakespeare the greatest English poet, was born in Bread Street, Cheapside, on December 9, 1608. His father, John Milton, was a prosperous scrivener, a Puritan but a musician, and composer of several pieces much admired by his contemporaries. He was descended from a family of yeomen settled in Oxfordshire, and had come to town upon being disinherited for his religious convictions by his father, a Catholic recusant. He appears to have from the first discerned the promise of his son, and to have determined to give him the best education he could. After studying under private tutors, young Milton was admitted about 1620 into St Paul's School, where he distinguished himself not only as a scholar, but as a poet. In February 1625 he entered Christ's College, Cambridge. His academical course was not wholly smooth; he seems to have been chastised—not, as the legend says, flogged—by his tutor, and was certainly rusticated for a short time in 1626. After his return, however, he went through the university course with credit, graduating as Bachelor at the proper time, and proceeding Master of Arts in July 1632. The condition of the church, over which Laud then ruled supreme, deterred the young Puritan from taking orders; he felt no vocation towards any other profession; and at Horton, in Buckinghamshire, where his father had retired upon the fortune he had acquired in business, he settled quietly down with the distinct purpose of making himself a poet by study and self-discipline. His poetical genius had already been attested by two noble productions, the 'Hymn on the Nativity,' and 'At a Solemn Music,' as well as much Latin verse of the highest quality; but it is remarkable how little stimulus he seems to have felt to occasional composition. During his six years' residence at Horton he produced, so far as known, only two English poems of importance which can be ascribed to direct poetical impulse from within, the *Allegro* and the *Penseroso*. *Comus* was written at the instance of his friend, the musician Henry Lawes, to celebrate Lord Bridgewater's assumption of the wardenship of the Welsh marches, and was performed at Ludlow before a select assemblage in September 1634. *Lycidas* was evoked by the death of his friend, Edward King, shipwrecked on his passage to Ireland in 1637. There is, perhaps, not another instance in literature of a great poet so entirely dependent upon circumstances for inspiration, and, while meditating the highest things, so content to bide his time in calm reliance upon his ability to do what he pleased when he pleased. The four productions of this Horton period were indeed of themselves sufficient to place him in the first rank of English poets. Their most individual characteristic is perhaps chastened exuberance—boundless poetical wealth severely controlled, and splendidly displayed without lavish-

ness or ostentation. *Comus* and *Lycidas* tell us much of the man; in the former we see the scholar's disdain, perhaps slightly tinged with moroseness, for all save intellectual pleasures; in the latter the patriot and the Puritan speaks his bitter scorn of the ruling faction in the church. Perhaps he had spoken too freely; at all events very shortly after the publication of his elegy, about the beginning of 1638, as part of an obituary collection in memory of Edward King, he left England for a tour in Italy.

Milton's visit to Italy is one of the most agreeable chapters of his life. He was cordially received by the Italian literati, especially at Florence, where he made not only pleasant acquaintanceships, but permanent friendships. At Rome, notwithstanding his undaunted profession of Protestantism, he was treated with especial attention, and at Naples the venerable Marquis Manso, half a century earlier the protector of Tasso, gave him hospitality and presents, which Milton requited with an elegant Latin poem. The impression which Milton thus produced upon foreigners is a proof of something imposing and attractive in his personality, for all his solid claims to fame were of course a sealed book to the Italians. His journey home was hastened by news of the outbreak of hostilities between Charles I. and the Scots, and his return was saddened by tidings of the death of his friend Diodati, whom he celebrated in his elegy 'Damon,' the finest and the last of his Latin poems. He settled in St Bride's Churchyard, afterwards in Aldersgate Street, and devoted himself to the education of his widowed sister's children, the two young Philippses. Unconscious of the long farewell he was about to bid to poetry, he occupied his leisure with schemes for poems mostly dramatic and scriptural, of which numerous skeleton outlines are preserved. The conception of *Paradise Lost* as a mystery or miracle play gradually dawned upon his mind, and Satan's address to the Sun was actually written about this time. But the Civil War came, and for long silenced Milton's muse, except for an occasional sonnet.

It has been much debated whether the world has lost or gained more by Milton's absorption in politics. The question is somewhat idle: to wish for Milton other than he was is to wish for a succession of *Comuses* rather than a *Paradise Lost*. No man capable of conceiving such a work as Milton's epic could be unaffected by the situation of his country at that tremendous crisis, and with Milton's poetical temperament lively interest in anything signified total occupation by it for the time. The tracts which he now poured forth are as truly lyrical inspirations as any of his poems; by no means masterpieces of reasoning, but dithyrambic ecstasies of love or hate. Three appeared in 1641, two in 1642. All five relate to church government: never was diction so magnificent called forth by a theme so unpromising. In fact, however, the writer's thoughts are much higher and deeper than his subject, and, stripped of what is temporary and accidental in the latter, they appear magnificent idealisations of the possibilities of a far-off future, which to Milton seemed ever at the door. The great drawback to their enjoyment at the present day is the scurrility of their invective, which passed comparatively unperceived amid the excitement of revolution.

In 1643 Milton's activity as a public writer was diverted into a new channel by private affairs, which, however, he so handled as to render of universal concern. In June of this year, after a very short courtship, he married a young lady, Mary Powell, daughter of an Oxfordshire squire, previously known to him as a debtor to his father

for money advanced on mortgage. The bride's family were cavaliers, and she would seem to have been as little suited to her husband in every other respect as by her education and connections. The idealising imagination of the poet must in all probability have been at work, and the thoughtless precipitancy of the whole transaction would alone show how greatly in many respects the popular estimate of Milton's character needs revision. The poor girl was naturally shocked at the sudden transfer from a jovial country household to the apartments of an austere scholar, whose intellect and character she was utterly unable to appreciate, and whose principles ran counter to all her prejudices. After a few weeks' trial of matrimony she went back to her friends, under a promise, Milton's nephew says, to return at Michaelmas; but doubt is cast upon this statement by the fact, discovered by Professor Masson, that Milton's first tract on divorce was written and printed at the very time of the separation. She certainly did not return, and early in the following year Milton put forth another edition of his *Doctrine and Discipline of Divorce*, greatly extended, and enriched with erudition and argument. It brought many attacks upon him, mainly from the Presbyterians, from whose views on church and state he had been more and more dissociating himself. He replied to his opponents in three supplementary pamphlets, and a threat of prosecution by a parliamentary committee, which came to nothing, occasioned the production (November 1644) of the most famous of his prose-works, *Areopagitica, a Speech for the liberty of Unlicensed Printing*, which has come to be regarded as almost the gospel of freedom of speech, and, if less eloquent than his tracts on church government, nevertheless contains the best known passages of his prose-writings. It must be remembered that even here Milton does not contend against the prosecution of published opinions deemed pernicious, but merely against the right to forbid publication through the instrumentality of a licenser. A few months previously he had composed and published, at the instance of his friend Samuel Hartlib, a *Tractate of Education*, of little practical pedagogic value, but full of inspiration and suggestion.

Milton was not the man to permit his opinions to remain empty speculations, and in the course of 1645 he was taking serious steps towards carrying the most obnoxious of them into practice by paying his addresses to 'a very handsome and witty gentlewoman,' when the absent wife thought it time to return. Her repentance may probably have been further stimulated by the overthrow of the Royalist cause, which had occasioned the total ruin of her family. Conscious, probably, of his own failings in temper and considerateness, Milton did not prove obdurate; and by September his household was re-established in the Barbican. She further induced him to receive her mother and other members of her impoverished family, persons whom he had little reason to love, and of whose incompatibility he complains in a letter to an Italian friend. Little else can be said of her, except that she brought him three daughters, and died in 1652. He lost the father to whom he owed so much in 1647, a year after the fruits of his education and the partial accomplishment of the purpose of his life had been manifested in a collected edition of his poetical works, English and Latin.

During all this time Milton's calling, apart from his studies and polemics, had been educational; other pupils, mostly sons of friends, had been gradually added to his nephews, and he seemed to the world a schoolmaster. He was now to enter public life. The execution of Charles I., January 30, 1649, was followed within a fortnight by his

defence of the deed, *The Tenure of Kings and Magistrates*. Having thus definitively cast in his lot with the ruling party, he was appointed on March 15 to a post which no other man in England was so competent to fill, that of 'Secretary of Foreign Tongues,' whose duty it was to draft diplomatic correspondence with foreign powers, then carried on in Latin. Milton had few equals in that age as a Latinist, whether in prose or verse, and his public letters were an honour to himself and his country, but there is no reason to suppose that he was ever much more than the mouthpiece of the government. His services were more conspicuous in another department, his justification of the king's execution in his reply to Salmasius's *Regii Sanguinis Clamor ad Cælum*, a pamphlet whose publication had been a European event. Milton's *Pro Populo Anglicano Defensio* (1651) was pronounced, even by those who condemned it, a great controversial victory. In erudition, Latinity, and, it must be added, scurrility, the combatants were well matched, but Milton spoke from the heart, and Salmasius from a brief. This work, now so little read, made Milton famous all over Europe, and is memorable as the immediate occasion of the loss of his eyesight, deliberately yielded up by him in the cause of his country. By 1652 the impaired vision had wholly failed, and it was necessary to provide him with an assistant in his official duties. His domestic life at this period was tranquil, distinguished chiefly by his second marriage and the loss of his wife (1656-58), and the pleasing intimacy of young friends, recorded in his sonnets. The magnificent sonnet on the massacre of the Vaudois was written in 1655. Several controversial pamphlets with Alexander Morus followed his contest with Salmasius, chiefly remarkable for the fortitude and dignity of his references to his affliction, and for his flattering portraits of the great men of the Commonwealth, especially Cromwell. Always leaning to the more radical side, he had supported Cromwell in all his extra-legal measures, though the disappointment of his early republican ideal must have cost him many pangs. He retained his secretaryship until the abdication of Richard Cromwell, when the condition of public affairs again made him a pamphleteer. His writings of this period, greatly inferior in splendour of diction to his first productions of the kind, are still most interesting as passionate protests, conclusive of his entire lack of practical statesmanship and his essentially poetical temperament. The Restoration drove him into concealment. Few had more bitterly exasperated the Royalist party; but the new government was not bloodthirsty, and about the beginning of 1661 he found himself settled in Jewin Street (afterwards in Artillery Walk, Bunhill Fields), honourably released from politics with the gratifying consciousness of having done his duty and his best, and free to devote himself entirely to the permanent purpose of his life.

Paradise Lost was probably commenced some time before the Restoration, and completed about 1663—a striking instance of rapid composition, considering the magnitude and perfection of the work, the interruption by political revolution, and the fact that Milton's poetical vein only flowed freely between the autumnal equinox and the vernal. It was chiefly composed at night, and necessarily dictated to some amanuensis, usually one of his daughters. Plague and fire for a time warred against the publication, which at length, after some difficulty on the licenser's part had been surmounted, took place in August 1667. Every one knows that the copyright was sold for five pounds: it is not always remembered that that sum represented three times its value at the present day, and that there were contingencies which, had Milton

lived to benefit by them, would have raised his emolument to about £70 of our money. The sale of thirteen hundred copies within twenty months is certainly no discredit to the taste of the age. Milton's claim to a place among the great poets of his country seems to have been admitted from the first, though in the absence of reviews his fame travelled slowly. The year 1671 witnessed the publication of *Paradise Regained*, probably written in 1665-66, and of *Samson Agonistes*, written later still. The former was composed at the suggestion of the Quaker Ellwood, working on the suspicion Milton could not but entertain that he had after all made Satan the hero of *Paradise Lost*. *Samson Agonistes*, dramatic in form, is lyrical in substance, a splendid lament over the author's forlorn old age, and the apostasy, as he deemed it, of his nation. Both pieces evince the continued tendency of his style towards simplicity, which sometimes degenerates into baldness. They are noble pendants to *Paradise Lost*, but the more their relation to this palmary work is studied the more one feels that it and it alone places him among the supreme poets of the world.

Milton's domestic life during this period had not been fortunate. The great cause of sorrow was the undutifulness of his daughters—very ordinary young women, it would seem, who felt no sympathy or admiration to counterbalance their natural impatience of their heavy task as his readers and amanuenses. The blind poet on his part was no doubt often stern and exacting; and on the whole the history of his household is one of sordid sadness up to his marriage (1663) with Elizabeth Minshull, a pretty and domestic woman of twenty-five, the daughter of a Cheshire yeoman. She restored comfort to his house, but failed to conciliate his daughters, who, after being taught embroidery at their father's expense, left to set up for themselves. The accounts we have of him in his later years convey a generally pleasing picture of a not uncheerful retirement solaced by music and the attention of friends. When the poetic impulse had departed he addressed himself vigorously to other unfulfilled designs of his youth, writing the early history of England and endeavouring to amend men's conceptions of grammar and logic. These writings are indeed of little value; but his Latin *Treatise of Christian Doctrines*, though devoid of all pretensions to eloquence, is a memorable work. His theology had become profoundly modified in the course of his life; he is now an Arian as regards the person of Christ; he is indifferent to all rites and ceremonies; he is as anti-Sabbatarian as Luther; he would even tolerate polygamy. The charm of the treatise consists in its dignified candour, and the absence of all polemic virulence. The tranquillity of evening was indeed closing around him as he penned this last legacy, the MS. of which, confiscated and mislaid, was not to see the light for a hundred and fifty years. Reduced still further in means by losses through the great fire of 1666, but still above want; execrated as a regicide by the majority of his countrymen, but already acclaimed by the discerning as the first poet of his age; worn by attacks of gout, but cheerful and even joyous in the intervals of pain, he closed his chequered life on November 8, 1674. He was interred in St Giles's, Cripplegate.

Milton is one of the poets respecting whose place in literature there has been least question, whether as regards the literature of their own country or that of the world. He stands at the head of those epic poets whose themes have not, like Homer's or Virgil's, been national, or have not, like Dante's, condensed the essence of the belief of ages. He is indebted for this superiority partly to his felicitous choice of the finest subject which yet remained for

epical treatment, partly to his exceptional qualifications for treating it, but most of all to the actual superiority of his genius. After Homer there is no poet to whom the sublime is so much a native element, who rises into it with so little apparent effort, and remains in it for so long together. Another circumstance which would alone make him a poet for the world is that in him and in him alone the Hebraic and the Hellenic spirit appear thoroughly at one. His theme and his creed connect him with the Scriptures, but his literary tastes and models are the tastes and models of the Renaissance. As an English poet he fills up the great gap which would otherwise yawn between the age of Shakespeare and the age of Dryden, and, like Wren in architecture, proves that the classical style need not necessarily be synonymous with pedantry or inanity. In the artful harmony of blank verse he surpasses every English poet, though he may not have caught the 'wood-notes wild' of Shakespeare and his contemporaries. His magnanimity as a man matched his sublimity as a poet; but he had perhaps more than a usual share of the failings attendant upon the magnanimous character, and at first sight appears arrogant and unamiable. It is not until we consider that the circumstances of his life forced these characteristics into prominence, and that biographers have too commonly thought the softer and more familiar traits unworthy of record; until we remember that the company of this austere idealist was frequented by the young, and that the pleasures of the social hour have been exquisitely sung by him; above all, until we note his almost entire dependence for composition upon external impulse, the rashness of some of his actions and the chivalry of others, that we perceive him to have possessed his full share of the emotional temperament common to poets.

The principal contemporary authority for Milton's life is his nephew, Edward Phillips. Toland has added some interesting notices. Symmons, Mitford, Todd, and others wrought usefully in their day in collecting and investigating particulars, but their labours have been entirely superseded by Professor Masson (6 vols. 1876-79), who has left nothing unexplored, and whose verdict is in most cases decisive. Johnson's short biography, however, must always be read for its literary merit, and as a remarkable instance of insuperable antipathy striving to be just. Milton's Life has been written on a small scale by Mark Pattison ('Men of Letters,' 1880) and by Richard Garnett ('Great Writers,' 1889, with full bibliography). There is an excellent and comprehensive German biography by Alfred Stern (2 vols. Leip. 1877-79). Addison, Johnson, Channing, and Macaulay are especially distinguished among Milton's critics.

Millville, a city of New Jersey, on the Maurice River, 41 miles by rail S. by E. of Philadelphia. It has manufactures of cottons and glass. Pop. (1885) 8824; (1890) 10,002.

Milwaukee, capital of Milwaukee county, Wisconsin, and the largest city in the state, is situated on the west shore of Lake Michigan, at the common mouth of three improved and navigable rivers, which, with a canal, supply 20 miles of dockage. It is 85 miles by rail N. of Chicago, and overlooks Milwaukee Bay, which has a width of 7 miles and contains a harbour of refuge. The parked and terraced bluffs have an average height of 80 feet above the water. Milwaukee is beautifully built with light yellow bricks—to which it owes its name of 'the Cream City.' The streets are wide and parked between the roadway and the sidewalk, and are lined on either side by magnificent elms whose branches form an almost continuous arch in the residential parts. The public parks contain some 600 acres, and are connected by wide boulevards. There are nineteen street railway lines, nearly all operated by electricity, and the streets are mainly lighted by arc lights. A new and vast

system of intercepting sewers is partly in operation, and in the meantime the river, into which much of the sewage flows, is flushed by means of a huge tunnel from the lake, built at a cost of \$250,000. In 1889 two new railway passenger depôts were built at a cost of \$200,000 each. Appropriations have been made for a new government building to cost \$2,000,000, a new city hall, and a public library and museum building. The public library contains nearly 60,000 volumes. In 1888 was completed the Layton Free Art Gallery, the gift for which, exclusive of the value of pictures and statuary, was \$300,000. There are 123 churches, and 45 public and 67 private and parochial schools, with 831 teachers and, in 1889, 42,835 pupils. The public-school expenditure for 1889 was \$409,012. The charitable homes, hospitals, and asylums have a capacity of 2474, and the annual expenditure is about \$75,000.

Milwaukee is essentially a manufacturing city. The value of its products in 1889 was more than \$100,000,000, of which \$14,000,000 was in engines, machinery, and iron and brass products, \$10,500,000 in beer, \$10,000,000 in slaughtering and packing, \$6,000,000 in flour, &c. The number of manufacturing establishments was 1997; capital, \$40,000,000; number of hands, 46,707. The 'jobbing' trade in the same year amounted to \$94,000,000. The total receipts of grain of all kinds were 20,474,275 bushels. Milwaukee is a port of entry for goods in bond both by rail and water. Value of direct imports (1889), \$755,658; number of vessels arriving, 5563, with an aggregate tonnage of 2,895,337. Milwaukee is the meeting-point of 14 railway lines and 11 lake steamship lines regularly employing 68 steamers. Pop. (1870) 71,440; (1880) 115,578; (1890) 204,468 within the city limits (18 sq. m.).

Mīmāṃsā (from the Sanskrit *mān*, 'to investigate'; hence, literally, investigation) is the collective name of two of the six divisions of orthodox Hindu philosophy. It is distinguished as *Pūrva* and *Uttara-mīmāṃsā*, the latter being more commonly called *Vedānta*, while the former is briefly styled *Mīmāṃsā*. Though the Mīmāṃsā is ranked, by all native writers, with the five other philosophical systems, the term philosophy can scarcely be applied to it in the same sense as to them; its object is merely to lay down a correct interpretation of such Vedic passages as refer to the Brāhmanic ritual, to solve doubts wherever they may exist on matters concerning sacrificial acts, and to reconcile discrepancies—according to the Mīmāṃsā, always apparent only—of Vedic texts. See SANSKRIT, VEDAS.

Mimes, the name given by the ancients to certain dramatic performances, in which, with little attempt at art, scenes of actual life were represented, sometimes in improvised dialogue. The Greek mimes appear to have been invented by the Greeks of Sicily and Southern Italy. They were a favourite amusement of convivial parties, the guests themselves being generally the performers. Sophron of Syracuse (about 420 B.C.) composed many in the Doric dialect, which were much admired, and which Plato was accustomed to read.—The Roman mimes were not borrowed from the Greek, but were of native Italic growth. They were not only far ruder and coarser, but in some respects they were essentially different—the dialogue occupying a smaller place, and mere gesture and mimicry predominating. The humour and satire, however, were often genuine, though rough and even indecent, and they were greatly relished by all classes; even the patrician Sulla was fond of them. Their most famous mimic poets were Decimus Laberius and Pub. Syrus.

Mimicry. The fact that insects belonging to very different groups often bear an extremely

close superficial resemblance to each other has been known for a long period of time. The names given to various species of British moths are sufficient proofs of this. Such names as *Bombyliiformis*, *Apiformis*, *Bembeciformis*, &c. imply a recognition of the resemblance between these species and others belonging to an entirely different order. The meaning of such likenesses was, however, unknown until the appearance of H. W. Bates's classical paper in 1862. In this essay the author shows that the species which has departed from the normal type of its group (the mimicker) is far rarer than the form which it resembles, while the latter (the mimicked) is abundant and well defended by some special protection, such as the possession of an unpleasant taste or smell or the power of stinging. Bates's observations were conducted in tropical America, where abundant, conspicuous, slow-flying, nauseous butterflies (*Heliconiidae* and *Danaidae*) are closely mimicked by *Pieridae* (the family containing our common garden white butterflies) and other butterflies, and in many cases by day-flying moths. Subsequent observation has confirmed Bates's suggestion. Wallace found numerous instances of mimicry among the Lepidoptera of India and the Malay Archipelago, and Trimen directed attention to similar facts among South African butterflies. The latter include the most remarkable instance of mimicry yet discovered. The male of a South African swallow-tailed butterfly (*Papilio cenea*) is typical in appearance and possesses the characteristic 'tails' on the hind-wings: the female is utterly unlike the male in the colouring and form of the wings, the 'tails' being entirely absent. While the female is so different from the male of its own species it appears in three well-marked varieties mimicking three different species of the nauseous genus *Danais*—viz. the black brown-spotted *D. Echeria*, the

Abyssinia (*P. antinorii*). This example strongly enforces a conclusion also arrived at by Bates and Wallace—viz. that the females are far more frequently mimetic than the males. Wallace has explained this because of the especial dangers incurred by the female during her slow flight when laden with eggs, and her exposure to attack during oviposition.

The examples selected for illustration were lent by Colonel Swinhoe; the figures are about half the natural size. Fig. 1 represents the male of the Indian and African *Hypolimnias misippus*: it is non-mimetic and very unlike the female, being distinctly marked with a large iridescent blue spot on each of the four wings. The iridescent spots on the right wings appear to be larger than those on the left, because they are seen at a different angle. The male remains unchanged in the localities where its female alters in correspondence with the form it mimics. Fig. 2 is the commonest form of female, which mimics the above-mentioned *Danais chrysippus* (fig. 2A), occurring nearly all over the Old World. In Aden and some parts of Africa the latter butterfly is represented by a variety or sub-species with white hind-wings (*Danais alcippus*); see fig. 3A. In the same localities there is a similar variety of the female *Hypolimnias* (the *alcippoides* form), shown in fig. 3. Finally, in Aden and certain African localities there is another variety or sub-species of the *Danais* (*D. dorippus*) without the black and white marks at the tip of the fore-wing, shown in fig. 4A; while the *Hypolimnias* follows with a similar form of female, seen in fig. 4. This latter is also common in the south-west of India, where it has been stated that the mimicked form (*D. dorippus*) does not occur. Colonel Swinhoe, however, felt sure that the existence of the mimicker implied the former presence of the mimicked species. He tested this hypothesis by examining large numbers of the *Danais*, and he found that the *dorippus* form does exist in that part of India, although it is extremely rare: he came across about a dozen in four or five years. It is probable that *dorippus* has been nearly supplanted by the dominant form *chrysippus*, the resemblance between the two being sufficiently close for the mimic of the former to be mistaken for the latter. The case forms a most interesting exception to Wallace's third law quoted below.

The butterflies which afford models for mimicry chiefly belong to the two families *Danaidae* (including *Euploea*, *Danais*, and *Hestia*) and *Acraeidae*, in addition to the *Heliconiidae* of tropical America. There is some direct and much indirect evidence to show that all mimicked species are specially protected by an unpleasant taste or smell. Wallace has concisely stated the conditions under which mimicry occurs, as follows: '(1) That the imitative species occur in the same area and occupy the same station as the imitated. (2) That the imitators are always the more defenceless. (3) That the imitators are always less numerous in individuals. (4) That the imitators differ from the bulk of their allies. (5) That the imitation, however minute, is external and visible only, never extending to internal characters or to such as do not affect the external appearance.'

Examples of mimicry are also well known in other orders of insects. The formidable Hymenoptera (including the hornets, wasps, bees, and ants) are frequently resembled by defenceless insects belonging to other orders, such as moths (Lepidoptera), beetles (Coleoptera), flies (Diptera), &c. The most remarkable example yet described was discovered by W. L. Sclater in tropical America. The leaf-cutting ants (*Ecodoma*) are extremely abundant in this part of the world, and present a

black and white *D. niavius*, and the black reddish-brown and white *D. chrysippus* (see fig. 2A). In West Africa a closely related swallow-tail (*P. merope*) has a very similar male, and females mimicking *D. chrysippus* and the West African form of *D. niavius*. While such remarkable changes have occurred on the mainland of Africa, the ancestral form from which these mimetic species have been developed has been preserved comparatively unchanged in the island of Madagascar, as the closely related *Papilio meriones* in which the female much resembles the male and is non-mimetic. Similar species with sexes almost alike have been found in the Comoro Islands (*P. humbloti*) and in

very characteristic appearance, each homeward-bound ant carrying a piece of leaf vertically in its jaws. Sclater found a homopterous insect which faithfully resembled an ant together with its piece of leaf. The latter was suggested by the thin compressed green body of the insect, and its profile was precisely like that of the jagged edge of the fragment of leaf held over the back of the ant.

The mimicking may be separated from the mimicked species by a still wider interval. Spiders in many parts of the world are defended by resembling the aggressive and justly respected ants. Again, many large caterpillars intimidate their foes by resemblance to snakes. The extraordinary prevalence of mimicry among insects is probably to be explained by their usual defenceless condition, and by their immense fertility and the rate at which the generations succeed each other—conditions which strongly favour the rapid action of natural selection. Hence it is that other forms of protective resemblance are also especially characteristic of insects (see articles BUTTERFLY and CATERPILLAR

in this work). Mimicry is, however, by no means unknown in other animals. Thus, the gaudy colours of the deadly coral snakes (Elaps) of tropical America are mimicked by harmless snakes; and the powerful friar-birds are resembled by defenceless orioles in various Malayan islands. All the instances cited above illustrate protective mimicry—a resemblance which serves to defend the imitator from attack. But there are other although far rarer examples of aggressive mimicry, in which the resemblance favours the attack of the imitator upon the mimicked species or upon species which accompany the latter. Thus, the larvæ of certain flies (*Volucella*) feed upon the larvæ of humble-bees and wasps. The parent fly resembles the humble-bee or wasp, and is thus less likely to arouse suspicion when engaged in laying its eggs in or near the nest.

Mimetic appearances are often combined with other methods of defence; thus, many large caterpillars are well concealed by protective resemblance, and only assume the terrifying snake-like appearance

I. Colours which cause an animal to resemble some part of its environment, or to mimic the appearance of some other species (APATETIC COLOURS).	II. Warning and signalling colours which suggest something unpleasant to an enemy, or aid in the escape of other individuals of the same species (SEMA-TIC COLOURS).	III. Colours displayed in courtship (EPIGAMIC COLOURS). Ex.—Bright colours of male birds.
A. Colours which conceal an animal by causing it to resemble some part of its normal surroundings (protective and aggressive resemblance: CRYPTIC COLOURS).	B. False warning and signalling colours deceptively suggesting something unpleasant to enemies or attractive to prey (protective and aggressive mimicry and alluring colours: PSEUDOSEMATIC COLOURS).	
1. Concealment as a defence against enemies (protective resemblance: PRO-CRYPTIC COLOURS). Ex.—Colours by which palatable insects are concealed (see arts. Butterfly and Caterpillar).	1. Colours which deceptively suggest something unpleasant or dangerous to an enemy (protective mimicry: PSEUDOSEMATIC COLOURS). Ex.—Hornet-like moth, snake-like caterpillar.	1. Colours which warn an enemy off by denoting something unpleasant or dangerous (warning colours: APOSEMATIC COLOURS). Ex.—Gaudy colours of noxious or dangerous insects.
2. Concealment enabling an enemy to catch its prey (aggressive resemblance: ANTICRYPTIC COLOURS). Ex.—Colours of tiger, lion, &c.	2. Colours which deceptively suggest something attractive to prey, or enable an enemy to approach without exciting suspicion (alluring colours and aggressive mimicry: PSEUDEPISEMATIC COLOURS). Ex.—Mantis (<i>Hymenopus</i>), which attracts the other insects on which it feeds by resembling a pink flower, <i>Volucella</i> .	2. Colours which enable individuals of the same species quickly to recognise and follow each other (recognition marks: EPISEMATIC COLOURS). Ex.—White tail of rabbit.

when alarmed. It is of great interest to trace the relation of mimicry to the other uses of colour in animals. This relationship is shown in the above table. The difference between mimicry and protective resemblance (with which it is often confused) will be seen when A is compared with B.

The term mimicry has been criticised as seeming to imply conscious volition on the part of the imitator. Such a misapprehension is unlikely to arise in any one who has read the literature of the subject. Authorities are agreed that the resemblance has been gradually produced by the operation of natural selection which has ensured the persistence of all variations tending in the direction of some well-defended insect avoided by foes.

See H. W. Bates, 'Butterflies of the Amazon' (*Trans. Linn. Soc.*, xxiii.); A. R. Wallace, 'Malayan Butterflies' (*Trans. Linn. Soc.*, xxv.), *Essays on Natural Selection, Tropical Nature, Darwinism*; R. Trimen, 'South African Butterflies' (*Trans. Linn. Soc.*, xxvi.); Belt, 'Naturalist in Nicaragua'; Poulton, 'Colours and Markings of Insects' (*Proc. Zool. Soc.*, 1887), *Colours of Animals* (Inter. Sc. Series).

Mimosæ, a sub-order of Leguminosæ, distinguished by regular flowers and petals valvate in bud. Over 1500 species are known, all natives of warm climates, a few only extending beyond sub-tropical regions in the southern hemisphere. The

genera *Acacia* (q.v.) and *Mimosa* are the best known. To the latter genus belong the Sensitive Plant (q.v.), also a great variety of trees usually of beautiful foliage (though their leaves, as in *Acacias*, may be reduced to phyllodia) and often also of valuable timber. The fruits are often esteemed, but the roots and seeds not unfrequently possess drastic or even poisonous properties. They are also rich in tannin and gums.

Mimulus, a genus of plants of the natural order Scrophulariaceæ, having a prismatic 5-toothed calyx, a somewhat bell-shaped corolla, of which the

Mimulus maculatus—var. Arlequin.

upper lip is bifid and the lower lip trifid, two long and two short stamens, and a stigma of two lamellæ, which close together upon irritation. The species are mostly herbaceous plants, natives of America. Some of them are very frequent in flower-gardens, and many fine varieties have resulted from cultivation. They sometimes receive the name of *Monkey-flower*. One species, *M. luteus*, a native of Peru and Chili, and there used as a potherb, has become naturalised in many parts of Britain. The little yellow-flowered Musk Plant, now so common in gardens and on window-sills in Britain, is *M. moschatum*, a native of Oregon and other north-western parts of America.

Mina, a Greek weight and money of account, the sixtieth part of a Talent (q.v.), containing 100 Drachmæ (q.v.).

Mina Bird. See MYNA.

Mineans. See SABÆANS.

Minaret, Minar, a tall turret used in Saracenic architecture. It contains a staircase, and is divided into several stories, with balconies from which the muezzins summon the Mohammedans to prayer—bells not being permitted in their religion—and is terminated with a spire or ornamental finial. The minarets are amongst the most beautiful features of Mohammedan architecture, and are an invariable accompaniment of the Mosques (q.v.). For an illustration, see ARABIAN ARCHITECTURE. In India *Minars*, or pillars of victory, are frequently erected in connection with mosques; some of these are lofty and splendid monuments, that of Kutab, at Old Delhi (q.v.), being 47 feet in diameter at the base and 238 feet high. The form of the minaret was derived from the Pharos (q.v.), the ancient lighthouse of Alexandria; and the name is from the Arabic *mandrat*, 'a lighthouse.'

Minas, capital of a wild, mountainous province (area, 4844 sq. m.; pop. 23,000) of the same name in southern Uruguay, 75 miles by rail N.E. of Montevideo. Pop. 7000.

Minas Geraes, the most populous state of Brazil, lies inland from Espírito Santo and south of Bahia, and has an area of 222,160 sq. m. Pop. (1888) 3,018,807. Lying wholly in the tableland, its surface is occupied with grass and bush-covered *campos*, rising, however, in the Serra do Espinhaco to 5900 feet. The principal rivers include the navigable São Francisco and the Rio Grande, which unites with the Paranaíba to form the Paraná. Agriculture and stock-raising are the chief industries. Some gold is still obtained, and diamonds, iron, and lead are mined. The inhabitants include very few whites; among the Indians the Botocudos (q.v.) are met with.

Mince-pies, an important item of English Christmas fare, composed of very numerous ingredients (suet, raisins, apples, lemons, currants, figs, almonds, flavoured with nutmeg, cinnamon, ginger, &c.) variously compounded and baked in pastry. Formerly mutton or neat's-tongue was an essential ingredient. The shape of the crust was not originally round, but is said to have been intended to represent the manger in which the Holy Child was laid.

Minch, the channel separating the island of Lewes from the mainland of Scotland. It is 24 to 40 miles wide, and has a rapid current. The *Little Minch*, separating Skye from North Uist and the neighbouring islands in the Outer Hebrides, is 14 to 20 miles wide.

Minchinhampton, a market-town of Gloucestershire, 3½ miles SSE. of Stroud. James Bradley is buried in the churchyard. Pop. of parish, 4561.

Mincio, a tributary of the Po, rises in south Tyrol, and flows as the Sarca 80 miles to Lake Garda, from which it issues as the Mincio, and after a southerly course of 93 miles past Mantua joins the Po from the left. It forms an integral part of the Quadrilateral (q.v.) or system of fortification defending North Italy, and has had several great battles fought in its vicinity, as Castiglione (1796), Solferino (1859), Custoza (1849 and 1866).

Mind. See PSYCHOLOGY.

Mindanao. See PHILIPPINE ISLANDS.

Minden, a Prussian town in Westphalia, on the Weser, 40 miles W. of Hanover. Till 1873 a fortress of the second class, it was already a town in Charlemagne's day, and suffered much in the Thirty Years' War, and again in the Seven Years' War, when, on 1st August 1759, the French were defeated here by an Anglo-Hanoverian army under Ferdinand of Brunswick and Lord George Sackville. It has a fine new bridge (1874), a Gothic town-hall, a Catholic church (till 1811 cathedral), built between the 11th century and 1379, and restored in 1864-85, manufactures of tobacco, beer, brandy, glass, &c., and a considerable river trade. Pop. (1885) 18,592. See also MÜNDE.

Mindere's Spirit, or SOLUTION OF ACETATE OF AMMONIA, is a valuable diaphoretic, much used in febrile diseases. It is prepared by adding ammonia or the carbonate of ammonia to acetic acid till a neutral liquid is obtained. It is sometimes applied hot on flannel in cases of mumps, while it has also been employed as an eyewash in chronic ophthalmia.

Mine. See MINING, MINES (MILITARY).

Minehead, a watering-place of Somersetshire, on the Bristol Channel, 25 miles NW. of Taunton. Till 1832 it was a parliamentary borough. Pop. of parish, 1774.

Mineral Kingdom, the inorganic portion of nature. Under this term, however, are not included the inorganic products of organic beings, as sugar, resins, &c., although substances more remotely of vegetable or even animal origin are reckoned among minerals, as naphtha, bitumen, asphalt, &c. To the mineral kingdom belong liquid and gaseous, as well as solid substances; water, atmospheric air, &c. are included in it. All the chemical elements are found in the mineral kingdom, from which vegetable and animal organisms derive them; but many of the compounds which exist in nature belong entirely to the vegetable and animal kingdoms, and are produced by the wonderful chemistry of life.

Mineralogy, the science which treats of minerals, does not embrace all that relates to the mineral kingdom. *Simple minerals* alone, or homogeneous mineral substances, are regarded as the subjects of mineralogy; rocks formed by the aggregation of simple minerals, and their relations to each other, are the subjects of Geology (q.v.). This limitation of the term mineralogy is comparatively recent. Geology or geognosy was formerly included in it. The arrangement and description of simple minerals according to their external characters has been called by Werner and others *Oryctognosy*, but the term has fortunately fallen into disuse. Nor is the study of mere external characters sufficient in mineralogy. The chemical composition of minerals equally demands attention. In the classification of minerals some mineralogists, as Mohs and Jameson, have regarded only the external characters, and some, as Berzelius, only the chemical composition; but the results have been unsatisfactory, and the present tendency is in favour of a system which seeks

to constitute natural groups by having regard to both.

Some minerals being of great use, and others highly valued for their beauty, have received much attention from the earliest ages. But the ancient naturalists describe few minerals. The first attempt at scientific mineralogy was by George Agricola in the 16th century. The systems of the Swedes Wallerius and Cronstedt, in the later half of the 18th century, were the first worthy of the name. That of Werner followed, and was extensively adopted. The discoveries of Haüy in crystallography, and the progress of chemistry, gave mineralogy a new character; and then sprang up two schools of mineralogists, one resting chiefly on external characters, and the other on chemical composition.

The chemical classification of minerals is rendered difficult by the endless variety of combination and proportion in the elements of which they are composed, the presence of substances not essential to the mineral, and yet more or less affecting its characters, and the frequent impossibility of determining what is to be deemed essential and what accidental. Chemical purity is almost never found in nature. Even the purest diamond, when burned, leaves some traces of ash; and the various colours of diamond, quartz, and other minerals are due to the presence of substances which are often in so small quantity as not to affect their crystalline forms or other physical properties. Again, some minerals of identical chemical composition differ in their crystallisation, so that an arrangement founded upon it would separate them too widely. There are also many minerals which are often found in an uncrystallised state, and others which are always so. In the arrangement of minerals into natural groups, their chemical composition, although not alone to be regarded, is of the first importance, so that the place of a new mineral in the system can never be determined without analysis; and in determining the nature of a mineral chemical tests, such as the application of acids, are continually resorted to. It is also necessary to know its specific gravity, and how it is acted upon both by a moderate heat and by the blowpipe. An examination of the crystalline forms, with measurement of the angles of the crystals, is often sufficient to distinguish minerals which have otherwise much resemblance. The *cleavage* of crystals is also important—a readiness to split in planes parallel to certain of their faces only, by which the *primitive form* of the crystal may be ascertained. Minerals not crystallised exhibit important varieties of *structure*, as *laminated*, *fibrous*, *granular*, &c. Certain peculiarities of *form* are also frequently characteristic of uncrystallised minerals, as *mamillary*, *botryoidal*, &c. Minerals exhibit, when broken, very different kinds of *fracture*, as *even*, *conchoidal*, *splintery*, &c. *Opacity*, *translucency*, and *transparency* are more or less characteristic of different kinds: *electric* and *magnetic* properties demand attention; and very important characters are derived from *lustre*, which in some minerals is *metallic*, in others *semi-metallic*, in others *pearly*, *vitreous*, &c. *Colour* is not generally of much importance, but in some minerals it is very characteristic. The colour of the powder formed when a mineral is scratched often differs from that of the solid mass. This is the *streak* of the mineral, and is frequently very characteristic. *Hardness* and *tenacity* are very important, and are of all various degrees. *Uncutness* and other peculiarities to be ascertained by the touch are very characteristic of some minerals, and peculiarities of *taste* and *smell* belong to others.

Mineralogy has very important relations with geology, which cannot be studied without regard

to the mineral constituents of rocks. The mineral composition of soils greatly affects vegetation and agriculture. The economical uses of minerals are also very important and various. It is enough merely to allude to salt, sulphur, borax, alum, graphite, cryolite, native metals, metallic ores, &c. Naphtha, petroleum, bitumen, asphalt, &c. are of well-known utility; and a high value has always been attached to gems and other ornamental stones. There are special handbooks by Bauerman, Dana, Wöhler, Brush, and Erni. See GEOLOGY, CRYSTALLOGRAPHY.

Mineral Oil. See BAKU, NAPHTHA, PARAFFIN, PETROLEUM.

Mineral Tallow, or HATCHETTINE, a remarkable substance found in several places in Britain, Germany, Siberia, &c., soft and flexible, yellowish white, yellow, or greenish yellow, resembling wax or tallow, often flaky like spermaceti, inodorous, melting at 115° to 170° F., and composed of about 86 per cent. carbon and 14 per cent. hydrogen. The mineral is closely related to, if it be not identical with, ozokerite or native paraffin. Like other hydrocarbons, such as naphtha, petroleum, asphalt, &c., Hatchettine appears to have resulted from the chemical alteration of organic matter.

Mineral Waters, spring waters which possess qualities in relation to the animal body different from those of ordinary water, have been used as remedial agents from a very early period. The oldest Greek physicians had great faith in their curative power, and the temples erected to Asclepius were usually in close proximity to mineral springs; the warm baths of Calirrhoe, near the Dead Sea, are mentioned by Josephus as having been tried by Herod in his sickness. We are indebted to the Romans for the discovery not only of the mineral thermic springs in Italy, but of some of the most important in other parts of Europe, amongst which may be named Aix-la-Chapelle, Baden-Baden, Bath, Spa in Belgium, and many others; and Pliny (*Natural History*) mentions a very large number of mineral springs in almost all parts of Europe (see BATH, HYDROPATHY). The therapeutic action of mineral waters or spas depends chiefly upon their chemical composition and their temperature, though other circumstances, as situation, elevation, climate, geological formation, mean temperature, &c., have an important bearing upon the success of the treatment.

The best time for undergoing a course of mineral waters is, in the majority of cases, the months of June, July, August, and September. There are, however, exceptions depending upon climate; for example, at Gastein, celebrated for its thermal springs, the weather is changeable and stormy in June and July, but pleasant in May, August, and September. Early rising is usually advisable during a course of mineral waters, and, as a general rule, the water should be drunk before breakfast, at intervals of about a quarter of an hour between each tumbler, moderate exercise being taken in the intervals. In many cases bathing is of even greater importance as a remedial agent than drinking. Baths are generally taken between breakfast and dinner, and should never be taken soon after a full meal. The time during which the patient should remain in the bath varies very much at different spas, and the directions of the local physician should be strictly attended to on this point. As a general rule, the treatment should not be protracted beyond the space of six weeks or two months, but on this point the patient must be solely guided by the physician resident at the spa. Indulgence in the pleasures of the table, and excesses of any kind, frequently counteract the salutary effects of the waters, while perfect mental

relaxation is an important auxiliary to the treatment. Spas are only suitable for patients suffering from *chronic disorders*.

No classification of mineral waters based upon their chemical composition can be strictly exact, because many springs are, as it were, intermediate between tolerably well characterised groups. The following classification, adopted by Althaus, is perhaps the most convenient: (1) Alkaline Waters; (2) Bitter Waters; (3) Muriated Waters; (4) Earthy Waters; (5) Indifferent Thermal Waters; (6) Chalybeates; (7) Sulphurous Waters.

(1) The Alkaline Waters are divisible into (a) *Simple Alkaline Acidulous Waters*, of which the chief contents are carbonic acid and bicarbonate of soda. The most important spas of this class are the thermal springs of Vichy and the cold springs of Fachingen, Geilnau, and Bilin. These waters are useful in certain forms of indigestion, in jaundice arising from catarrh of the hepatic ducts, in gallstones, in renal calculi and gravel, in gout, in chronic catarrh of the respiratory organs, and in abdominal plethora. Vichy (q.v.) may be taken as the representative of this class of springs. (b) *Muriated Alkaline Acidulous Waters*, which differ from the preceding sub-group in additionally containing a considerable quantity of chloride of sodium. The most important spas of this kind are the thermal springs of Ems, and the cold springs of Selters and Salzbrunn. They are useful in chronic catarrhal affections of the bronchial tubes, the stomach and intestines, and the larynx; while the Ems waters possess a high reputation in certain chronic diseases of the womb and adjacent organs. (c) *Alkaline Saline Waters*, of which the chief contents are sulphate and bicarbonate of soda, such as the warm springs of Carlsbad and the cold springs of Marienbad, serviceable to patients suffering from abdominal plethora, if unconnected with diseases of the heart or lungs. These waters, especially those of Carlsbad, afford an excellent remedy for the habitual constipation which so frequently arises from sedentary occupations.

(2) The chief contents of the Bitter Waters are the sulphates of magnesia and soda; and the best-known spas of this class are those of Sedlitz, Friedrichshall, and Kissingen; although two valuable English examples are the bitter water of Cherry Rock, near Kingswood, in Gloucestershire, and the Purton Spa, near Swindon, in Wiltshire. These waters act both as purgatives and diuretics.

(3) The Muriated Waters are divisible into (a) *Simple Muriated Waters*, of which the chief contents are a moderate quantity of chloride of sodium or common salt. The chief spas of this class are Wiesbaden and Baden-Baden, which are hot; those of Soden (in Nassau), of Mondorf (near Luxembourg), and of Canstatt (near Stuttgart), which are tepid; and those of Kissingen, Homburg, and Cheltenham, which are cold. The muriated saline springs of Saratoga in the United States are some of them chalybeate, others sulphurous or iodinous; all of them being rich in carbonic acid gas. The Ballston saline spring near Saratoga has a very high proportion of carbonic acid. They are chiefly employed in cases of gout, rheumatism, scrofula, and abdominal plethora. (b) *Muriated Lithia Waters*, of which the chief contents are the chlorides of sodium and lithium. In gout they first aggravate the pain, but then give relief; and in periodic headache they have been found serviceable. (c) *Brines*, whose chief contents are a large amount of chloride of sodium, such as the spas of Rehme in Westphalia and Nauheim in Hesse. They are mostly employed for bathing, and are often of much service in scrofula, anaemia, rheumatism, certain forms of paralysis, and catarrh of the mucous membranes. (d) *Iodo-bromated Muri-*

ated Waters, in which, besides a moderate quantity of chloride of sodium, the iodides and bromides of sodium and magnesium are contained in an appreciable quantity. The Kreuznach waters are used both for drinking and bathing, and are of service in scrofulous infiltrations of the glands, in scrofulous ulcers, in chronic inflammation of the uterus and ovaries, &c. The waters of Hall, in Austria Proper, have a high reputation in cases of bronchocele or goitre.

(4) Earthy Waters, of which the chief contents are sulphate and carbonate of lime, as at Wildungen, Leuk, Bath, Lucca, and Pisa. The Wildungen water is 'a capital diuretic, and not only promotes the elimination of gravel and renal calculi, but, by its tonic action on the mucous membrane of the urinary passages, serves to prevent the formation of fresh concretions. It is also much used for chronic catarrh of the bladder, neuralgia of the urethra and neck of the bladder, dysuria, and incontinence of urine.' The baths of Leuk, in which many patients remain nine hours daily (viz. from 4 A.M. to 10 A.M., and from 2 P.M. to 5 P.M.), until an eruption appears, are chiefly used in chronic skin diseases. The waters of Bath, Pisa, and Lucca, which are thermal, are useful in chronic skin diseases, gout, rheumatism, &c.

(5) Indifferent Thermal Waters, which usually contain a small amount of saline constituents. Of the spas of this class the most important are Gastein (95° to 118°), Teplitz (120°), Wildbad (96°), Warmbrunn (100°), Clifton (86°), and Buxton (82°). Their most striking effects are to stimulate the skin and excite the nervous system. 'They are especially used in chronic rheumatism and atonic gout; in diseases of the skin, such as prurigo, psoriasis, lichen; in neuralgia and paralysis due to rheumatic and gouty exudations, to parturition, or to severe diseases, such as typhoid fever and diphtheria; in hysteria; and in general weakness and marasmus.'

(6) Chalybeate Waters, which are divisible into (a) *Simple Acidulous Chalybeates*, whose chief contents are carbonic acid and bicarbonate of protoxide of iron; and (b) *Saline Acidulous Chalybeates*, whose chief contents are sulphate of soda and bicarbonate of protoxide of iron. The quantity of iron present is very small—from .08 to .15 in 1000 parts. Many of the chalybeate springs, especially in Germany, contain also much carbonic acid; carbonate, sulphate, and chloride of sodium is frequently present, and may help in the cure. Harrogate, Rippoldsau, Homburg, and the Putnam Spring at Saratoga are examples of chalybeate wells which are very seldom thermal. Strathpeffer has both chalybeate and sulphurous springs. Chalybeate waters are valuable in anaemia, enlargement of the spleen, and many female disorders.

(7) Sulphurous Waters, which contain sulphuretted hydrogen or metallic sulphides (sulphurets), or both. The most important sulphurous thermals are those of Aix-la-Chapelle, Baden (near Vienna), Bâreges, Eaux-Chaudes, and Bagnères de Luchon; whilst amongst the cold sulphurous springs those of Nenndorf (in Hesse-Nassau) and Harrogate are of great importance. They are extensively used in chronic diseases of the skin, and are of service in many cases in which exudations require to be absorbed, as in swellings of the joints, in old gunshot wounds, and in chronic gout and rheumatism. In chronic laryngeal and bronchial catarrh they frequently give relief, and in chronic poisoning by lead or mercury they favour the elimination of the poison, although to a far less degree than iodide of potassium taken internally. The sulphurous waters are employed externally and internally, and mineral mud-baths are believed by many physicians to form a valuable auxiliary to this treatment.

See Althaus, *Spas of Europe* (1862); Glover, *Mineral Waters* (1857); Tichbourne and Prosser James, *Mineral Waters of Europe* (1883); Bradshaw's *Dictionary of Mineral Waters* (new ed. 1886); Walton, *The Mineral Waters of the United States and Canada* (1875); German works by Herschfeld and Pichler (1875-76), Lehmann (1877), Flechsigs (1882); and the works cited at HEALTH-RESORTS.

Minerva, the name of a Roman goddess, identified by the later Græcising Romans with the Greek Athena (q.v.). Her name is thought to spring from the same root as *mens* ('mind'); and the ancient Latin scholar and critic, Varro, regarded her as the impersonation of divine thought—the plan of the material universe of which Jupiter was the creator and Juno the representative. Hence all that goes on among men, all that constitutes the development of human destiny—itsself but the expression of the divine idea or intention—is under her care. She is the patroness of arts and trades, and was invoked alike by poets, painters, teachers, physicians, and all kinds of craftsmen. She also guides heroes in war; and, in fact, every wise idea, every bold act, and every useful design owes something to the high inspiration of this virgin goddess. Her oldest temple at Rome was that on the Capitol, but she had another on the Aventine. Her festival was held in March, and lasted five days, from the 19th to the 23d inclusive.

Minerva-press, the name of a printing-office in Leadenhall Street, London, from which issued in the later part of the 18th and the earlier part of the 19th century a long series of highly sentimental novels, with remarkably intricate plots and an ample measure of tribulation and tears before the happy denouement was reached. These were gradually laughed out of existence as a taste for more humane and healthy fiction spread over England.

Minervino, an agricultural town of Southern Italy, 44 miles W. of Bari. Pop. 14,972.

Mines, MILITARY, are underground passages by means of which explosives are lodged in such a position as to destroy the enemy's works or to gain cover for lodgments from which the besieger may continue his advance. They are generally but a few feet below the surface, never driven through rock for any distance, and require lining with wooden cases.

Before the invention of gunpowder, mines were constantly used to effect an entrance into a besieged place or to breach its walls by underpinning them with timber, which was then set on fire. By means of them Alexander the Great breached the walls of Gaza. Caesar found the Gauls skilled in their use, and even able to arrest the progress of his own miners. Powder mines began to be largely used early in the 16th century. At the siege of Padua in 1509 the breaches were ruined and the mines exploded under the feet of the storming parties. *Countermines*, too, behind the walls near their base, and then long galleries from them under the ditch with transversals and listeners were added to the permanent fortifications of the 17th century. These enabled the besieged to ascertain the direction of the besiegers' mining approach and to destroy his galleries by timely explosions. Thus at the siege of Candia by the Turks, which lasted two years and a half (1667-69), more than 1300 mines were exploded by one side or the other. Systems of countermines became very elaborate during the 18th century, radiating from the salients sometimes in several tiers; the length of the galleries for a single front in some cases amounted to 3 miles or more. Modern systems are perhaps less elaborate, but their importance is fully recognised.

When the besieger can no longer advance by surface approaches he has recourse to mining, sinking a vertical *shaft* (4' x 2' inside measurement) or an *inclined gallery* (6' 8" x 6' 6" or 4' 10" x 2'), generally from the third parallel, and from it working his way forwards. *Branch-galleries* (3' 6" x 2') are broken out wherever necessary, and specially constructed *frames* fitted throughout as the work progresses. In such a confined space only very small tools can be used, and only one man can work at the head of a gallery at one time, doing about 12 inches an hour. Small trucks and bellows, or other ventilating appliances, are also necessary. At the head of the gallery a chamber is constructed to hold the charge, which is then *tamped*—that is to say, the gallery in rear is filled with earth, for a distance greater than the length of the *line of least resistance*, or distance to the nearest surface, and fired by electricity, powder hose, or Beckford's fuse. If the circular opening made by the explosion has a diameter equal to the line of least resistance it is called a *one-lined crater*; if double that line, a *two-lined crater*, and so on. Mines producing *two-lined craters* are called *common mines*; those so lightly charged as to produce no craters are called *camouflets*. The latter are used by the defender to destroy the assailant's mines without forming craters which he might utilise as lodgments. Gunpowder is preferred to other explosives if the gallery is to be used again, as the fumes are not so noxious.

Mining tactics require very great coolness, judgment, and resolution, especially on the part of the besieged. He must from his listening galleries estimate the distance of the enemy and avoid exploding his countermines too soon or he will only injure his own galleries. If he ceases to hear the miner's truck running in the enemy's gallery he will know that tamping has commenced and that, if within range, the time has come to explode his *camouflet*. The defender is restricted to small charges for fear of making craters, unless his countermine galleries are very deep, while the besieger can advantageously use very large ones. Thus the former may be said to fight with a short-range weapon against an adversary using one which is effective at a greater distance. The chief point in his favour is that he can prepare beforehand a network of galleries, and by using boring tools he can place charges some distance in advance of their heads; but the besieger will ascertain their disposition and extent by means of plans or spies, and will place heavily charged mines on a line as nearly as possible parallel to the ends of the countermines, but not nearer than 14 yards, the distance at which work is audible to the enemy. These are fired and lodgments formed in their craters from which the same tactics are repeated; the countermines when broken into are occupied, and thus ground is gradually gained, and the defender driven back step by step until the counterscarp is reached. This wall is broken through by a mine, the ditch crossed, the breach reached and occupied. Under the breach the defender will have placed mines which he will spring at the moment of assault.

Somewhat akin to these latter are the *ground torpedoes* placed in front of a work close under the surface of the ground over which the enemy must pass to the assault, and fired by the pressure of his weight upon them. These are chiefly of use against savages, and were largely employed by General Gordon in the defence of Khartoum.

Another similar form of defence called a *fougasse* is an excavation in the form of the frustum of a cone with its axis inclined at about 40° with the horizon. The charge is placed in a recess at the bottom, covered with a strong wooden

platform on which rough stones, bricks, or shells are placed. On being fired these are projected forward and cover a large surface of the ground in front. Eighty pounds of powder would throw 5 tons of bricks and stones over a space 160 yards long and 120 broad. A *shell fougasse* is simply a box buried in the ground, the lower part filled with powder and the upper with shells. It is generally self-exploding, like the ground torpedo.

Submarine mines are charges of explosive material (usually gun-cotton or dynamite) sunk in rivers, estuaries, or roadsteads to prevent the passage of hostile ships. They are either *observation* mines, fired by electricity from an observing station; *controlled* electro-contact mines, fired by the defender when a vessel striking them gives notice of its being over them; *uncontrolled* mines, mechanical, electro-mechanical, or chemical, which are exploded when struck with adequate force by friend or foe; or *dormant* mines, which, sunk at first, can at any time be caused to rise and obstruct the passage.

Submarine mines are usually placed chequerwise in several rows and groups and often at varying depths. Observation mines cannot be relied upon at greater distances than one sea mile in foggy weather, and at night must be watched by electric search-lights. With contact mines there is the danger of friendly ships mistaking the channel. All mine fields must be defended by heavy guns placed in batteries secure against landing parties, otherwise the enemy's boats will creep for the mines or clear a passage through them by exploding countermines. It is so difficult to arrange a system of mines which will not interfere with the passage of friendly ships and yet can be relied upon to prevent that of an enemy's vessels at all times and in all weathers, however disguised, that they are only unobjectionable when used for the absolute closing of comparatively narrow channels to all traffic.

Some sea-forts have torpedo passages from which Whitehead fish torpedoes and similar projectiles can be discharged; but these can hardly be classed as submarine mines.

Minghetti, MARCO, Cavour's most distinguished disciple and successor as leader of the Italian Right, was born 8th September 1818 of a commercial family in Bologna, and supplemented a brilliant course at its university by a prolonged tour in France, Germany, and Great Britain. Free trade as vindicated by Richard Cobden found him prepared for its acceptance, by familiarity with the teaching of its Tuscan anticipator Bandini. With the election in 1846 of Pope Pius IX. young Italy's aspirations for national unity and constitutional government seemed nearing their fruition, and Minghetti started a journal in aid of his country's regeneration. He enjoyed Pio Nono's favour, and was made member of the 'Consulta della Finanze' and minister of Public Works. But under the pressure of Austria, backed by Radetsky's forces, the pope's reforming zeal was short-lived, and Minghetti, like others of his school, aborted the papal government and enrolled in the Sardinia army to fight for his country's cause under King Charles Albert. He served with distinction in the Lombard campaign; was promoted captain, then major; and on the field of Custoza earned the cross of the Knights of St Maurizio. After the fatal defeat at Novara he settled at Turin, an ardent student of economics and devoted friend of Cavour, whose confidences he shared during the diplomatic meetings at Paris which preceded the Crimean war, the war of 1859, and the expulsion of Austria from Lombardy. In the eventful years 1859-60 he was Cavour's secretary for foreign affairs, till he resigned with his chief over

the treaty of Villafranca. His next post was that of minister of the Interior, and on Cavour's death in June 1861 he was regarded as his ablest representative in the Italian chamber. In 1863 he became prime-minister, in 1864 he concluded with the Emperor Napoleon the 'September Convention.' In 1868 he was Italian minister in London, and thereafter minister of Agriculture. In 1870 the collapse of the Second Empire brought with it the dissolution of the September Convention, and Rome became the capital of Italy and seat of government. From 1873 to 1876 Minghetti was prime-minister for the second time, and among many useful measures earned his country's gratitude by effecting the 'paraggio' or financial equilibrium between her outlay and income. For the next ten years Minghetti was still the most prominent member of the Italian parliament. His lectures and essays on Raphael and Dante illustrate on the æsthetic side a catholicity of culture which in the sphere of practical politics can point to his treatises on *Economia Publica* (1859) and *La Chiesa e lo Stato* (1878). He died in Rome, 10th December 1886. See his *Miei Ricordi* (Turin, 1888).

Mingrelia. See GEORGIA, CAUCASUS.

Minho (Span. *Minho*, anc. *Minus*), a river of Spain and Portugal, rises in the north-east of Galicia, flows south-west through the Spanish provinces of Lugo and Orense, and, after forming the boundary between Portugal and Spain, falls into the Atlantic Ocean. Its total length is 174 miles, and it is navigable for small craft 25 miles above its mouth; a bar at the entrance prevents the passage of large vessels. Area of basin, 157,000 sq. m. Its chief tributary is the Sil, which joins it from the left.

Miniature-painting, or the painting of portraits on a small scale, originated in the practice of embellishing manuscript books (see ILLUMINATION OF MANUSCRIPTS). As the initial letters were written with red lead (Lat. *minium*), the art of illumination was expressed by the Low Latin verb *miniare*, and the term *miniatura* was applied to the small pictures introduced. After the invention of printing and engraving this delicate art entered on a new phase; copies in small dimensions of celebrated pictures came to be in considerable request, and, in particular, there arose such a demand for miniature-portraits that a miniature in popular language came to signify 'a very small portrait.' Soon after their introduction miniature-portraits were executed with very great skill in England. Holbein (c. 1495-1543) painted exquisite miniatures, and having settled in London, his works had great influence in calling forth native talent. The works of Nicholas Hilliard (born at Exeter 1547, died 1619) are justly held in high estimation. Isaac Oliver (1556-1617) was employed by Queen Elizabeth and most of the distinguished characters of the time; his works are remarkable for careful and elaborate execution; and his son, Peter Oliver (1601-47), achieved even a higher reputation. Thomas Flatman (1637-88) painted good miniatures. Samuel Cooper (born at London 1609, died 1672), who was with his brother Alexander a pupil of his uncle, John Hoskins, an artist of reputation (died 1664), carried miniature-painting to high excellence. Cromwell and Milton sat to him; he was employed by Charles II., and obtained the highest patronage at the courts of France and in Holland. Jean Petitot (1607-91) was the first to bring to perfection the art of enamelling as applied to portraiture. There are as many as fifty-eight examples of this great artist in the Jones Collection at the South Kensington Museum. Richard Cosway (1740-1821) was one of the most famous miniaturists of the 18th century.

Robert Thorburn (1818-85) first made his name as a miniaturist, and many others might be mentioned; but the last famous miniature-painter was Sir William Ross (1794-1860), who lived to see his art superseded by photography. The number of his miniatures in existence is said to number over 2200. Of late years public interest in the work of the miniaturist has revived, and several exhibitions of miniatures have been held. Prices have advanced, and it is extremely difficult to obtain good examples. The works of Cosway are especially sought after. Photography may be said to have killed the art, although miniatures have continued to be painted; but enthusiasts hope from the interest now taken in historical specimens that the art may yet be revived. As to technical details, the early artists painted on vellum and used body-colours—i.e. colours mixed with white or other opaque pigments, and this practice was continued till a comparatively late period, when thin leaves of ivory fixed on card-board with gum were substituted. Many of the old miniature-painters worked with oil-colours on small plates of copper or silver. After ivory was substituted for vellum transparent colours were employed on faces, hands, and other delicate portions of the picture, the opaque colours being only used in draperies and the like; but during the 19th century, in which the art has been brought to the highest excellence, the practice has been to execute the entire work with the exception of the high lights in white drapery with transparent colours.

See Walpole's *Anecdotes; Catalogue of Miniatures exhibited at South Kensington* (1865); Russell, *Art of Miniature* (4th ed. 1870); Wagner, *Miniature Painting* (Philadelphia, 1876); Foster, 'Some Miniature Painters,' in *Antiquary* (vols. xiii.-xiv.); J. W. Bradley, *Dictionary of Miniaturists* (3 vols. 1888-89); and J. L. Probert, *History of Miniature Art* (1889).

Minie, CLAUDE ETIENNE, inventor of the Minie rifle, was born in Paris in 1814, enlisted in the army as a private soldier, and quitted it as colonel in 1858. He devoted his principal thought to the perfecting of firearms, and in 1849 invented the Minie rifle (see RIFLE). In 1858 the khedive of Egypt appointed him director of a small-arms factory and musketry school in Cairo. He died in 1879.

Minims (*Fratres Minimi*, 'Least Brethren')—so called, in token of still greater humility, by contrast with the *Fratres Minores* or Lesser Brethren of St Francis of Assisi, an order of the Roman Catholic Church, founded by another St Francis, a native of Paula, a small town of Calabria, about the middle of the 15th century. See FRANCESCO DI PAULA.

Mining. The art of mining comprehends all the processes whereby the useful minerals are obtained from their natural localities beneath the surface of the earth, and the subsequent operations by which many of them must be prepared for the purposes of the metallurgist. The art has been practised from the remotest times. It is referred to in the 28th chapter of the Book of Job; and an Egyptian papyrus, drawn in 1400 B.C., preserved in the museum at Turin, depicts the workings of a gold-mine. The first writer who treated mining systematically was Georgius Agricola. In 1556 he published in Latin an exhaustive treatise on the subject. The introduction of gunpowder as a blasting-agent in 1620 completely changed the conditions under which mining had up to that time been carried on, and the enlarged scale on which mining operations are now conducted has led to the invention of new methods of working, and to the introduction of machines of greater precision and power.

All mineral deposits are divided into two very

broad divisions. The first includes the beds or seams of iron ore, coal, and salt. These are deposits laid out more or less horizontally and parallel to the stratification of the surrounding rocks. The second class includes mineral veins or lodes (see ORE-DEPOSITS). Various names have been given to these deposits. In the British colonies, for example, they are termed *reefs* (see GOLD), a somewhat misleading name. A lode may be defined as a repository of mineral matter which fills more or less completely a former fissure in the earth's surface.

The mining appliances employed are very different in the two classes of deposits. In the first class, it is desirable to make a hole of the shortest possible depth from the surface of the ground to the bed of mineral. A shaft is therefore sunk through valueless beds until the mineral is reached. Machinery of the best class is then used to extract the whole of the mineral, due precautions being taken to avoid danger from falls of roof and from noxious gases. In the second class of deposits, the inclination of the mineral vein has to be taken into account, as the deposit varies considerably in inclination and in size. The vein must therefore be studied foot by foot, downwards from the top. The miner does not look favourably on vertical veins. Certainly in most cases it would appear that the chance of vertical lodes being productive is much less than in inclined ones. In some cases a vertical shaft is sunk, and passages, known as *cross-cuts*, are driven from this to the vein at different levels. A vertical shaft presents the advantages of greater ease in sinking, hauling, and pumping. At the Comstock lode, in Nevada, thousands of pounds were wasted in sinking a perpendicular shaft, the advantages of which were urged with considerable plausibility. A deep shaft may cost from £10,000 to £50,000. In the case of an inclined shaft the ore obtained from the shaft itself enables some of the charges to be recouped. In a well-known Cornish copper-mine, Tresevean, after an inclined shaft had been used for many years, a new shaft, 1800 feet in depth, was sunk at a cost of £20,000; but success had already been assured before this great outlay was contemplated. The best arrangement for an extensive mine is to have a main vertical shaft and several secondary inclined ones. With inclined shafts it is out of the question to put in the highly-perfected engines used at collieries, the object being not the removal as quickly as possible of large quantities of material, but the exploration of the vein by slow and careful degrees at many points and with a moderate number of men.

In searching or prospecting for mineral deposits large sums of money are spent, sometimes in vain. The surface of the rock is usually covered by deposits of sand and gravel, vegetable matter, vegetation, and, in some cases, peat bogs. In consequence, many notable mines have been discovered by accident. Thus, the observation of the pellets picked up by birds led to the discovery of veins of gold ore in Lower Hungary. The famous silver-mines of Potosi are said to have been discovered by an Indian who, taking hold of a bush to prevent his falling, pulled it up by the roots and thereby disclosed glittering masses of native silver. Again, gold was discovered in California by James W. Marshall, in 1848, while cutting a small mill-race. In ancient times the search for mineral deposits was based on the indications given by the Divining-rod (q.v.); and there still exist intelligent miners who believe in this curious myth.

In the search for mineral deposits, the best evidence is obtained by putting down bore-holes. These are made by various methods, and are put down to a depth of a few feet when required for

testing the character of the foundation subsoil, or, in other cases, to thousands of feet when required in seeking for or estimating the value of deposits of coal, salt, and ironstone. Ages ago bore-holes were put down by the Chinese to a depth of 3000 feet. Recently, in Europe and America, depths of 2000 feet have not unfrequently been attained. At Schladebach, near Merseburg, the deepest bore-hole in the world has been put down by the Prussian government in search of coal. The sinking occupied several years (1880-86), and the depth attained amounted to 5834 feet.

Bore-holes may be made by a circular borer moved by a lever. The rods are of iron, with square heads, and are turned by a cross-head worked by a couple of men. In this way an auger-like cutting action is effected. With harder rock it is usual to advance by means of percussion. A chisel-headed tool is employed, which cuts holes of 3 to 4 inches in diameter. At each stroke the bore-master causes the tool to turn slightly. When sufficient debris has accumulated the rods are withdrawn, and an instrument put down to extract the powdered material and water. With a length of rods amounting to 400 to 500 feet the weight is enormous, and, in consequence of the concussion, difficulties arise. Men are not sufficient to raise the load. In some cases a lever is used to raise the rods a few inches or feet, and to let them fall suddenly. In other cases the rods are replaced by a rope. This, however, from being wet and dry alternately, is apt to snap suddenly, and the rods remaining in the hole are difficult to recover. The rods, too, may get twisted or the nature of the iron itself be altered by the vibration. In putting down a bore-hole, a tower or shears is erected over the hole. By making this 60 to 70 feet high, the rods may be extracted in lengths of 60 feet, and thus the 6 to 8 hours a day usually spent in unscrewing the rods are saved. In some cases it is necessary to tube or line the whole bore-hole. See BORING.

The Chinese method of boring with ropes has been imitated in Europe with great economy, but with great liability to fracture and consequent loss. This has been done by Messrs Mather & Platt of Salford, who employ a chisel-bit with circular sides so as to keep the bore-hole true. This is raised and allowed to fall a few inches or feet, according to the nature of the ground. It is attached to a weighty mass of iron with rings serving as guides. The whole mass is suspended by a flat hempen rope. This rope passes over a pulley to a drum on which a mass of rope can be accumulated. The pulley is attached to the piston-rod of a steam-engine. The action of the steam behind the piston lifts the pulley, and consequently the tool, the rope being clamped. The steam then causes the tool to fall, and on falling it automatically turns. A cylindrical tool can easily be inserted, and a core obtained that shows the nature of the rock and its inclination. At the Paris Exhibition of 1862 a proposal was made to drill with a tube in which diamonds were fixed. This was merely intended for use on a small scale; but it was soon applied to deep bore-holes. For this drill black diamond is employed, a substance with the full hardness of the ordinary diamond and a certain amount of toughness. Though very expensive, this method of boring is found advantageous when great speed is required. The fall of rock in bore-holes is apt to cause serious interruption on account of the jamming of the rods. The sudden strain given to release them is liable to cause fracture, besides which the full work is not done by the rods. This difficulty is obviated in several ways, notably by replacing the iron rods by wooden ones, 30 to 32 feet long, with iron connections. The free-falling

cutter proposed by Kind and the hollow rods of Von Oeynhausen may be instanced as having rendered good service in the execution of great works.

In order to open up a mine, tunnels or adit-levels are driven on the lode or to cut it whenever the contour of the country allows it. Shaft-sinking involves a larger outlay of capital and greater working costs. In the ordinary method of sinking shafts, the workmen standing upon the bottom of the pit blast out the rock, and send the excavated material to the surface by means of an engine, rope, and bucket. The sides of the shaft are supported by timbering or walling. In water-bearing strata many difficulties are encountered. Brunel, the father of the great engineer, proposed to obviate these by employing a circular frame with a cutting ring. On this, with hydraulic mortar, a wall was built and held firmly together by ties. In a second method, largely used in modern collieries, beams of cast-iron are employed, and 10,000 to 20,000 wooden wedges driven in, a succession of cast-iron segments or rings, known as *tubbing*, being built in. The shaft is thus sunk and the water pumped out. Tubbing a shaft is a very difficult operation, and the method has frequently been known to fail after £20,000 to £30,000 has been spent. In order to get over the difficulties and dangers, Kind, a German engineer, thought of sinking a bore-hole with sufficiently large tools consisting of solid masses of iron with sharp steel teeth. The shaft having been bored, ridges of cast-iron could, he thought, be fixed in and the water pumped out. This was tried in 1840 in a very difficult case and was found impracticable, and not until 1860, when Chaudron, an eminent Belgian, took the matter in hand, was the method successful. A watertight bottom was made, half a dozen workmen at the surface doing all the work. The method has been employed in the United Kingdom in a few instances. One remarkable case may be mentioned. At the mouth of the Tyne are coal-measures of great value, and at South Shields attempts were made to work the coal under the sea. Difficulty, however, was caused by a band of magnesian limestone highly charged with water. The enterprise promised to be very costly. Tubbing was totally unsuccessful, notwithstanding the fact that enormous pumps were employed raising as much as 11,000 gallons of water per minute. The shaft was 14 feet in diameter, and if the pumping ceased the water rose in the shaft 12 feet in two minutes. Recourse was then had to the Kind-Chaudron method, which had previously been successfully tried on the Continent. The *trepan* or cutter of the boring tool was 3 or 4 feet in diameter, and the hole was bored to a certain depth. A larger cutter was then used. In this way the sides were formed into inclined planes, so that the fragments rolled into a suspended bucket in the smaller hole, the bucket being raised from time to time. When a place was reached where a watertight joint could be made, Chaudron's tubbing was applied and the shaft successfully completed. In this tubbing the bottom ring has a sliding case in which is placed a quantity of moss, which, when the whole length of tubbing comes to rest on the watertight bed cut for it under water by the borer, packs together and forms a tight joint. This method of sinking shafts is practically self-acting. It is economical and simple, and eliminates risk to human life. In ordinary shaft-sinking accidents are frequent, as a screw or a hammer falling down the yawning gulf is likely to produce a fatal injury.

An ingenious device for overcoming the difficulties of shaft-sinking was invented by a French engineer, Triger. This consists in damming back the water by employing a constant resisting force; that is to

say, in pumping into the iron cylinder that forms the shaft such an amount of air that the pressure on the bottom from within should be equal to that from without. By means of a flooring in the cylinder, a lower air-tight compartment is formed, in which it is found that men can work under a pressure of $3\frac{1}{2}$ atmospheres. In order that the men may enter or leave their working-place without disturbing the equilibrium of the forces, the principle of the canal-lock is applied, a second chamber being formed above the working one with trap-doors communicating with the shaft above and with the chamber below. One of these doors being always closed while the other is open, the excavated material can be drawn up without any appreciable loss of compressed air. This method has been successfully applied at a number of shafts on the Continent.

Another ingenious process of sinking through quicksand is that devised by H. Poetsch. This consists in freezing the water contained in that portion of the water-bearing ground which occupies the position of the intended shaft into a solid mass of ice, and then sinking through it by hand without having to pump any water. This method has proved successful at several Continental collieries and at the Chapin mine in Michigan.

The average depth of coal-mines before the introduction of the steam-engine did not exceed 100 yards, whilst a near approximation for the present time would be 400 yards. The deepest shaft in Great Britain is that of the Ashton Moss Colliery, near Manchester, which has attained a depth of 2850 feet. The seams dip at the rate of 9 inches per yard, so that parts of the workings are 3000 feet deep. The deepest shaft in the world was until recently that of a silver-lead mine in Bohemia, at Przibram, where the Adalbert shaft is 3432 feet in depth. This depth has, however, been exceeded in the Lake Superior copper-mining district, where in 1890 the Calumet shaft attained a depth of 3900 feet.

The cutting of a path through the harder rocks, as carried on by the ancient miners, was particularly laborious. The work was executed in confined spaces, and a large amount of dust was produced. The miners' vocation was excessively unhealthy, inasmuch as they were obliged to inhale large quantities of dust; they thus became subject to disorders of the lungs to which they fell victims at an early age. Previous to the introduction of blasting the implements used were of the nature of wedges and hammers. Bit by bit pieces of rock were broken away, the operation being aided by natural fissures in the rock and by the brittleness of the hard material. In this way the ancient miners cut coffin-shaped galleries 5 feet in height. At the present time the galleries or levels are usually $7\frac{1}{2}$ feet high and 5 feet wide, thus affording great facility for travelling and for ventilation. The invention of gunpowder is of much greater antiquity than its application to mining purposes. In the 14th century it was largely used for musketry and cannon, and even for blowing down defences; but, curiously enough, it was not applied to mining purposes until the beginning of the 17th century, and even then made its way so slowly that it was not largely employed until the 18th century. In the operation of blasting use is made of a borer or drill of iron, or, as is more usual, of cast-steel. This is struck with a hammer. A borer of larger diameter may be used, held by one man and struck by another. Of late years mechanical rock-drills driven by steam or by compressed air have come largely into use; see BORING, with illustration. The bore-hole, when finished, is then charged. The gunpowder is enclosed in a little bag of cloth dipped in pitch and provided with a fuse. Instead

of using a cartridge of this kind, clay may be forced down the hole by a claying bar so as to shut off feeders of water, and the hole will be dry enough to receive a charge of powder. A needle of iron or steel is placed in the midst of the charge with the ring at its end protruding, and tamping is introduced. For this purpose it is best to put in clay piecemeal until the whole is filled up. Accidents may happen by pushing down the iron bar, which is apt to strike fire against hard rock. A second suspected cause is that, when a man takes a tamping bar and strikes it with a hammer, the air is compressed, and the temperature augmented sufficiently to explode the powder. These disadvantages are set aside by Messrs Bickford & Smith's safety-fuse (see BLASTING). The older fuse consisted of carefully selected straws filled with fine powder. The safety-fuse is of cotton with gunpowder in the middle. For use in wet ground it is covered with a waterproof composition. Considerable attention has been paid to the subject of consolidating the charge. Excellent work has been done with compressed powder; dynamite has become quite indispensable; and gun-cotton is also employed, the best form being the compressed variety invented by Abel. Nitrated gun-cotton or tonite has also given admirable results. The fullest benefit of these modern explosives can only be obtained by the use of strong detonators fired by electricity, by which it is possible to place a number of bore-holes in such a manner that when fired simultaneously they shall help each other.

For removing coal these high explosives are too quick in their action, and blasting-powder continues to be used. Millions of tons of coal are still obtained by its aid. In order to obviate the danger of explosions in fiery collieries, many ingenious substitutes for blasting have been proposed. For example, a hole is bored, and wedges inserted to force down the coal which has previously been under-cut with the pick. Another plan of great promise is that devised by Smith and Moore, in which cartridges of caustic lime are employed, water being forced into them by a force-pump. The pressure of steam generated by the usual charge of seven cartridges is 2850 lb., the cartridges themselves expanding to about five times their original size. The efficiency of these cartridges varies with the nature of the coal, the best results having been obtained in the Derbyshire collieries.

The work of the miner engaged in under-cutting the coal-seam is very arduous, and various coal-cutting machines have been invented with a view to lessen the labour and expense. They work with compressed air or electricity, and have the cutters arranged on the periphery of a rotating disc, or on a travelling pitch-chain. Though largely employed in America, they have not yet come into extensive use in Great Britain. The coal, when broken down, is placed in wagons, and drawn by horses or engine-power to the bottom of the shaft and raised to the surface.

The actual mode of working the coal, although varying greatly in every district, may be broadly divided into (1) the post-and-stall, or bord-and-pillar, or (in Scotland) stoop-and-room, method, where the first stage of excavation is accomplished with the roof sustained by coal; (2) the long-wall method, where the whole of the coal is allowed to settle behind the miners, no sustaining pillars of coal being left. The latter method, when well planned, is the safer both as regards facility of ventilation and less liability to accidents from falls. At a Durham colliery, working the Harvey seam, which is $3\frac{1}{2}$ feet in thickness, 5185 tons of coal were obtained when working by the long-wall system, and 5052 tons when working by the post-and-stall

system. In thick and highly-inclined beds it is usual to remove the coal by horizontal slices, and to fill the excavation with waste material. In some instances blast-furnace slag is used for the purpose.

The mode of working metalliferous veins differs greatly from that followed in the case of the more or less horizontal coal-beds. Horizontal galleries, termed *levels*, are driven upon the lode usually 10 fathoms (60 feet) apart. They are rarely perpendicularly above one another, as they follow the inclination of the vein. The levels are connected by means of small shafts, termed *winzes*. Represented on a vertical plane, the vein will thus be seen to be cut up into pillars which are worked by the method of *stoping*. Of this there are two varieties—underhand and overhand stoping. In the former the ore is gradually worked away downwards from the floor of one level, the ore and worthless mineral being taken out through the level next below. In most districts underhand stoping has been superseded by the more economical overhand method, in which the miners stand on timber platforms and break down the mineral above them.

The great depth and size of modern collieries necessitate the raising of greater quantities of coal through a single shaft than was ever contemplated in former times. The winding-engines of modern erection are consequently of extraordinary power. Thus, at Harris' Navigation Colliery the engines have cylinders with a diameter of 54 inches, and are capable of raising 6 tons of coal, or, with ropes and the cages containing the coal-trucks, a total load of 15½ tons, at a speed of 32 feet per second. The quantities which can thus be raised are enormous. It is by no means uncommon for 900 to 1400 tons to be raised from one pit in the day.

In collieries both coal and men are raised in the cages, but in the metalliferous mines the man-engine is largely used. This consists of a reciprocating rod or pair of rods fitted with steps, by which the miner is raised 8 to 14 feet at a stroke. Although this method obviates the tax on the energies of the men entailed by the climbing of ladders, it is by no means free from danger. Prussian statistics show that where man-engines are employed there are four times as many accidents as where cages and ropes or where ladders are used.

At the Épinac collieries in France a remarkable pneumatic system of raising coal and men is employed. An air-tight wrought-iron tube, 5 feet 3 inches in diameter, is placed in the shaft and fitted with a piston-cage carrying nine coal-wagons. The air being exhausted above the piston, a load of 3 tons of coal is raised at a rate of 19 inches per second. The great cost of the installation has prevented the method from being generally adopted.

In almost all mines the surrounding rock contains water which rapidly accumulates in the workings. Where the contour of the district is suitable, the best method of draining the mine is by means of an *adit-level*—i.e. a tunnel driven in the hillside. In some cases extensive areas are drained by adits. Thus, the great Gwennap adit in Cornwall, which is with its branches 40 miles in length, drains 30 sq. m. As further examples of long adits may be cited the Ernst-August adit in the Harz Mountains, which has a total length of 14 miles and cost £85,500, and the Rothschilder adit at Freiberg in Saxony, which is 25 miles long. In cases where adits are unavailable, recourse must be had to pumps either of the lifting or forcing type. The principal type of engine is that known as the Cornish pumping-engine, which is a single-acting condensing beam-engine working expansively. Some of these engines are of enormous size, the cylinders in some cases

being as much as 100 inches in diameter. Their great cost and ponderous character have led to the introduction of cheaper direct-acting engines which placed underground force columns of water to vertical heights of as much as 1000 feet. At a silver-mine at Klausthal, in the Harz Mountains, a pair of direct-acting rotary engines have been erected, driven by hydraulic power, with a head of 1959 feet. At twelve revolutions per minute these pumps force 330 gallons of water up 750 feet.

The ventilation of subterranean workings is a problem of the greatest importance. The air is contaminated by the respiration of men and horses, by the combustion of lights, by the smoke of explosives, and by deleterious dust. Added to which, in the case of collieries, the insidious fire-damp or carburetted hydrogen exudes from the coal. Mingled with air this gas forms the explosive mixture to which so many miners owe their death (see FIREDAMP, CHOKE-DAMP, SAFETY-LAMP). It is obvious that the ventilating current must be sufficient to dilute this mixture below the firing-point and to sweep it away. The general mode of ventilating a colliery is to have two shafts, a *downcast* and an *upcast*. The pure air entering by the downcast shaft traverses the roadways of the colliery. By means of doors and stoppings, the current is caused to travel in the required direction so as to reach the innermost workings of the mine. It then passes to the upcast shaft and returns to the life surface. The motion of the air-current is caused by furnaces or by mechanical ventilators. In the former case, a large furnace is kept burning at the bottom of the upcast shaft, the air in which it heats and causes to expand. In this way a volume of air is obtained suitable for very extensive workings, as much as 120,000 to 250,000 cubic feet of air being passed through the shafts per minute. In the case of mechanical ventilators, the vitiated air is withdrawn from the colliery by the exhausting action of centrifugal fans, which may be made either of large diameter to run at low velocity, or of small diameter to run at high velocity. At several important collieries these fans attain enormous dimensions, in some cases as much as 45 feet in diameter and 14 feet in width.

Almost as important as ventilation in relation to the safety of human life is the accurate construction and the preservation of mine-plans. In many cases the plans are laid down without any reference to the phenomenon of the variation of the magnetic needle. Trusting to old plans constructed in this way, the miner may drive straight into old workings filled with water, the tapping of which would be death to all employed in the colliery.

The progressive legislation in connection with mines (e.g. the Coal-mines Regulation Act of 1872, amended 1886, which prescribes for the inspection of mines by duly appointed inspectors, &c.) has proved beneficial in diminishing the proportion borne by the accidents to the number of miners employed; for whereas in 1850, when the output of coal in the United Kingdom did not exceed 50,000,000 tons, the number of miners employed being about 200,000, the deaths slightly exceeded 1000 in the year, in 1877, when the output of coal was 134,000,000 tons and the number of miners double that in 1850, the deaths were only 1200 in number. The deaths from explosions of firedamp during the eleven years 1875–1885 formed but 23·57 per cent. of the total deaths, the remainder being due to falls of roof and other causes. For statistics of mineral production, see GREAT BRITAIN, UNITED STATES, &c.

In England and Ireland the crown has the right to all mines of gold and silver; but where these metals are found in mines of tin, copper, iron, or

other baser metal, then the crown has only the right to take the ore at a price fixed by statute. In Scotland gold-mines belong to the crown without limitation, and silver-mines when three-halfpence of silver can be extracted from the pound of lead. As a general rule, in the United States as well as in Britain, whoever is the owner of freehold land has a right to all the mines underneath the surface, for his absolute ownership extends to the centre of the earth; but under special grants and contracts it is not uncommon for one person to be owner of the surface of the land and another to be owner of the mines beneath; or several persons may be owners of different kinds of mines lying one above the other in the different strata. On the public lands of the United States, a title or license may be obtained by any citizen from the general land office at Washington, at the rate of \$5 per acre of surface pre-empted; no royalty is paid, but the claim must be worked in accordance both with local regulations and with the general mining laws, which prescribe as one condition the performance of a certain amount of work annually. If this condition is not fulfilled, the mine may be 'denounced,' and any other person secure the claim.

BIBLIOGRAPHY.—The literature of mining is very extensive, but the following may be cited as useful works of reference: Callon's *Lectures on Mining*, translated by Dr C. Le Neve Foster and W. Galloway; Sir Warington Smyth, *Coal-mining* (7th ed. Lond. 1890); J. J. Atkinson, *Practical Treatise on the Gases met with in Coal-mines* (Lond. 1879); R. Hunt, *British Mining* (1884); H. M. Chance, *Report on Coal-mining* (Philadelphia, 1885); B. H. Brough, *Mine Surveying* (2d ed. Lond. 1889); Arundel Rogers, *Mining Law* (Lond. 1876); *Report of the Accidents in Mines Commission* (1886). The principal sources of information on mining matters are the *Transactions of the Mining Institutes*, the technical journals, and the annual reports of H.M. Inspectors of Mines. See also articles COAL, COPPER, GOLD, IRON, LEAD, DIAMOND, &c.

Minister, a public functionary who has the chief direction of any department in a state, the ministry being the body of ministers to whom the sovereign or chief-magistrate commits the executive government (see CABINET, PARLIAMENT, TREASURY). Minister is also a term for a delegate or representative of a sovereign at a foreign court (see AMBASSADOR). Christian preachers and priests are ministers of the word of God or of Jesus Christ in Catholic usage; minister, a name, was adopted by French-speaking Protestants for their clergy, and was formerly so used by Anglicans, as it still is by Presbyterians and many Nonconformists.

Minium, or RED LEAD. See LEAD, Vol. VI. p. 543.

Minlver. See FURS.

Mink (*Putorius*), a name applied to several carnivores in the same genus as weasel, polecat, ferret, and ermine, and with essentially similar characteristics. The body measures from 12 to 18 inches in length, not including the bushy tail. The colour of the valuable fur is chestnut-brown. The Siberian Vison (*P. sibiricus*), the European Vison (*P. lutreola*), and the American Mink proper (*P. vison*) are very nearly related, if indeed they are not simply varieties of one circumpolar species. They all live by rivers and lakes, in which they swim and dive, feeding chiefly on fishes, frogs, mussels, and the like; though not refusing any small mammals which come in their way. They are keen-scented, bold and persistent, but are readily tamed when caught young. See FURS.

Minneapolis, the largest city of Minnesota, adjoins the capital, St Paul, and is situated on both sides of the Mississippi, which is here crossed by twelve bridges. The Falls of St Anthony, with a perpendicular descent of 16 feet, afford a water-

power which has been a chief source of the city's prosperity. The streets are wide and handsome, and there are beautiful public parks. Among the most notable buildings are the masonic hall, the post-office, the Exposition Building, and the Guarantee Loan edifice. This last is twelve stories high, built of granite and sandstone; it contains 400 offices, and on the roof is a garden where concerts are given. The churches number nearly 150, and the public schools had in 1890 more than 500 teachers and 20,000 pupils; while the state university here has five departments and about a thousand students, of both sexes. There is a public library of over 30,000 volumes. The lumber and flour mills of Minneapolis are among the largest in the country. In the latter, stones have been discarded, and the Hungarian or 'roller' process (see MILL) is employed. The total daily capacity of the mills is 35,000 barrels. The railway facilities of Minneapolis are very great, and the growth of the city has been remarkably rapid. Pop. (1870) 13,066; (1880) 46,887; (1890) 164,738.—Five miles by rail SE. of Minneapolis are the Falls of Minnehaha ('Laughing Water'), celebrated in Longfellow's *Hiawatha*.

Minnesinger, the collective name given to the lyric poets of Germany who flourished during a period marked approximately by the years 1170 and 1250. For the most part the singers were of knightly birth and belonged to the inferior nobility, though men of the very highest rank, reigning princes and even emperors, wrote these lyric effusions, and a few were of burgher birth. They get their name from the principal theme that inspired them, *minne* = 'love,' the love of fair women. Thus they were so far akin to the troubadours of Provence and France. The movement, however, though it certainly received suggestions from the singers beyond the Rhine, was essentially of native origin. The difference between the two schools is most clearly seen in the spirit of their work. The German singers wrote of love in a more refined and delicate spirit, and with a greater reverence for woman, than the troubadours. The best of them treated of the inner life of the soul, the feelings and emotions of the heart, rather than of the gallantries and adventures of a sensual love; they move in the world of imagination and idealism, shunning the real world and its gross pleasures; the shy, speechless, reverent attitude of ingenuous youth that characterised them was closely akin to the reverent homage paid to the purest and holiest of women, the Virgin Mother of Christ. Yet they did not altogether lose touch of the world. They loved to sing the praises of nature, especially of spring, the perennial inspirer of poets' hearts and tongues. Often, too, there is a decided strain of sadness and melancholy, always touches of true naïveté, and frequently of arch humour, and on occasion the sterner note of moral indignation and contempt of the follies and vices of the time. Thus, the best of the minnesinger, like Walther von der Vogelweide, the most illustrious of them all, Heinrich von Ofterdingen, Wolfram von Eschenbach, Hartmann von Aue, Gottfried von Strasburg, Heinrich von Veldeke (the earliest), and others, were distinguished on the one hand from the poets of the monasteries, who celebrated the deeds of martyr and saint, and on the other hand from the wandering gleemen, whose subjects were suited to the coarse and ignorant peasantry who formed their usual audiences. But it is not in subject only, and their spirit of treating it, that the minnesinger differ from all their contemporaries; they also paid great attention to poetical form, striving after melodious and sonorous language, regularity of verse-structure, and smoothness and correctness of versification, in all which they

[illegible]

attained a high degree of skill. Their art was, however, wider than the poet's at the present day: they not only wrote the text but composed the air to which the text was to be sung, for all their lyrics were written with the express purpose of being sung to the accompaniment of viol or harp. One class alone was exempted from musical accompaniment—viz. short didactic or sententious poems called *sprüche* = 'sayings,' which were recited. As it was incumbent upon a 'singer' to invent his own combination of text and melody, and was considered dishonourable for him to appropriate those of his predecessors or contemporaries, their poems are remarkable for a great variety of forms, poetic and musical. This in course of time, when the fresh inspiration of the movement began to wane, was the fruitful cause of much artificial writing, and eventually of the decay of the art. But there were still deeper causes of decay inherent in it. The less refined of the 'singers' were unable to keep the levels of exalted sentiment of their superiors, and degenerated into false sentimentality, lifeless conventionality, and above all a gross and vulgar sensualism. The minnesinger wrote principally in the Swabian dialect of Middle High German. Their use of this language was due to the great encouragement they received from the Hohenstaufen emperors. Next to these rulers their chief patrons were the dukes of Austria, and especially Hermann of Thuringia, at whose court of Eisenach the semi-mythical Wartburgkrieg occurred (c. 1207). This was a poetical contest between the chief minnesinger as to the merits of the patrons of the art: Heinrich of Ofterdingen was outsung by Walther von der Vogelweide, and Heinrich's ally, the magician Klingsor of Hungary, by Wolfram von Eschenbach.

When men of knightly birth began to neglect the writing of lyric poetry, and the minnesinger were no longer held in honour in the halls of the great, the art took refuge with the burghers and craftsmen of the cities. But with the exception of Hans Sachs of Nuremberg, those *meistersinger* or *meistersänger*, as they called themselves, possessed little real poetic feeling. They formed themselves into guilds and wrote poems as they plied their trade, by purely mechanical rules, and bound themselves by a multitude of puerile restrictions and pedantic regulations. Their subjects were painfully commonplace, and their treatment destitute of all artistic feeling. Yet these singers' guilds flourished from the 13th to the 16th century; the last was not dissolved until 1839, at Ulm. Wagner's opera, *Die Meistersinger zu Nürnberg*, perpetuates their memory.

The lyrics of the 160 Minnesinger, of whom alone specimens survive, were published by Von der Hagen in 1838 (4 vols.). Modern versions have been made by Tieck (1803), Simrock (1857), and others. See A. Schultz, *Das höfische Leben zur Zeit des Minnesangs* (2 vols. 2d ed. 1889); Uhland in *Schriften zur Geschichte der Dichtung und Sage* (vol. v. 1870); and Lyon, *Minne- und Meister-sang* (1882).

Minnesota (an Indian name, signifying 'sky-tinted water'), the twentieth in population of the states of the American Union, Copyright 1891 in U.S. by J. B. Lippincott Company. and the northernmost in the Mississippi valley, extends from 43° 30' to 49° N. lat., and from 91° to 97° W. long. It is bounded on the N. by Manitoba and Ontario, E. by Lake Superior and Wisconsin, S. by Iowa, and W. by North and South Dakota. Its area is 83,530 sq. m., or nearly as large as Great Britain. In Minnesota are the remote sources of the great rivers Mississippi, Red River of the North, and St Lawrence, whose waters, flowing in different directions, reach respectively the Gulf of Mexico, Hudson Bay, and the Atlantic Ocean. Within

the state the Minnesota River is the largest tributary of the Mississippi. Between the St Croix River and Red River of the North are hundreds of clear lakes, the largest of which are Red Lake (530 sq. m.), Mille Lacs, and Leech Lake. About two-thirds of the state is prairie, but in the northern portion there are extensive pine-forests, and in the north-east great marshes, bearing a scanty growth of tamarack and fir. The minerals include iron (which is profitably worked), slate, granite, and other rocks, and the red pipestone. The climate is bracing in winter, very dry and equable; the mean for the year 1889 was 45°. The rainfall is sufficient and well distributed throughout the year.

Minnesota is an agricultural and especially a wheat-producing state; its manufactures as yet are principally flour and lumber mills. The principal crops in 1889 were: wheat, 46,660,583 bushels; oats, 48,253,799 bushels; maize, 22,115,769 bushels; potatoes, 6,444,137 bushels. The facilities for commerce are great. The Mississippi is navigable as high as St Paul; the lakes, with Duluth for a port, open a waterway to the Atlantic; and there are over 5000 miles of railway in the state.

Education is well cared for. At the end of 1888 the permanent school fund exceeded \$8,000,000; and during that year over 250,000 pupils were on the roll. There are four state normal schools, and a state university at Minneapolis, besides Macalester College (Presbyterian) and Hamline University (Methodist) at St Paul, Carleton College (Congregationalist) at Northfield, Episcopal schools at Faribault, and a Presbyterian college for women at Albert Lea.

History.—Minnesota was visited by French explorers in 1659–60, and the portion west of the Mississippi was part of the province of Louisiana purchased by the United States from France in 1803. Fort Snelling, at the mouth of the Minnesota River, was built and occupied in 1821. In 1837 the Chippeway Indians surrendered all the land east of the Mississippi; immigration then began, and Minnesota became a territory in 1849, a state in 1858. It claims the distinction of having, through its governor, offered the first regiment for the defence of the Union; and during the civil war, out of 40,000 citizens able to bear arms, it sent 24,000 into the army. In August 1862 occurred a terrible massacre by the Indians, who attacked the frontier settlements and in ten days killed some 800 men, women, and children. As a consequence, the Sioux and Winnebagoes were removed from the state, and their hunting-grounds are now occupied by farms and prosperous towns. The principal cities are St Paul, the capital (133,156), Minneapolis (164,738), and Duluth (32,115). Pop. (1860) 172,023; (1880) 780,773; (1890) 1,301,826, including a large proportion of Scandinavians and Germans.

Minnow (*Leuciscus phoscinus*), a small fish of the same genus as the roach, dace, chub, &c. It is widely distributed in Europe, from Norway to Italy. It is usually 3 or 4 inches long, but it occasionally in favourable localities may attain to as much as 7 inches. The minnow varies its colour; it is more brilliant when taking food, and brighter during the day than at night. The colours are most brilliant at spawning time, particularly in the males. The back is olive-brown in colour, becoming lighter at the sides with a metallic lustre. The fins are silvery gray, often rose tinted at the base. The colours become paler after spawning. The minnow is an active little fish found in large swarms, generally in shallows in summer or near the surface; in winter it conceals itself under stones and muddy banks. It is a voracious feeder, living on aquatic plants, worms, insects, small snails and fresh-water molluscs, and even its own kind; and in turn it is preyed upon by nearly

every fish in the stream. Minnows have the peculiar habit of arranging themselves like the spokes of a wheel or the petals of a flower, with their heads towards the centre and their tails at nearly equal distances from one another when anything that can serve as food is thrown into the water. They may be caught by small hand-net or by hook and line, baited with worm or paste. They are very prolific; they breed in June, and the eggs hatch in a few days. As food they are much esteemed, cooked in various ways or dressed as 'white bait.' They are used as bait for eels, or as spinning bait for trout, perch, pike, or chub. Some fish-breeders advocate stocking rivers with minnows to feed the young salmon, but the wisdom of this proceeding has been questioned on various grounds.

Minor is, in Scotch law, the term describing a person who, if a male, is between the ages of 14 and 21; and if a female, is between 12 and 21. In England the technical term is an Infant (q.v.).

Minor. See SCALE.

Minor Barons. See BARON.

Minorca, the second largest of the Balearic Isles (q.v.), lies 25 miles NE. of Majorca. It is 28 miles long, by an average of 10 wide, and has an area of 284 sq. m. Pop. 34,173. Its coast is rocky and inaccessible, but broken by numerous inlets, and its surface low, undulating, and stony. Its productions and climate are similar to those of Majorca, though the soil is less fertile. The chief towns are Port Mahon (q.v.) and Ciudadela (8000). The island is remarkable for its great number of ancient megalithic remains (called talayots) and its stalactite caves (at Prella). See BYNG (JOHN); Bidwell's *Balearic Isles* (1876), and Sir R. L. Playfair, *Mediterranean* (3d ed. 1890, Murray's Guide-book series).

Minorites. See FRANCISCANS.

Minority. See REPRESENTATION.

Minos, the name of two mythological kings of Crete. The first is said to have been the son of Zeus and Europa, the brother of Rhadamanthus, the father of Deucalion and Ariadne, and, after his death, a judge of the shades in Hades.—The second of the same name was grandson of the former, and son of Lycastus and Ida. To him the celebrated Laws of Minos are ascribed, in which he is said to have received instruction from Zeus himself. Homer and Hesiod know of only one Minos, the king of Cnossus, and son and friend of Zeus.

Minotaur, one of the most repulsive conceptions of Greek Mythology, the offspring of Pasiphaë and a bull, for which she had conceived a passion, gratified through the contrivance of Poseidon. The queen placed herself in an artificial cow made by Dædalus, and so became the mother of the monster, half-man half-bull, a man with a bull's head. Minos, the husband of Pasiphaë, shut him up in the Cnossian Labyrinth, and there fed him with the seven youths and seven maidens, whom Athens was obliged to supply at fixed periods as a tribute, till Theseus, with the help of Ariadne (q.v.), slew the monster.

Minsk, the chief town of the Russian government of Minsk, stands on an affluent of the Beresina, 436 miles by rail WSW. of Moscow and 331 ENE. of Warsaw. Pop. (1883) 54,307, many of whom are Jews. The town existed in the 11th century; was Lithuanian in the 13th and Polish in the 15th; and was annexed by Russia in 1793. The government of Minsk has an area of 35,282 sq. m., and a pop. (1883) of 1,591,767, embracing White Russians (67 per cent.), Lithuanians (44 per cent.), Poles (11 per cent.), and Jews (10 per cent.), with Tartars and Germans. Seventy per cent. of the soil is covered with marshes, swamps,

moors, lakes, and forests; less than 24 per cent. of the total area is actually cultivated.

Minster (Lat. *monasterium*, 'a monastery'), the church of an abbey or priory; but often applied, like the German *Münster*, to cathedral churches without any monastic connection, as especially to York Minster.

Mint (*Mentha*), a genus of plants, of the natural order Labiatae, with small, funnel-shaped, quadrifid, generally red corolla, and four straight stamens. The species are perennial herbaceous plants, varying considerably in appearance, but all with creeping root-stocks. The flowers are whorled, the whorls often grouped in spikes or heads. The species are widely distributed over the world. Some of them are very common in Britain, as Water Mint (*M. aquatica*), which grows in wet grounds and ditches, and Corn-mint (*M. arvensis*), which abounds as a weed in cornfields and gardens. All the species contain an aromatic essential oil, in virtue of which they are more or less medicinal. The most important species are Spearmint, Peppermint, and Pennyroyal.—Spearmint or Green Mint (*M. viridis*) is a native of almost all the temperate parts of the globe;

it has erect smooth stems, from one foot to two feet high, with the whorls of flowers in loose cylindrical or oblong spikes at the top; the leaves lanceolate, acute, smooth, serrated, destitute of stalk, or nearly so. It has a very agreeable odour.—Peppermint (*M. piperita*), a plant of equally wide distribution in the temperate parts of the world, is very similar to spearmint, but has the leaves stalked, and the flowers in short spikes, the lower whorls somewhat distant from the rest. It is very readily recognised by the peculiar pungency of its odour and of its taste.—Pennyroyal (*M. pulegium*), also very cosmopolitan, has a much-branched prostrate stem, which sends down new roots as it extends in length; the leaves ovate, stalked; the flowers in distant globose whorls. Its smell resembles that of the other mints.—All these species, in a wild state, grow in ditches or wet places. All of them are cultivated in gardens; and peppermint largely for medicinal use and for flavouring lozenges. They are naturalised in America, where, however, the common species is *M. canadensis*, the Wild or Horse-mint. *Mint Sauce* is generally made of spearmint, which is also used for flavouring soups, &c. A kind of mint with lemon-scented leaves, called Bergamot Mint (*M. citrata*), is found in some parts of Europe, and is cultivated in gardens. Varieties of peppermint and Horse-mint (*M. sylvestris*), with *crisped* leaves, are much cultivated in Germany under the name of Curled Mint (*Krause-minze*); the leaves are dried and used as a domestic medicine, and in poultices and baths. All kinds of mint are easily propagated by parting the roots or by cuttings. It is said that mice have a great aversion to mint, and that a few leaves of it will keep them at a distance.

Spearmint (*Mentha viridis*).

Peppermint, pennyroyal, and spearmint are used in medicine. The pharmacopœias contain an *aqua*, *spiritus*, and *oleum* of each of them; the official part being the herb, which should be collected when in flower. *Peppermint* is a powerful diffusible stimulant, and, as such, is antispasmodic and stomachic, and is much employed in the treatment of gastrodynia and flatulent colic. It is also extensively used in mixtures, for covering the taste of drugs. *Pennyroyal* and *spearmint* are similar in their action, but inferior for all purposes to peppermint.

Mint (Lat. *moneta*), an establishment for making coins or metallic money (see MONEY). The early history of the art being traced under the head Numismatics, the present article is mostly confined to a sketch of the constitution of the British mint, and of the modern processes of coining as there followed.

In Canute's laws, an officer called a 'reeve' is referred to as having some jurisdiction over the mint, and certain names which, in addition to that of the sovereign, appear on the Anglo-Saxon coins seem to have been those of the moneyers, an important class of functionaries, who were, until the operations of coining were undertaken by the state in 1850, responsible for the manufacture of the coin. Besides the sovereign, barons, bishops, and the greater monasteries had the control of mints, where they exercised the right of coining, a privilege enjoyed by the archbishops of Canterbury in the reign of Henry VIII., and by Wolsey as Bishop of Durham and Archbishop of York. After the Norman Conquest the officers of the Royal mint became to a certain extent subject to the authority of the exchequer. Both in Saxon and Norman times there existed, under control of the principal mint in London, a number of provincial mints in different towns of England; there were no fewer than thirty-eight in the time of Ethelred, and the last of them were only done away with in the reign of William III. The officers of the mint were formed into a corporation by a charter of Edward II.; they consisted of the warden, master, comptroller, assay-master, workers, coiners, and subordinates. Coining at the Scottish mint in Edinburgh ceased with the Union; but the office of master of the mint was not incorporated with the English one till 1817.

The seignorage for coining at one time formed no inconsiderable item in the revenues of the crown. It was a deduction made from the bullion coined, and comprehended both a charge for defraying the expense of coining, and the sovereign's profit in virtue of his prerogative. In the reign of Henry VI. the seignorage amounted to 6d. in the pound; in the reign of Edward I. it was 1s. 2½d. By 18 Car. II. chap. 5, the seignorage on gold was abolished, and it has never since been exacted. The 'shere' or 'remedy,' as it is now called, is an allowance for the unavoidable imperfection of the coin in regard to both standard weight and fineness.

The function of the mint, so far as concerns the standard gold coinage, is to receive gold in ingots from individuals, and return an equivalent weight in sovereigns. But, in point of fact, gold is now exclusively coined for the Bank of England; for, although any one has the right to import gold into the mint for coining, receiving an equivalent weight of sovereigns at the rate of £3, 17s. 10½d. per oz. standard, after a sufficient delay to allow of the gold he imports being converted into coin, he can at once receive payment on presenting his bullion at the Bank of England at the slightly lower rate of £3, 17s. 9d., and the additional 1½d. offered by the mint is not found sufficient to compensate for the necessary delay which occurs.

Silver, which was formerly a legal tender to any amount, has, by 56 Geo. III. chap. 68, ceased to be so. That act provided that each troy pound of standard silver should be coined into sixty-six shillings, and, since this exceeds the price at which the metal in its uncoined state can be purchased, it follows that the coinage of silver is a source of profit to the state. When the price fell to 42½d., this profit, or seignorage, amounted to no less than 54 per cent., and even at 5s. per ounce there remains a profit of about 10 per cent. It should, however, be borne in mind that this 'token' coinage is only a legal tender to a limited amount (forty shillings), whereas gold coin is legal tender to any amount. The profit derived from the bronze token coinage is proportionately even greater. The seignorage, which was formerly retained by the master of the mint to defray the expense of coining, has since 1837 been paid to the credit of the Consolidated Fund.

A new mint was erected on Tower Hill in 1810. In 1815 some alterations were made in its constitution; and in 1851 a complete change was introduced in the whole system of administration. The control of the mint was then vested in a master, a deputy-master, and a comptroller. The mastership, which had, in the early part of the 19th century, become a political appointment held by an adherent of the government, was restored to the position of a permanent office, the master being the ostensible executive head of the establishment. The operative department was entrusted to the assayer, the melter, and the refiner. The moneyers, who had from early times enjoyed extensive privileges and exemptions, and were contractors with the crown for the execution of the coinage, were abolished, and the contracts with the crown were entered into by the master of the mint, who also made subordinate contracts for the actual manufacture of the coin. Further changes were made in the administration of the mint in 1869. The mastership was added to the duties of the Chancellor of the Exchequer, without any addition of salary, and the offices of deputy-master and comptroller were amalgamated. A yearly saving of £10,000 is believed to have been effected by the changes of 1851, and a further £8000 by those of 1869, with an increase of efficiency. Mints were established at Sydney and Melbourne to coin the gold so largely found in Australia, in 1853 and 1869 respectively.

Processes of Coining.—Down to the middle of the 16th century little or no improvement seems to have been made in the art of coining from the time of its invention. The metal was simply hammered into slips, which were afterwards cut up into squares of one size, and then forged round. The required impression was given to these by placing them in turn between two dies, and striking them with a hammer. As it was not easy by this method to place the dies exactly above each other, or to apply proper force, coins so made were always faulty, and had the edges unfinished, which rendered them liable to be clipped. The first great step was the application of the screw, invented in 1553 by a French engraver of the name of Brucher. The plan was found expensive at first, and it was not till 1662 that it altogether superseded the hammer in the English mint. The chief steps in coining as now practised are as follows: The gold or silver to be coined is sent to the mint, for the most part in the form of *ingots* (Ger. *eingiessen*, Du. *ingieten*, 'to pour in,' 'to cast'), or castings; those of gold weighing either about 200 or 400 troy ounces, while the silver ingots are much larger. Before melting, each ingot is weighed and tested as to its purity by Assaying (q.v.). For melting the gold, pots or crucibles of plumbago

are used, made to contain each about 1200 ounces. The pots being heated in furnaces to a bright red heat, the charge of gold is introduced along with the amount of copper which calculation, based on the weight of the gold and its composition as ascertained by assay, proves to be necessary in order to bring it to the standard, which in Great Britain is 22 parts of pure gold to 2 of copper (see ALLOY). The metal, when melted, is poured into iron moulds, which form it into bars 21 inches long, $1\frac{1}{2}$ inch broad, and three-eighths of an inch thick, if for sovereigns; and somewhat narrower, if for half-sovereigns. For melting silver (the alloy of which is adjusted to the standard of 222 parts of silver to 18 of copper) larger plumbago crucibles capable of containing 5500 ounces are used, and the metal is cast into bars similar to those of gold.

The copper, or rather bronze coinage, first issued in 1860, is formed of an alloy consisting of 95 parts of copper, 4 of tin, and 1 of zinc. The coins are only about half the weight of their old copper representatives. The processes of casting and coining the bronze are essentially the same as in the case of gold and silver.

The operation of *rolling* follows that of casting. It consists in repeatedly passing the bars between pairs of rollers with hardened steel surfaces, driven by steam-power; the rollers being brought closer and closer as the thickness becomes reduced. At a certain stage, as the bars become longer, they are cut into convenient lengths; and, to reduce the hardness induced by the pressure, they are annealed. The finishing rollers are so exquisitely adjusted that the *fillets* (as the thinned bars are called) do not vary in thickness in any part more than the ten-thousandth part of an inch. The fillets are still further adjusted in the British mint by means of what is called the 'draw-bench,' in which they are drawn between steel blocks, as in wire-drawing, and they are then exactly of the necessary thickness for the coin intended.

The fillets thus prepared are passed to the tryer, who, with a hand-punch, cuts a trial-blank from each, and weighs it in a balance, judging by experience whether the variation found to exist from the strict legal weight is such as to justify his passing the fillet into work.

The *blanks* of which the coins are to be made are cut out by means of punching-machines of simple construction, in which two or more short steel plungers are forced by an eccentric through the fillet, and enter holes in the bed of the machine; the fillet is then advanced automatically and the operation repeated. The scrap left after the blanks are cut out, called *scissel*, is sent back to be re-melted.

To ensure their being properly milled on the edge, the blanks are pressed edgewise in a machine between two grooves, one in a fixed steel block, and the other in the face of a revolving steel disc, whereby the edge is raised and the blanks are brought to a uniform diameter. After this they are annealed to soften them, before they can be struck with dies; they are also dipped into hot dilute sulphuric acid, to remove oxide of copper from the surface. Subsequently they are washed with water, and dried in hot sawdust.

We now come to the press-room, where the blanks receive the impression which makes them perfect coins. The screw coining-presses which were erected in the mint in 1810 were superseded in 1882 by lever presses of what is known as the Uhlhorn pattern. Of these no less than sixteen now exist in the mint. It is not necessary to give any detailed account of their mode of action, but it may be explained that the lower die (see DIE-SINKING) is fixed, and, after the blank has been automatically laid on it, a steel collar which is

milled on the inside rises so as to surround this blank, and, while it is thus enclosed, the upper die descends upon it, considerable pressure being applied through a lever acting on a toggle joint. It will thus be seen that at the moment at which the pressure is applied the blank is completely enclosed, the result being that all the details which exist on the two dies and on the collar are reproduced in the comparatively soft metal of the blank. The upper die then immediately rises, the collar descends, and the now finished coin is automatically pushed on one side to give place to another blank. In cases where letters are put on the edge of a coin, a collar divided into segments working on centre pins is used. On the proper pressure being applied, the segments close round, and impress the letters on the edge of the coin. It is possible to strike coins at the rate of no less than 120 per minute, but it is found that the best results are obtained when the number does not exceed 90 per minute.

After being examined with a view to remove any faulty pieces, the finished coins are now passed on to be weighed in the automatic balances, since the act regulating the coinage (33 Vict. chap. 10) provides that no gold or silver coin shall be issued from the mint which varies by more than a specified and very small amount from the exact legal standard weight. These very beautiful instruments, which were introduced in 1844 by William Cotton, governor of the Bank of England, but have since been much modified and improved, are each capable of weighing about twenty-three coins per minute within $\frac{1}{1000}$ th of a grain, and distributing them into three separate compartments, respectively for those which are too heavy, too light, or within the limits of weight allowed by law. The first two classes are returned to be melted, while the third class, having been rung on iron anvils with a view to eliminate such as are 'dumb,' are, so far as their manufacture is concerned, ready to be issued to the public. It is first necessary, however, that sample coins be taken for assay, as a final guarantee that they are within the limits as regards standard fineness allowed by the coinage act.

The gold coin is delivered to the importer (generally the Bank of England) as soon as finished, the *weight* of coin being the equivalent of that of the bullion imported, without making any deduction for loss in the operations of coinage or for the cost of alloying metal. Silver coin, however, is made up in bags of £100 nominal value, and stored in the mint until required by the Bank of England, Scotland, or Ireland for distribution in either of those countries, or by the government of a British colony in which imperial silver coin circulates. In the same way bronze coin is made up in bags of £5 nominal value and kept in store.

The following table gives the full legal weight in grains of all Imperial coins of gold, silver, and bronze:

Denomination.	Weight in Grains.	Denomination.	Weight in Grains.
GOLD.		SILVER.	
Five pounds	616·3724	Sixpence	43·6363
Two pounds	246·5489	Fourpence (Maundy) ..	29·0909
Sovereign	123·2744	Threepence	21·8182
Half-sovereign	61·6372	Twopence (Maundy) ..	14·5454
SILVER.		Penny (Maundy)	7·2727
Crown	436·3636	BRONZE.	
Double florin	349·0909	Penny	145·8333
Half-crown	218·1818	Halfpenny	87·5000
Florin	174·5454	Farthing	43·7500
Shilling	87·2727		

It will be noticed that in the case of both gold and silver the values are in proportion to the weights of the coins, but that this is not the case as regards bronze: whereas a ton of pence is nominally worth £448, the same weight of half-pence or farthings is only valued at £373, 6s. 8d.

In the United States there are five mints—at Philadelphia (since 1793), New Orleans (1835), San Francisco (1854), Carson City, and Denver—all under the charge of the Bureau of the Mint of the U.S. Treasury Department, and presided over by the Director of the Mint. Only the first three are in active operation, the other two are really assay offices; and at Philadelphia alone all the authorised coins are struck. The United States coins and their weights are as follows, those marked with an asterisk having been discontinued:

Denomination.	Weight in Grains.	Denomination.	Weight in Grains.
GOLD.			
Double eagle.....	516	20-cent*.....	77.16
Eagle.....	258	Dime.....	38.68
Half-eagle.....	129	Half-dime*.....	19.2
Quarter-eagle.....	64.5	3-cent*.....	11.62
2-dollar piece.....	77.4	MINOR COINS.	
Dollar.....	25.8	5-cent (nickel).....	77.16
SILVER.			
Dollar.....	412.5	2-cent (nickel).....	80
Trade-dollar*.....	420	2-cent (bronze)*.....	96
Half-dollar.....	192.9	Cent (copper)*.....	168
Quarter-dollar.....	96.45	Cent (nickel)*.....	72
		Cent (bronze).....	48
		Half-cent (copper)*.....	84

The total amount of gold coinage minted from 1793 to the end of 1885 was \$1,389,981,508.50; silver, \$434,224,610.00; minor coin, \$17,463,608.44.

Minto, SIR GILBERT ELLIOT, first EARL OF, was born at Edinburgh, April 23, 1751. As a boy he spent two years at a school at Fontainebleau under the eye of David Hume, and, after passing through the universities of Edinburgh and Oxford, in 1769 entered Lincoln's Inn, and was called to the bar in 1774. Two years later he entered parliament as a supporter of Lord North, but from 1782 attached himself to Fox and Burke. In 1794-96 he was viceroy of Corsica. He was created Baron Minto in 1797, and went out to India as governor-general in 1806. He showed great vigour in his measures for establishing order and securing the frontiers by treaties, like that of Amritsar with Ranjit Sing. He next captured Mauritius and Bourbon, the Spice Islands and Java, but returned to England as Earl of Minto and Viscount Melgund in May 1814, to die on June 21st. See his *Life and Letters*, edited by his great-niece, the Countess of Minto (4 vols. 1874-80).

Minucius Felix, an early Latin apologist, of whose history nothing is known with certainty. His name survives through his *Octavius*, a dialogue held on the beach at Ostia, between the pagan Cæcilius Natalis and the Christian Octavius Januarius. The latter succeeds in convincing his opponent, although his Christianity shows no trace of such distinctive dogmas as that of the resurrection. Cyprian's *De Idolorum Vanitate* borrows from *Octavius*; as also does Tertullian's *Apologeticus*, according to Ebert, Teuffel, Keim, Kühn, and most scholars; the opposite view, however, is argued by Salmon.

See Holden's edition (Camb. 1853), Halm's edition in the *Corpus Scriptor. Eccl. Lat.* (Vienna, 1867), and Kühn, *Der Octavius des Minucius Felix* (1882).

Minuet, the air of a graceful dance, originally from Poitou, in France, and performed in a slow tempo. The music is in $\frac{3}{4}$ -time.

Minute, the 60th part of an hour; also the 60th part of a degree of a circle. See DAY, DEGREE.

Minute Men, in the American Revolution, were the militia, who were prepared for service at a minute's notice.

Minyas, in Greek Mythology, the son of Chryses, the eponymous hero of the *Minyæ*, from whom were descended most of the Argonauts. He built the city of Orchomenus. His three daughters, Clymene, Iris, and Alcihoë, or Leuconoë, Leucippe, Alcihoë, were changed into bats for having made light of the mysteries of Dionysus.

Miocene System (Gr., 'less recent'). The name was applied by Lyell to that division of the Tertiary strata which contains a smaller proportion of recent species of Mollusca than the Pliocene System (q.v.), and a larger proportion than the Eocene. Of late years the lower part of the Miocene has been separated from that system, and now ranks as a separate system (see OLIGOCENE). No true Miocene deposits occur in Britain. Marine accumulations of this age are sparingly developed in Belgium (Black Crag), and cover considerable areas in the low grounds of Touraine (*Faluns de la Touraine*) in the west of France. In the Rhine valley Miocene beds extend from the Taunus southwards (Mainz Basin). These beds are chiefly of fresh-water origin—the lower portion being marine. A more important Miocene area is met with in the Vienna Basin. Here the lower series of beds is marine, while the overlying strata are less distinctly so, many of the fossils indicating brackish-water conditions. Another interesting development of Miocene occurs in Switzerland and South Bavaria—the beds being partly marine and partly of fresh-water origin. These are the more important European areas. In North America marine Miocene strata occur sparingly on the Atlantic borders of the eastern states; while fresh-water deposits of the same age are widely spread in the western states and territories. Miocene beds have been met with far within the Arctic Circle, in Greenland and Spitzbergen.

Life of the Period.—The flora of the earlier stages of the Miocene of central Europe is indicative of somewhat tropical conditions, the nearest representatives of many of the more characteristic plants being now confined to India and Australia. Palms seem at that time to have flourished over a large part of Europe, and with these were associated conifers (*Sequoia*, *Libocedrus*), evergreen oak, fig, laurel, cinnamon, various proteaceous plants (*Banksia*, *Dryandra*), olive, magnolia, maple, myrtle, mimosa, acacia, &c. Later on the climate became more temperate, for we meet with species of birch, alder, oak, beech, chestnut, plum, willow, poplar, &c. Among the more notable terrestrial animals of the Miocene were *Dinotherium*, *Mastodon*, *Anchitherium*, *Hyotherium*, species of rhinoceros, tapir, fox; a gigantic form of ant-eater (*Macrotherium*); *Helladotherium*, allied to the giraffe; *Machairodus*, a lion-like, sabre-toothed carnivore; various antelopes and deer with small horns and antlers; opossums, apes, and monkeys. The molluscs of the marine Miocene are all modern types—those of the older strata having a tropical or subtropical facies, while the shells in the younger strata seem, like the plants, to indicate milder climatic conditions.

In Miocene times the British area was probably dry land, and the same appears to have been the case with all northern Europe. The sea, however, overflowed the low grounds of Belgium and extended into north-west Germany. It is not unlikely, indeed, that most of the Low Countries, Hanover, and Sleswick-Holstein, were at that time submerged. In like manner the sea covered wide areas in the north-west and west of France, extending into the heart of the country now drained by the Loire and its affluents the Cher and the Indre, and stretching across the old district of Aquitania to the Mediterranean. Spain and Portugal then formed an island, considerable tracts in the south and east of Spain being submerged. From the Gulf of Lions a long arm of the sea passed up the valley of the Rhone, and swept north-east through northern Switzerland, sending a branch into the Mainz basin, and then traversing Bavaria, across which it continued to the wide sea which then occupied all the great plains of Hungary. Northern

and eastern Italy were at the same time under water, as was also the case with many parts of eastern Europe and Asia Minor. Southern Europe was thus in the Miocene period an extensive archipelago, in which the plateaus of Spain and central France, the Alps, the Carpathians, &c. existed as islands. The most continuous land-mass was in the north of Europe: and if the Miocene of the Arctic regions, with its abundant flora, be of the same age as the Miocene of Europe, then we may infer that a vast area of the North Atlantic existed on dry land, across which migrations of the flora took place. Considerable movements of elevation seem to have occurred in Europe before the close of Miocene times, causing the sea to disappear from wide regions which it had formerly occupied. Thus, the Mainz basin and the sea that occupied much of northern Switzerland, &c. were replaced by fresh-water lakes, while the wide sea of the Vienna basin was much reduced in size, and eventually became freshened—the conditions resembling those that characterise the Black Sea.

Miquelon, GREAT and LITTLE, two islands connected by a long, narrow, sandy isthmus, off the south-west coast of Newfoundland, forming with St Pierre the sole remaining colony of France in North America. Fishing is nearly the sole occupation, and dried and fresh cod and cod-liver oil are exported. Area, 78 sq. m.; pop. (1885) 5765.

Mir, the Russian commune, consisting of the inhabitants of one or more villages, who are as a community owners of the surrounding land, and redistribute the same to the members from time to time. See LAND LAWS, Vol. VI. p. 502; RUSSIA; VILLAGE COMMUNITIES.

Mirabeau, VICTOR RIQUETI, MARQUIS DE, father of the great statesman of the French Revolution, was born, October 5, 1715, at Pertuis in Provence, of a family that claimed a noble Florentine descent, but was really sprung from a wealthy bourgeois family of Digne and Marseilles that had acquired in 1570 the domain of Mirabeau by purchase, and the title in 1685. He was an able but eccentric and exceedingly hot-headed and self-willed man, and he showed himself a senseless and brutal tyrant in the treatment of his family. It is said that he procured at one time or other no fewer than fifty-four *lettres de cachet* against his wife and children, and he strove to curb the extraordinary genius of his greatest son by a course of unnatural severity, which ended with shattering all the ties of kindred and driving him into the most defiant and reckless excesses. Yet he was himself a theoretical philanthropist and active promoter of physiocratic ideas, and in this cause published a series of books, as *Ami des Hommes* (5 vols. 1755) and *La Philosophie rurale* (4 vols. 1763), in which the vigour of phrase often fore-shadows the stronger hand of his son. He died at Argenteuil, 13th July 1789.

See Loménie, *Les Mirabeau* (1878-89), and Oncken, *Der ältere Mirabeau* (Bern, 1886).

HONORÉ GABRIEL RIQUETI, COMTE DE MIRABEAU, the greatest figure in the French Revolution, and perhaps the ablest statesman that France has yet produced, was born at Bignon in Provence, 9th March 1749, of a family that had been for three generations famous for stormy passions and great abilities. Within his vigorous frame and massive intellect were concentrated all the good and all the evil of his race; his unusually ugly face, scarred with smallpox and crowned with an immense mane of black hair, bore unmistakably the stamp of power, and from boyhood he possessed a marvellous personal fascination which subdued all men and women to his will. His education was left to

take care of itself, and at seventeen he entered as a lieutenant the Berri regiment of cavalry, and lived a life of such recklessness at the little garrison-town of Saintes that his imperious father imprisoned him in 1768 on the Isle of Rhé, near La Rochelle, and next sent him with the French legion of Lorraine to Corsica, where his conduct earned him the confidence of his chiefs and the affection of his men. But his father refusing to purchase him a company, he left the service in 1770, and settled down to practise the physiocrat system on an estate in Limousin. Two years later his father married him to the only daughter of the Marquis de Marignan, a sprightly and pretty, but vain and shallow woman, with whom he broke out into lavish expenditure, and lived unhappily. On account of his debts his father confined him, in May 1773, in the town of Manosque, next in the Château d'If, near Marseilles, and at last in 1775 in the castle of Joux, near Pontarlier. Here he formed an intrigue with Sophie de Ruffey, the young wife of the gray-haired legal president, the Marquis de Monnier, and fled with her to Switzerland and thence to Amsterdam, where for eight months he made his bread by laborious hack-work for the Dutch booksellers, among other tasks translating from the English Watson's *Life of Philip II.* His *Essai sur le Despotisme*, begun at Manosque and now completed, made a sensation by its audacity and vigour. Meantime the parliament of Besançon sentenced him to the penalty of death, in contumacious absence, for abduction and robbery, and caused a paper effigy of him to be beheaded. The search made for him at the instigation of his father at length proved successful, and in May 1777 he was handed over by the States-general and flung into the frowning castle of Vincennes, where, in a close imprisonment of three years and a half, and after he had worked off his grosser feelings in writing the indecent *Erotica Biblion* and *Ma Conversion*, he worked out his own salvation by study and meditation, and the writing of his famous *Essai sur les Lettres de Cachet et les Prisons d'Etat* (2 vols. 1782). His too glowing letters from the prison to Sophie were discovered later by Manuel in the archives of police at Paris, and published under the title of *Lettres originales de Mirabeau, écrites du Donjon de Vincennes* (4 vols. 1792). In December 1780 Mirabeau was released, and he at once began by a bold process to labour for his restoration to society. At length, September 1782, after eloquent pleadings that drew upon him all eyes in France, he succeeded in getting his sentence annulled. Next year he lost his suit at Aix for the restitution of his conjugal rights, but did something by the attempt to rehabilitate his reputation. Now also he broke off the illicit relation with his mistress, who had not remained true to him, and whose later disappointments in love drove her to the refuge of suicide in September 1789.

Again flung upon his own resources, deeply drowned in debt, and thriftless and extravagant by temperament, Mirabeau made for some years a shifty living by his pen, writing and compiling innumerable books and pamphlets against speculation, stock-jobbing, and other political and social evils of the time, and fitting restlessly from France to Prussia, to Holland, and to England. His grosser passions had not yet burned themselves out, and his life was stained by countless unworthy *liaisons*, amid which one woman alone—the Dutch Madame de Nehra—stands out as an elevating influence. In England he was intimate with Sir Gilbert Elliot, afterwards first Earl of Minto, Lord Lansdowne, and Romilly, and his close observation of English politics taught him the good of moderation, compromise, and opportunism. In 1786 he

was sent by the French government on a secret mission to Berlin, and there from Major Mauvillon he obtained the materials for his work, *Sur la Monarchie Prussienne sous Frédéric le Grand* (4 vols. 1787). When the States-general was convened he offered himself as a candidate to the nobles of Provence, and was rejected, whereupon he turned to the *tiers état* and was returned enthusiastically for both Marseilles and Aix. He chose to sit for the latter, and, badly received though he was at first, soon showed himself a born leader of men, as well as the one really practical statesman in the Assembly. On the 17th June, on the motion of Sieyès, the *tiers état* constituted itself as the National Assembly, and on the 23d Mirabeau made his memorable answer to the royal messenger, the Marquis de Dreux-Brézé, who had come from the king to command the deputies to separate: 'If you have orders to remove us from this hall, you must also get authority to use force, for we shall yield to nothing but to bayonets.'

Mirabeau's political sagacity and foresight quickly made him a great force in the Assembly, while his audacity and volcanic eloquence made him at once the darling of the mob and the terror of the court. Meantime he extended his influence by unceasing diligence in journalistic work, and for his *États-Généraux*, *Lettres à mes Commettants*, and *Courrier de Provence*, drew on the knowledge and abilities of a host of coadjutors, such as the Genevese Duroveray and Étienne Dumont. Moved by his instinctive dread of anarchy, he proposed the establishment of a citizen-guard, out of which grew the National Guard, but he trembled at the 'nocturnal orgies' of August 4, 1789, when in the breathless legislation of a single night were swept away together serfdom, feudal jurisdiction, manorial ground-rents, tithes, game-laws, saleable offices, fees, clerical robing dues, municipal and provincial privileges, privileges of rank, exemptions from taxes, and plurality of offices and livings. None of his contemporaries equalled him in breadth of view, temperance in judgment, and freedom from prejudice—no actor in the great drama save himself saw that 'the notion of equality is only a fit of the revolutionary fever.' He saw clearly the fatuity of such schemes as the foolish Lafayette's theatrical declaration of the rights of man, pointing out that such a thing might well enough be done after the work of constructing the constitution had been accomplished. Mirabeau was not personally responsible for the furious *émeute* of October 5 and 6, which brought the king to Paris, for indeed hatred of anarchy was his most deeply-rooted political principle. As early as May 1789 he had tried in vain to come to terms with Necker and Lafayette, yet his character was too magnanimous to desire revenge for the rebuffs with which his overtures had been received. He formed a warm friendship with the Count de la Marck, a particular friend of Marie Antoinette, and in conjunction with him he drew up his first memoir for the guidance of the court, just after the transference of the king and Assembly to Paris. In this admirable paper he set forth the necessity for a new constitution, the initiative to come from the king; that all that had been passed must be ratified, and a responsible ministry appointed after the pattern of the English parliamentary usage; and that the king must leave Paris for some such loyal city as Rouen, and throw himself frankly upon France. He suggested a ministry, with Necker and Lafayette as its prominent members, himself to have a seat but no portfolio. But the infatuated queen detested and distrusted the great tribune, and the Assembly, mad with suspicion and fear, passed a suicidal self-denying ordinance (November 7, 1789) that no member should take office under the crown

while holding his seat, or for six months after. Mirabeau's hopes were thus blasted for the time, yet he worked on with unabated energy. He surrounded himself with a group of able and enthusiastic friends who provided him with his facts, and even wrote for him his speeches and articles, content to efface themselves to enhance a beloved master's glory: Never was there so marvellous a collaboration of unpaid enthusiasm: Dumont wrote the political speeches; Clavière, the financial; the Abbé Lamourette, those on the civil constitution of the clergy. Pellenc, the private secretary, constantly accumulated facts; the Genevese Reybaz wrote the speeches on the assignats, and on the right of making war and peace. The orator took freely these materials so generously prepared for him, fused them in the alembic of his own marvellous genius, and stamped them afresh with the impress of his own individuality.

In the spring of 1790 communication opened anew with the court, and fresh appeals were made to Lafayette. If Mirabeau was a bitter enemy of feudalism he was a devoted friend of order, and saw the necessity of a strong executive as its foundation, but he was constantly mortified to find himself mistrusted and misunderstood. His past rose up in judgment against him, and he could not gain the full confidence either of the respectable classes or of the court—as he himself said bitterly to Dumont, 'The sins which I committed in my youth are giving me their full punishment now.' The court provided money to pay his debts, which were scheduled at 208,000 livres—among them the bill for his wedding-clothes—and agreed to allow him 100 louis a month, with 300 livres for De Comps, his copyist, whereupon Mirabeau broke out into indiscreet extravagance. He risked all his popularity by successfully opposing Barnave's motion that the right of peace and war should rest not with the king but the Assembly. On the 3d July the queen gave him an interview in the gardens at Saint-Cloud, and at its close Mirabeau, with the fine chivalry of his nature, as he bent to kiss her hand, assured her with the words, 'Madame, the monarchy is saved.' But as the popular movement progressed his dream of placing the king at the head of the revolution became more and more a dream, and he was cut to the heart to find, as he did by the winter of 1790, that the court did not yet grant him its full confidence, but listened also to other counsellors than himself, and that it would not accept his plan of an appeal to the provinces. He inspired Montmorin in his management of foreign affairs, and showed himself a really great financier in his measures to avert national bankruptcy, while he continued to interchange notes of advice with the court. His secret aim was now to undermine the popularity and influence of the Assembly, and compel it to dissolve. Neither counter-revolution nor foreign intervention were within his schemes, but the advent of a new assembly, which he hoped to guide to a moderate conception of liberty and to wise concessions to the throne. He suggested the establishment of a bureau of correspondence with the provinces, a publishing committee to buttress the cause of order with the throne as its centre, a plan for gaining over the chief members of the present Assembly in preparation for its dissolution, and an organised system of ascertaining the opinions of journalists and leading politicians. But the queen would not commit herself to the tribune, and Mirabeau's heart sank within him as he saw slip from his grasp his great dream of establishing a responsible parliamentary government in France. This summer his health and eyesight gave way alarmingly, but he refused to abate his giant labours. In December 1790 he was elected

president of the Jacobin Club; as well as an administrator of the Seine department, and in the January following one of its eight directors; but by Lafayette's influence he was defeated in his candidature for the office of its procureur-general-syndic, as well as for the presidency. He was chosen, however, commandant of the battalion of National Guards of his district, and on January 30, 1791, was at last elected president of the Assembly for the fortnight, and none showed more dignity and impartiality in the office. He overthrew the proposed law against emigration, and that same evening at the Jacobin Club bore down all opposition by his irresistible eloquence, and left the club amid thunders of applause. He opposed vigorously the motion of Sieyès (March 22) that in the event of the king's death the regent should be elected by the Assembly, as an abandonment of the hereditary principle, and carried his point. But his health was fast sinking, although he refused to allow himself any relaxation—a splendid atonement of self-sacrifice for the errors of his youth. His last battle was on the rights of property in mines, into which debate he threw himself with the enthusiastic chivalry of friendship, for it was a question closely affecting the interests of his dear friend De la Marck. He returned from the Assembly utterly exhausted, with the words, 'Your cause is won, but I have got my death-blow.' On the last day of his life he said, with the prophetic foresight of genius, 'I carry with me the ruin of the monarchy. After my death factions will dispute about the fragments.' As he looked on the sun he exclaimed, 'If that is not God, it is at least his cousin.' The famous chemist Cabanis from the first gave no hope, and on the morning of April 2, 1791, after a night of agony, when speech had gone, he wrote on a slate, 'Sleep—I wish only to sleep,' and a few moments after his heart had ceased to beat. He was buried in the Pantheon amid universal mourning, his funeral procession extending for about four miles. Another National Assembly, the Convention, two and a half years afterwards, when the papers revealing the secret relations of Mirabeau and the court were discovered in the king's iron chest, ordered the body to be disinterred from the Pantheon and cast into the churchyard of Sainte-Catherine.

'Do not rejoice over the death of Mirabeau,' said the king to Marie Antoinette; 'we have suffered a greater loss than you imagine.' That loss was the one influence that might still have saved the throne, and averted a deluge of blood in which the light of liberty was itself extinguished.

His writings were collected by Blanchard (10 vols. 1822). For his life, see especially the *Mémoires Biographiques, Littéraires, et Politiques de Mirabeau écrits par Lui-même, par son Père, son Oncle, et son Fils Adoptif—Lucas de Montigny, son of Madame de Nehra* (8 vols. 1834; Eng. trans. down to the commencement of his public life, in 4 vols. 1835-36). See also Dumont, *Souvenirs sur Mirabeau* (1832), and A. Stern, *Das Leben Mirabeaus* (2 vols. 1889); and for his political ideas especially M. de Baour's *Correspondance entre le Comte de Mirabeau et le Comte de la Marck pendant les Années 1789, 1790, et 1791* (3 vols. 1851). Loménie's work, *Les Mirabeau* (3 vols. 1878-89), is mostly upon his father and uncle. Other works of value are Ph. Plan, *Un Collaborateur de Mirabeau—Reynolds* (1874); H. Reynald, *Mirabeau et la Constituante* (1873); and Aulard, *L'Eloquence parlementaire pendant la Révolution Française* (1882). See also the Histories of the Revolution of Carlyle, Von Sybel, and H. Morse Stephens (vol. i.), also essays by Carlyle (*Miscellanies*, vol. iv.) and Henry Reeve (*Royal and Republican France*, vol. i. 1872).

ANDRÉ BONIFACE RIQUETI, VICOMTE DE MIRABEAU, brother of the preceding, was born 30th November 1754 at Bignon, and from an early age was notorious for his ill-regulated life and for a thirst that earned him the nickname of 'Barrel

Mirabeau.' It was as he said the only vice his brother had left for him. He fought with distinction in the American war, and at the outbreak of the Revolution was returned to the States-general by the nobility of Limoges. Here he showed himself a fierce aristocrat in policy, and after the death of his brother he quitted France, and raised on the Rhine the 'Hussards de la Mort,' a legion of embittered *émigrés*, with whom he began in 1792 a bloody partisan warfare against his country. He was run through by accident, 15th September of the same year, at Freiburg in Breisgau.

Miracle, a term commonly applied to certain marvellous works (such as healing the sick, raising the dead, changing of water into wine) ascribed in the Bible to some of the ancient prophets, and to Jesus Christ and his followers. It signifies simply that which is wonderful—a thing or a deed to be wondered at, being derived directly from the Latin *miraculum*, 'a thing unusual'—an object of wonder or surprise. The same meaning is the governing idea in the term applied in the New Testament to the Christian miracles, *teras*, 'a marvel,' 'a portent;' besides which, we also find them designated *dynameis*, 'powers,' with reference to the power residing in the miracle-worker, and *semeia*, 'signs,' with a reference to the character or claims of which they were assumed to be the witnesses or guarantees. Under these different names the one fact recognised is a deed acknowledged by the common judgment of men to exceed man's ordinary powers; in other words, a deed *supernatural*, beyond the common powers of nature, as these are understood by men.

In the older speculations on the subject, a miracle was generally defined to be a violation or suspension of the order of nature. While, on the one hand, it was argued that such a violation or suspension was absolutely impossible and incredible, it was maintained, on the other, that the Almighty, either by His own immediate agency, or by the agency of others, could interfere with the operation of the laws of nature, in order to secure certain ends which without that interference could not have been secured, and that there was nothing incredible in the idea of a law being suspended by the Person by whom it had been made. The laws of nature and the will or providence of God were, in this view, thus placed in a certain aspect of opposition to each other, at points here and there clashing, and the stronger arbitrarily asserting its superiority. Such a view has, with the advance of philosophical opinion, appeared to many to be inadequate as a theory, and to give an unworthy conception of the Divine character. The great principle of Law, as the highest conception not only of nature, but of Divine Providence, in all its manifestations, has asserted itself more dominantly in the realm of thought, and led to the rejection of the apparently conflicting idea of 'interference,' implied in the old notion of miracle. Order in nature and a just and uncapricious will in God were felt to be first and absolutely necessary principles. The idea of miracle, accordingly, which seems to be now most readily accepted by the advocates of the Christian religion, has its root in this recognised necessity.

All law is regarded as the expression, not of a lifeless force, but of a perfectly wise and just will. All law must develop itself through natural phenomena; but it is not identified with or bound down to any necessary series of these. If we admit the mainspring of the universe to be a living will, then we may admit that the phenomena through which that will, acting in the form of law, expresses itself, may vary without the will varying or the law being broken. We know absolutely nothing of the mode of operation in any recorded miracle; we only see

certain results. To affirm that these results are either impossible in themselves, or necessarily violations of natural law, is to pronounce a judgment on imperfect data. We can only say that, under an impulse which we must believe proceeds from the Divine will, in which all law subsists, the phenomena which we have been accustomed to expect have not followed on their ordinary conditions. But from our point of view we cannot affirm that the question as to *how* this happens is one of interference or violation; it is rather, probably, one of higher and lower action. The miracle may be but the expression of one Divine order and beneficent will in a new shape, the law of a greater freedom, to use the words of Trench, swallowing up the law of a lesser. Nature being but the plastic medium through which God's will is ever manifested to us, and the design of that will being, as it necessarily must be, the good of His creatures, that theory of miracle is certainly most rational which does not represent the law of nature and the will of God as separate and opposing forces, but which represents the Divine will as working out its highest moral ends, not against but through law and order, and evolving from these a new issue, when it has a special beneficent purpose to serve.

The evidence for the Christian miracles is of a twofold kind—external and internal. As alleged facts, they are supposed to rest upon competent testimony, the testimony of eye-witnesses, who were neither deceived themselves, nor had any motive for deceiving others. They occurred not in privacy, but for the most part in the open light of day, amidst the professed enemies of Christ. They were not isolated facts, nor wrought tentatively, or with difficulty, but the repeated, the overflowing expression, as it were, of an apparently supernatural life. The gospel miracles, moreover, are supposed in themselves to be of an obviously Divine character. They are miracles of healing, of beneficence, in which the light equally of the Divine majesty and of the Divine love shines.

Spinoza strongly controverted the possibility of miracles, explaining by natural causes the events recorded as such. The English Deists also rejected them, and explained the tradition of them as due to mistaken allegory, 'enthusiasm,' or even conscious fraud on the part of the narrators. Hume's famous argument was that miracles are incapable of proof, because they rest on testimony, and no testimony can be so strong and convincing as our own experience of the uniformity of nature; this was answered in Campbell's *Dissertation on Miracles* (1762). The German rationalists of the school of Paulus explained the miracles as exaggerations or misapprehensions of quite ordinary events. Strauss (q.v.) caustically criticised these so-called explanations and brought forward his 'Mythical Theory,' according to which the gospel miracles originated in the fixed conviction that the Messiah would perform certain wonders; and the faithful, intent on seeing in Jesus a complete fulfilment of the Old Testament prophecy, allowed the 'mythopoetic instinct' to invent the fulfilment, and ascribe to Jesus as miracles what were really the symbolisations of abstract ideas. The Positive philosophy expressly excludes miracles; many of the representatives of natural science (Huxley, Tyndall, Spencer) and historical investigators (Buckle, Lecky) treat belief in them as pure superstition.—The literature is very extensive. See the manuals of Dogmatics by Schleiermacher, Rothe, Auberlen, Schenkel, Schweitzer, Weiss, Lipsius; the special German works on miracle by W. Beyschlag (1863), F. Nitzsch (1865), H. Cremer (1865), Flügel (1869), Bender (1871), Lommatsch on Schleiermacher's conception (1872), J. Kreyher (1880), R. Kübel (1883), and Gloatz (1886); Bushnell's *Nature and the Supernatural* (New York, 1858); M'Cosh, *The Supernatural in Relation to the Natural* (1862); the Duke of Argyll's *Reign of Law* (1866); and J. Lias, *Are Miracles Credible?* (1883). See also Trench, *Notes on the Miracles* (1846); Mozley's admirable *Eight Lectures on Miracles* (1865); and the expository books on our Lord's miracles by Godet (1867), Steinmeyer (Eng. trans. 1875), Taylor (New York,

1880); and Laidlaw (1890); and for the relation of the scriptural to the ecclesiastical miracles, Conyers Middleton's *Free Inquiry* (1748) on the one side, and Newman's *Two Essays* (1870) on the other. Protestants hold that miracles ceased with or soon after the apostolic age; the Catholic Church holds that the gift of miracles is a permanent possession, manifested from time to time. While the scriptural miracles must be accepted without doubt, as resting on Divine faith, the ecclesiastical miracles are not the object of this faith—they must be tested, and Catholics are not bound to believe in any miracle not in Scripture. See CANONISATION, STIGMATISATION, LOURDES, KNOCK, &c., also CONVULSIONARIES; on the evidences generally, the article APOLOGETICS; and for another aspect of miracles, see A. R. Wallace, *On Miracles and Modern Spiritualism* (1876).

Miracle Plays. See MYSTERIES.

Mirage. The density of the air generally diminishes with the height; rays of light proceeding obliquely upwards from an object then become more and more nearly horizontal, but generally pass away into space. Assume the density to diminish with the height with unusual rapidity, as when the air is cooler the nearer it is to the earth; the obliquely ascending rays may become quite horizontal and then bend down towards the earth, reaching it at a distant point. The observer at that point sees distant objects at an unusual elevation, or sees above the true horizon erect images of objects which may or may not be beyond the horizon. This is what the sailors generally call looming, and it causes us sometimes to see distant coasts with unusual distinctness, or to see from a mountain top a double horizon, such as is regularly seen in the autumn mornings from the Colorado foot-hills across the prairies. If the layer of air near the earth, say 50 or 100 feet thick, be uniformly dense, as in the cold air over a frozen sea, and a warmer stratum lie above it in which the density rapidly diminishes, so that the rays are brought back to the earth as above, we find, on tracing the path of the rays reaching the observer from the top and the bottom of the distant object respectively, that these rays have crossed one another in the hot stratum; the observer therefore seems to see the object suspended in the air, magnified and upside down; and this may happen while the observer sees the object itself by direct vision through the lower air. An intermediate stratum between a cold ground-stratum and a warm upper stratum gives rise to more than one image, inverted or erect, or both, according to positions. In the mirage of the Sahara and other arid deserts the conditions are reversed; the air is hottest nearest the hot sand; skylight rays descending become bent upwards; the eye receives an impression resembling that produced by the reflection of skylight from water; the illusion is rendered more perfect by the flickering due to convection currents, which causes an appearance like a breeze playing over the illusory water.

The phenomena of mirage are frequently very strange and complicated, the images being often much distorted and magnified, and in some instances occurring at a considerable distance from the object, as in the case of a tower or church seen over the sea, or a vessel over dry land, &c. Looming is very frequently observed at sea, and a most remarkable case of this sort occurred on the 26th of July 1798, at Hastings. From this place the French coast is 50 miles distant; yet from the seaside the whole coast of France from Calais to near Dieppe was distinctly visible, and continued so for three hours. In the Arctic regions it is no uncommon occurrence for whale-fishers to discover the proximity of other ships by means of their images seen elevated in the air, though the ships themselves may be below the horizon. Generally,

when the ship is above the horizon, only one image, and that inverted, is found; but when it is wholly or in great part below the horizon, double images, one erect and the other inverted, are frequently seen. The faithfulness and distinctness of these images at times may be imagined from the fact that Captain Scoresby, while cruising off the coast of Greenland in 1822, discovered the propinquity of his father's ship from its inverted image in the sky. Another remarkable instance of mirage occurred in May 1854, when from the deck of H.M. screw-steamer *Archer*, then cruising off Oesel, in the Baltic, the whole English fleet of nineteen sail, then nearly 30 miles distant, was seen as if suspended in the air upside down. Beside such phenomena as these, the celebrated *Fata Morgana* (q.v.) of the Straits of Messina sinks into insignificance. The *Spectre of the Brocken* is a magnified shadow of persons, &c., on the summit of the mountain, seen at sun-down and sunrise thrown on mist banks on the side of the mountain opposite to the sun, with or without rainbow colours. This is rather a *glory* than a mirage proper (see HALOS). Its varieties are indeed numberless, and we refer those who wish for further information to Brewster's *Optics*, to Biot's *Traité de Physique*, and for the mathematical theory of the mirage to Tait on Mirage, *Trans. Roy. Soc. Edin.*, 1881. See also REFLEXION and REFRACTION.

Miraj, a native state of India in the southern Mahratta country; pop. 69,732. The capital, Miraj, near the Kistna River, has a pop. of 20,616.

Miramar, a palace standing on the rocky shore of the Adriatic near Grignano, 6 miles NW. of Trieste, the home of the Archduke Maximilian, afterwards Emperor of Mexico. See also MAJORCA.

Miramichi, the second river (220 miles) of New Brunswick, entering the Gulf of St Lawrence through Miramichi Bay. It is navigable to 2 miles above Newcastle, the principal town on its banks. Salmon and trout abound both in the river and its tributaries, in one of which there is a government fish-breeding establishment.

Miranda, or SA DE MIRANDA, FRANCISCO DE (1495-1558), a Portuguese poet, founder of the school of which Camoens is the most brilliant representative. His earlier efforts were written in Spanish; his sonnets were the first written in Portuguese; his most characteristic works, his epistles in verse, are all in Portuguese but one. His works appeared at Lisbon in 1595: a better edition in 1614; the most scholarly one, by Vasancellos, at Halle in 1835.

Miran'dola, a town of Northern Italy, 19 miles by rail NNE. of Modena. It has a fine cathedral and an old castle. Pop. 3059. See PICO.

Mirecourt, a town in the department of Vosges, 236 miles by rail ESE. of Paris, with manufactures of lace and musical instruments. Pop. 5341.

Mirfield, a manufacturing town in the West Riding of Yorkshire, 3 miles W. by S. of Dewsbury, and 4½ NE. of Huddersfield. It has a town-hall (1868), a parish church (restored in 1871 by Sir G. G. Scott), and manufactures of woollen cloths, carpets, blankets, &c. Pop. of parish 15,872; of town (1881) 11,508; (1891) 11,707.

Mirror, a reflecting surface, usually made of glass lined at the back with a brilliant metal, so as strongly to reflect the image of any object placed before it. When mirrors were invented is not known, but the use of a reflecting surface would become apparent to the first person who saw his own image reflected from water; and probably for ages after the civilisation of man commenced the still waters of ponds and lakes were the only mirrors; but we read in the Pentateuch of mirrors

of brass being used by the Hebrews. Mirrors of bronze were in very common use amongst the ancient Egyptians, Greeks, and Romans, and many specimens are preserved in museums. Praxiteles taught the use of silver in the manufacture of mirrors in the year 328 B.C. Mirrors of glass were first made at Venice in 1300; and judging from those still in existence—of which one may be seen at Holyrood Palace, in the apartments of Queen Mary—they were very rude contrivances, in comparison with modern ones. It was not until 1673 that the making of mirrors was introduced into England. It is now a very important manufacture; and mirrors can be produced of any size to which plate-glass can be cast. After the plate of glass is polished on both sides, it is laid on a perfectly level table of great strength and solidity, usually of smooth stone, made like a billiard-table with raised edges; a sheet or sheets of tinfoil sufficient to cover the upper surface of the glass are then put on, and rubbed down smooth, after which the whole is covered with quicksilver, which immediately forms an amalgam with the tin. The superfluous mercury is then run off, and a woollen cloth is spread over the whole surface, and square iron weights are applied. After this pressure has been continued a day and night, the weights and the cloth are removed, and the glass is removed to another table of wood, with a movable top, which admits of gradually increasing inclination until the unamalgamated quicksilver has perfectly drained away, and only the film of amalgam remains coating the glass, and perfectly adherent to it. Mirrors are also made by silvering glass with an ammoniacal solution of a silver salt to which tartaric acid and sugar-candy have been added.

Heat is reflected like light; so that a concave mirror may be used to bring rays of heat to a focus. In this way combustible substances may be set on fire at a distance from the reflector whence they receive their heat. Thus used, a mirror is called a *Burning Mirror*.

The mirror is one of the most characteristic features of Japanese life and legend. It is usually of bronze, convex, polished by mercurial amalgam, and engraved on the back. In a few specimens the mirror may be used as a mirror in the ordinary way, but bright light reflected from its polished surface on to a screen gives bright-lined images corresponding to the figures on the back. This property of the so-called *Magic Mirror of Japan* is (according to Professors Ayrton and Perry) due to inequalities of curvature associated with inequalities of thickness, the thicker portions being the flatter.

Mirza (a contraction of *Emir Zadah*, 'son of the prince'), a Persian title, equivalent to 'Prince' when it follows the surname, and merely the common title of honour (like our 'Mr') when it is prefixed to it.

Mirzapur, a town and district in the North-western Provinces of British India. The town stands on the right bank of the Ganges, 45 miles by rail SW. of Benares. It has manufactures of shellac, carpets, and brass-ware. Pop. (1881) 56,378. The district has an area of 5223 sq. m., and a pop. (1881), almost all Hindus, of 1,136,796.

Miscarriage. See ABORTION.

Misdemeanour, in the law of England and Ireland, means a crime not involving forfeiture of property on conviction. Every crime is either treason, felony, or misdemeanour; and in creating new offences the legislature determines how they are to be classed. The distinction between felony and misdemeanour is not logically drawn, and it would disappear if the criminal law were codified on a rational plan. See Stephen's *Hist. of Crim. Law*.

Miseno, a promontory forming the western side of the Bay of Pozzuoli (*Cumæ*), 10 miles SW. of Naples. On it are ruins of the ancient city of Misenum, which Augustus made one of the principal stations of the Roman fleet.

Miserere, the name by which, in Catholic usage, the 50th Psalm of the Vulgate (51st in Authorised Version) is commonly known. It is one of the so-called 'Penitential Psalms,' which are said after Lauds on the Fridays in Lent, except Good Friday. It has been commonly understood to have been composed by David in the depth of his remorse for the double crime which the prophet Nathan rebuked in the well-known parable (2 Sam. xii.). Another opinion, however—plainly stated by Theodore of Mopsuestia (died 428), and adopted by many moderns—attributes this psalm to some of the psalm-writers of the Captivity; whilst others, again, hold that the last two verses only were added after the return from the Exile.

Miserere, a projection on the under side of the seats of the stalls of mediæval churches and chapels, &c. They are usually ornamented with

Miserere.

carved work, and are so shaped that when the seats proper are folded up they form a small seat at a higher level, sufficient to afford some support to a person resting upon it. Aged and infirm ecclesiastics were allowed to use these during long services.

Misericordia, or MISERICORDE ('mercy'), a narrow-bladed dagger used by a knight in giving the *coup de grâce* or finishing stroke to a wounded foe.—Misericordia is also the name of a society (of laymen) in Florence, founded in the 13th century, who tend the poor sick, carry victims of accident or disease to the hospitals, and the dead to their burial. Members of all classes of the community, including the highest, are enrolled in this charitable association; and their sombre and forbidding costume—a dark monastic dress, with the cowl pulled down over the face so that

A Frate della Misericordia.

the eyes merely peep through little holes—is not

assumed because the Frati della Misericordia are penitents, but to check demonstrations of gratitude to the individual brethren.

Mishmee Bitter. See COPTIS.

Mishna (from Heb. *shana*, 'to learn'; erroneously held to designate Repetition) comprises the body of the 'Oral Law,' or the juridico-political, civil, and religious code of the Jews; and forms, as such, a kind of complement to the Mosaic or Written Law, which it explains, amplifies, and immutably fixes. It was not, however, on the authority of the schools and the masters alone that these explanations, and the new ordinances to which they gave rise, depended, but rather on certain distinct and well-authenticated traditions, traced to Mount Sinai itself. The Mishna (to which the Toseftas and Boraithas form supplements) was finally redacted, after some earlier incomplete collections, by Jehudah Hanassi, in 220 A.D., at Tiberias. It is mostly written in New Hebrew, and is divided into six portions (*Sedarim*): 1. Zeraim (Seeds), on Agriculture; 2. Moed (Feast), on the Sabbath, Festivals, and Fasts; 3. Nashim (Women), on Marriage, Divorce, &c. (embracing also the laws on the Nazirship and Vows); 4. Nezikim (Damages), chiefly civil and penal law (also containing the ethical treatise *Aboth*); 5. Kadashim (Sacred Things), Sacrifices, &c.; description of the Temple of Jerusalem, &c.; 6. Taharoth (Purifications), on pure and impure things and persons. See also EXEGESIS, Vol. IV. p. 497; TALMUD.

Misiones, an Argentinian territory, lies between the Uruguay and the Paraná, and is bounded on all sides but the SW. by Brazil and Paraguay. Area, 20,823 sq. m.; pop. 30,000—though before the expulsion of the Jesuits (1767) it exceeded 100,000. There are three low mountain-chains radiating from the centre. The greater portion of the surface is covered with forest, producing building and dye-woods, oranges, medicinal herbs, and the *yerba maté*. Maize is largely grown, and sugar-cane to some extent; of late years several sugar-houses have been erected. Capital, Posadas (pop. 3000), on the Paraná.

Miskolcz, a town of Hungary, 113 miles by rail NE. of Pesth. Pop. 24,319.

Misprision. See TREASON.

Misrepresentation, a false statement affecting the validity of a contract or transfer of property. Wilful misrepresentation is the same as Fraud (q.v.). Innocent misrepresentation affects the formation of a contract in cases where one party has to rely on statements made by the other. An insurance company grants a policy in reliance on the statements made by the insured; a purchaser of land must rely on statements made by the vendor; an applicant for shares in a company relies on the truth of the prospectus. In these cases even unintentional misrepresentation will prevent the party responsible for it from enforcing the agreement against the party who has been misled. There are also cases in which a party is taken to warrant the truth of his statement; in these cases even an innocent misstatement may give the other party a right to be discharged altogether, or a right to claim damages for breach of warranty.

Missal, the volume containing the prayers used in the celebration of the Mass. Anciently, considerable variety in minor details prevailed among the books in use in different countries, and even in different churches of the same country. With the view of restoring uniformity, the pope, in virtue of a decree of the Council of Trent, in 1570 ordered that all churches which had not, for a clearly ascertained period of 200 years, enjoyed an uninterrupted use of a peculiar service-book of their own, should

thenceforth adopt the Roman Missal. Of this exemption several churches in Germany, France, and even in Italy availed themselves; but in later times the great majority have conformed to the Roman use. The Roman Missal has twice since that date been subjected to revision and correction—in 1604 by Clement VIII., and in 1634 by Urban VIII. The latter recension still continues in use. The missals of the oriental rites differ from that of the Roman Church, each having for the most part its own proper form. See LITURGY.

Missions. The truth and divine origin of Christianity being assumed, it might have been expected that missions to propagate the faith should have been carried on continuously till the world was evangelised, and that that goal should have been reached long ere now. It has not been so. There have been long periods of intermission, during which the work either ceased, or was prosecuted without zeal or energy; and others during which abundant zeal was neutralised by a strange lack of discretion. In point of fact there have been but three periods in the history of the Church which have been distinctively marked as missionary periods, and a history of missions would be fairly complete if it gave an account of (a) the apostolic and immediately post-apostolic; (b) the mediæval; and (c) the modern missions.

(a) *Missions of the Apostolic and immediately subsequent Ages.*—It is certain that the gospel made great progress during the lifetime of the apostles. From the 'Acts of the Apostles' it is manifest that within a few years of the resurrection of Christ the gospel obtained a footing in most countries to the east and the north of the Mediterranean; while from other authentic sources we learn that in the same brief period it was successfully introduced into Egypt and the other African regions on the southern shores of that sea. Neither Gibbon, in his estimate of the effects of 'secondary causes,' nor the orthodox apologists who criticised that estimate, nor writers of the history of missions in our day appear to estimate highly enough, as contributing to the production of this result, the labours of those Hellenistic Jews and proselytes of whose conversion to the faith we read in the second chapter of the Acts. While there were in Jerusalem tens of thousands of Jews who had never left the precincts of the Holy Land, and who knew no language but the Hebrew of their Scriptures and the Aramaic dialect into which it had degenerated, no mention is made of them as witnesses of the miracle of the gift of tongues, but only of the Hellenistic Jews and proselytes who had come for the observance of the great feast from numerous Asiatic, African, and European lands, and from the remote isles of the sea. Of these three thousand were baptised. They thenceforth constituted a 'native agency' for conveying the message of the gospel into their several lands, and telling of 'Jesus Christ and Him crucified' in the vernacular speech of these lands. But they needed training for this work, and remained for a time under the teaching and fellowship of the apostles. As the result of 'the persecution which arose about Stephen,' 'they were all scattered abroad, except the apostles,' and 'they that were scattered abroad went everywhere, preaching the word.' It must have been through the labours of these evangelists, under the direction of the apostles, that Christian churches were founded in many places remote from Jerusalem—as, for example, at Damascus, where we find a church of such importance as to warrant the employment of the arch-persecutor for its suppression.

As to the personal labours of the apostles we have no reliable information outside the book of the

Acts. There are innumerable churches that claim the honour of apostolic foundation; but their claims rest on traditions which cannot be traced beyond the 13th, the 12th, or, at most, the 11th century. There are, indeed, two exceptions, that relating to the foundation of a church in the kingdom of Edessa by Thaddeus, and that which ascribes the introduction of the gospel into India to the apostle Thomas. The authorities for these are apocryphal 'acts,' which are certainly of an early date. The books contain multitudes of mistakes and anachronisms, and cannot be regarded as historical authorities; but they wear the aspect of a misapprehension of actual facts and occurrences, rather than that of pure invention. A greater amount of probability than is usually assigned to it appears to belong to the apostolic origin of the Syrian Church in Southern India (see THOMAS, ST).

We have no sufficient data from which to estimate the rate of the progress of the gospel during the apostolic age. From such data as exist statisticians have estimated the number of Christians existing at the death of the apostle John, or at the close of the first Christian century, at numbers varying from less than a quarter of a million to more than half a million. It were not safe to assume that the actual number was a mean between these two extremes, or even that it lay between them at all. It may possibly have been below the smaller, or, equally possibly, above the greater. Certainly, however, the number was large. The testimony of Tertullian to this effect would not be of much value if it stood alone. But from it, confirmed as it remarkably is by the unexceptionable testimony of the younger Pliny, it cannot but be inferred that within a century of the resurrection of Christ the gospel had been preached over a great part of the Roman world, and that at least in some provinces, as in Bithynia, the gospel was threatening to supersede the worship of the gods of the empire.

(b) *Mediæval Missions.*—Apart from missions in the technical sense of the term, it is certain that various causes contributed to the wide diffusion of a knowledge of the gospel. Setting aside some altogether untrustworthy legends and traditions, we find no reason to believe that the gospel was first introduced into the British Islands by apostles or apostolic men, or by missionaries specially set apart for the work; and yet it is certain that before the time of Constantine there were churches of considerable extent both in the southern and the northern sections of Britain. The most probable supposition is that these churches owe their origin to the intercourse of Britain with Rome, which began with Caesar's invasion, and soon attained a great extent. Soldiers and civilians came from Rome to Britain, some of whom were Christians, while others brought with them Christian slaves. British merchants went to Rome as traders, British chieftains as diplomats, British ladies as hostages. There is some reason to believe that one of the last class was a friend of Paul during his imprisonment there. But if the British Church did not owe its origin to missionaries in the strict sense of the term, it is its proud distinction to have been the greatest missionary church throughout the earlier of the mediæval centuries. If Patrick really was a Briton, as seems demonstrable, he was the great leader of the British missionary host. He found Ireland entirely heathen, and he lived to see it professedly Christian. During his lifetime it was changed from a condition of barbarism into a land of saints and a land of scholars, in whose schools were trained not only the choicest youths of the neighbouring Britain, but many also from the continent of Europe. The debt that

Ireland owed to Scotland for the mission of Patrick she nobly repaid by the mission, just a century later, of Columba and his associates to Iona. The religion imported probably in a casual way by Roman soldiers and Roman civilians and Roman slaves, and by British sojourners in Rome, had not died out, but it had not become widespread. The Picts were uncivilised and unevangelised. It was from the sequestered I or Iona that the light went forth which shone brightly for many generations—all the more brightly by reason of the depth of the darkness which it had to penetrate. If the Scottish Patrick might fitly be called the apostle of Ireland, and the Irish Columba in some sort the apostle of Scotland, Aidan, one of the Iona 'family,' is entitled in like sort to be regarded as the apostle of Northumbria; and St Cuthbert was a spiritual descendant of Aidan. Moreover, the Irish-Scottish missionaries were the great evangelists of a large part of the European continent. Ebrard has shown the magnitude and the importance of the work undertaken and accomplished by Columbanus and Gallus and a host of others, 'numerous as swarms of bees,' who, in the midst of innumerable difficulties, introduced agriculture and civilisation, learning and religion, into France and Switzerland and Italy and Germany, of which last country the English Boniface became the 'apostle.' Not that the externals of Christianity were non-existent at an earlier time. In France, for example, these noble missionaries had to do with the religion introduced by the Romans; but the pure faith was now represented by a corrupt clergy ministering to dissolute nobles and neglecting an enslaved people. Then they had to do with the recent invaders, who were partly heathen and partly Arian. Sad to say, the missionaries seem to have suffered less from the heathens than from the Arians, less from the Arians than from the orthodox, and, among the orthodox, less from the peasantry than from the nobles, and most of all from the clergy, or from others at their instigation.

What the Irish and Scots did for Europe in the earlier middle ages the Nestorians about the same time attempted, with no less zeal, though with less success, for Asia. Condemned as a heretic by a council held at Ephesus in the 5th century, Nestorius (q.v.) was banished from Constantinople to Egypt. From that time onwards, for five centuries the Nestorians carried on extensive and not unsuccessful missionary operations in central Asia, and founded churches, some of which exist in a languishing condition to this day, whilst others recognised papal authority in the later mediæval centuries. The Nestorian Tartar Church seems to have subsisted under a succession of ecclesiastics (see PRESTER JOHN) until the country was devastated by Genghis Khan. The Nestorians either introduced the gospel into India, or else revived a church previously founded, possibly by the apostle Thomas. There can be no reasonable doubt that in the 7th century they passed through Tartary into China, that they founded churches there, that they were at least tolerated and probably subsidised by successive emperors till the end of the 9th century, when, with a revolution or change of dynasty, the system of intolerance was introduced.

In the later mediæval centuries the missionary work was mainly in the hands of the great Roman orders, the Dominicans (q.v.) and the Franciscans (q.v.), especially the latter. Their work was chiefly among the Mussulmans of Spain, North Africa, and western Asia. Las Casas (q.v.) earned the title of 'apostle of the Indians.'

(c) *Modern Missions.*—The Jesuit order was formed immediately after the Reformation, avowedly for the purpose of retrieving the disaster which that great event had caused to the Church

of Rome. By far the most distinguished of the early Jesuit missionaries was Francis Xavier (q.v.). Unquestionably Xavier was no ordinary man; it is, however, evident even from the eulogies passed on him by his admirers that he did not make any spiritual impression on the minds of the people of India and Japan, though he consolidated the Portuguese mission in India and helped to open China and Japan to missionary effort. After the labours of Ricci and Schall there are said to have been in China 300,000 Catholics in 1663. For the Jesuit 18th-century missions in Paraguay, see JESUITS, PARAGUAY. Notes on the Catholic missions in Japan and Corea will be found in the articles on these countries. There is a separate article on the Propaganda (q.v.). The *Missiones Catholice* states that the number of European missionaries belonging to the Roman Catholic Church in 1886 was 2800, of mission adherents nearly 2,800,000; in India there being 1,180,000, in Indo-China over 500,000, nearly 500,000 in China, 210,000 in Africa, and over 100,000 in Oceania.

The Reformation was a great preparation for evangelistic work, but the Reformation period was not distinctively a missionary period. This was not merely, though it might be in part, because the hands of the Reformers were full of the work which they had to do at home. It is to be remembered that the nations which had foreign relations, foreign traffic, and foreign possessions were Spain and Portugal, in which the Reformation got no firm hold. But it must be admitted that the Reformers did not rightly apprehend the commission to preach the gospel to every creature. When Luther, therefore, has occasion to refer to that text, he tacitly assumes that its requirement is fulfilled when the *gospel*, as distinguished from Romanism, is preached to the nations of Europe. In the 16th and 17th centuries, therefore, we find no more than sporadic and ill-sustained efforts after mission-work among Jews or heathens. Leibnitz, indeed, anticipated the conception of a later age, and may well be regarded as the harbinger of modern missions, even as, along with Newton, he is honoured as the harbinger of modern science. It was natural that the needs of the English colonies should first attract the interest of Englishmen to foreign parts; the life labours of John Eliot, 'the Indian apostle' (1604–90), were carried out under the auspices of the Corporation for the Spread of the Gospel in New England. The Hon. Robert Boyle, first governor of that society, contributed to the translation of the gospels into Malay, and left a bequest for foreign missions. Bishop Berkeley laboured for the foundation of a missionary college in Bermuda; and it was mainly for the spiritual wants of the American colonies that the Society for the Propagation of the Gospel in Foreign Parts was founded in 1701; its first missionary to India sailed in 1818.

Early in the 18th century the first Protestant mission was sent to India. It was projected by the king of Denmark, having probably been suggested to him by his chaplain, Dr Lütkens. At first, and for a long time, Germany supplied the missionaries; but the pecuniary support of the mission soon devolved upon England, Prince George of Denmark, the husband of Queen Anne, having recommended the object to the Society for Promoting Christian Knowledge. Among many noble men who have been engaged in this mission the most notable is Schwartz, who probably obtained an influence over all classes of the people of India such as no other European ever possessed.

While all the Protestant churches of Europe and America are now engaged in missionary work, there is one church which is distinguished from all

the rest by this, that it is simply a missionary institute. Other churches make their missionary work subordinate to their pastoral functions; the Moravians or *Unitas Fratrum* have long regarded the conduct of missions as the end of their being. There is not in the history of human enterprise a more interesting chapter than that which relates the missionary works of the Moravians from their first beginnings in St Thomas and in Greenland to their latest undertaking in the Tibetan Himalayas.

To William Carey belongs the high distinction of having been the first to inculcate effectually upon British Protestants the duty and the privilege of missions, and the first English Protestant to engage personally in the work. He and his coadjutors were noble men, and had to contend not only with heathen prejudices, but also with the timid policy of the rulers of India. The battle which fell to them to fight had to be fought once for all; and it is due to their singular discretion and their inflexible determination that it was fought so well. These men made Serampore a classic spot, and amid all the changes, material and spiritual, which have come over India in these last years, and the greater changes which a near future will certainly effect, the names of Carey and Marshman and Ward will be held in ever-growing veneration. Carey went to India in 1793; Henry Martyn's labours lay between 1805 and 1812. In 1795 the London Missionary Society was formed, and began its work by the despatch to the South Seas of the ship *Duff* with a large body of missionaries. For a long time the mission was not successful; but after a time it met with great success, and now there are many of the islands in which heathenism has long been extinct. The London society cordially welcomed numerous fellow-labourers from England, Scotland, Germany, and America, and most generously consented to a division of the islands which they could not have been much blamed if they had claimed as their own. It may be noted in passing that these small islands have contributed to a disproportional extent to the enrichment of missionary literature. It is part of the common creed of mankind that truth is stranger than fiction, but is not generally so attractive. Yet in our day there have not appeared more fascinating books than William's *Missionary Enterprises*, Miss Yonge's life of Bishop Patteson, and Mr Paton's narrative of his own work and that of his brethren in the New Hebrides.

The societies of the Church of England are the Society for the Propagation of the Gospel, High Church (1701), and the Church Missionary Society (1799). The English Nonconformists are represented in the mission-field all over the world by agents of the London (1795), the Baptist (1792), and the Wesleyan Missionary Societies (1817). The Americans are not behind in the good work. The American Board of Missions (1810) and the American Presbyterian Board are great organisations, whose agents are doing most effective work in many fields; while the Baptists have good reason to rejoice in their Burmese Mission (1813). The Methodist Episcopal Church came more recently into the field (1819), but set about its work with characteristic energy. Zenana missions are a special department of Indian missions. The efforts of the Salvation Army (q.v.) in the foreign field deserve mention. Missions to the Jews have a peculiar interest for many Christians; and home missions are an integral part of church work at home.

The Evangelical body in Germany is, in proportion to its strength, most creditably evangelistic. By means of many institutions they have trained and sent forth a large number of missionaries, some of whom have been men of extensive scholar-

ship, but the greater proportion men of earnest piety, able and willing to endure hardness, as good soldiers of Jesus Christ. The Rationalistic party in Germany have not shown much zeal in the mission cause.

The Scottish missions differ from the others in this, that they are conducted by the churches as such, without the intervention of societies. The Established, the Free, and the United Presbyterian Churches have extensive missions in India, Africa, China, the South Seas, and Japan. The English Presbyterian Church has an extensive and successful mission in China. The Presbyterian bodies cherish the memories of Duff and Wilson and Anderson in India, and of William Burns and Carstairs Douglas in China.

The following table, based on the calculations of the American Board, will give an idea of the extent of Christian missions (other than Roman Catholic) in 1889.

Countries.	Societies or Churches.	Missionaries.	Christians.	Income in £ Sterling.
Great Britain.....	23	2658	1,361,028	£332,156
America.....	35	2127	742,832	781,398
Germany and Switzerland }.....	17	559	344,760	142,423
Other European Countries.....	8	96		
Total.....	78	5440	2,448,629	£1,879,399

The Church Missionary Society's income is more than twice that of any other English society.

The mode of carrying on missionary operations by the various bodies is essentially one, though, of course, modified by circumstances. Of recent years 'medical missions' have been found to be a valuable, and in some cases an indispensable, adjunct to the other agencies. The missions of the Scottish churches have employed education as an evangelistic power to a greater extent than the other bodies. Such institutions as the Christian College at Madras, the mission station at Blantyre, and the Free Church Institution at Lovedale in South Africa are producing a great effect on the minds of the people.

The success of missionary work in our day is not such as either to elate or to discourage the friends of missions. The actual population of the world may be taken as fifteen hundred millions, of whom about four hundred millions are professedly Christians. Thus, not so much as a third part of the world is evangelised. But then it should be considered that an immense amount of preparatory work has been accomplished; and also that great national movements often reverse in a few years the aspect of affairs. In our own time we have seen such reversals in Madagascar and the Fiji Islands and Japan. In China we have seen a change, in the freedom with which the gospel can be preached, which our fathers, and indeed ourselves at one time, would have considered simply impossible. All are convinced that in India there must come ere long a mighty change; and the friends of the gospel earnestly hope that that change will be favourable to the cause of Christ.

Some account of mission operations are given in the articles on the countries where missions have had conspicuous success (FIJI, JAPAN, &c.); there are also biographical notices of the most eminent missionaries (ELIOT, CAREY, LIVINGSTONE, DUFF, HANNINGTON, &c.). See also works on missions by Marshall (1863), Rufus Anderson (Yew York, 1869), R. Grundemann's *Missionsatlas* (Gotha, 1867-70; and Calw, 1884), Christlieb (2d ed. 1880), Young (1881), P. Joung (New York, 1883), H. Gundert (2d ed. Calw, 1886), Warneck (Eng. trans. by T. Smith, 1884), George Smith (1884; new ed. 1890); on Catholic missions, Henrion's *Histoire des Missions Catholiques*, and Durand's *Missions Catholiques Françaises*; works on special missions; the numerous missionary journals and year-books; and the lives of the notable

missionaries. Buddhism (q.v.), especially in its earliest period, and Mohammedanism (q.v.) have been grouped with Christianity as missionary religions, in contradistinction to Judaism, Zoroastrianism, and Brahmanism. See Max-Müller's papers on missions in *Chips from a German Workshop*, vol. iv.

Mississippi, one of the Gulf States of the American Union, lies west of Alabama and south of western Tennessee, and is bounded on the W. by the Mississippi River. Length, north to south, 335 miles; width, 150 miles. Area, 46,810 sq. m. The surface, except in the Yazoo delta, is generally hilly, though nowhere mountainous, the highest hills being only 800 feet above the sea-level. There are three distinct watersheds; the eastern counties are drained by the Tombigbee and its tributaries; the Pearl, Pascagoula, and Escatawpa with their affluents drain the central and south-eastern portion; and the Homochitto, Big Black, and Yazoo carry the water of the western and northern counties into the Mississippi. The Orange-sand formation (Post-Tertiary, 40 to 60 and even 200 feet thick) characterises the greater portion of the surface of the state, and forms the main body of the hills and ridges. It is usually coloured with hydrated peroxide of iron, or yellow ochre, and presents an endless variety of tints. Ferruginous sandstones, capping the tops of hills and thereby preventing denudation, are found in all sections covered by the Orange-sand formation. Gravel beds also abound, as well as beds of pipeclay, and of ochreous clays used for paints; and there are also vast beds of lignite of excellent quality, and marls which are used as ingredients of commercial fertilisers. There are mineral springs in different portions of the state.

Mississippi is essentially an agricultural state. The north-eastern prairie region, 70 miles long and from 15 to 20 wide, with its fertile, black, calcareous soil, contains much of the best farming and grazing land in the state. There are no springs here, but cisterns dug in the rotten limestone, bored wells, and artesian wells furnish ample water. In the north the bottom lands along the numerous creeks and rivers especially are well adapted to agriculture; while in the central portion stock-raising is carried on, and in the yellow-pine region large herds of sheep are raised. The yellow pine ranks first among the forest trees of Mississippi; it extends northward from the coast for 150 miles. The *Yazoo Delta*, embracing the elliptical area of alluvial bottoms between the Mississippi and Yazoo rivers, extending from Vicksburg to the state line on the north, has until within recent years been subject to inundations; but levees now protect the lands, and the rise in the Mississippi in 1890—the highest and most prolonged ever known—left the levees unbroken except in four places which together were less than a mile in extent. Less than 15 per cent. of the delta was overflowed. The delta's drainage flows into lakes, small but numerous, which form the head-waters of other bayous, and through them after miles of meandering find outlets into the Yazoo and other streams. The delta contains 44 millions of acres of alluvial land, only 500,000 acres of which are under cultivation. Virgin forests of hardwoods cover the rest. For the state, the annual production of cotton is about 900,000 bales, of corn 28,000,000 bushels, and of oats 4,000,000 bushels. The fruits and vegetables shipped in 1890 were valued at \$1,000,000. This industry flourishes in the central and southern portions.

The winters in Mississippi are short and mild, the mean temperature 45° F.; the summers are devoid of intense heat, the mean 81°, seldom reaching 100°. Ice from one to two inches thick forms in the northern part of the state. The elevation of

the surface and the Gulf breezes render the climate delightful during most of the year. The annual rainfall ranges from 48 to 58 inches. The death-rate is very low—12·9 in 1000.

Mississippi sends seven representatives to congress. The state legislature is composed of 145 representatives and 45 senators, elected quadrennially. There are three supreme judges, appointed for nine years by the governor, and circuit and chancery judges, appointed for four years. The public schools are maintained four months annually by the state, but forty towns and cities maintain graded schools for ten months a year. Separate schools are maintained for the coloured race. There are enrolled 148,435 white and 173,552 coloured children: average daily attendance—white, 90,716; coloured, 101,710. The state supports the university at Oxford (1844), agricultural and mechanical college at Starkville (1878), industrial institute and college at Columbus (1884; for white girls), a college for coloured youth at Rodney, and a normal school at Holly Springs, for training coloured teachers. There are also private universities and colleges, for both white and coloured youth, besides 155 high schools and academies. Institutions for the deaf and dumb (100) and the blind (50) are at Jackson, the capital; there also are the state penitentiary (500) and the lunatic asylum (550).

History.—Mississippi was first settled by the French, and constituted a part of Louisiana. Iberville planted the first colony at Biloxi in 1699. It was ceded to Great Britain in 1763; was admitted into the Union as a state, December 10, 1817; seceded January 9, 1861 (principal battles during the civil war, Corinth, Baker's Creek, Holly Spring, Iuka, siege of Vicksburg); was readmitted into the Union, 1869. In 1890 there were 2475 miles of railway in the state. Vicksburg, Greenville, and Natchez are principal ports on the Mississippi River, and Pascagoula and Biloxi on the Gulf. Cotton-factories are located at Wesson (value 3 millions), Columbus, Natchez, Enterprise, Meridian, Water Valley, Carrollton, and Corinth; wood-factories at Jackson and Meridian. Pop. (1820) 75,448; (1850) 605,948; (1880) 1,131,597; (1890) 1,289,600.

Mississippi - Missouri. The Mississippi River (Algonkin *Missi Sepi*, 'Great River'), the largest river of North America, is, with its tributaries, wholly within the boundaries of the United States. It drains most of the territory between the Rocky and Alleghany Mountains, embracing an area of 1,257,545 sq. m., or more than two-fifths of the area of the United States. This basin includes the minor basins: Lower Mississippi, 65,646 sq. m.; Red River, 92,721; Arkansas, 184,742; Missouri, 527,690; Upper Mississippi, 179,635; Ohio, 207,111. Besides the four tributaries here named, there are forty-one others navigable, and 200 more of moderate size. The total length of the Mississippi is 2960 miles, of which 2161 are navigable; but the Missouri affluent (see below) is longer than the Upper Mississippi, and with the lower river gives a total of 4200 miles. The total navigable waters amount to 16,090 miles.

The source of the Mississippi is Lake Itasca in the north-west central part of Minnesota, about 7 miles long by 1 to 3 wide, which has, however, several feeders, the principal being Elk or Glazier Lake. The remotest springs of Itasca rise in 47° 34' N. lat. and 95° 20' W. long., and are 1680 feet above sea-level. As it issues from this lake the Mississippi is about 12 feet wide and 18 inches deep. Through pine-forests and swamps for hundreds of miles it winds from lake to lake, with frequent rapids and picturesque falls, until, 1200

feet wide, at the city of Minneapolis it plunges over the Falls of St Anthony. This point is the head of river-navigation, though in various reaches above small steamboats ply. After receiving the St Croix, the Mississippi becomes the boundary between the states of Minnesota, Iowa, Missouri, Arkansas, and Louisiana on the right, and Wisconsin, Illinois, Kentucky, Tennessee, and Mississippi on the left. Its frequent rapids within Minnesota are due to the granite bed, but sandstone prevails farther down, to Rock Island, Illinois. On the Wisconsin boundary the river expands into Lake Pepin, and thereafter, fully a mile wide, flows between bluffs 200 and 300 feet high, and sometimes through dense forests. At Rock Island there are rapids with 22 feet of fall, and 125 miles farther down are the Des Moines rapids with 24 feet of fall. Around these obstructions to navigation the United States government has constructed ship-canal. The entrance of the turbid Missouri produces a marked change in the character of the river; for several miles the diverse waters refuse to mingle, the Missouri's muddy tribute taking the right bank and the Upper Mississippi's clear stream the left. When the union is complete, the whole river has henceforth a light yellowish colour, modified somewhat by the Ohio's greenish water and more by the reddish water of the Arkansas and Red. From the mouth of the Ohio the trough of the Mississippi is about 4470 feet wide, but as it approaches the Red it is narrowed to 3000 feet, and at New Orleans is 2500 feet. The usual depth of the channel southward from the Ohio is from 75 to 100 feet, and its surface is sometimes higher than the country beyond its banks. In fact, from the Missouri to the Gulf the Mississippi rolls in serpentine course through vast alluvial tracts or 'bottoms,' whose width varies from 30 to 150 miles. Their total area, including those along tributary streams, is variously estimated from 29,790 to 41,193 sq. m. Though of unsurpassed fertility, scarcely one-tenth of these lands are cultivated owing to the dangers of the annual overflow. The melting of the ice and snow in the upper basin swells the lower current from March to June. Levees or embankments, largely built by the government, now extend for more than 1600 miles. Between the Ohio and the Red rivers extraordinary floods, rising from 47 to 51 feet, occur about once in ten years, making 'crevasses' in the levees, and doing immense damage. In these great floods the river has been known to spread over a tract of 150 miles. Below the Red River the waters are discharged through numerous 'bayous' into the Gulf of Mexico. The main channel runs south-eastward, and finally divides into five or six passes, the principal being the south, the north-east, and the south-west; the last is in 28° 58' 5" N. lat. and 89° 10' W. long.

The mean velocity of the Lower Mississippi is 2½ miles per hour. The yearly discharge into the Gulf is nearly 145 cubic miles; the sedimentary matter carried with this would form a prism 1 mile square and 263 feet high, while the amount pushed along the bottom of the channel would make another 1 mile square and 27 feet high. These vast deposits and the constant changes caused by floods tend to embarrass the entrance to the great river. To keep an open channel, at least 20 feet deep, Captain Eads (q.v.) contracted with the United States government to erect and maintain a system of jetties at the South Pass. The construction was begun in 1875, and has proved highly successful, a depth exceeding 30 feet having been maintained. The mouth of the Mississippi is essentially tideless.

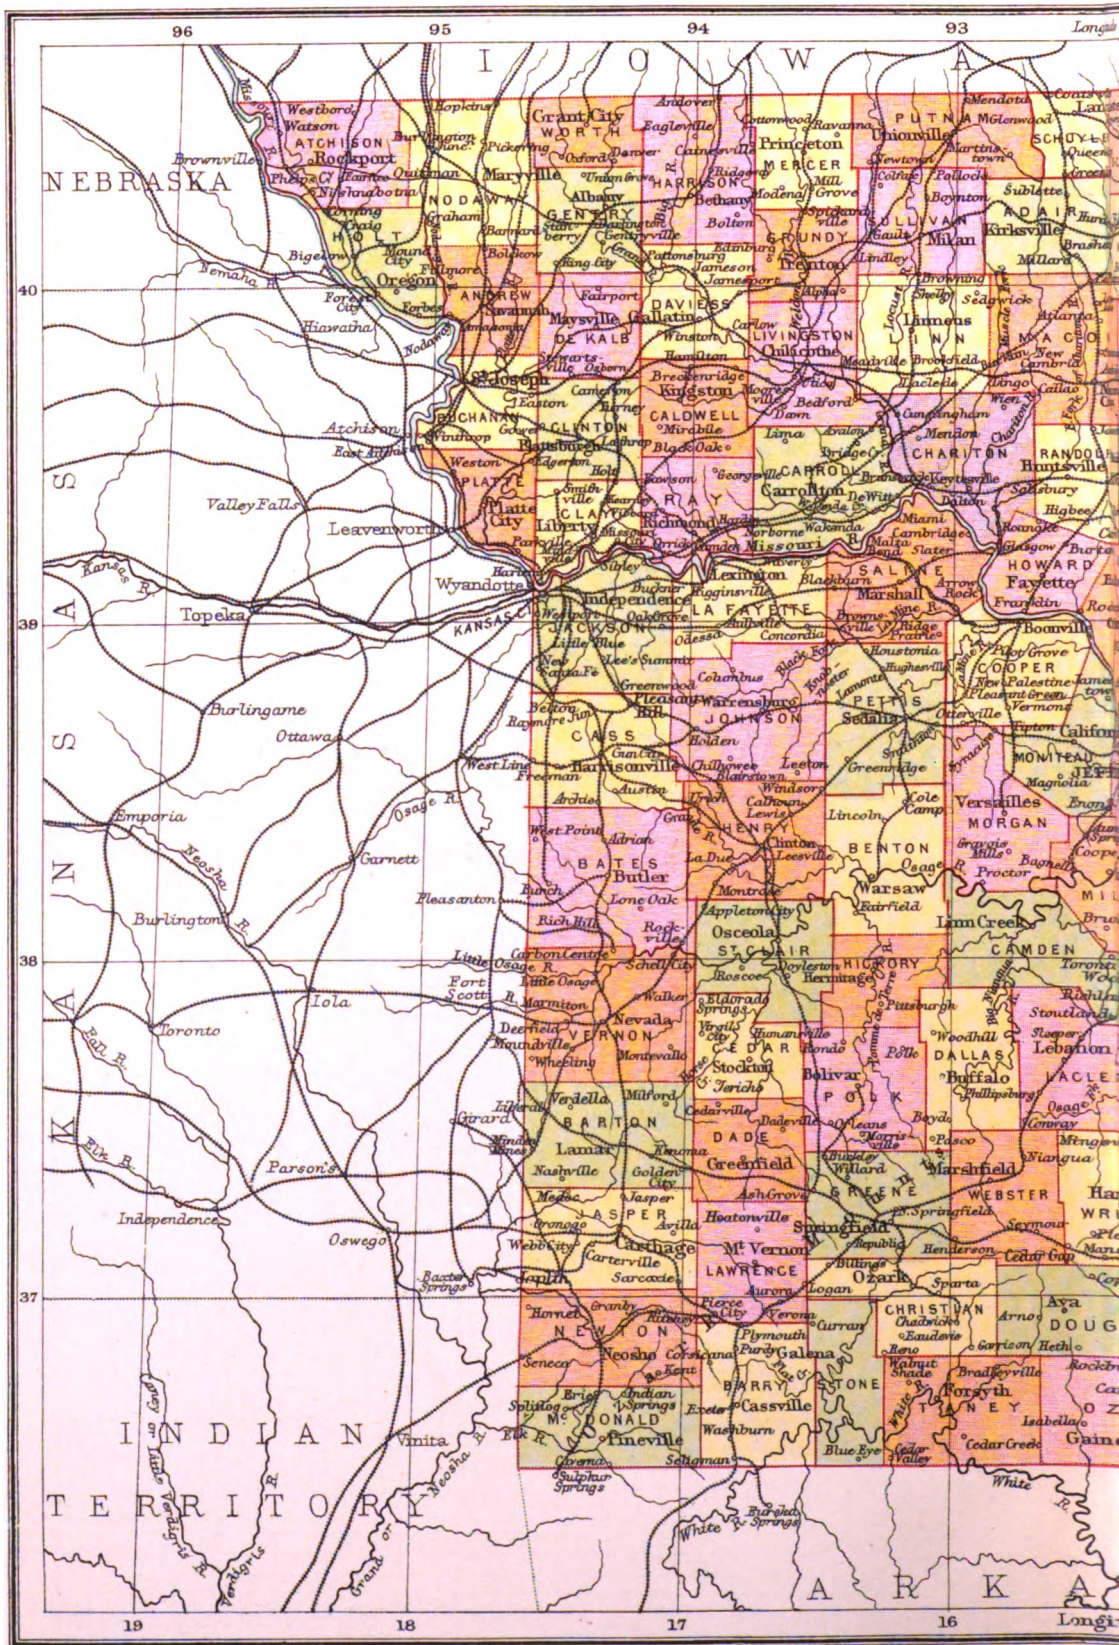

The principal cities on the great river are Minneapolis, St Paul, La Crosse, Dubuque, Keokuk, Quincy, Hannibal, St Louis, Memphis, and New

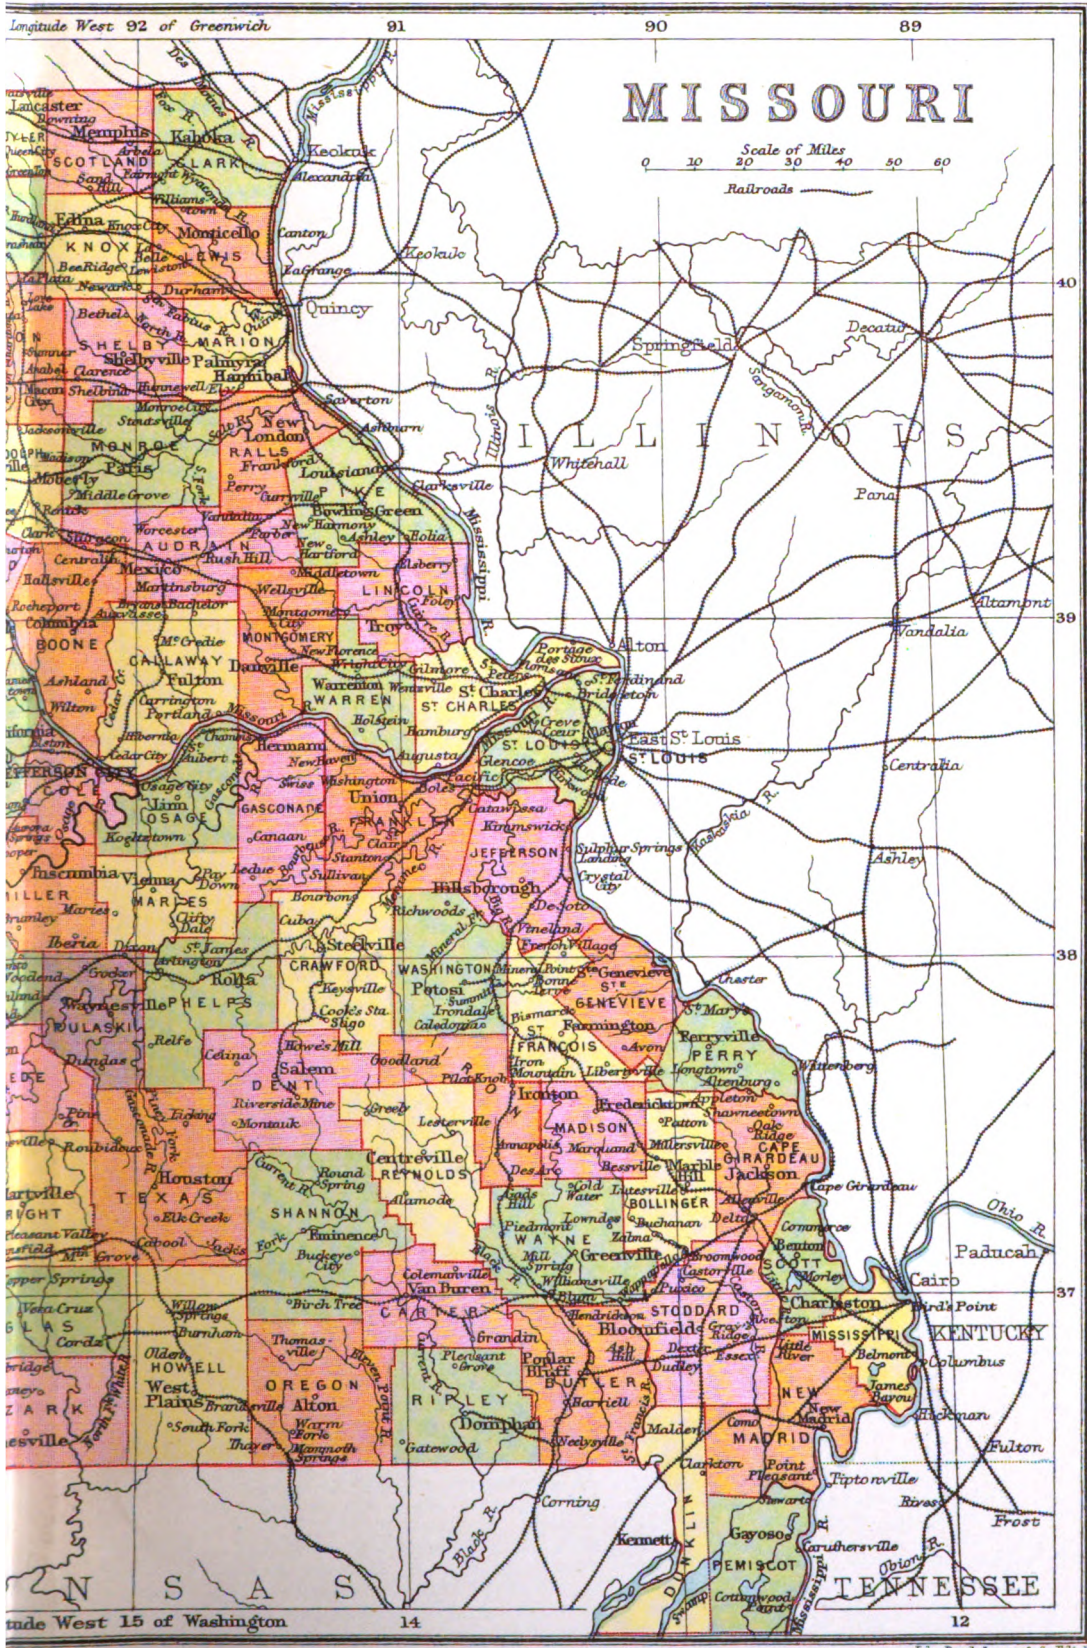

Orleans, at several of which the river is crossed by railway bridges. The steel bridge at St Louis (1867-74) is the most southern, besides which another was constructed at the same city in 1890.

See Humphrey's and Abbot's *Physics and Hydraulics of the Mississippi River* (Phila. 1861), and *Commerce and Navigation of the Mississippi* (Washington, 1888).

MISSOURI RIVER ('Big Muddy'), the principal branch of the Mississippi River, is formed by the confluence of the Jefferson, Gallatin, and Madison rivers, at Gallatin City, Montana, 4132 feet above the sea-level. These rivers rise in the Rocky Mountains, close to the sources of the Columbia and Colorado rivers, and to the Continental Divide. The Madison has the remotest source in a small lake of the same name in Yellowstone National Park in Wyoming, 44° 19' N. lat. and 110° 50' W. long., at an elevation of 7632 feet. This river flows north-west and north to the junction of the Three Forks. The Missouri then flows northward, skirting the main range of the Rocky Mountains, and, after passing through a gorge called 'The Gate of the Mountains,' turns to the north-east and reaches Fort Benton, the head of navigation, 225 miles from Gallatin City. About 40 miles above Fort Benton are the Great Falls, where the river descends 327 feet in 15 miles by a series of cataracts, the highest having a perpendicular fall of 87 feet. From Fort Benton the course is easterly, the river being flanked by bluffs about a mile apart until it passes the rapids 400 miles below, when the valley opens to a width of 10 miles. The Milk River is its first large tributary, but at the boundary of North Dakota the still larger Yellowstone joins it. The Yellowstone also rises in the National Park, and flows at first over cataracts and through cañons until it emerges in a more level country. It is 1152 miles long, and has the general characteristics of the Missouri. From its junction, which is the head of navigation in the low-water season, the Missouri flows through North Dakota, east and then south-east to Bismarck (1610 feet above sea-level), where it is crossed by the splendid bridge of the Northern Pacific Railroad. Through South Dakota the south-easterly course continues to Sioux City, whence flowing south the river becomes the boundary between Nebraska and Kansas on the right and Iowa and Missouri on the left. On receiving the tributary Kansas the stream turns to the east, and flowing across the state of Missouri pours its muddy waters into the channel of the Mississippi, 20 miles above St Louis. The Missouri is 3047 miles long, of which 2682 are called navigable, but owing to its tortuous, treacherous, and obstructed channel navigation is attended with great risks. The growing cities on its banks forsake the use of the river for commercial purposes and depend on the railways. In 1866 there were seventy-one steamers in active service in that part within the state of Missouri, but twenty years later the number had diminished to seven steamers and three tow-boats. The chief towns on the banks are Bismarck, Yankton, Sioux City, Omaha, Council Bluffs, Nebraska City, St Joseph, Atchison, Leavenworth, and Kansas City.

Mississippi Scheme, projected in France by John Law (q.v.) of Lauriston in 1717, proposed to develop the resources of the province of Louisiana and the country bordering on the Mississippi. The company, incorporated as *Compagnie des Indes Occidentales*, started with a capital of 200,000 shares, of 500 livres each. Shares were eagerly bought; and when, in 1719, the company obtained the monopoly of trading to the East Indies, China, the South Seas, and all the possessions of the French East India Company, the brilliant vision opened up to the public gaze was irresistible. The

John Bartholomew & Co. Edin.

PINCOTT COMPANY.

Compagnie des Indes, as it was now called, created 50,000 additional shares, but a rage for speculation had seized all classes, and there were at least 300,000 applicants for the new shares, which consequently went up to an enormous premium. The public enthusiasm now rose to absolute frenzy, and Law's house and the street in front of it were daily crowded with applicants of both sexes and of all ranks; and while confidence lasted a factitious impulse was given to trade in Paris. But the regent had meanwhile caused the paper circulation of the national bank to be increased as the Mississippi stock rose in value, and many wary speculators, foreseeing a crisis, had secretly converted their paper and shares into gold, which they transmitted to England or Belgium for security. The increasing scarcity of gold and silver becoming felt, a general run was made on the bank. The Mississippi stock now fell considerably, and despite sundry desperate efforts, which were attended with momentary success, to keep up its credit, it continued to fall steadily and rapidly. In February 1720 the National Bank and the *Compagnie des Indes* were amalgamated, but, though this gave an upward turn to the share-market, it failed to put the public credit on a sound basis. Several useless attempts were made by Law, now controller-general of the finances, to mend matters; and those suspected of having more than a limited amount (fixed by a law passed at the time) of gold and silver in their possession, or of having removed it from the country, were punished with the utmost rigour. The crisis came at last. In July 1720 the bank stopped payment, and Law was compelled to flee the country. A share in the Mississippi Scheme now with difficulty brought twenty-four livres. An examination into the state of the accounts of the company was ordered by government; much of the paper in circulation was cancelled; and the rest was converted into 'rentes' at an enormous sacrifice. See LAW (JOHN), and books there cited.

Missive, in Scotch law, is a memorandum.

Missolonghi (*Mesolongion*), a seaport town of Greece, in the nomarchy of Ætolia, on the northern shore of the Gulf of Patras, 24 miles W. of Lepanto. A modern place, built on a swampy flat, it is chiefly memorable for the two sieges which it underwent during the war of independence. In 1821-22 it was vainly invested for three months by land and sea by the Turks; in 1825-26 it was again besieged by an overwhelming Ottoman force, and, after ten months of resistance and suffering, its garrison, reduced from 5000 to 3000 fighting-men, cut their way through the ranks of the enemy, carrying with them a great number of the women and children. The Turks then entered the town, which was all but totally destroyed. There is a statue (1835) over the grave of Bozzaris, and another (1881) of Lord Byron, on the spot where his heart is interred. Pop. 6324.

Missouri, one of the central states, and the fifth in order of population, of the American Union, lies between 36° and 40° 30' N. lat. and between 89° 2' and 95° 51' W. long., and occupies a commanding position in the Mississippi valley. It is 280 miles long from north to south, and gradually increases in width from 208 miles in the north to 312 miles in the south. Area, 68,735 sq. m., or nearly that of Scotland, Ireland, and Wales. The Missouri River divides the state into two unequal sections, designated 'North Missouri' and 'South Missouri' respectively. That part of the state lying north of the Missouri River is generally level or slightly undulating, consisting of rolling prairies and level bottom lands,

diversified with a luxuriant growth of timber along the streams. The southern section has a more diversified surface, deriving its distinctive features from the Ozark Mountains, which cover about one-half of this division. These mountains enter the state from north-western Arkansas, and extend across the state to the Mississippi River; throughout the greater part of their length they may very properly be classed as tablelands, reaching their highest altitude (1500 feet) in Greene and Webster counties, and gradually breaking up into narrow ridges, spurs, knobs, and peaks farther east. The entire eastern limit of the state is washed by the Mississippi River, with a water front of 560 miles, while the Missouri River forms the boundary from the extreme north-west corner to Kansas City, and thence across the state to the Mississippi, with which it unites just above St. Louis. Many smaller tributaries flow into these two majestic rivers—into the Mississippi the Fabius, Salt, Cuivre, Meramec, St. Francis, Current, and Black; and into the Missouri the Nodaway, Platte, Grand, and Chariton on the north, and the Osage and Gasconade on the south. The general drainage of the surface is indicated by long gentle slopes toward the Mississippi and Missouri rivers, except in the extreme south-west, where the streams flow into the Arkansas. The climate is genial, agreeable, and healthful. All the extremes of heat and cold peculiar to this latitude are experienced; but the mean annual temperature is about 54°, and the mean average rainfall is 41 inches.

Missouri is pre-eminently an agricultural state. Of the 44,000,000 acres of her land surface more than 42,000,000 are adapted to agricultural and horticultural purposes. The soils are rich, deep, and unsurpassed in variety and productiveness. The principal crops are Indian corn (200,000,000 bushels), oats (30,000,000 bushels), wheat (28,000,000 bushels), potatoes, rye, barley, hemp, flax, cotton, sorghum, buckwheat, and hay (1,600,000 tons). Of tobacco a fair crop is 15,000,000 lb.; and orchard products are grown in great abundance. In the decade 1880-90 there was a great increase in the number of grazing animals, though sheep are not largely raised. The immense quantities of dressed beef and pork shipped annually to home and foreign markets are constantly increasing.

The mineral resources of Missouri are exceedingly rich, comprising extensive coalfields, that cover more than 20,000 sq. m.; also vast deposits of iron ore, lead, and zinc; while copper, cobalt, nickel, fireclays, fine marble, granite, and limestone of excellent quality abound in different localities. The coalfields are capable of yielding 100,000 tons of bituminous coal a day for several thousand years. The supply of iron ore is excellent in quality and inexhaustible in quantity; but the richest deposits yet worked are confined chiefly to two counties in the south-east—Iron and St. François. Yet the iron belt south of the Missouri River, and extending from the Mississippi River on the east to Osage River on the west, covers an area of 25,000 sq. m. Excellent transportation facilities are afforded by the Mississippi River along the eastern border of the state, and by the Missouri River across the state; and the railroads are nearly 7000 miles in length.

Missouri returns two senators and 14 representatives to congress. The general assembly (34 state senators and 140 representatives) meets every two years. The public-school system is very complete and very efficient, embracing the state university, the school of mines, four state normal schools, and city, town, village, and country schools. All public schools are supported by state appropriations, local taxation, and interest on the state, county, and township school funds. Missouri has

a larger permanent school fund than any other state of the American Union. The corps of teachers number 15,000. In addition to the state system of education there are 30 private academies, seminaries, denominational colleges, and universities, several of which are of a high order of excellence.

The metropolis of Missouri is St. Louis (pop. 1890, 451,770), one of the greatest railroad, manufacturing, and commercial centres in the country. Next comes Kansas City (119,668), St. Joseph, Springfield, Hannibal, Sedalia, Chillicothe, Mexico, Moberly, Booneville, Nevada, Marshall, Kirksville, Carrollton, Lexington, and Carthage, all thriving cities. Pop. (1820) 20,845; (1840) 140,455; (1860) 1,182,012; (1880) 2,168,380; (1890) 2,679,184.

History.—Missouri was first explored by De Soto in 1541-42, and in 1673 Marquette and his followers visited its eastern border. It formed part of the 'Louisiana Purchase' (see LOUISIANA), the northern portion of which in 1805 was organised as the 'District of Louisiana.' It was not till 1812 that a part of this territory took the name of Missouri. In 1821 Missouri was admitted into the Union, but the present limits of the state were not established till 1836. Its admission was preceded by a long and bitter political controversy between the representatives of the North and South, the former resisting its entrance as a slave-state. The discussion resulted in the famous 'Missouri Compromise,' under which compact it was agreed that slavery should be for ever excluded from all that part of Louisiana north of 36° 30' lat., except Missouri. During the four years of the great civil war the citizens of Missouri suffered terribly. The people were nearly equally divided in sentiment, and both sides prepared for the conflict. The state furnished 109,111 men for the Union army, and about three-fourths as many for the other side. Death and the destruction of property everywhere prevailed. But when the war ended the people commenced to build up the waste places; improvements were extended in all directions, bitter feelings soon died away, and the state entered upon an era of singular prosperity.

Missouri River. See MISSISSIPPI.

Mist. See FOG.

Mistassiní, LAKE, in Labrador, some 300 miles N. by W. of Quebec, is strictly speaking an expansion of the river Rupert, which flows into the southern extremity of Hudson Bay. It is 100 miles long from north-east to south-west by 12 in average breadth.

Mistletoe. This mystic plant, with its thick, succulent, yellow-hued foliage, and white, viscous berries, was long a puzzle to botanists, its peculiar mode of growth having given rise to the most curious fancies. Its name is most probably from the Anglo-Saxon *mist-el*, from *mist*, 'mist,' 'gloom' (Ger., 'dun'), and *tán*, 'twig.' The only British species of this genus of parasitical shrubs is the Common Mistletoe (*Viscum album*), a native also of the greater part of Europe (not of north England, Scotland, or Ireland), growing on many kinds of trees, particularly on the apple, and others botanically allied to it, as the pear, service, and hawthorn; sometimes, also, on sycamores, limes, poplars, locust-trees, and firs, but very rarely on oaks (contrary to the common belief). In the Himalayas the mistletoe grows abundantly on the apricot-tree, on the vine and *Loranthus* in Italy, on spruce-firs in France and Switzerland. The evergreen leaves of the *V. album* of English woods, with their yellowish hue, make a conspicuous appearance in winter among the naked branches of the trees. The flowers are insignificant, and grow in small heads at the ends and in the divisions of the branches, the male and female blossoms on separate

plants. The berries are about the size of currants, white, translucent, and full of a very viscid juice, which serves to attach the seeds to branches, where they take root when they germinate, the radicle always turning towards the branch, whether on its

Mistletoe (*Viscum album*).

upper or under side. It may be easily made to grow on suitable trees even where not native—as in Scotland, for example.

The mistletoe was intimately connected with many of the superstitions of the ancient Germans and of the British Druids. In the northern mythology, Balder (q.v.) is said to have been slain with a spear of mistletoe; and in Holstein it is the Märentaken, or 'branch of spectres,' which confers upon its possessor the power to see ghosts. Among the Celts the mistletoe which grew on the oak was in peculiar esteem for magical virtues. According to an old tradition the mistletoe supplied the wood for the cross, which until the time of the crucifixion had been a forest tree, but was henceforth condemned to exist only as a mere parasite. Traces of the ancient regard for the mistletoe still remain in some old English Christmas customs, as kissing under the mistletoe. The mysterious surrounding of the mistletoe invested it with a widespread importance in old folklore remedies, the Druids having styled it 'all-heal,' as being an antidote for all diseases. Culpepper speaks of it as 'good for the grief of the sinew, itch, sores, and toothache, the biting of mad dogs and venomous beasts;' while Sir Thomas Browne alludes to its virtues in the cure of epilepsy. In Sweden a finger-ring made of the mistletoe is an antidote against sickness, and in France amulets made of its wood were formerly much worn (see H. Friend, *Flower-lore*).—*Loranthus Europæus*, a shrub very similar to the mistletoe, but with flowers in racemes, is plentiful in some parts of the south of Europe, and very frequently grows on oaks.—*L. odoratus*, a Nepalese species, has very fragrant flowers.—The American mistletoe, of which there are some half-dozen species, is similar in general appearance and habit to the European, yet differs in so many points as to justify its being called by a different name, *Phoradendron*. The commonest species is *P. flavescens*, found from New Jersey to Mexico.

Mistral (also *Mistraou* and *Maestral*), a north-west wind which at certain seasons of the year prevails on the south coast of France. Its approach is heralded by a sudden change of the temperature, from the most genial warmth to piercing cold; the air is felt to be purer, and more easily inhaled, the azure of the sky is undimmed by cloud, and the stars shine by night with extraordinary and sparkling brightness. The mistral then comes in sudden gusts, struggling with the local aerial currents, but its fast-increasing violence soon overcomes all opposition. In a few hours it has dried up the soil, dispersed the vapours of the atmosphere, and raised

a dangerous tumult among the waters of the Mediterranean. The mistral blows, at intervals, with its greatest force from the end of autumn to the beginning of spring.

Mistral, FREDERICK, Provençal poet, was born a peasant's son near Maillaune (dept. Bouches-du-Rhône), on 8th September 1830, and studied law at Avignon; but for law he had no liking and went home to work on the land and write poetry, as Burns did before him. In 1859 he published the epic *Mirèio* (7th ed. 1884; Eng. trans. 1890), written in his native Provençal dialect. This charming representation of life in southern France made Mistral's name famous throughout the country, and gained for him the poet's prize of the French Academy and the cross of the Legion of Honour. It also led to the formation of the society called Lou Felibrige, which set itself to create a modern Provençal literature. In 1867 Mistral published a second epic, *Calendous*, and in 1876 a volume of poems entitled *Lis Iselo d'Or* ('Golden Islands'), songs steeped in the golden sunshine of the Mediterranean and its vine-clad shores. Since then he has written a novel, *Nerto* (2d ed. 1884), and issued a dictionary of the Provençal dialect (2 vols. 1878-86), the preparation of which occupied him many years. See an article by A. Daudet in the *Century* (1885).

Mistretta, a town of Sicily, near the north coast, half-way between Palermo and Messina. Pop. 12,235.

Mitau, the capital of the Russian government of Courland, on the right bank of the Aa, 27 miles by rail SW. of Riga. Founded in 1271 by the grand-master of the Teutonic Knights, and annexed to Russia in 1795, it has a castle, begun by Biron in 1738, and now the seat of the governor of the province, six churches, a museum, &c., with some very important manufactures, and a trade in grain and timber. From 1798 to 1807 Mitau offered an asylum to Louis XVIII. Pop. 29,615, of whom more than one-half are Germans, and nearly a fourth Jews.

Mitcham, a village of Surrey, 8½ miles by rail SW. of Victoria Station, London, and half-way between Wimbledon and Croydon (3 miles from each), lies in the centre of a district in which flowers and aromatic herbs (roses, lavender, camomile, &c.) are extensively grown. Pop. 8960.

Mitchel, JOHN, an Irish patriot, was born the son of a Presbyterian minister at Dungiven in County Derry, 3d November 1815. He studied at Trinity College, Dublin, and practised several years as an attorney at Banbridge. Soon after the formation of the Young Ireland party, and the starting of the *Nation* in 1842, Mitchel began to contribute, and after the death of Thomas Davis in 1845 he became assistant-editor. But his language was too violent for the paper, and three years later he started the *United Irishman*, for his articles in which he was tried on a charge of 'treason-felony' and sentenced to fourteen years' transportation. He was sent to Bermuda, and next to Van Diemen's Land, whence he made his escape to the United States in the summer of 1853. In New York he published his *Jail Journal*, or *Five Years in British Prisons* (1854). Next followed a series of short-lived newspapers, the *Citizen*, the *Southern Citizen*, the *Richmond Inquirer*, and the *Irish Citizen*, which cost him the confidence of many of his American friends by its enthusiastic defence of slavery and the South. In 1874 he returned unmolested to Ireland, and was elected to parliament for Tipperary, but declared ineligible. Again elected, he died at Cork, 20th March 1875.

Of his books may be mentioned a *Life of Hugh O'Neill, Prince of Ulster* (1845); and *History of Ireland from the Treaty of Limerick* (1868); besides editions of

the poems of Thomas Davis (1856) and James C. Mangan (1869). See the *Life* of him by William Dillon (2 vols. 1888).

Mitchell, capital of Davison county, South Dakota, 70 miles by rail W. of Sioux Falls, has a foundry and machine-shop, flour-mills, packing-house, &c. Pop. 5000.

Mitchell, DONALD GRANT, an American author, many of whose works have appeared under the pen-name of 'Ik Marvel,' was born in Norwich, Connecticut, 12th April 1822, was in 1853 appointed consul at Venice, in 1868-69 editor of the *Atlantic Monthly*, but is better known as the proprietor of a farm—Edgewood—near New Haven, about which he has written several delightful books. Among his other works are *Reveries of a Bachelor* and *Dream Life* (1850-51; new eds. 1889); a novel, *Dr Johns* (1866); and *English Lands, Letters, and Kings, from Celt to Tudor* (1889).

Mitchelstown, a market-town of County Cork, Ireland, 11 miles N. of Fermoy, became for a time a familiar name in the political war-cry 'Remember Mitchelstown.' On 9th September 1887, at a Nationalist meeting, the people refused to allow the government shorthand-writer to approach the speakers. The police endeavoured to make a way for him, but were resisted by the crowd. A riot ensued, on which the police fired, and two men were shot dead. In the immediate vicinity of the town is Mitchelstown Castle, the mansion of the Earls of Kingston, and 7½ miles to the north-east there are extensive stalactite caves, discovered in 1853. Pop. 2467.

Mite. See ACARINA, CHEESE-MITE.

Mitford, MARY RUSSELL, born at Alresford, Hants, 16th December 1786, was the only child of a physician, a selfish, extravagant man, who spent several fortunes, and was always in debt. A few years after his marriage he moved to Lyme Regis, and thence to London. On Mary's tenth birthday he took her to a lottery office, and bought her a ticket. She chose a particular number which drew a prize of £20,000. While this money lasted she was sent to a good school in Chelsea, and Dr Mitford built himself a large house near Reading. Here Mary returned when she was fifteen, a clever, accomplished girl, devoted to her parents, a great reader, and fond of gardening. Her first volume of poems appeared in 1810, and was followed in 1811 and 1812 by two other poems. Meantime, as the family became more and more impoverished, they were obliged to move to a cottage at Three Mile Cross, near Reading, and at length the need came for Miss Mitford to write to earn money. She wrote for magazines, and plays for the stage. Four of her tragedies, *Julian*, *The Foscari*, *Rienzi*, and *Charles I.*, were acted; the three first met with success, but they have not kept the stage. Her true line was describing what she saw around her in a series of sketches of country manners, scenery, and character. These little essays were rejected by several London editors, but at length found a place in the *London Magazine*, and were published in a collected form in 1824 under the name of *Our Village*, the series of five volumes being completed in 1832. Few would think, as they read this 'playful prose,' with what toil and anxiety it was written. Dr Mitford died in 1842, leaving his affairs in such a state that a subscription was started to enable his daughter to pay his debts; which was soon followed by a pension from the crown. In 1851 Miss Mitford moved to a cottage in Swallowfield, a village close by, where she spent the rest of her life. In 1852 she published *Recollections of a Literary Life*, and in 1854 a novel, *Atherton, and other Tales*. She died 10th January 1855, and was buried at Swallowfield. Her sketches are

charming; she describes homely scenes and people with the skill of an artist, and the humour and kindness of a clever, true-hearted woman. See *Life by L'Estrange* (3 vols. 1878), and his *Friendships of Mary Russell Mitford* (1882).

Mitford, WILLIAM, was born in London, 10th February 1744, entered Queen's College, Oxford, but left without a degree. In 1761 he succeeded to the family estate of Exbury near the New Forest, and in 1769 became a captain in the South Hampshire Militia, of which Gibbon was then major. By Gibbon's advice and encouragement he was induced to undertake his *History of Greece* (5 vols. 1784-1818). It is a pugnacious, opinionative, one-sided, and even fanatical production. The author is an intense hater of democracy, and can see in Philip of Macedon nothing but a great statesman, in Demosthenes nothing but a noisy demagogue. Yet his zeal, which so often led him astray, also urged him, for the very purpose of substantiating his views, to search more minutely and critically than his predecessors into certain portions of Greek history, and the result was that Mitford's work held the highest place in the opinion of scholars until the appearance of Thirlwall and Grote. He sat in parliament from 1783 to 1818, and died at Exbury, 8th February 1827.

See the Memoir prefixed to the 7th edition of his *History* (1838), by his brother John Freeman Mitford (1748-1830), who was Lord-chancellor of Ireland from 1802 to 1806, and was raised to the peerage as Lord Redesdale.

Mithras, or **MITHRA**, a Perso-Iranian divinity, whose worship, after passing through several changes and transformations, spread itself for a time far beyond the limits of its native seat. In the Zendavesta, or sacred writings of the ancient Persians, Mithras appears as chief of the Izeds or good genii, the god of the heavenly light and the lord of all countries. Protector and supporter of man in this life, he watches over his soul in the next, defending it against the spirits of evil. In the dualism of Zoroaster he fights as an invincible hero on the side of the principle of good, Ahura-Mazda or Ormuzd, in his eternal struggle with his rival Angra-Mainyu or Ahriman. At this stage the qualities attributed to Mithras had probably only a moral signification. Afterwards, as the political power of the Persians increased and their religion grew, by the natural processes of development and absorption, more ritualistic and composite, Mithras became the sun-god and was represented by the orb of day, which was worshipped in his name. By degrees his importance increased till he had scarcely a rival in the Persian pantheon. Unfortunately, owing to the almost entire destruction of the early religious literature of the East by the fanaticism of the followers of Mohammed, our knowledge of Mithraism as the dominant religion of its day is indirect and vague. Too great reliance is not to be placed on the speculations in which some modern writers such as Lajard indulge regarding it. But it would seem to have been, in its ultimate form at least, a system of secret rites and mysteries. For admission to these the aspirant was prepared by a series of trials of a severe description. He then underwent initiation, which, when duly and completely performed, comprised seven, or according to others twelve, degrees or successive steps, symbolically marked by the names of certain birds and animals. Baptism and the partaking of a mystical liquid, consisting of flour and water, to be drunk with the utterance of sacred formulas, are also said to have been among the inaugurative acts. Most of the ceremonies through which the devotee had thus to pass were of an extraordinary and even dangerous character. In spite, however, of all this rigour, Mithraism must

have had attractions of no ordinary kind. Introduced into Rome in 68 B.C. by some Cilician pirates whom Pompey had captured and whose national religion it was, it rapidly spread through the greater part of the empire. The well-known taurine tablets sculptured in bas-relief are the most interesting of its monuments that have come down to our time. There is a fine example in the British Museum, and others are to be seen in the principal museums of Europe. Mithras now appears as a beautiful youth, dressed in Phrygian garb, kneeling upon a bull, into whose neck he plunges a dagger. Surrounding the group are various emblems, a scorpion, a serpent, a dog, a raven, a crescent, and others, to which an astronomical or an allegorical meaning has been variously assigned. Caves in the living rock were often the scene of this sacrifice of the bull; but it was also performed in small temples or Mithreums, one of the most perfect of which was discovered in Ostia by the Cavaliere Lanciani (see *Athenæum*, Nov. 6, 1886). The floor and walls of this chapel are lined with mosaics representing the twelve signs of the zodiac, and the course of the planets, and containing allusions to the rites of Mithras. Tablets found at Housesteads in the Roman wall and at York are proof of the presence of Mithraism in Britain, to which it had doubtless been brought by the legionaries. Having come into collision with Christianity, it was formally suppressed by the prefect Gracchus 378 A.D., though St Jerome speaks of it as being still practised in his time.

See Montfaucon, *L'Antiquité Expliquée* (Paris, 1719); Hammer-Purgstall, *Mithriaca ou les Mithriaques* (1833); Wellbeloved, *Eburaeum* (York, 1842); Lajard, *Recherches sur le Culte Public et les Mystères de Mithra* (atlas of plates in 1847, letterpress not till 1867); Windischmann, *Mithra* (1857).

Mithridates (more properly MITHRADATES; Persian, 'given by Mithras'), the name of several kings of Pontus, Armenia, and Parthia, all of whom have sunk into insignificance, with the exception of Mithridates VI. of Pontus, surnamed Eupator, but more generally known as Mithridates the Great. He succeeded his father, probably about 120 B.C., while under thirteen years of age, and soon after subdued the tribes who bordered on the Euxine as far as the Chersonesus Taurica (Crimea). The jealous behaviour of the Romans, and the promptings of his own ambitious spirit, now incited him to invade Cappadocia and Bithynia, but a wholesome fear of the power of the great republic induced him to restore his conquests. The *First Mithridatic War* was commenced by the king of Bithynia (88 B.C.), who, at the instigation of the Romans, invaded Pontus. The generals of Mithridates repeatedly defeated the Asiatic levies of the Romans, and he himself took possession of Bithynia, Cappadocia, Phrygia, and the Roman possessions in Asia Minor. He also sent three powerful armies to aid the Greeks. He was, however, driven from Pergamus (85 B.C.) by Flavius Fimbria, and reduced to the necessity of making peace with Sulla, relinquishing all his conquests in Asia, giving up 70 war-galleys to the Romans, and paying 2000 talents. The wanton aggressions of Murena, the Roman legate, gave rise to the *Second Mithridatic War* (83-81 B.C.), in which Mithridates was wholly successful. In 74 B.C. he invaded Bithynia, commencing the *Third Mithridatic War*. He obtained the services of Roman officers of the Marian party, and his arms were at first prosperous; but afterwards the Roman consul Lucullus compelled him to take refuge with Tigranes of Armenia (72 B.C.). Lucullus then conquered Pontus, defeated Tigranes (69 B.C.) at Tigranocerta, and both Tigranes and Mithridates at Artaxata (68 B.C.). Mithridates, however, recovered possession of Pontus. After

the war had lingered for some time, Pompey completed the work of Lucullus (86 B.C.), defeating Mithridates on the Euphrates, and compelling him to flee to his territories on the Cimmerian Bosphorus. Here his indomitable spirit prompted him to form a new scheme of vengeance, which was, however, frustrated by the rebellion of his son, Pharnaces, who besieged him in Panticapæum. Deeming his cause hopeless, Mithridates put an end to his own life (63 B.C.). Mithridates was a specimen of the true eastern despot, possessing great ability and extraordinary energy and perseverance. He had received a Greek education at Sinope, is said to have spoken the twenty-two languages and dialects of his subject-peoples, and made a great collection of pictures, statues, and engraved gems.

Mitrailleuse. See MACHINE GUN.

Mitral Valve. See HEART.

Mitre (Lat. *mitra*, also *infula*), the head-dress worn by bishops in solemn church services. The name, as probably the ornament itself, is borrowed from the orientals, although, in its present form, it is not in use in the Greek Church, or in any other of the churches of the various eastern rites. The western mitre is a tall, tongue-shaped cap, terminating in a twofold point, which is supposed to symbolise the

Mitre.

‘cloven tongues,’ in the form of which the Holy Ghost was imparted to the apostles, and is furnished with two flaps, which fall behind over the shoulders. Opinion is much divided as to the date at which the mitre first came into use.

Eusebius, Gregory of Nazianzus, Epiphanius, and others speak of an ornamented head-dress, worn in the church; but the cleft mitre does not seem to have been known till the 12th century. The material used in the manufacture of the mitre is very various, often consisting of most costly stuffs, studded with gold and precious stones. The mitre of the pope is of quite a different form, and is called by the name *Tiara* (q.v.). Although the mitre properly belongs to bishops only, its use has been permitted by special privilege to certain abbots, to provosts of some distinguished cathedral chapters, and to a few other dignitaries.

In the English Church, since the Reformation, the mitre was no longer a part of the episcopal costume till 1885, when it was resumed by the Bishop of Lincoln; but it is placed over the shield of an archbishop or bishop, instead of a crest. The Bishops of Durham surround their mitre with a ducal coronet, in consequence of their having been till 1836 Counts Palatine of Durham.

Mitscherlich, EILHARD, chemist, was born at Neuende, near Jever in Oldenburg, Germany, on 7th January 1794, and died at Schöneberg near Berlin on 28th August 1863. At the university of Heidelberg (1811–13) he devoted himself to philology, especially to Persian. At this time of his life his ambition was to go to Persia, and for this end he visited Paris and began to study medicine in Göttingen after 1814. But whilst studying medicine, his deepest interest was arrested by the sciences of geology and mineralogy, chemistry and physics. Work in the Berlin laboratory in 1819 led him to discover the law of Isomorphism (q.v.). Berzelius invited the young chemist to Stockholm (1820), from which city he returned (1822) to fill the chair of Chemistry at Berlin. One of his earliest discoveries after his appointment was that of the double crystalline form of sulphur, one of

the first observed cases of Dimorphism (q.v.). His investigations regarding the production of artificial minerals, and his memoirs on benzene and the formation of ether, must also be noted. His principal work is *Lehrbuch der Chemie* (2 vols. 1829–35; 4th ed. 1840–48; 5th begun in 1855, but not completed). See Memoir by Rose (Berlin, 1864).

Mittweida, a town of Saxony, 11 miles by rail N. by E. of Chemnitz, has an engineers' and a weavers' school, and manufactures linen, woollen, and cotton goods. Pop. 9461.

Mitylene. See LESBOS.

Mivart, ST GEORGE, F.R.S., born 1827, was educated for the bar, but devoted himself to the biological sciences. In 1862–84 he acted as professor of Zoology and Biology at the Roman Catholic University College in Kensington, and in 1890 was appointed to the chair of Philosophy of Natural History at Louvain. He is known as an able and zealous opponent of the ‘Natural Selection’ theory. Among his works are *The Genesis of Species* (1871), *Man and Apes* (1873), *Contemporary Evolution* (1874), *Lessons from Nature* (1876), *The Cat* (1881), *Nature and Thought* (1883), and *The Origin of Human Reason* (1889).

Mixed Marriages. See MARRIAGE, p. 58.

Mizen, the sternmost of the masts in a three-masted vessel. See SHIP.

Mnemonics (Gk. *mnēmōn*, ‘mindful’), the art of assisting the memory; a mode of recalling to the mind any fact or number, or a series of disconnected terms or figures. Even ordinary recollection, according to Cicero, is not purely spontaneous or natural, but has some element of artificial suggestion, something to prompt the mind. To recall in the future a fact or figure, we associate it now with something else which is more to our hand; and afterwards the mental reproduction or actual presentation of the latter will give a suggestion of the former, in accordance with the psychological ‘law of contiguity.’ The number 3·1415926536 seems to a schoolboy hard of recollection till he is shown its importance in connection with certain ratios—when measuring a circle, ellipse, sphere, or cone, &c.—and then taught the phrase *But I must a while endeavour to reckon right the ratios*. Each word in that mnemonic sentence supplies, by the number of its letters, a corresponding figure of the ratio to be remembered. What association has the date 871 with King Alfred? None whatever, directly; but if those digits immediately appear as *ami* by a scheme which the pupil has already accepted or invented, then a clue or link-word is furnished to serve for a lifetime: $a = 8$, $m = 7$, $i = 1$. Of the surface of our globe 734 thousandths are water, and by the same mnemotechny 734 becomes *mer*, so that the fact is permanently registered for ready use. The earth’s diameter and circumference measure 7926 and 24,900 respectively, which numbers to that mnemotechnist read *mits* and *tm*, suggesting the phrase ‘minutes turn’ and the association that time is measured by the earth’s rotation. The list *bijou*, *joujou*, *chou*, *genou*, *caillou*, *hibou*, in French grammars, gives another familiar instance where recollection would to many be impossible without some artificial association. The following serves that purpose by stringing the words together—‘Finding a *jewel* in the garden, he made a *toy* of it, and jumping about he tripped against a *cabbage* and hurt his *knee* on a *flint*, whilst the *owl* overhead hooted derisively.’ Some rhythmical mnemotechnic contrivances have been used for ages: one, for example, which, notwithstanding the enormous multiplication of printed calendars, still survives is—‘Thirty days hath September, &c.

The Latin student is thankful for the mnemonic rhyme

In March, July, October, May,
The ideas are on the fifteenth day;
The nones I on the seventh day;
The rest thirteenth and fifth away;

and for centuries no text-book on logic has omitted the five hexameter lines (Barbara, Celarent, &c.) which compress the doctrine of the syllogism into a marvellous minimum of space. In these, however, as well as in the case of those numberless Latin verses over which so much time was till recently spent in our grammar-schools, the only help afforded is from the association of the sounds of certain barbarous dactyls and spondees in the ear. The perfection of mnemotechny is when there is an association by sense or natural suggestiveness. The thought of A will frequently bring Z to the mind sooner than B, because there is something not only not similar but grotesquely dissimilar in the ideas they awaken. Whoever practises the art of memory with success always selects unconsciously such associations as are best suited to the situation from his own point of view; and thus the art cannot be imparted in detail.

The value of mnemotechny under certain aspects is incontestable, considering that many in every class of life are constantly applying some method of storing and then utilising their knowledge. The art is, however, to be distinguished from the general faculty—memory, which is the essential and distinctive faculty of 'mind.' As such it depends not only on attention (as philosophers have ever taught), but on the healthy action of the nervous system and general physique, assisted perhaps in some individuals by a certain plastic and assimilative brain-power. Cicero approved of the art of artificial memory, and probably applied the topical method (to be mentioned presently) in some of his elaborate speeches; but Quintilian implies (*Inst.* xi. 2, 40) that to remember a subject properly we must master it in all its details. Practice and labour, he affirms, constitute the real mnemotechny: the best method of learning much by heart is by long, and if possible, daily study. The aim in such a case, however, was widely different from that which is now generally sought by using artificial memory.

The topical mnemonics (Gr. *topos*, 'place') of the ancients is adapted for recalling in order the arguments and illustrations of a public speech, or the succession of ideas in a poem or narrative. Besides the Roman writers, it is referred to by Plato and Aristotle, and was attributed to Simonides the Greek poet, who died 469 B.C. The speaker having selected, for example, a house with which he is so familiar as to remember well the position, not only of each room and passage, but of all the prominent objects in every room, associates as vividly as possible the introduction of his discourse with the entrance-hall, and systematically assigns thought after thought to the chief points there visible. The first main division of his subject may then be identified, as it were, with the dining-room; and every piece of furniture, every picture, &c., be judiciously utilised for recalling the succession of arguments with their illustrations and results. The second main division may then be associated in like manner with the drawing-room, and everything in it if need be; and thus for the rest of his discourse, till the successive rooms, statues, and windows, &c. are pressed into service, and all the series of his thoughts passed under review. The principle is that to recall a series of ideas they can be associated more easily with familiar (and, as it were, visible) objects or places than with each other. Another form of topical mnemotechny was

based on imagining the four walls of each room, and its floor, to be each divided into nine places, and a distinct object—such as a particular bust, picture, or tree, &c.—to be inseparably associated with each place. When these objects are thoroughly known so as to be promptly and faultlessly recalled, then the mnemotechnist who has a succession of things to be remembered assigns them to a particular room and compels himself to detect some association, no matter how incongruous, between each of them and one of the 'hieroglyphs' which are to serve as memorial links.

Many minor systems for learning dates and detached numbers have been based on that of Gregor von Feinaigle, a German who lectured in London, 1811. His scheme was

1	2	3	4	5	6	7	8	9	0
t	n	m	r	l	d	k	b	p	s

each letter was more or less suggestive of the figure which it represents: moreover, *p* may be supplanted by *f*, *k* by *c* or *g*, and *b* by *v* or *w*, &c. Thus, as an example, the Anglian kingdom from the Humber to the Firth of Forth was founded in 547, and by Feinaigle's scheme that date becomes *lrk*. By inserting vowels we form the mnemonic words *lark*, *lurk*, *large*, *lyric*, *Alaric*, &c., any one of which the historical student may choose to suit his notions of King Ida the Flamebearer, so as to remember the date of his landing in Yorkshire. Another student, for the same date, might prefer *la race*, *la rage*, &c., or Lat. *lorica* ('cuirass').

The following system (1730), that of Richard Grey, D.D. (1694–1771), does not require, like Feinaigle's, the insertion of arbitrary vowels, and is therefore not so elastic:

1	2	3	4	5	6	7	8	9	0
b	d	t	f	l	s	p	k	n	z
a	e	i	o	u	au	oi	ei	ou	y

A recent mnemotechnist, Dr Pick, has improved Feinaigle's method by introducing a principle not unlike that which we have noted in describing the topical systems. Given a list of detached words—e.g. 'garden, hair, watchman, philosophy,' &c.—they can be recalled in order by inserting between each pair a connective word which links them or forms a bridge. Thus, *garden*, maidenhair fern; *hair*, bonnet; *watchman*, wake, study; *philosophy*, &c. Other mnemotechnists have been Schenkel, 1547; Aimé Paris, 1833; Karl Otto, 1840; Gouraud, 1845; and Loissette. Grey's system was really a modification of that of Winckelmann, which attracted the notice of Leibnitz and gave him the suggestion of a universal alphabet.

MNEMO'SYNĒ, in Greek Mythology, the daughter of Uranus, and mother of the nine muses by Zeus. The principal seat of her worship was at Eleuthère, in Bœotia.

MOA (*Dinornis*, 'monstrous bird'), the name given by the Maoris to a genus of extinct ostrich-like birds that inhabited New Zealand and, to a less extent, Australia. It is supposed that none has been seen alive since about the middle of the 17th century, but the Maoris have many traditions relating to them, and moa-hunting was a recognised sport. Their bones have been found in great numbers imbedded in the sands of the shore, and of lakes, swamps, and river-beds. A few remains of eggs have also been found, and one nearly complete one containing a young bird; the eggs were about 10 inches long and 7 broad. Feathers and a part of the neck with muscles and skin attached have been discovered. There were several species of various size, the smallest about 2 feet, the largest about 14 feet in height. Their chief peculiarity was the entire absence of wings, not even the smallest rudiments having been found; associated with this

was the great size and weight of the legs, the bones of which and of the toes were in one species almost

Restoration of the Moa.

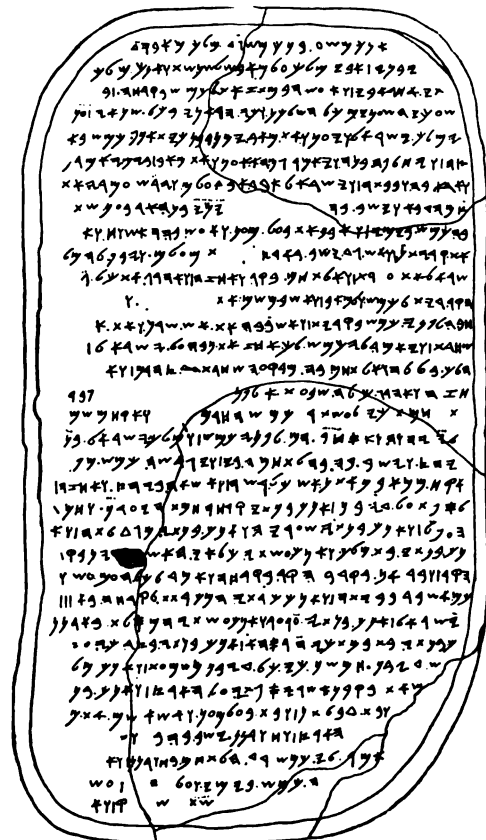

elephantine. There was an allied genus called Palapteryx which possessed the rudiments of wings and a fourth toe, which was absent in moa. They are most nearly represented at present by the genus Apteryx, whose relative size may be seen in the figure.

Moabites, a pastoral people, who inhabited the bleak and mountainous

country east of the lower part of the Jordan and of the Dead Sea, divided into two portions by the deep bed of the Arnon. Their capitals were Ar-Moab and Kir-Moab, both south of the Arnon, but their kings often resided in their native places, as Mesha in Dibon. Their sovereign divinity was Chemosh, and patriotism was an essential part of their religion. They were ethnologically cognate with the Hebrews, and were compelled to become tributary to David, but about 850 B.C. shook off their allegiance to the Jewish kings, and afterwards took part with the Chaldeans against the Jews. Their name no longer exists, and the remnants of the people have long been included among the Arabs. The most striking feature about the country in modern times is the immense number of rude stone monuments with which it is covered. Major Conder found no fewer than a thousand of these of the usual varieties (dolmens, menhirs, circles, and alignments) familiar in the British Isles and Brittany, occurring in distinct centres, usually with a cairn at the top of the nearest hill. He rejects the sepulture theory, and believes the dolmens to have been altars. The menhirs were anciently objects of worship, anointed with oil, or smeared with blood, and such a series of alignments and scattered stones as those of El-Mareighât may be supposed to be offerings of pilgrims to this shrine. For the so-called Moabite pottery, which Shapira succeeded in selling to the German government for nearly £3000, see an account by M. Clermont-Ganneau, who detected the imposture, in *Les Fraudes archéologiques en Palestine* (1885); see also Conder's *Heth and Moab: Explorations in 1881-82* (1883).

MOABITE STONE, a stone bearing an inscription of thirty-four lines in Hebrew-Phœnician letters, was discovered by the Rev. F. Klein in 1868 among the ruins of Dhibân, the ancient Dibon. The stone was of black basalt, rounded at the top and bottom, 2 feet broad, 3 feet 10 inches high, and 14½ inches in thickness, but was unfortunately broken up by the Arabs, whose cupidity had been aroused by the indiscreet eagerness to acquire it shown by M. Clermont-Ganneau. The fragments were afterwards collected and laboriously fitted into their proper places by means of imperfect squeezes made before the stone was broken, and the monument now stands in the Louvre at Paris. The inscription was discovered to be a record of Mesha, king of

Moab, mentioned in 2 Kings, iii., referring to his successful revolt against the king of Israel. The

The Moabite Stone.

(From Dr Ginsburg's monograph.)

characters of the inscription are Phœnician (see ALPHABET), and form a link between those of the Baal Lebanon inscription (10th century) and those of the Siloam text.

See Dr Ginsburg's *Moabite Stone* (2d ed. 1871); Héron de Villefosse's monograph, *Notice des Monuments provenants de la Palestine* (1876), contains a bibliography of books and papers written on this subject. Readings are given by Clermont-Ganneau in the *Revue Critique* for 1875, by Profs. R. Smend and A. Socin of Tübingen in their monograph, *Die Inschrift des Königs Mesa von Moab für Akademische Vorlesungen* (Freiburg, i. B., 1886), and by Dr A. Neubauer in *Records of the Past* (new series, vol. ii. 1889).

Moawiya. See CALIF, Vol. II. p. 648.

Moberly, capital of Randolph county, Missouri, 148 miles by rail WNW. of St Louis, is an important railway junction, and the dépôt of a rich coal country. It has large railway-shops, rope-walks, and foundries. Pop. (1890) 8213.

Mobile, the principal city and only seaport of Alabama, is situated on the west side of Mobile River, and at the head of Mobile Bay, which opens into the Gulf of Mexico, and is defended by Fort Morgan. It is 141 miles by rail ENE. of New Orleans, and is built with broad shaded streets on a sandy plain, rising gradually from the river. It has a fine custom-house and post-office (1859), a city hall and market-house (1857), a Roman Catholic cathedral and over thirty other churches, several asylums and hospitals, a medical college, a Jesuit college, and a convent and school. Mobile contains

a floating dry-dock and several shipyards, foundries, cotton and cottonseed-oil mills, a tannery, a manufactory of chewing-gum, numerous cigar-factories, &c. Before the war the chief business was the export of cotton; but since then this trade has shrunk almost to one-third of its former proportions, while the export of timber has increased. Mobile was settled by the French in 1702, and was a Spanish town until 1813, and its population still shows traces of this Latin origin. In 1879 the city limits were curtailed somewhat. Pop. (1870) 32,034; (1890) 31,076.

Mobilier, CRÉDIT. On the 18th November 1852 the French government sanctioned the statutes of a new bank under the name of the *Société Générale de Crédit Mobilier*. The name was intended as a contrast to the *Sociétés de Crédit Foncier* (see CRÉDIT FONCIER), which are of the nature of land banks, and advance money on the security of real or *immovable* property; while the *Crédit Mobilier* proposed to give similar aid to the owners of *movable* property. The declared object of this bank is especially to promote industrial enterprises of all kinds, such as the construction of railways, sinking of mines, &c. Various privileges were conferred upon it under its charter; in especial, it was allowed to acquire shares in public companies, and to pay the calls made upon it in respect of such shares, by its own obligations (or bonds); also to sell or give in security all shares thus acquired. The operations of the society were conducted upon a very extensive scale. In 1854 it subscribed largely to the government loan on account of the Russian war, to the Grand Central Railway Company, to the General Omnibus Company of Paris, and to various other important undertakings. The dividend for this year was 12 per cent. In 1855 it lent two sums to the government—the one of 250 and the other of 375 millions of francs. Its operations were vast during this year, and the dividends declared amounted to 40 per cent. The directors had not hitherto availed themselves of their privilege of issuing their own obligations, but this they now resolved on doing. They proposed to issue two kinds—the one at short dates, the other at long dates, and redeemable by instalments. The proposed issue was to amount to 240 millions of francs, but the public became alarmed at the prospect of so vast an issue of bonds, so that, in March 1856, the French government deemed it necessary to prohibit the carrying out of the proposed scheme. This was a severe blow to the institution. In 1856 its dividends did not exceed 22 per cent.; in 1857 they were only 5 per cent. Several attempts had been made to resuscitate its credit, but failed. On 12th November 1871 it was reorganised, the assets of the first society being reported at 48 million francs. In 1878 the capital was reduced from 80 millions to 32, and in 1879 raised again to 40 millions. Another reduction of capital was made in 1884—30 million francs.—On the model of the *Crédit Mobilier*, companies were organised in England, Holland, America, and elsewhere. The *Crédit Mobilier, Limited*, was established in London on 29th March 1864. It amalgamated on 30th September of the same year with the *Crédit Foncier* as the *Crédit Foncier and Mobilier of England, Limited*; and on the reorganisation of that company in 1866 the words ‘and Mobilier’ were dropped. The *Crédit Mobilier* has undoubtedly been useful, but its operations have been hazardous, public advantages being gained at the expense of private losses.

Mobilisation, a word for the act of making an army ready for taking the field. The process consists in bringing the various units to war

strength by calling in reserve men, in organising the staff of brigades, divisions, and army corps, constituting the commissariat, medical, and transport services, and in accumulating provisions and munitions. As the work of mobilising an army causes great and inevitable expense, it is only resorted to when hostilities appear imminent.

Moccasin, the shoe of the North American Indian, made all of soft hide, and often ornamented. —The Moccasin Snake (*Toxicophis piscivorus*) of North America is a brown-coloured poisonous swamp snake; the skin is marked with black bars.

Mocha, a seaport, and once the capital of Yemen in Arabia, is situated on the Red Sea, 130 miles WNW. of Aden. From early in the 16th century until the middle of the 17th Mocha was the port from which the coffee of Yemen was principally exported; hence called Mocha coffee. It is now a decayed place. Pop. 5000.

Mocha Stones are pieces of agate or of chalcedony, containing dendritic infiltrations, often assuming appearances very like finely ramified conifers, &c. They were first brought to Europe from Mocha. Of the same nature with Mocha stones are *Moss Agates*.

Mocking-bird, or MOCKING-THRUSH (*Mimus*), a genus of birds of the family Turridæ, order Passeres, having a more elongated form than the true thrushes, a longer tail, shorter wings, and the

Mocking-bird (*Mimus polyglottus*).

upper mandible more curved at the tip. Twenty species are known, ranging from Canada to Patagonia, and from the West Indies to the Galapagos Islands. The best-known species, the mocking-bird of the United States (*M. polyglottus*), is about the size of the song-thrush; the upper parts of a dark brownish ash colour, the wings and tail nearly black, the under parts brownish white. The mocking-bird is common in almost all parts of America, from the south of New England to Brazil; north of the Delaware it is only a summer visitant, but in more southern regions it is found at all seasons. It is one of the most common birds of the West Indies, and its exquisite song fills the groves with melody by night, for which reason it is there very generally known as the nightingale. By day the mocking-bird is generally imitative, excelling all birds in its power of imitation, now taking up the song of one bird, and now of another, and often deceiving the most practised ear by its perfect performance. By night its song is for the most part natural. It does not confine itself, however, to musical strains; it seems to take equal pleasure in repeating the harshest cries of the feathered tribes, and in domestication readily adds to its accomplishments the imitation of almost any sound which it is accustomed to hear, passing from one to another with great rapidity, so as to

produce an incomparable medley. The mocking-bird readily learns to whistle a tune, even of considerable length, but there is no well-authenticated instance of its imitating the human voice. The barking of a dog, the mewing of a cat, the crowing of a cock, the cackling of a hen, the creaking of a wheel-barrow are all within the compass of its powers. During its performances it spreads its wings, expands its tail, and throws itself about, as if full of enthusiasm and enjoyment. The mocking-bird is vocal at all seasons of the year. It enjoys almost everywhere the protection of man, and often makes its nest in a tree or bush close beside a house. The nest is rudely constructed of dried sticks, withered leaves and grasses, and lined internally with fibrous roots. The eggs are of a short ovoid form, and of a light-green colour spotted with amber. For the first brood from four to six are laid; for the second, four or five; and when there is a third brood, seldom more than three. The first brood is hatched about the middle of April. The male is extremely attentive to his mate, and manifests extraordinary courage in driving away enemies from the nest. Mocking-birds often assemble on such occasions, and birds of prey, far superior to them in size and strength, are compelled to retreat. Snakes are killed by reiterated blows on the head, and cats learn to consider the vicinity of a mocking-bird's nest unsafe. The food of the mocking-bird consists chiefly of berries and insects. The mocking-bird is easily reared by the hand if removed early from the nest, but it is said that it never attains in captivity the same wealth of song as in its free state. Another species of mocking-bird is found in the Rocky Mountains, and species of the same genus are among the finest song-birds of the temperate parts of South America.

Mock Orange, a name applied in England to the *Syringa* (q.v.), and in the United States to the *Prunus caroliniana*, a small evergreen resembling the cherry-laure.

Mode, a name given to the ecclesiastical scales formulated by St Ambrose and St Gregory (see HARMONY, PLAIN-SONG). For Major and Minor Modes, see SCALE.

Modelling. See CLAY, POTTERY, SCULPTURE.

Mod'ena (anc. *Mutina*), capital of the former duchy of Modena, stands on a broad plain in Northern Italy, 23 miles by rail NW. of Bologna. Pop. (1881) 31,053; in commune, 58,058. It is surrounded with ramparts, now converted into promenades, and has fine streets, many of them arched both sides. The ancient Via *Æmilia* divides it into the old and new city. The cathedral of St Geminianus, a Romanesque building, was begun, at the instance of the famous Countess Matilda, in 1099, and has a fine façade; its campanile is one of the great towers of Italy. The ducal (now royal) palace, a picturesque structure of the 17th century, has an infinity of galleries, courts, and marble arches, and contains the Este library of 90,000 volumes and 3000 MSS., the Este archives, collections of coins, and the gallery of pictures, including works by Guido, the Carracci, Guercino, Correggio, and other great Italian masters. Modena possesses besides a university (1678), with 35 teachers and 287 students, an academy of sciences and arts, an observatory, a botanic garden, and military schools. The chief manufactured products are silk, leather, vinegar, and cast metals. There is a very lively trade in agricultural products. Originally an Etruscan town, Modena was conquered successively by the Gauls and the Romans, and destroyed by Constantine the Great, the Goths, and the Longobards. Charlemagne made it the capital

of a line of counts. The family of Este (q.v.) became its masters in 1288; and in 1452 the reigning marquis was created duke by the Emperor Frederick III. During the first half of the 19th century its dukes pursued a tyrannous reactive policy against liberalism, and were on more than one occasion expelled their dominions, finally and definitively in 1860. The duchy was then incorporated in the kingdom of Italy, and afterwards divided into the provinces of Modena, Reggio, and Massa-Carrara. Area of province, 994 sq. m.; pop. (1881) 279,254; (1889) 303,541.

Modica, an inland town of Sicily, 45 miles SW. of Syracuse, with trade in fruit, oil, wine, and grain. Pop. 38,390.

Modjeska, HELENA, Polish actress, was born in Cracow, 12th October 1844, and began to act in a travelling company in 1861. Four years later she made a great name at Cracow, and from 1868 to 1876 was the first actress of Warsaw. Then she settled, with her second husband, near Los Angeles, California, to try farming; but the enterprise not succeeding, she returned to the stage, and won a complete triumph as Adrienne Lecouvreur at San Francisco in 1877, although she acted in English, of which language she had known nothing seven months before. Since that time she has been acknowledged one of the best of modern emotional actresses, achieving her greatest triumphs, both in the United States and in Great Britain, in such rôles as Juliet, Rosalind, Beatrice, and in the *Dame aux Camélias* and Sardou's *Odette*.

Modocs, an Indian tribe of Northern California, which in 1872, after firing on the United States forces, retreated to the neighbouring lava-beds, and there defended themselves desperately till June 1873, killing or wounding 132 of the troops. Their chief, Captain Jack, and three others were hanged in October; about a hundred who had not followed him were permitted to remain in California, the rest (145) were transferred to Indian territory.

Modulation, in Music. When in the course of a melody the keynote is changed, and the original scale altered by the introduction of a new sharp or flat, such change is called modulation. Much of the pleasure of music is derived from a judicious use of modulation. The art of good modulation from one key to another consists in the proper choice of intermediate chords. Sudden transitions, without intermediate chords, should be employed but sparingly, and in peculiar circumstances.

Moe, JÖRGEN (1815-82). See ASBJÖRNSEN.

Möen, a Danish island in the Baltic Sea, at the south-east end of Zealand. It is 20 miles in length, and has 13,000 inhabitants.

Mæris, LAKE, the ancient Greek name of a sheet of water in Egypt, now in the province of Fayyûm (q.v.), about 50 miles SW. of Cairo; extreme length from north-east to south-west, 35 miles. The waters are brackish. In the time of the Pharaohs the revenue derived from the fisheries was applied to the maintenance of the queen's wardrobe and perfumes.

Moero, or MERU, LAKE, lies SW. of Tanganyika in Central Africa, on 9° S. lat. and 29° E. long., and is traversed by the Luapula (see CONGO). This lake was discovered by Livingstone in 1868. Its shores yield salt.

Mæsia, an ancient Roman province, divided by the river Cíbrus (Zibritza) into two parts, the eastern corresponding to the present Bulgaria, and the western (Mæsia Superior) to Servia. Its original inhabitants were mostly of Thracian race. In 75 B.C. the Romans first came into

conflict with the Gaulish or Celtic invaders of the land, who had settled in Western Mœsia two hundred years previously; but they did not conquer Western or Upper Mœsia until 29 B.C. and Eastern or Lower Mœsia until 15 B.C. To protect these provinces from the Dacians and Sarmatians beyond the river, a wall was built and fortified posts erected along the Danube. The Emperor Valens permitted the Visigoths to settle in Mœsia in 375 A.D. From the 5th to the 7th century Western Mœsia was colonised by the Slav races who still occupy it, and Eastern Mœsia by the Bulgarians.

Mæso-Goths, the name given to the Goths (q.v.) who in the 3d century and in the 5th settled in Lower Mœsia. It was for them that Ulfilas (q.v.) translated the Scriptures.

Moffat, a pleasant watering-place and burgh of barony (1635) in Upper Annandale, Dumfriesshire, 51 miles SSW. of Edinburgh by road, and 64 by a short branch (1883) of the Caledonian Railway. It lies 370 feet above sea-level, engirt by round grassy hills (the loftiest, Hartfell, 2651 feet), and in the midst of delightful scenery, chief features of which are 'dark Loch Skene,' the Grey Mare's Tail, and the Devil's Beef-tub. Its mineral springs, the principal of which, like that of Harrogate, is saline and sulphurous, have been celebrated since 1653; and its visitors have included Home, Hume, Carlyle, 'Ossian Macpherson,' Boswell, Blair, Burns, and William Black. Pop. (1841) 1413; (1881) 2161. See Turnbull's *History of Moffat* (1871).

Moffat, ROBERT, missionary, was born at Ormiston, East Lothian, 21st December 1795. While following the occupation of a gardener at High Leigh, Cheshire, in 1815, he offered himself for the mission-field. His services were accepted by the London Missionary Society, and he sailed for South Africa in 1816. He arrived at Capetown in January 1817, and proceeded northwards beyond the boundaries of Cape Colony and began his labours (January 1818) in Great Namaqualand at the kraal of Afrikaner, a chief who from being a terror to the neighbouring districts of the colony had embraced Christianity, and now showed a desire for its promotion. On December 27, 1819, Moffat married Mary Smith (1795-1870), daughter of his former employer at Dukinfield near Manchester, who proved a worthy helpmate. He made several journeys and laboured at various stations before he settled at Kuruman (1826-70) in Bechuanaland, north of the Orange River. There he wrought a marvellous work in reforming the habits of the natives, and Kuruman became a centre of Christian light and civilisation. Wherever he went he preached the gospel, and guided the people in the arts of civilised life. He learned the Sechwana language, and printed in it the New Testament (1840), the Old Testament (1857), and several religious works. Moffat spent about five years in England (1838-43), where he had an enthusiastic reception, and published his *Labours and Scenes in South Africa* (1842), which gave a graphic description of his missionary tours and remarkable adventures. In 1843 Moffat returned to his labours reinforced by other missionaries, remaining till 1870, when he finally returned to England after fifty-four years spent in Africa. In 1873 he was presented with £5000 in recognition of his great services. He lectured on African missions in Westminster Abbey in 1875, and in 1881 was entertained at a banquet by the Lord Mayor of London. He died at the village of Leigh, Kent, 9th August 1883. It may be said that Moffat's influence drew Livingstone to Africa; it was to Kuruman Livingstone went first, and he married Mary Moffat. See *Lives of Robert and Mary Moffat*, by J. S. Moffat (1885).

Mofussil (from an Arabic word meaning 'separate'), a term commonly used by Anglo-Indians for the rural part of a district as opposed to the administrative headquarters. Thus in Bengal the Mofussil means practically the whole province beyond the city of Calcutta.

Mogador, or SUEIRA, a seaport 130 miles WSW. of the city of Morocco. Pop. about 19,000, of whom 8000 are Jews and 200 Europeans. It stands on a rocky promontory opposite a small island, the channel between which forms the somewhat indifferent harbour. It is the best built and most modern town in the empire, having been laid out in 1760 by Cornut, a French engineer. On its landward side the place is surrounded by drifting sandhills, but the climate is salubrious, dry, and temperate. In the Kasbah or Castle, extended in 1865 by the 'New Kasbah,' live the governor and other Moorish officials, nearly all the Christians, the consular corps, and a number of protected Jews: here also are the government offices. The Medinah is exclusively a Moorish quarter, while the Mellah is allotted to the sorely oppressed Hebrews. Mogador is the seat of a considerable trade with the interior, and next to Tangier is of all the Moroccan ports the one frequented by most shipping. Caravans reach it from Timbuktu, and it is the outlet not only for the cities of Morocco and Demnat, but for the whole of the Sûs country. It exports almonds, olive-oil, wool, goat-skins, hair, gum-arabic, beans, lemons (citrons), &c. Commerce is mainly in the Jews' hands. The chief imports are woollens, cottons, glass, candles, tin and copper sheets, and hardware generally. Its manufactures are brass trays, daggers, furniture of arar wood, woollen cloth, &c. The total imports are on an average worth about £197,000, and the exports £175,000 per annum, of which fully three-fourths are sent from or taken to Great Britain. See Brown's edition of *Pellow's Adventures* (1890).

Mogileff. See MOHILEFF.

Moguer, a town and small port of Spain, on the Rio Tinto, near its mouth, and 8 miles E. of Huelva, with some trade. Pop. 8322.

Mogul, also spelt *Moghul* and *Mughal*, is really but another form of *Mongol*. The term 'great Mogul' is the popular designation of the emperor of Delhi in India. The first Great Mogul was Baber (q.v.), a descendant of Timur the Tartar or Tamerlane (q.v.); he founded the empire in 1526. The dynasty lost its power and territories to the English in 1765. The last emperor, having joined the rebels in 1857, died a prisoner in Rangoon (1862). See Keene, *Moghul Empire* (1866).

Mohacs, a market-town of Hungary, on the western arm of the Danube, 37 miles by rail ESE. of Fünfkirchen. It is a station for steamboats on the Danube, and the seat of considerable trade in wine, coal, timber, and agricultural produce. Pop. 12,385. Here, on 29th August 1526, Louis II. of Hungary, with 25,000 Hungarians, met the Sultan Soliman at the head of 200,000 Turks. The battle resulted in the disastrous defeat of the Hungarians, who lost their king, seven bishops, many nobles and dignitaries, and upwards of 22,000 men. In a second battle fought here on August 12, 1687, the Turks in their turn were defeated by an Austro-Hungarian army under Charles of Lorraine.

Mohair, the wool of the Angora Goat (q.v.). Few animals have so beautiful a covering as the fine, soft, silky, long, and always pure white wool of this goat. See WOOL.

Mohammed (*Muhammad*, and less correctly *Mahomet*; Arab., 'Praised'), the founder of Islam. He was born about the year 570 A.D., at Mecca,

and was the son of Abdallâh, of the family of the Hashim, and of Amina, of the family of Zuhra, both of the powerful tribe of the Koreish, but of a side-branch only, and therefore of little or no influence. His father, a poor merchant, died either before or shortly after Mohammed's birth, whom his mother is then supposed to have handed over to a Bedouin woman, to be brought up in the healthy air of the desert; but in consequence of the repeated fits of the child, which were ascribed to demons, the nurse sent him back in his third year. When six years old he lost his mother also. His grandfather, Abd-Al-Muttalib, adopted the boy; and when, two years later, he too died, Mohammed's uncle, Abu Tâlib, though poor himself, took him into his house, and remained his best friend and protector throughout his whole life. It seems that he at first gained a scanty livelihood by tending the flocks of the Meccans. In his twenty-fifth year he entered the service of a rich widow, named Khadija, likewise descended from the Koreish, and accompanied her caravans—in an inferior capacity, perhaps as a camel-driver—thus visiting Syria. Up to that time his circumstances were very poor. Suddenly his fortune changed. The wealthy, but fifteen years older, and twice widowed Khadija offered him her hand, which he accepted. She bore him a son, Al-Kâsim—whence Mohammed adopted the name Abul-Kâsim—and four daughters: Zainab, Rukaija, Umm Kulthûm, and Fâtima; and afterwards a second son, whom he called Abd Manâf, after an idol worshipped among his tribe. Both his sons died early. Mohammed continued his merchant's trade at Mecca, but spent most of his time in solitary contemplations.

Mohammed was of middle height, rather lean, but broad-shouldered, altogether of strong build, and fair-skinned for an Arab; slightly curled black hair flowed round his strongly developed head; his eyes, overhung with thick eyelashes, were large and coal-black; his nose, large and slightly bent, was well formed. A long beard added to the dignity of his appearance. A black mole between his shoulders became afterwards among the faithful 'the seal of prophecy.' In his walk he moved his whole body violently, 'as if descending a mountain.'

About the year 600 A.D. Christianity had penetrated into the heart of Arabia, through Syria on the one hand, and Abyssinia on the other. Judaism no less played a prominent part in the peninsula, chiefly in its northern parts, which were dotted over with Jewish colonies, founded by emigrants after the destruction of Jerusalem; and round about Yathrib (Medina) remnants of the numerous ancient sects, dating from the first Christian centuries, such as Sabians and Mandæans, heightened the religious ferment which, shortly before the time of Mohammed, had begun to move the minds of the thoughtful. At that time there arose several men in the Hedjaz who preached the futility of the ancient pagan creed, with its star-worship, its pilgrimages and festive ceremonies, its temples and its fetiches. It had in reality long ceased to be a living faith; but the great mass of the people clung to it as to a sacred inheritance. The unity of God—the 'ancient religion of Abraham'—human responsibility, and judgment to come were the doctrines promulgated by these Hanifs ('converts'), forerunners of Mohammed; and many, roused by their words, turned either to Judaism or to Christianity. The principal scenes of these missionary labours were Medina, Taif, and Mecca; this last was then the centre of pilgrimage to most of the Arabian tribes, and there, from times immemorial, the Kâaba, Mount Arafat, the Valley of Mina, &c. were held sacred—the Koreish, Mohammed's tribe, having had the

care of these sanctuaries ever since the 5th century. It was under these circumstances that Mohammed felt moved to teach a new faith, which should dispense with idolatry on the one hand, as with narrow Judaism and corrupt Christianity on the other. He was forty years of age when he received the first 'divine' communication in the solitude of the mountain Hirâ, near Mecca. Gabriel appeared to him, and in the name of God commanded him to preach the true religion. That he was no vulgar impostor is now generally recognised. What part his epilepsy, or rather hysteria, had in his visions we are not able to determine. Certain it is that, after long and painful solitary broodings, something at times moved him with such fearfully rapturous vehemence that, during his revelations, he is said to have roared like a camel, and to have streamed with perspiration; his eyes turned red, and the foam stood on his lips. The voices he heard were sometimes those of a bell, sometimes of a man, sometimes they came in his dreams, or they were laid in his heart. Waraka, one of his wife's relatives, who had embraced Judaism, spoke to him of the Jewish doctrine, and told him the story of the patriarchs and Israel, not so much according to the Bible as to the Midrash; and the gorgeous hues of the legendary poetry of the latter seem to have made as deep an impression on Mohammed's poetical mind as the doctrine of the unity of God and the *morale* of the Old Testament, together with its civil and religious laws. Christianity exercised a minor influence upon him. All his knowledge of the New Testament was confined to a few apocryphal books, and with all his deep reverence for Jesus, whom he calls the greatest prophet next to himself, his notions of the Christian religion and its founder were excessively vague (see KORÂN).

His first revelation he communicated to no one, it would appear, except to Khadija, to his daughters, his stepson Ali, his favourite slave Zaid, and his friend the prudent and honest Abu Bekr. His other relatives rejected his teachings with scorn. Abu Lâhab, his uncle, called him a fool; and Abu Tâlib, his adoptive father, although he never ceased, for the honour of his family, to protect him, yet never professed any belief in Mohammed's words. In the fourth year of his mission, however, he had made forty proselytes, chiefly slaves and people from the lower ranks; and now first some verses were revealed to him, commanding him to come forward publicly as a preacher, and to defy the scorn of the unbelievers. He now inveighed against the primeval superstition of the Meccans, and exhorted them to a pious and moral life, and to the belief in an all-mighty, all-wise, everlasting, indivisible, all-just, but merciful God, who had chosen him as he had chosen the prophets of the Bible before him, so to teach mankind that they should escape the punishments of hell, and inherit everlasting life. God's mercy was principally to be obtained by prayer, fasting, and almsgiving. The belief in the sacredness of the Kâaba and the ceremonies of the pilgrimage was too firmly rooted in his and the people's minds not to be received into the new creed; but certain barbarous habits of the Bedouins, such as the killing of their new-born daughters, were unsparingly condemned by Mohammed. The prohibition of certain kinds of food also belongs to this first period, when he as yet entirely stood under the influence of Judaism; the prohibition of gambling, usury, and wine coming after the Hegira. Whether he did or did not understand the art of writing and reading at the commencement of his career is not quite clear; certain it is that he pretended not to know it, and employed the services of amanuenses for his Koranic dicta,

which at first consisted merely of brief, rhymed sentences in the manner of the ancient Arabic soothsayers. The Meccans did not object to his doings; they considered him a common 'poet' or 'soothsayer,' who, moreover, was not in his right senses, or was simply a liar. Gradually, however, as the number of his converts increased, they began to pay more and more attention to his proceedings; and finally, fearing mostly for the sacredness of Mecca, which the new doctrine might abolish, they rose in fierce opposition against the new prophet and his adherents, who dared 'to call their ancient gods idols, and their ancestors fools.' The Koreish now demanded that Abu Tālib should silence or surrender his nephew. Abu Tālib refused. Many of the converted slaves and freedmen had to undergo terrible punishments; and others suffered so much at the hands of their own relatives that they were fain to revoke their creed. A hundred believers, on the prophet's own advice, emigrated to Abyssinia. Mohammed himself, although protected by the strong arm of Abu Tālib, was yet at that time so low-spirited and fearful that, before an assembly of the Koreish, he raised three of the idols to mediatorial beings between God and man—a dictum, however, which he next day revoked as an inspiration of Satan, thereby increasing the hatred of his adversaries. All the Hashimi family were now excommunicated, and all except Abu Lahab retired to Abu Tālib's ravine in the mountains east of Mecca. After two years they were restored when on the brink of starvation.

A great grief befell Mohammed at this time—his faithful wife Khadija died, and, shortly afterwards, his uncle Abu Tālib; and, to add to his misery, the vicissitudes of his career had reduced him by this time to poverty. An emigration to Taif proved a failure; it was with great difficulty that he escaped with his life. Shortly after his return from Taif he married Sauda, and he afterwards so increased the number of his wives that at his death he still left nine, of whom Ayesha, the daughter of Abu Bekr, and Hafsa, the daughter of Omar, are best known. In the midst of his vain endeavours to find a hearing in his own city, he succeeded, during a pilgrimage, in converting several men from Medina, whose inhabitants had long been accustomed to hear from the numerous Jews there the words Revelation, Prophecy, God's Word, Messiah. The seed sown in the minds of these men bore a fruitful harvest. While he waited for the next pilgrimage he had in vision his night journey to heaven, the relation of which caused even his staunchest adherents to smile at his hallucination. The next pilgrimage brought twelve, and the third more than seventy adherents to the new faith from Medina, and with these he entered into a close alliance. Mohammed now conceived the plan to seek refuge in the friendly city of Medina, and about June 622 A.D. he fled thither. About one hundred families of his faithful flock had preceded him some time before, accompanied by Abu Bekr, and reached, not without danger, the town, called thence *Medinat An-nabi* ('City of the Prophet'), or *Medina* ('City'), by way of eminence; and from this flight dates the Mohammedan Era, the Hegira (q.v.).

Now everything was changed to the advantage of the prophet and his religion; and if formerly the incidents of his life are shrouded in comparative obscurity, they are from this date known often to their most insignificant details. Formerly a despised 'madman or impostor,' he now assumed at once the position of highest judge, lawgiver, and ruler of the city and two most powerful Arabic tribes. His first care was directed towards the consolidation of the new worship, and the inner arrangements in the congregation of his flock; his next chief endeavour was to proselytise the numer-

ous Jews who inhabited the city, to whom he made many important concessions also in the outer observances of Islam, but he was sorely disappointed in his hopes to convert them. They ridiculed his pretension to be the Messiah, and so enraged him by their constant taunts that he soon abrogated his concessions and became their bitterest adversary up to the hour of his death. The most important act in the first year of the Hegira was his permission to go to war with the enemies of Islam in the name of God—a kind of manifesto chiefly directed against the Meccans. Not being able at first to fight his enemies in open field, he endeavoured to weaken their power by attacking the caravans of the Koreish on their way to Syria. Being successful enough to disturb their trade and to conclude alliances with the adjoining Bedouin tribes, he at last dared to break even the peace of the sacred month of Radjab, and with this the signal to open warfare was given. A battle, the first, between 314 Moslems and about 600 Meccans was fought at Badr, in the second year of the Hegira, December 623; the former gained the victory and made many prisoners. A great number of adventurers now flocked to Mohammed, and he successfully continued his expeditions against the Koreish and the Jewish tribes, chiefly the Beni Keinukā, of a suburb near Medina, whom he sent destitute into exile; and the Beni Kureidhah of another suburb, 700 of whom he beheaded after the victory, while the women and children were sold. In January 625 the Meccans defeated him at Ohod, where he was dangerously wounded. The siege of Medina by the Meccans in 627 was frustrated by Mohammed's ditch and earthworks. In 6 A.H. he proclaimed a public pilgrimage to Mecca. Although the Meccans did not allow this to be carried out, he gained the still greater advantage that they concluded a term of peace with him at Hudaibiyyeh for ten years. He was now allowed to send his missionaries all over Arabia, and even beyond the frontiers, without any hindrance; and in the following year he had the satisfaction of celebrating the pilgrimage with 2000 followers for three days undisturbed at Mecca. Shortly afterwards, during his expeditions against the Jews of Chaibar and Fadak, Mohammed very nearly lost his life: a Jewess, Zainab by name, a relative of whom had fallen in the fight against him, placed a poisoned piece of roast meat before him, and although he merely tasted it he yet up to his death suffered from the effects of the poison. His missionaries at this time began to carry his doctrines abroad. He wrote letters demanding the conversion of Chosroes II., of Heraclius, of the king of Abyssinia, the Viceroy of Egypt, and the chiefs of several Arabic provinces. Some received the new gospel, but Chosroes II., the king of Persia, and Amru the Ghassanide rejected his proposals with scorn, and the latter had the messenger executed in Moab. This was the cause of the first war between the Christians and the Moslems, in which the latter were beaten with great loss by Amru. Some Meccans having taken part in a war between a tribe in their alliance and another in Mohammed's alliance, he marched at the head of 10,000 men against Mecca before its inhabitants had had time to prepare for the siege. It surrendered, and Mohammed was publicly recognised as chief and prophet. With this the victory of the new religion was secured in Arabia. While employed in destroying all traces of idolatry in the captured city Mohammed heard of new armies which several warlike Arabic tribes had concentrated near Taif (630). There again he was victorious, and now his dominion and creed extended farther and farther every day. From all parts flocked the deputations to do homage to him in the name of the various tribes, either as

the messenger of God or at least as the Prince of Arabia, and the year 8 of the Hegira was therefore called the year of the Deputations. Once more he made most extensive preparations for a war against the Syrian subjects of Byzantium; but, not being able to bring together a sufficient army, he had to be satisfied with the homage of a few minor princes on his way to the frontiers. Towards the end of the tenth year of the Hegira he undertook his last solemn pilgrimage to Mecca, and there on Mount Arafat fixed for all time the ceremonies of the pilgrimage (Hajj); and he again solemnly exhorted his believers to righteousness and piety, and chiefly recommended them to protect the weak, the poor, and the women, and to abstain from usury.

Returned from Mecca, he occupied himself again with the carrying out of his expedition against Syria, a necessary aid to religion and patriotism in keeping his people together, but fell dangerously ill very soon after his return. One night while suffering from an attack of fever he went to the cemetery of Medina and prayed and wept upon the tombs, praising the dead, and wishing that he himself might soon be delivered from the storms of this world. For a few more days he went about; at last, too weak further to visit his wives, he chose the house of Ayesbah, situated near the mosque, as his abode during his sickness. He continued to take part in the public prayers as long as he could, until at last, feeling that his hour had come, he once more preached to the people recommending Abu Bekr and Osâma the son of Zaid as the generals whom he had chosen for the army. He then asked whether he had wronged any one, and read passages from the Koran preparing the minds of his hearers for his death and exhorting them to peace among themselves. A few days afterwards he asked for writing materials, probably in order to fix his successor as chief of the faithful; but Omar, the most influential of his followers and friends, fearing he might chose Ali while he himself inclined to Abu Bekr, would not allow him to be furnished with them. In his last wanderings he spoke only of angels and heaven. He died in the lap of Ayesbah about noon of Monday the 12th (11th) of the third month in the year 11 of the Hegira (8th June 632). His death caused an immense excitement and distress among the faithful; and Omar, who himself would not believe in it, tried to persuade the people that he was still alive. But Abu Bekr said to the assembled multitude: 'Whoever among you has served Mohammed let him know that Mohammed is dead; but he who has served the God of Mohammed let him continue in His service, for He is still alive and never dies.' While his corpse was yet unburied the quarrels about his successor, whom he had not definitely been able to appoint, commenced; but finally Abu Bekr received the homage of the principal Moslems at Medina. Mohammed was then buried in the night between the 9th and 10th of June, after long discussions, in the house of Ayesbah, where he had died, and which afterwards became part of the adjoining mosque.

A man of Mohammed's extraordinary powers and gifts is not to be judged by a modern commonplace standard; the manners and morals of his own time and country must also be taken into consideration. He was at times deceitful, cunning, revengeful, cowardly, addicted to sensuality, and even a murderer. Yet not only his public station as prophet, preacher, and prince, but also his private character, his amiability, his faithfulness towards friends, his tenderness towards his family, and the frequent readiness to forgive an enemy must be taken into consideration, besides the extreme simplicity of his domestic life; he lived when

already in full power in a miserable hut, mended his own clothes, and freed all his slaves. And, to do him full justice, his melancholic temperament, his nervousness, which often bordered on frenzy and brought him to the brink of suicide, and his poetic temperament must not be forgotten. Altogether his mind contained the strangest mixture of right and wrong, of truth and error. Although his self-chosen mission was the abolition of superstition, he yet believed in jinns, omens, charms, and dreams—an additional reason against the now generally abandoned notion that he was a vulgar designer, who by no means deceived himself about those revelations he pretended to have received. And though the religion of Islam may rightly or wrongly be considered the bane of eastern states and nations in our day, it should be remembered that it is not necessarily Islam that has caused the corruption, as indeed its ethics are for the most part of a high order; and in the second place, that Mohammed is not to be made responsible for all the errors of his successors. Take him all in all, the history of humanity has seen few more earnest, noble, and sincere 'prophets,' men irresistibly impelled by an inner power to admonish and to teach, and to utter austere and sublime truths the full purport of which is often unknown to themselves.

See the *Lives in German* by Weil (1843), Sprenger (1861-65), Nöldeke (1863), Krehl (vol. i. 1894); in French by Delaporte (1874); and Sir W. Muir, *Life of Mahomet* (4 vols. 1858-61; new ed. 1877), and *Mahomet and Islam* (1887); also Syed Ameer Ali, C.I.E., *The Life and Teachings of Mohammed* (1890).

MOHAMMEDANISM, the religion founded by Mohammed, or, according to him, the only orthodox creed existing from the beginning of the world, and preached by all the prophets ever since Adam. It is also called *Islâm*, 'Resignation,' entire Submission to the will and precepts of God. In its exclusively dogmatical or theoretical part it is *Imân*, 'Faith'; in its practical, *Dîn*, 'Religion.' The fundamental principles of the former are contained in the two articles of belief: 'There is no God but God; and Mohammed is God's Apostle.' The Mohammedan doctrine of God's nature and attributes coincides with the Christian, in so far as He is by both declared to be the Creator of all things in heaven and earth, who rules and preserves all things, without beginning, omnipotent, omniscient, omnipresent, and full of mercy. But, according to the Mohammedan belief, He has no offspring: 'He begetteth not, nor is He begotten.' Nor is Jesus called anything but a prophet and apostle, although His birth is said to have been due to a miraculous divine operation; and as the Koran superseded the Gospel, so Mohammed superseded Christ. The crucifixion is said to have been carried out upon another person, Christ having been taken up unto God before the decree was put into execution. Christ will come again upon the earth to establish everywhere the Moslem religion, and to be a sign of the coming of the day of judgment. Next to the belief in God, that in angels forms a prominent dogma. Created of fire, and endowed with a kind of incorporeal body, of no sex, they stand between God and man, adoring or waiting upon God, or interceding for and guarding man. The four chief angels are Gabriel, 'The Holy Spirit' or 'Angel of Revelations'; Michael, the special protector and guardian of the Jews; Raphael (Azraël, Azraël), the 'Angel of Death'; and Uriel (Israfil), whose office it will be to sound the trumpet at the Resurrection. Islam borrowed its ideas of the unseen world from the Persians or from the Jews, who had borrowed them from the Persians (see ANGEL). To each human being are appointed two guardian angels. Besides angels, there are good and evil genii, the chief of the latter, who are

generally called Ifrit, being Iblis ('Despair'), once called Azazel, who, refusing to pay homage to Adam, was rejected by God. These jinn are of a grosser fabric than angels, and subject to death. They are, in almost every respect, like the Shēdim in the Talmud and Midrash. A further belief is in certain God-given Scriptures, revealed successively to the different prophets. Four only of the original one hundred and four sacred books—the Pentateuch, the Psalms, the Gospel, and the Koran—are said to have survived; the three former, however, in a mutilated and falsified condition. The number of prophets, sent at various times, is stated variously at between two and three hundred thousand, among whom 313 were apostles, and six were specially commissioned to proclaim new laws and dispensations, which abrogated the preceding ones. These were Adam, Noah, Abraham, Moses, Jesus, and Mohammed—the last the greatest of them all, and the founder of the final dispensation.

The belief in the resurrection and the final judgment is the next article of faith. The dead are received in their graves by an angel announcing the coming of the two examiners, Munkir and Nakir, who put questions to the corpse respecting his belief in God and Mohammed, and who, in accordance with the answers, either torture or comfort him. Concerning the condition of the soul between death and the resurrection Islam has no authoritative teaching. The soul is supposed, according to its rank, either to enter immediately into paradise (as do the prophets), or to partake, in the shape of a green bird, of the delights of the abode of bliss (as the martyrs); while, in the case of common believers, it stays near the grave, or is with Adam in the lowest heaven, or remains either in the well of Zem-Zem or in the trumpet of the resurrection. The souls of the infidels dwell in a certain well in the province of Hadramaut, or, being first offered to heaven, then offered to earth, and rejected by both, are subject to unspeakable tortures until the day of resurrection. Concerning the latter, great discrepancy reigns among the Mohammedan theologians. Mohammed himself seems to have held that both soul and body will be raised; and the 'bone Luz' of the Jewish Haggadah was by him transformed into the bone Al Ajb ('the rump-bone'), which will remain uncorrupted till the last day, and from which the whole body will spring anew, after a forty days' rain. Among the signs by which the approach of the last day may be known—nearly all taken from the legendary part of the Talmud and Midrash—are the decay of faith among men, the advancing of the meanest persons to highest dignities, wars, seditions, and tumults, and consequent dire distress. The sun will rise in the west, the Beast will appear, Constantinople will be taken by the descendants of Isaac, the Mahdi (q.v.) will come, the Dejjāl or arch-impostor also will come and be killed by Jesus at Lud. There will further take place a war with the Jews, the coming of Gog and Magog (Yāyūj and Mājūj's), a great smoke, an eclipse, the Mohammedans will return to idolatry, the Kāba will be destroyed by the Ethiopians, beasts and inanimate things will speak, and finally, a wind will sweep away the souls of those who have faith. The time of the resurrection Mohammed himself could not learn from Gabriel: it is a mystery. Three blasts will announce it: that of consternation, of such terrible powers that mothers shall neglect the babes on their breasts, and that heaven and earth will melt; that of examination, which will annihilate all things and beings, save paradise and hell, and their inhabitants; and forty years later, that of resurrection, when all men, Mohammed first, shall have their souls breathed into their restored bodies, and will sleep in their sepulchres until the final doom

has been passed upon them. The day of judgment, lasting from one to fifty thousand years, will call up angels, genii, men, and animals. The trial over, the righteous will enter paradise to the right hand, and the wicked will pass to the left into hell; both, however, have first to go over the bridge Al Sirāt, laid over the midst of hell, and finer than a hair, and sharper than the edge of a sword, and beset with thorns on either side. The righteous will proceed on their path with ease and swiftness, but the wicked will fall down headlong to hell below.

Hell is divided into seven stories or apartments, respectively assigned to Mohammedans, Jews, Christians, Sabians, Magians, idolators, and, lowest of all, the hypocrites, who, outwardly professing a religion, in reality had none. The degrees of pain, chiefly consisting in intense heat and cold, vary; but Mohammedans and all who professed the unity of God will finally be released, while unbelievers and idolators will be condemned to eternal punishment. Paradise is divided from hell by a partition (Arāf), in which a certain number of half-saints will find place. The blessed, destined for the abodes of eternal delight (Jannat Aden; Heb. Gan Eden), will first drink of the Pond of the Prophet, which is supplied from the rivers of paradise, whiter than milk, and more odoriferous than musk. Arrived at one of the eight gates, they will be met by beautiful youths and angels; and their degree of righteousness (prophets, religious teachers, martyrs, believers) will procure for them the corresponding degree of happiness. Yet, according to the Mohammedan doctrine, it is not a person's good works or merits that gain his admittance, but solely God's mercy. The poor will enter paradise five hundred years before the rich. The majority of the inhabitants of hell are women. The various felicities which await the pious (and of which there are about a hundred degrees), are a wild conglomeration of Jewish, Christian, Magian, and other fancies on the subject, to which the Prophet's own exceedingly sensual imagination has added largely. Feasting in the most gorgeous and delicious variety, the most costly and brilliant garments, odours and music of the most ravishing nature, and above all, the enjoyment of the Hūr Al Oyūn, the black-eyed daughters of paradise, created of pure musk, and free from all the bodily weaknesses of the female sex, are held out as a reward to the commonest inhabitants of paradise, who will always remain in the full vigour of their youth and manhood. For those deserving a higher degree of recompense rewards will be prepared of a purely spiritual kind—i.e. the 'beholding of God's face' by night and by day. A separate abode of happiness will also be reserved for women. The last of the precepts of pure faith taught by Mohammedanism is the full and unconditional submission to God's decree (Islam), and the predestination of good and evil. Not only a man's fortunes, but his deeds, and consequently his future reward or punishment, are irrevocably, and thus unavoidably, pre-ordained (Fate, *kismeh*): a doctrine which is not, however, taken literally by all Moslems, but which has no doubt contributed largely to the success of Islam by inspiring its champions with the greatest contempt for the dangers of warfare.

The Dīn, or practical part of Islam, which contains the ritual and moral laws, inculcates as the chief duties the following four: prayer, almsgiving, fasting, and pilgrimage.

Prayer, 'the key of paradise,' comprises also certain religious purifications, as the most necessary preparations. They are of two kinds: the *Ghāsl*, or total immersion of the body, required as a religious ceremony on some special occasions; and

the *Wudû*, a partial ablution, to be performed immediately before the prayer. This is of primary importance, and consists of the washing of hands, face, ears, and feet up to the ankles—a proceeding generally accompanied at each stage by corresponding pious sentences, and concluded by the recital of the 97th chapter of the Koran. If water be beyond reach, dry dust or sand may supply its place. 'The practice of religion being founded on cleanliness,' the ground or the carpet upon which the believer prays must be as clean as possible, and the use of a special prayer-carpet is therefore recommended. Every Mohammedan is obliged to pray five times in the space of every twenty-four hours. The prayer (*Salât*) itself consists partly of extracts from the Koran (*Fard*), partly of pieces ordained by the Prophet without allegation of a divine order (*Sunnah*). The first time of prayer commences about sunset; the second at nightfall; the third at daybreak; the fourth about noon; the fifth in the afternoon. The believers are not to commence their prayers exactly at sunrise, or noon, or sunset, lest they might be confounded with the infidel Sun-worshippers. These several times of prayer are announced by the Muezzins (q.v.) from the minarets of the mosques. Their chant, sung to a very simple but solemn melody, sounds harmoniously and sonorously down the height of the mosque, through the mid-day din and roar of the cities, but its impressiveness is most strikingly poetical in the stillness of night. The day-call (the *Adân*) consists chiefly of the confession of faith ('God is most great,' 'Mohammed is God's apostle;') 'Come to prayer, come to security' repeated several times; the night-calls (*Ula*, the first; *Ebed*, the second), destined for persons who desire to perform supererogatory acts of devotion, are much longer. The believer often changes his posture during his prayers; and one series of such inclinations of head and knees, prostrations, &c. is called a *Rêka*. It is also necessary that the face of the worshipper should be turned towards the Kibleh, in the direction of Mecca, the exterior wall of the mosque marking that direction being distinguished by a niche (*Mihrab*). All sumptuous and pompous apparel is laid aside before the believer approaches the sacred place; and the extreme solemnity and decorum, the humility, the devotion which pervades it have been unanimously held up as an example to other creeds. The mosques are always open. Women, although not strictly forbidden to enter the mosque, yet are practically not allowed to pray there, lest their presence might be hurtful to true devotion. Besides these prayers, there are others ordained for special occasions, as on a pilgrimage, before a battle, at funerals, during an eclipse, &c. Moslems pray to God only, but implore the intercession of Mohammed, saints, and angels (see *MOSQUE*). Mohammedanism has no clergy in our sense of the word, the civil and religious law being bound up in one (see *MOLLAH*, *MUFTI*).

Next in importance stands the duty of giving alms. These are twofold—legal and voluntary, but the former, once collected by the sovereign, and applied to pious uses, has now been practically abrogated. The latter is, according to the law, to be given once every year, of cattle, money, corn, fruits, and wares sold, at about the rate of from two and a half up to twenty per cent. Besides these, it is usual to bestow a measure of provisions upon the poor at the end of the sacred month of Ramadan.

The duty of fasting follows (see *FASTS*). During the whole month of Ramadan the Moslem is commanded to refrain from eating, drinking, smoking, smelling perfumes, bathing, and every unnecessary indulgence in worldly pleasure, from daybreak until sunset. From that period till the morning

he is allowed to eat, drink, and enjoy himself. The Arabian year consisting of twelve lunar months, it often happens that the Ramadan falls in mid-summer, when the fasting, more especially the abstaining from drinking, is excessively mortifying. None are exempt from this duty save the sick, travellers, and soldiers in time of war; but they are bound to fast an equal number of days during some other months. Nurses and pregnant women are entirely free from fasting. It is Mohammed's special and express desire that no one should fast who is not quite equal to it, lest he might injure his health and disqualify himself for necessary labour. Of the other commendable fast-days the Ashûra, on the 10th of Moharram, deserves special mention. There are very few Moslems that do not keep the Ramadan, even if they neglect their other religious duties; at all events, they all pretend to keep it most strictly, fasting being considered 'one-fourth part of the faith,' nay, 'the gate of religion.'—For the fourth paramount duty of the Mohammedan, the pilgrimage to Mecca, see *MECCA*.

With the 'positive' ordinances of Islam may also be reckoned the minor and greater festivals. The first (*Al-Fetr*, or 'breaking the fast'), following immediately upon the Ramadan, begins on the first day of the month of Shawâl, and lasts three days. The second (*Eed Al-Korbân*, or 'sacrifice') begins on the 10th of Dhu'l Hijjah, when the pilgrims perform their sacrifice, and lasts three or four days. The weekly day of rest is the Friday, because, from times long before Mohammed, the people used to hold public assemblies for civil as well as religious purposes on that day. When the special Friday service with its *Chotbeh* or Homily is over, the people are allowed to return to their worldly affairs, if they cannot afford to give themselves up entirely to pleasure or devotion for the rest of the sacred period.

The ancient rite of circumcision is used in Mohammedanism as the badge of the faith. It is commonly performed between the sixth and eighth year. Of the fundamental prohibitory laws of the Koran, one forbids the drinking of wine, which includes all strong and inebriating liquors, as giving rise to 'more evil than good;' and although of late, chiefly through European influence, very many Moslems have lost their religious scruples on that score, and not only secretly but openly indulge in spirits, yet the great bulk of the faithful refuse even to make use of the proceeds of the sale of wine or grapes. Some over-scrupulous believers even include opium, coffee, and tobacco in the prohibition; but general practice has decided differently. The prohibitory laws respecting food resemble closely those of Judaism; blood, the flesh of swine, animals that have died from disease or age, or on which the name of some idol has been invoked, or that have been sacrificed to an idol, or have been strangled, or killed by a blow, a fall, or by some other beast, are strictly forbidden. 'Pure' animals must be slaughtered according to certain fixed rules, and the name of God is to be invoked before the operation, without, however, the usual addition of the benevolent epithets. Fish, birds, and game are mostly allowed for food.

All games subject to chance, such as dice, cards, tables, bets, are considered so wicked that a gambler's testimony is invalid in a court of law. Chess and other games depending on skill, provided that they do not interfere with the regular performance of religious duties, and that they are played without any stakes whatsoever, are allowed by the majority of Moslem theologians. Usury is strictly prohibited. Taking interest upon any loan, however large or small, or profiting in trade

through any questionable means, save by buying and selling, is severely condemned.

To prevent the faithful from ever falling back into idolatry the laws relating to images and pictures have been made very stringent. Whosoever makes an imitation of any living being, in stone, wood, or any other material, shall on the day of judgment be asked to endow his creation with life and soul, and, on his protesting his inability to do so, shall undergo the punishment of hell for a certain period. The head of law civil and religious is the Calif. His vicegerent in religion is the Grand Mufti or Sheikh ul Islām, under whom are the whole guild of Ulemā or experts.

The civil and criminal laws of Mohammedanism, founded both on the Koran and on the Traditions (*Sunna*), are in some instances, where the letter of the written or oral precept allows of various explanations, or where the case in question is not foreseen, interpreted according to the opinion of one of the four great masters of Islam—Abu Hanifa, Malek Ibn Ans, Shāfeī, Ibn Hanbal—within the pale of their respective sects. The principal points, however, upon which all Mohammedans agree are the following. Polygamy is allowed. 'Take in marriage of the women who please you, two, three, or four; but if ye fear that ye cannot act equitably, one, or those whom your right hands have acquired'—i.e. your slaves. Thus four wives, and a certain number of concubine slaves, is the extent to which a Moslem may legally go. The Prophet's example proves nothing to the contrary, since he was endowed with special privileges. It is moreover added, as an advice, that to marry one or two is quite sufficient for a man. A Moslem may, if urged by excessive love, or if unable to obtain a wife of his own creed, marry a Christian woman or a Jewess, but a Mohammedan woman is not, under any circumstances, to marry an unbeliever. In all cases, however, the child of a Moslem father, whatever the mother's faith, is a Moslem; nor does the wife that is an unbeliever inherit at her husband's death. A simple declaration of a man and woman at the age of puberty, before two witnesses, of their intention to marry each other, and the payment of part of the dowry (which is indispensable, and must amount to at least ten dirhems, or about five shillings) is sufficient for a legal marriage. A girl under age is given away by her natural or appointed guardian, with or without her consent. To see the face of any woman who is neither his wife nor his concubine, and who does not belong to any of the forbidden degrees, is strictly forbidden to the believer. Divorce is an easy thing for a Moslem husband. Twice a man may send away his wife and take her back again without any ceremony; the third time, however, or if he unite the triple divorce in one sentence at once, he dare not receive her again in wedlock until she have been married to another man in the meantime. Mere dislike is sufficient reason for a man to dissolve the conjugal ties, and his saying 'Thou art divorced,' or 'I divorce thee,' together with the payment of part of the wife's dowry, is all that is required from him by the law. A wife, on the other hand, is bound to her husband for ever, unless she can prove some flagrant ill-usage or neglect of conjugal duty on his part; and even then she forfeits part, or the whole, of her dowry. A woman proving disobedient to her husband may be declared by the *cadi* rebellious, and the husband is no longer bound to maintain her; but he cannot be forced to divorce her under these circumstances. If a slave becomes a mother by her master, and he acknowledges the child to be his own, the child is free, and the mother is to be emancipated at the master's death. A free person wishing to marry his or her slave must first emancipate this slave.

The privilege of primogeniture does not exist in the Mohammedan law, but males generally receive a double share. A person may not bequeath more than one-third of his property, unless there be no legal heirs. Children—whether begotten with the legal wife, or slave, or concubine, or only adopted—and their descendants are the first heirs; next come the claims of wives, parents, brothers, sisters, in their order. Where there is no legal heir the property falls to the crown. The law is very lenient towards debtors, the Koran recommending the creditor to remit a debt 'as alms.' Insolvency and inability to work for the discharge of the claim solve all further obligations. The most conscientious performance of all private contracts, however, is constantly recommended in the Koran.

Murder is punishable either with death or by the payment of a fine to the family of the deceased, according to their own pleasure. There must, however, be palliating circumstances in the latter case. Unintentional homicide is expiable by freeing a believer from slavery, and paying to the family a certain sum in proportion to the rank and sex of the deceased. He who has not the means of freeing a believer is to fast for two months, by way of penance. According to the strict letter of the law, a man is not liable to capital punishment for killing his own child or an infidel; but, practically, no difference is generally made by civilised Mohammedan governments in our day: murder is punished with death, and no fine frees the culprit.

The Mosaic law of retaliation, in case of *intentional* wounds and mutilation, holds good also for Islam; that is (not, as has ignorantly been supposed, that the corresponding limb of the offender is to be cut off), a certain proportionate fine in money is to be paid to the injured. The payment for any of the single limbs of the human body, such as the nose, is the full price, the same as for a homicide; for a limb which is found twice, like hand or foot, half; for a finger or toe, the tenth part. Women and slaves have smaller claims. Injuries of a dangerous or otherwise grievous nature pay the full price; those of an inferior kind bring the perpetrator within reach of the lash or cudgel.

The Koran orders theft to be punished by cutting off the chief offending limb, the right hand; the second theft is punishable by the loss of the left foot; the third, of the left hand; the fourth, of the right foot; but the ordinary punishments of imprisonment, hard labour, and the bastinado have been substituted in our days. Not, however, if the property stolen were of easy access to the thief, nor if it consisted of food, since he may have taken this to satisfy the craving of his hunger.

Unchastity on the part of a woman was, in the commencement of Islam, punished by imprisonment for life, for which afterwards, however, stoning was substituted in the case of a married woman, and a hundred stripes and a year's exile in the case of an unmarried free woman; a slave to undergo only half of that punishment. Fornication in either sex is, by the law of the Koran, to be visited with a hundred stripes.

Infidelity, or apostasy from Islam, is a crime to be visited by the death of the offender, if he have been warned thrice without recanting. Equally severe, and not to be averted by repentance or revocation of any kind, is the punishment inflicted for blasphemy—against God, Mohammed, Christ, Moses, or any other prophet.

A further injunction of the Koran, for the carrying out of which the time has well-nigh gone by, is that of making war against the Infidels. He who is slain while fighting in defence and for the propagation of Islam is reckoned a martyr; while a deserter from the holy war is held up as an

object of execration, and has forfeited his life in this world as well as in the world to come. At first all the enemies taken in battle were ruthlessly slain. Later, however, it became the law to give the people of a different faith against whom war was declared the choice of three things: either to embrace Islam, in which case they became Moslems at once, free in their persons and fortunes, and entitled to all the privileges of Moslems; or to submit to pay tribute—in which case they were allowed to continue in their religion, if it did not imply gross idolatry or otherwise offend against the moral law; or to decide the quarrel by the fortune of war—in which case the captive women and children were made slaves, and the men either slain, unless they became converts at the last moment, or were otherwise disposed of by the prince. The fifth part of the spoil belongs 'to God,' that is, the Sanctuary, to the apostle and his kindred, to the orphans, the poor, and the traveller.

In cases for which subsequent ages found no written rules laid down by the Prophet, traditional oral dicta were taken as the norm, and later still precedents of the califs were binding. Hence contradictions in theory and practice have crept in, according to the different traditions and decisions of the Imams or expounders of the Law, besides the various interpretations put upon the book itself within the pale of the different Mohammedan sects. The secular tribunals, therefore, not unfrequently differ in their decisions from the judicial tribunals; and the distinction between the written civil Law of the ecclesiastical courts and the common Law, aided by the executive power, is, fortunately for the cause of civilisation, getting clearer and clearer every day.

That part of Islam which has undergone least change in the course of time, and which most distinctly reveals the mind of its author, is also its most complete and its most admirable part—we mean the ethics of the Koran. They are not found, any more than the other laws, brought together in one, or two, or three Surahs, but 'like golden threads' they are woven into the huge fabric of the religious constitution of Mohammed. Injustice, falsehood, pride, revengefulness, calumny, mockery, avarice, prodigality, debauchery, mistrust, and suspicion are inveighed against as ungodly and wicked; while benevolence, liberality, modesty, forbearance, patience and endurance, frugality, sincerity, straightforwardness, decency, love of peace and truth, and, above all, trust in God and submission to His will are considered as the pillars of true piety, and the principal signs of a true believer. Nor must we omit to point out expressly that Mohammed never laid down that doctrine of absolute predestination which destroys all human will and freedom, because the individual's deeds cannot alter one iota in his destiny either in this world or in the next. So far from it, foolhardiness is distinctly prohibited in the Koran (ii. 196). Caution is recommended. And a glance at the whole system of faith, which is built on hope and fear, rewards and punishments, paradise and hell, destined to be man's portion according to his acts in this life, as well as the incessant exhortations to virtue and denunciations of vice, are sufficient to prove that the extreme doctrine of predestination is not in the Koran. But submission to the Lord's will, hope during misfortune, modesty in prosperity, and entire confidence in the Divine plans are supported by the argument that everything is in the hands of the Highest Being, and that there is no appeal against His absolute decrees.

That the worst side of Mohammed's character, the often wanton cruelty with which he pursued the

propagation of his faith, should by his successors have been taken as a thing to be imitated is not wonderful if we consider how brilliant the results of the policy of the bloody sword had proved. The progress of the Moslem arms is described in the article CALIF. Eighty years after Mohammed's death Islam reigned supreme over Arabia, Syria, Persia, Egypt, the whole of the northern coast of Africa, and over Spain; and notwithstanding the subsequent strifes and divisions in the interior of this gigantic realm, it grew and grew outwardly, until the Crescent was made to gleam from the spires of St Sophia at Constantinople (1453), and the war-cry, 'La ilāha ill' Allāh!' resounded before the gates of Vienna (1529). From that time, however, the splendour and the power of Mohammedanism began to wane. Two hundred millions, or 14 per cent. of the human race, profess Islam. Two-thirds of these are found from Turkey to farthest Malaysia, the rest in Africa. There are upwards of 45 millions of Moslems in British India alone. Among the African races Mohammedanism has lately made great progress. Yet since it left off conquering it has lost also that energy and elasticity which promises great things. Its future fate will depend chiefly on the progress of European conquest in the East, and the amount of Western civilisation which it will, for good or evil, import thither.

The strong points of Mohammedanism, its sobriety, its pure theism, its simple and intelligible creed, are heavily counterbalanced by its slavery, its degradation of woman, its stereotyping of laws and science, and its belief in the past rather than in the future. Yet over a great part of the world it is what Mohammed declared every prophet before him to have been, a pioneer of better things.

Besides the Koran, the Sunna, and the native (Arabic, Persian, Turkish, &c.) writers on the foregoing subject, we mention as further references the works of the European scholars D'Herbelot, Sale, De Sacy, Hammer-Purgstall, Burckhardt, Sprenger, Burton, Muir, Garcin de Tassy, Lane, Weil, Geiger, Nöldeke, Kremer. See also the articles on ARABIA, CALIF, CRUSADES, DEMONOLOGY, KORAN, MEOGA, SHITES, SUNNITES, TURKEY, WAHABIS.

Mohammed, the name of four sultans of Turkey, of whom the most noted is MOHAMMED II., the conqueror of Constantinople; born 1430, succeeded 1451, died 1481. See TURKEY.

Mohammerah (*Muhammrah*), a town of Khuzistan, Persia, near the Turkish frontier. It stands on the lower Karun, where the latter connects by the Haffar Canal with the Shat-el-Arab. It has about 5000 inhabitants, and has become of commercial importance since the opening of the navigation of the Karun (q.v.).

Moharram, or MUHARREM, the first month of the Mohammedan year, kept by the Shiite Mohammedans as a month of fasting and mourning, in commemoration of the sufferings of Hassan and Hussein (Hasan and Hosain), nephews of the Prophet. A celebrated passion-play (Eng. version by Sir Lewis Pelly in 1879) is performed during this month in honour of the two saints at several towns in Persia and India.

Moha've Desert, a basin, with little water or vegetation, chiefly in the SE. of California, and extending into Arizona. The Mohave River rises in the San Bernardino range, and finally disappears in the Mohave Sink.

Mohawks. The Mohock or Mohawk Club, mentioned in the *Spectator* by Steele (No. 324) and Budgell (No. 347), was a scandalous club existing in London in 1711-12. 'The avowed design of their institution was mischief.' Gay mentions, in *Trivia*, that the Mohawks rolled

women in hogsheads down Snowhill, and Swift told Stella of a report that eighty of them had been put into prison; while Lady Wentworth, writing to her son Lord Strafford, says, 'I am very much frightened with the fyer, but much more with a gang of devils that call themselves Mohocks.' A royal proclamation was issued against them, March 18, 1712.

Mohawks. See IROQUOIS.

Mohic'ans, or MOHEGANS, a warlike sub-tribe of Delaware Indians, which in the 17th century settled in Connecticut, and afterwards helped the English against the French, and the colonists against the English. Of the few survivors, some remain at Norwich, and the rest are in Kansas and at Green Bay, Wisconsin. Their name has become widely known through Cooper's novel, *The Last of the Mohicans*.

Mohileff, or MOGILEFF, the capital of a government in European Russia, is situated on the right bank of the Dnieper, 95 miles SW. of Smolensk. It is the seat of a Greek and a Roman Catholic archbishop, their respective cathedrals dating from 1780 and 1692, and has an old castle, and a town-house built in 1679. Tanning is the principal industry. There is an active trade in cereals, leather, brandy, salt, sugar, fish, timber, &c. Pop. (1885) 41,899, two-thirds being Jews. The town was burned down by Peter the Great for strategical reasons in 1708. Here on 23d July 1812 the French under Davout defeated the Russians under Bagration.—The government has an area of 18,551 sq. m. and a pop. (1887) of 1,294,116.

Mohileff, or MOGILOFF, a town of Podolia, Russia, is situated on the left bank of the Dniester, 190 miles NW. of Odessa. Pop. (1884) 18,421.

Mohl, JULES, orientalist, was born at Stuttgart, 25th October 1800, and educated for the Lutheran Church at Tübingen. But at an early age he was irresistibly attracted to oriental studies, and in 1823 he betook himself to the famous Silvestre de Sacy and Rémusat at Paris. He was nominally professor at Tübingen from 1826 to 1833, but he lived all his life in Paris, becoming a member of the Institute in 1844, and professor of Persian at the Collège de France in 1847. He was long secretary to the Société Asiatique, and his admirably learned and luminous annual reports on the progress of oriental learning were collected by Madame Mohl, under the title *Vingt-sept Ans d'Histoire des Études Orientales* (2 vols. 1879-80). His great edition of the *Shah Nāmah* was published in six folio volumes, from 1838 till 1868; a posthumous seventh volume, edited by Meynard, completed the gigantic undertaking in 1878 (Fr. trans., 7 vols., in same year). Mohl died 3d January 1876. He was a scholar of altogether unusual breadth of mind, and exercised a wide influence on his contemporaries, to which his charming and accomplished wife, *née* Mary Clarke, contributed in no small degree. Her salon was one of the few centres at Paris of high thinking, refinement, and brilliant talk in the degradation of the Second Empire.

See Kathleen O'Meara's *Madame Mohl: her Salon and Friends* (1885); Mrs Simpson's *Letters and Recollections of Julius and Mary Mohl* (1887); and Max-Müller's *Biographical Essays* (1883).

Möhler, JOHANN ADAM, Roman Catholic theologian, was born at Igersheim, in Würtemberg, May 6, 1796, and studied at the university of Tübingen, where, after being theological tutor, he became ordinary professor of Theology in 1828. His earliest publication was a treatise *On the Unity of the Church* (1825), which was followed, in 1827, by a historico-theological essay on *Athanasius*. But his reputation, both posthumous and

among his own contemporaries, rests mainly on his well-known *Symbolik*, a work on the doctrinal differences between Catholics and Protestants, as represented by their public confessions of faith (1832). This remarkable book passed through five large editions in six years, was translated into all the leading languages of Europe, and drew forth numerous criticisms and rejoinders, the most considerable of which is that of Baur (q.v.), 1833. To this Möhler replied in 1834, and next year he accepted a professorship in the new university of Munich. He died April 12, 1838. His miscellaneous works were collected and published posthumously (2 vols. 1839-40) by Dr Döllinger.

Moldart. See INVERNESS-SHIRE.

Moldore, a former gold coin of Portugal, worth 27s. sterling.

Moir, DAVID MACBETH, a minor Scottish poet and humorist, was born at Musselburgh, January 5, 1798, and practised there as a physician till his death, July 6, 1851. He was much beloved by his friends for his amiability, and he earned a wide popularity, and made his pen-name of *Delta* (Δ) famous in Scotland at least by his verses contributed to *Blackwood's Magazine*. Of these a collection was made by Thomas Aird in 1852. Of more lasting merit is his genuinely humorous and still popular *Autobiography of Mansie Wauch* (1828). Other books of less value were *Outlines of the Ancient History of Medicine* (1831) and *Poetical Literature of the Past Half-century* (1851).

Moirs. See HASTINGS.

Moire (from the French verb *moirer*, to water silk in a large pattern, as distinguished from *tabiser*, to water or wave it in a small pattern), silks figured by the peculiar process called 'watering.' The silks for this purpose must be broad and of a good substantial make; thin and narrow pieces will not do. They are wetted, and then folded with particular care, to ensure the threads of the fabric lying all in the same direction, and not crossing each other, except as in the usual way of the web and the warp. The folded pieces of silk are then submitted to an enormous pressure, generally in a hydraulic machine. By this pressure the air is slowly expelled, and in escaping draws the moisture into curious waved lines, which leave the permanent marking called watering. The finest kinds of watered silks are known as *Moirés antiques*.—The same process has been applied to woollen fabrics called *Moreen*, which is only an alteration of the word *moire*.

Moissac, a town in the French department of Tarn-et-Garonne, on the river Tarn, 111 miles SE. of Bordeaux. It has a very interesting church, built between 1100 and 1400. Pop. 5692.

Mokanna. HAKIM BEN ALLAH, called AL-MOKANNA, 'The Veiled,' was the founder of a sect in Khorassan, who first appeared in the 8th century, during the reign of Almahdi, the third Abasside calif. He commenced his career as a soldier. In a fight, an arrow pierced one of his eyes, and in order to hide this deformity he henceforth constantly wore a veil, a habit attributed by his followers to the necessity of shrouding from the eye of the beholder the dazzling rays which issued from his divine countenance. Mokanna set himself up as an incarnation of God. Among other miracles, he is said to have caused a moon or moons to issue from a deep well. Mokanna found many adherents, and his little band increased so that ere long he was able to seize upon several fortified places. But Almahdi marched against him, and after a long siege took his stronghold of Kash (780 A.D.), when, together with the remnant of his army, the veiled one took poison.

Mola, a seaport of Italy, on the Adriatic, 12 miles by rail SE. of Bari. Pop. 12,070.

Mola di Gaeta. See FORMIA.

Molasses. See SUGAR.

Mold, a town of Flintshire, on the Alyn, in a rich mineral district, 14 miles by rail W. by S. of Chester. Its fine 15th-century church, rich in stained glass, contains the grave of the painter Wilson. The former county prison, recently built at a cost of £25,000, was sold in 1880 for £3500 to expelled French Jesuits, who renamed it St Germanus' House, in memory of the 'Alleluia Victory' hard by (see GERMANUS). With Flint, &c., Mold returns one member. Pop. (1851) 3432; (1886) 5055.

Moldau (Bohemian *Vltava*), the chief river of Bohemia, and an important tributary of the Elbe, rises in the Böhmerwald Mountains, on the southwest frontier, at an elevation of 3870 feet above sea-level, and flows south-east to Hohenfurt, where it bends northward, and pursues that direction to its confluence with the Elbe opposite Melnik, after a course of 278 miles. Its course to the point of confluence is longer than that of the Elbe, and the navigation of that river is greatly facilitated by the body of water which it contributes. It receives on the left the Wotawa and the Beraun, and on the right the Luschnitz and the Sazawa. The chief towns on its banks are Budweis and Prague. It becomes navigable from Budweis.

Moldavia, formerly a principality, now forming the northern division of the kingdom of Roumania (q.v.).

Mole (*Talpa*), a genus of quadrupeds of the order Insectivora and family Talpidae. In structure and habits all the species, seven in number, essentially resemble the Common Mole (*T. europæa*). This animal is found in the southern and central parts of Europe, extending northwards as far as to the shores of the Baltic and throughout Denmark, also in central Asia as far as to the confines of China. In Britain it is very plentiful, but it is not found in Ireland, nor in the western islands of Scotland, except in Mull. It possesses a plump, nearly cylindrical body, covered with a velvet-like coat of short soft fur of a black or blackish-brown colour inserted perpendicularly to the skin, very short stout limbs with naked flesh-coloured feet, a short scaly tail furnished with long stiff hairs, and a pointed muzzle. The total length is about

Fig. 1.—Common Mole (*Talpa europæa*).

6 inches, of which the tail measures about half an inch. It has no external ears, and its eyes are so minute as to be easily overlooked. By its bodily structure it is so eminently fitted for underground progression that it might almost be said to swim through the soft earth. Its whole skull is like a wedge, and its nose is a borer fastened to the sharp end of the wedge. The nostrils are elastic and flexible tubes of cartilage, strengthened by a little

bone, and moved by special muscles. The fore-limb is enclosed in the skin of the body up to the wrist. The fore-feet are extremely broad and strong, the palm is turned outwards and backwards; the last phalanges are much longer than the others, are bifurcated, and have strong claws firmly attached to them. The wrist is composed of short and compact bones, and from its inner side there springs a long sickle-shaped bone which runs forward towards the first digit, strengthening the hand and increasing its breadth. The elbow process is long, thus giving greater leverage to the arm than usual. The bone of the upper arm is short, broad,

Fig. 2.—Shoulder Girdle and Fore-limbs of the Common Mole:

s, shoulder-blade, or scapula; c, collar-bone, or clavicle; m, manubrium; h, humerus; u, ulna; r, radius; f, falciform or sickle-shaped bone of the wrist; i to v, the digits.

flattened at both extremities, and contracted in the middle, and has upon it very prominent ridges for the attachment of the muscles moving the shoulder-joint. These ridges give it a most peculiar appearance, different from anything found among mammals. The shoulder-blade has the form of a long stout triangular rod. The breast-bone has its fore-part (manubrium) longer than the body and keeled below and expanded. The collar-bone is short, almost cuboid, and is placed at some considerable distance in front of the ribs, thus allowing the fore-limb to be brought very close to the head in burrowing. The hind-limbs are more slender, and are used only for purposes of progression. The incisor teeth are small and sharp, the upper canine is long and possesses a double fang. There are three nearly equal conical premolars and a fourth much larger: the true molars are broad, with many sharp conical projections. The dentition is represented by the formula $i. \frac{1}{2} c. \frac{1}{2} p. \frac{1}{2} m. \frac{1}{2} = 44$. The senses of hearing, taste, and smell are very strongly developed. The eye is extremely small, with a nearly globular lens and a minute optic nerve, and is at least sensitive to light. The mole is an exceedingly voracious animal; his appetite is a sort of frenzy—a 'rage of hunger.' Vegetable substances form no part of his diet. Earthworms, the larvæ of various insects, mice, small birds, lizards, frogs, even weaker individuals of his own species, all fall victims to his ravages. His practice is to throw himself, in a state of violent excitement as if maddened with rage, on his prey, and immediately, if it is a bird or a quadruped he has captured, to tear open its abdomen and satiate himself with blood. His favourite food is earthworms, and in quest of them, and guided chiefly by the sense of smell, he works his way underground, throwing up the earth in mole-hills; more rarely in fine summer nights he seeks for them on the surface of the ground, where he is himself in turn likely to be

picked up by some hungry owl. The mole's digestion is very rapid; after a feast he falls into a profound sleep, but from this he soon wakes prepared for another raid. If deprived of food for even a short time he perishes. His thirst, too, is very great, and where there is a colony of moles it is said that a run is always made towards the nearest ditch or pond, and also that where water cannot be conveniently reached deep perpendicular shafts are sunk into the ground, at the bottom of which water is always found.

The habitation of the mole is a very remarkable structure. Each mole has his own encampment, but sometimes two or three moles may be sufficiently sociable to share a common passage. It consists of a hillock of earth larger than an ordinary mole-hill, and containing two circular galleries, one above the other, with five connecting passages, and a

Fig. 3.

a, section of the habitation of the mole; b, plan of ditto.

central chamber which has access to the upper gallery by three passages; whilst about nine passages lead away from the lower gallery in different directions. The end of a passage entering a gallery on one side is usually not opposite to the end of a passage entering on the other. To afford all facility of escape in case of any alarm, a passage leads at first downwards from the central chamber, and then upwards till it joins one of the high roads, kept open for access to the moles' hunting-grounds or for escape in time of danger. Moles pair early in spring. As the males exceed the females in number there is often a search for the females and a fierce struggle for possession of them. The shallow tracks running in all directions which are made by the mole when in search of a partner are called by French naturalists *traces d'amour*. The nest in which the female mole produces her young is not the encampment that has been described, but is a chamber lined with dried grass, leaves, and fine roots, formed generally under a mole-hill rather larger than usual at the point of meeting of two or three ordinary passages, at some distance from the fortress. Only a single litter is produced in the year, consisting of four or five young, rarely more. The attachment of the parent moles to their young and also to each other seems to be very strong.

Of all British mammals moles are the most constantly and determinedly persecuted. They are regarded by farmers and gardeners as a pest owing to the injury done to lawns and pastures by their burrows, and to young plants in their search for grubs; and mole-catching has long been practised in Britain as an extensive trade. Capture is effected by inserting traps of various kinds in the runs made by the moles, which catch them as they pass. It is a question, however, whether moles do not fully compensate for the injury they do by destroying many insects and other noxious animals.

Another species of mole (*T. caeca*) is found in the most southern parts of Europe, very similar to the common mole, but rather smaller, and having its eyes covered by a membrane which is pierced only by a minute hole, so that it justifies Aristotle's assertion that the mole is blind. Among the other Talpidae are the Cape Golden Mole (*Chrysochloris capensis*), which exhibits splendid metallic reflec-

tions, and is remarkable in not having the clavicle short and the manubrium of the sternum expanded and keeled, but in having the chest-wall hollowed out for the lodgment of the forelimb; the Shrew Mole (*Scalops*), a genus to which the most common American moles belong, so called from its resemblance in den-

Fig. 4.

a, side, and b, front view, of the nose of the Star-nosed Mole, natural size.

tion to the shrews; and the Star-nosed Mole (*Condylura*), also American, and found from Canada to Florida, having the end of the nose surrounded by about twenty fleshy radiating filaments, which are movable, and serve as organs of touch.

The name mole is abbreviated from the old English name *Mouldwarp* or *Mouldiwarp*, still provincially used, which is derived from the Anglo-Saxon *molde*, 'mould,' and *weorpan*, 'to throw up.' Cf. Ger. *Maulwurf*. For moles on the person, see *NÆVUS*; for masonry moles, see *BREAKWATER*.

Molé, MATTHIEU LOUIS, COMTE, a statesman, descendant of Matthieu Molé (1584-1656), the mediator between the king of France and the parlement of Paris during the troubles of the Fronde, and son of Edouard Molé, president of the parlement in 1788, was born at Paris, 24th January 1781. As soon as the storms of the Revolution were assuaged, Molé returned to France, and made his début in public life with *Essai de Morale et de Politique*, in which he vindicated the government of Napoleon on the ground of necessity. The emperor appointed him Master of Requests, and eventually raised him (1813) to the dignity of a count, and to a place in the cabinet. Louis XVIII. made him a peer in 1815, and in the same year he was appointed minister of Marine. After Louis-Philippe ascended the throne he became minister of Foreign Affairs, but at the end of a few months gave place to the Duc de Broglie. In 1836 he succeeded Thiers as prime-minister; his ministry was unpopular, and in 1839 he appealed to the electors, but unsuccessfully. Henceforward he took little part in political affairs, except that after the revolution of 1848 he exerted himself, though in vain, to rally and unite the party of order in the Assembly, to which he had been elected. He died at Champlâtreux, 23d November 1855.

Mole-cricket. See **CRICKET**.

Molecule. The smallest mass of any substance which can exist in the free state without modification, through subdivision, of its chemical constitution or of its physical properties. Molecules are held to be of definite size and mass; and any piece of apparently homogeneous matter is held to be made up of molecules or granules which conjointly make up the aggregate mass. That matter, apparently homogeneous, is really granular in this sense, appears firstly from the following physical considerations: (1) Compressibility and porosity show that matter does not fill space; (2) dispersion of light by the prism would be impossible if the glass were homogeneous; (3) chemical combination is attended with the absorption or evolution of limited amounts of heat; (4) soap films require energy to stretch them, and if they could be attenuated beyond a certain limit the energy applied in stretching them would be more than sufficient to volatilise them; (5) the kinetic theory of gases, when numerically worked out, shows the number of molecules in a given space to be limited (see **MATTER**). These considerations lead to the conclusion that it is impos-

sible to have a sheet of matter thinner than from $\frac{1}{1000000}$ cm. to $\frac{1}{10000000}$ cm. thick; and that a figure of this order represents the diameter of the space occupied by one molecule. From the chemical point of view, the laws of definite proportion and of multiple proportion find their best explanation in the atomic theory; but the chemical atom, which is active, is not the same thing as the physical molecule, which is chemically somewhat inert; as we see, for example, in the contrast afforded by the mutual combination of oxygen and hydrogen when in the nascent state, or when exposed to high temperature, and their want of combination when simply mixed as free gases at ordinary temperatures.

The kinetic theory of gases—that gases consist of molecules in a continual condition of mutual collision and rebound—leads to the theorem (Avogadro's Law) that all gases contain within the same volume, under equal conditions of temperature and pressure, the same number of molecules; and if we assume each molecule to be made up of the masses of a group of chemical atoms sufficient to make up the smallest possible free mass of the chemical substance, then this law is in perfect accord with the observations of Dulong and Petit on the relative densities of gases, which are proportional to the weights of the molecules, as derived from the known atomic weights or combining masses of the elements (see CHEMISTRY).

For this reason it has been usual to ascertain the molecular weight of substances by observation of their gas or vapour density, the molecular weight of hydrogen being reckoned as 2, or that of oxygen as 32. Thus, hydrochloric acid gas, which is 18.25 times as heavy as hydrogen gas, has a molecular weight 36.5, which is equal to the sum of the atomic weights of chlorine (= 35.5) and of hydrogen (= 1). Hydrogen itself has a molecular weight = 2, not = 1, because its molecule is held to be made up of two atoms, each of which has an atomic weight equal to unity; and so with other elementary gaseous or volatile substances. There are abnormalities, however; sulphur vapour has so great a density as to show its molecule to consist, below a red heat, of six atoms, while at higher temperatures it consists of two; iodine vapour at lower temperatures has two, at higher one atom in the molecule; mercury, cadmium, zinc, potassium, and sodium molecules contain one atom each; chlorine and bromine molecules partially break up into single atoms when heated. The molecules of liquids are probably compound; those of solids are almost certainly so, as allotropic modifications and variations in crystalline form show, though the vapours, produced from these various forms, if the solids be volatile, are identical. Other and more convenient means of measuring molecular weights have recently become known. These are—(1) a solid dissolved in a liquid lowers the vapour pressure (or 'vapour tension') of that liquid by an amount which bears to the original vapour pressure at the particular temperature of experiment the same ratio as the number of molecules of the dissolved substance does to the total number of molecules in the solution (Raoult); (2) the freezing-point of a solution is lowered in a similar ratio (Raoult); (3) osmotic pressure (see OSMOSE) is the same as that which would be exercised by the substance dissolved if it were transformed into a 'gas' and made to occupy alone the space occupied by the solution (Van t'Hoff); whence the specific gravity of the 'gas' can be ascertained and the molecular weight of the dissolved substance computed. In all these cases there are abnormalities observed, which are due to dissociation or breaking up of the molecules; these are specially observed in the case of salts and other

electrolytic substances. A solution of common salt, NaCl, for example, contains (Arrhenius) very little combined chloride of sodium, the particles of which have split up into monatomic sub-molecules of sodium and chlorine, heavily charged with opposite electricities; and the electrolytic conductivities afford additional means of measuring the proportion of the salt which has thus dissociated. Those acids which thus dissociate most into active sub-molecules are the most active. Heat has also a powerful action in breaking up molecules, and causing either dissociation, as in the case of acetic acid, whose molecules are complex until its vapour is strongly heated; or chemical decomposition, as in many well known reactions. Those compounds whose formation is attended with the evolution of heat have molecules which are generally most stable at low temperatures; those which absorb heat during their formation are, as a rule, most stable at high temperatures. When a substance is heated, the energy imparted to the molecules is not only spent in giving them motion relatively to one another, but also, and in many instances to a still greater extent, in giving the molecules themselves movements of elastic vibration and of rotation; and this disturbed condition affects the stability of the molecule. How the molecules are built up from their constituent molecules in each particular substance and its isomers is a matter now being diligently investigated; the graphic formulæ to be found in all the text-books of chemistry, and which have been of enormous utility in the systematisation and discovery of organic compounds, are beginning to give place to 'stereochemical' formulæ, in which the attempt is made to represent the tridimensional relations of the atoms within the molecule. The forces between molecules vary with their mutual proximity (see MATTER); and many of the observed anomalies in the obedience of Gases (q.v.) to Boyle's Law under varying pressures and temperatures can be reduced to order by taking instead of v , the whole volume occupied by the gas, a term $v - b$, the free space within that volume unoccupied by the molecules of the gas; and instead of p , the external pressure, a term $p + \frac{a}{v^2}$, where $\frac{a}{v^2}$ represents a force of mutual attraction of the molecules. See Ostwald's *General Chemistry* (1890).

Mole-rat (*Spalax*), a genus of rodent quadrupeds of the family Muridæ, having teeth almost like those of rats, but in many respects resembling moles, as in general form, shortness of limbs, concealment of ears, smallness or even rudimentary condition of eyes, and burrowing habits—although their food is altogether different, consisting wholly of vegetable substances, and chiefly of roots. The mole-rats are almost confined to the African continent and to the oriental region; a few species occur in south-east Russia, Greece, and Hungary. *Bathyergus maritimus* of the Cape is a large species which inhabits the sand-dunes of the coast.

Moleschott, JAKOB, physiologist, born at Boisdue in Holland, 9th August 1822, studied medicine at Heidelberg, and taught there physiology, anatomy, and anthropology from 1847 until 1854, when he resigned his chair, the senate of the university having 'warned' him on account of the strong materialistic tendency of his writings. In 1853 he established a private laboratory and worked in it until 1856, when he was nominated professor of Physiology at Zurich; in 1861 he moved to the university of Turin, and in 1878 to that of Rome. He has written *Untersuchungen zur Naturlehre des Menschen und der Tiere* (1856 et seq.), *Licht und Leben* (3d ed. 1879), *Kleine Schriften* (2 vols. 1880-87), and other works.

Moleskin. See FUSTIAN.

Molesworth, MRS (Mary Louisa Stewart), novelist and popular writer for the young, was born of Scotch parentage at Rotterdam, and her childhood was passed in Manchester and Scotland, and partly in Switzerland. She has since lived a good deal abroad. She began to write when very young, and her first attempts were published when she was only sixteen. She was most carefully educated under the superintendence of a very cultivated and accomplished mother, and she owed much to the instruction and direction of the Rev. William Gaskell, husband of the novelist, himself a perfect master of literary style. Her first complete works were written under the *nom de plume* of Ennis Graham, when she was about twenty-four. These were novels entitled *Lover and Husband*, *She was Young and He was Old*, *Not without Thorns*, *Cicely*, and several years later *Hathercourt Rectory* and *Miss Bouverie*. When she was about thirty she began to write for children and was at once successful, and has since held foremost rank in this department. Her children are invariably natural and childlike, they think, speak, and act like real children, and she has command of an easy and graceful flow of language, which carries the reader pleasantly onward. Her children's stories, which now number more than two dozen volumes, include *Tell Me a Story* (1875), *Carrots* (1876), *Tapestry Room* (1879), *Herr Baby* (1881), *Rectory Children* (1890), *The Green Casket* (1890), *Children of the Castle* (1890). She has also contributed largely to the better class juvenile magazines.

Molesworth, SIR WILLIAM, the 'liberator and regenerator of Britain's colonial empire,' was born in London, 23d May 1810, of an old Cornish family, the Molesworths of Pencarrow, near Bodmin. He succeeded as eighth baronet in 1823; studied at Cambridge, at Edinburgh, and in Germany; made the tour of Europe; and sat in parliament for East Cornwall 1832-37, for Leeds 1837-41, and for Southwark from 1845 till his death on 22d October 1855, having accepted office in 1853 as First Commissioner of Public Works under the Earl of Aberdeen, and in 1855 as Colonial Secretary under Palmerston. He was the intimate friend of Bentham and James Mill, and was regarded as the parliamentary representative of the 'philosophical Radicals,' whose organ, the *Westminster Review*, he purchased in 1836, and merged with it the *London Review*, started a year before by him and Roebuck. A great admirer of Hobbes, he edited his complete works (16 vols. 1839-45) at a cost of £6000; but he will chiefly be remembered as having drawn attention to the abuses connected with the transportation of criminals, and as having pointed out the maladministration of the colonial office, investigated the natural relations between the imperial government and the colonial dependencies, and expounded the true principles of colonial self-government.

Molfetta, a seaport and cathedral city of Southern Italy, on the Adriatic, 16 miles by rail NW. of Bari. Pop. 29,897.

Molière (JEAN BAPTISTE POQUELIN, who took this stage-name for reasons not apparent, and every point in whose imperfectly known life has been the subject of elaborate disquisition) was born at Paris, probably in the Rue St Honoré, and early in the year 1622. The house is not certain, and the exact date is unknown, though it appears to have been about the middle of January. His father was Jean Poquelin, his mother Marie Cressé, and the family came from Beauvais, there being no proofs of the Scotch origin which used to be asserted. Poquelin, the father, was a substantial tradesman and *valet tapissier de chambre du roi*, an office combining the

arrangement with the supply of furniture. The son was well educated, though the precise details of his education are very uncertain. He is supposed to have studied under the Jesuits at the Collège de Clermont, under Gassendi the philosopher, and under the regular teachers of law. He may have been called to the bar. His mother, who had some property, died when he was ten years old, and thus when he came of age he received his share of her fortune at once, becoming his own master. He declined to follow up his father's business (though it is said that he had already as his representative attended Louis XIII. on a royal progress as *valet tapissier*), hired a tennis-court, and embarked in theatrical affairs with the Béjart family and others, under the style and title of *L'Illustre Théâtre* (1643-46). This first venture lasted for over three years in Paris and failed. The company then proceeded to the provinces and had a sufficient amount of success to keep it going for twelve years, from 1646 to 1658, and to enable its manager to return triumphantly to the capital at the end of that time.

All the pains which have been spent on Molière's history have failed to elaborate any connected or detailed history of these long *Wanderjahre*. We hear most of the troupe at Lyons and in Languedoc; but its range must have been considerable, since it journeyed as far northwards as Rouen. The Prince de Conti (said to have been Molière's school-fellow) took it under his protection for a time, and Pézenas, near his Languedocian seat of La Grange, is one of the fixed points of Molière's biography. When, Conti having taken to Catholic Methodism, his protection failed, Molière succeeded in obtaining that of the king's brother, Philippe d'Orleans, so that his troupe became the servants of Monsieur. He was now in haste to return to Paris, where he at once received marks of royal favour, played before the king on October 24, 1658, and organised, first in the Petit Bourbon, then, on its demolition, in the Palais Royal, a regular theatre in competition with, if not in opposition to, those of the Hôtel de Bourgogne and the Marais.

During his sojourn in the provinces Molière had acquired considerable experience as a comic writer. Most of his work had been in a style not far removed from that of the old farces, and of this we have only two relics in *La Jalouse du Barbouillé* and *Le Médecin Volant*. But he had also written *L'Étourdi* and the *Dépit Amoureux*, and it is more than probable that some of his still greater work was at least on the stocks before his return to Paris. As a theatre manager he had to give tragedy as well as comedy: he is said to have been mistaken as to his own powers of tragic acting, and he had to depend for his tragedies on others. Corneille's *Nicomède*, with which he opened, was not a success; and though the other great tragedian of the day, Racine, was a personal friend of Molière's, their connection as manager and author was, not at all by Molière's fault, brief and unfortunate. But he did not tarry long before showing the immense resources which he possessed in his own talent as a comic writer. *Les Précieuses Ridicules*, the first essay of 'la bonne comédie,' as a famous story has it, dates, as far as publication is concerned, from November 1659; and from that time to his death on February 17, 1673, no year passed without one, and few years without more than one, of the greatest achievements in their own particular line that the world has seen. Except in one respect, the history of Molière during these fourteen busy years is the history of his work as an author, an actor, and a manager. But the one exception is the most important incident of his life. In the spring of 1662 (perhaps on

St Valentine's day, perhaps earlier or later, for the exact date, like almost everything else in this history, is disputed) Molière married Armande Claire Elisabeth Gréssinde Béjart, an actress in his own company, probably about nineteen years old, and the youngest member of the above-mentioned family of Béjart, whereof two other sisters, Madeleine and Geneviève, and one brother, Joseph, had been members of the *Illustre Théâtre*. On this marriage scandal, both at the time and since, has exhausted itself. It was and still is, in the teeth not indeed of positive evidence, but of something nearly approaching thereto, maintained that Madeleine Béjart and Molière were not only comrades but lovers, that Armande was not Madeleine's sister but her daughter, even that Molière himself (this crowning calumny was, it seems, started by the jealousy of Montfleury, a rival actor and playwright) was the father of his wife. Not content with this imputation, later scandal asserted that Madame, or, as the time called her, Mademoiselle Molière, was unfaithful to her husband, and contemporary satire asserted that he was at any rate very jealous of her. Of this last there is, both from internal and external evidence, too much probability; of the graver charge there is in the other case no evidence, while such evidence as there is is against it. It may be said before going further that Molière was during his whole life at Paris the butt of vehement animosities, professional and other; that before his death (1670) a sort of play, *Élomire Hypochondre* (Élomire = Molière), appeared, written by a certain Le Boulanger de Chalussay, with intent to take revenge for Molière's jests on doctors, which contains much spiteful tittle-tattle; and that long afterwards, in 1688, a venomous libel on his widow, entitled *La Fameuse Comédienne*, threw some mud at him in order to throw more on her. A kind of Molière-legend also sprang up, composed of stories such as the famous but apparently impossible tale of the *en-cas de nuit* or cold collation which Louis XV. shared with Molière in order to overcome the prejudice of his aristocratic *valets de chambre*, that of the old woman to whom he is supposed to have read his plays, that (better grounded than the others) of the marquis who, angry at the actor's satire, rubbed Molière's head against the sharp buttons of his own coat in a feigned embrace, and so forth. Such authentic documents as we have show us a man well-to-do, though not above his work, well thought of by good judges, and living well. In August 1665 the king adopted Molière's troupe as his own servants. In 1667 symptoms of lung disease showed themselves in him, but were for the time checked. On the 17th February 1672 Madeleine Béjart, his comrade of thirty years, if nothing more, died. On the same day next year, after the seventh representation of his last play (see below), Molière died in his own house in the Rue de Richelieu of hæmorrhage from the bursting of a blood-vessel, having struggled through, as no imaginary sick man, the title-part. He was buried, despite the frowns of the church on his profession and himself, in the churchyard of St Joseph, with maimed but not inconsiderable ceremony. But the exact tomb has not been identified. In person he is said to have had a good figure, but not a handsome face. His character would appear to have been extremely generous and amiable, though he seems to have certainly suffered from jealousy, and most probably from hypochondria. Nor is there discoverable in his work, or in anything reported of him, the least excuse for the accusations of irreligion which were brought against him, partly by private malice, partly as retaliation for the terrible attack on religious hypocrisy in *Tartuffe*, and for the misunderstood irony of *Don Juan*. The first-named piece was delayed five

years before it could be completely played, and *Don Juan* was stopped and subjected to excisions. Part of Molière's ill-fame in this respect was no doubt due to his earlier associations with Gassendi and to his fondness for that teacher's favourite classic, Lucretius, whose poem Molière himself is said to have translated as a whole.

The dates and titles of Molière's plays are as follows: *L'Étourdi*, *Le Dépit Amoureux* (1658; in the provinces two years earlier); *Les Précieuses Ridicules* (1659); *Sganarelle* (1660); *Don Garcie de Navarre* (1661); *L'École des Maris*, *Les Fâcheux*, *L'École des Femmes* (1662); *La Critique de l'École des Femmes* *Impromptu de Versailles* (1663); *Le Mariage Forcé*, *La Princesse d'Élide*, *Tartuffe* (partially, 1664); *Le Festin de Pierre* [*Don Juan*], *L'Amour Médecin* (1665); *Le Misanthrope*, *Le Médecin Malgré Lui*, *Mélicerte*, *Le Sicilien* (1666); *Tartuffe* (fully, but stopped after first night, 1667); *Amphitryon*, *George Dandin*, *L'Avare* (1668); *Tartuffe* (at last fully), *Monsieur de Pourceaugnac* (1669); *Les Amants Magnifiques*, *Le Bourgeois Gentilhomme* (1671); *Les Fourberies de Scapin* (1671); *La Comtesse d'Escarbagnas*, *Les Femmes Savantes* (1672); *Le Malade Imaginaire* (1673). To this must be added part of *Psyché* (1671) in collaboration with Quinault and Corneille, the two farces above referred to (which are almost certainly his), attributed to him on the authority of J. B. Rousseau, a few arrangements of court masques, and some miscellaneous poems, the only important one being a copy of verses on Mignard's fresco-work at the church of Val de Grâce.

For posterity, however, Molière is nothing if not a comic dramatist; and the enormous majority of competent suffrages—a majority increasing as years go on—puts him at the very head of all writers of his own particular class. In France he is called a poet; but, though he could manage verse well enough when he chose to write in it, he is almost always best in prose, and his work possesses few, if any, of the more distinguishing and essential qualities of poetry. It is as a dramatist of manners—who more and more adjusted his art to the direct purpose of satirising and, if possible, reforming folly and vice, and who almost alone of all writers that have done this never sacrificed the art to the purpose—that he is absolutely unrivalled. Romantic or poetical comedy, like that of Shakespeare and Calderon, he hardly ever tried (almost the sole successful play in it being *Don Juan*), and it is not very probable that he would have frequently succeeded in it. The time made it impossible for him to be poetical like Aristophanes in subject, and his own genius did not incline him to be fancifully creative like Aristophanes in form. But in the sphere defined above he has no superior, and is very unlikely ever to have an equal. He gradually confined himself to it more and more closely, and always with the result of improvement. Nothing is more instructive than to compare *Les Précieuses Ridicules*, which is almost his first play, with *Les Femmes Savantes*, which is almost his last. They are so closely connected in subject that the later play has sometimes been called an expanded recast of the earlier. But the improvement in treatment is immense. Amusing as *Les Précieuses Ridicules* is, it is not much more than farce of the very best sort. *Les Femmes Savantes* is comedy of the highest kind, the result of exact observation of life informed by intimate knowledge of character, and clothed with the most accomplished phrase. Molière has sometimes been reproached with a leaning towards farce up to the last—exemplified not merely in such avowedly lighter plays as *Le Bourgeois Gentilhomme*, and the two satires on the provincial gentry, *Monsieur de Pourceaugnac* and *La Comtesse d'Escarbagnas*, but

in passages of his more serious pieces. The objection shows a wholly erroneous conception of comedy itself, and may be said to argue deficiency of humour in one direction. But the merely farcical side predominates, as undoubtedly as naturally in the earlier plays, the serious in the later. It is not till *L'École des Femmes*, perhaps not till *Le Misanthrope*, that the full genius of the author appears; and these two, with *Tartuffe*, *Le Festin de Pierre*, *Les Femmes Savantes*, *Le Malade Imaginaire*, and perhaps the admirable *Bourgeois Gentilhomme* as an example of the lower kind, may be said to be Molière's masterpieces. But from the *Dépit Amoureux* onward no play of his, not even the slightest, is without touches of his admirable wit, his astonishing observation, his supreme power over his own language, his masterly satire. It can hardly be said that any class of men or any prominent trait of mankind is spared by this satire, but undoubtedly three subjects—the vanity and levity of women, the frivolity of the nobles, and the pedantic professionalism of the learned classes, especially of medical men, have the largest share of Molière's lash. He has been accused of taking too low a view of human nature, but this again seems to come from a mistake in appreciating the conditions of his work. He also was and is accused of plagiarism; and it is quite true that in his early pieces especially he avails himself of existing canvas for his own embroidery freely. The best defence of the practice is the boldest: that any man who can embroider like Molière does only too well to requisition canvas where and to what extent he likes. Of another, a subtler, and a less easily refuted observation—that, admirable as his criticism of humanity in general is, his characters tend too much to types, and are lacking in the individuality which Dante and Shakespeare give—we have no room to speak fully. Indeed, much more space than can be here afforded would be insufficient to discuss even most briefly the various aspects of his genius. We must content ourselves with saying that of all French writers he is that one whose reputation stands highest by the combined suffrage of his own countrymen and of foreigners, that at his best he keeps the stage with perfect ease and success after two hundred years, and that he is almost everywhere delightful in the study for his wonderful truth to nature and his not less wonderful expertness in art.

As hinted above, the bibliography of Molière is very voluminous. The first complete edition of his work was edited in 1682 by his friends and comrades, La Grange and Vinot. The last, and by far the best, complete as to text, but still wanting life, lexicon, &c., is that of Despois and Mesnard in the series of *Les Grands Écrivains Français* (9 vols. 1873-86). The bulk of recent work on Molière (for ten years there has existed a special periodical called the *Moliériste*) has not been fully digested into any life. That of Taschereau, though old, is perhaps still the best, but the completest is the German Life of Mahrenholtz (Heilbronn, 1881). M. Loiseau's *Points Obscurs de la Vie de Molière* has been a great centre of discussion, and an excellent collection of studies will be found in M. Larroumet's *La Comédie de Molière*. The Life to be prefixed to the above-named *Grands Écrivains* edition will probably be a complete digest of the whole subject; as to which it is improbable that any new facts will now be found, every source having long since been ransacked. There are excellent editions by Anatole France in the 'Collection Lemerre' (7 vols. 1876-91), with notes by G. Monval in the 'Bibliothèque des Bibliophiles' (8 vols. 1882). There is a special *Bibliographie Moliéresque* (1875); and there are translations by Van Laun (1875-77) and Heron Wall (1876-77).

Molina, LUIS, a celebrated Spanish Jesuit theologian, was born at Cuenca, in New Castile, in the year 1535, and, having entered the Jesuit Society in his eighteenth year, studied at Coimbra,

and was appointed professor of Theology at Evora, where he continued to teach for twenty years. He died at Madrid, 12th October 1600. Molina's celebrity is mainly confined to the theological schools. His principal writings are a commentary on the *Summa* of St Thomas Aquinas (1593); a minute and comprehensive treatise, *De Justitia et Jure* (1592); and the celebrated treatise on the reconciliation of grace and free-will (*Liberi Arbitrii cum Gratiae Donis . . . Concordia*), which was printed at Lisbon in 1588, with an appendix, printed in the following year. The problem which the latter work is meant to resolve is almost as old as the origin of human thought itself, and had already led, in the 4th century, to the well-known Pelagian controversy (see PELAGIUS). In reconciling with the freedom of man's will the predestination of the elect to happiness, and of the reprobate to punishment, Molina asserts that the predestination is consequent on God's foreknowledge of the free determination of man's will, and, therefore, that it in no way affects the freedom of the particular actions, in requital of which man is predestined whether to punishment or to reward. God, in Molina's view, gives to all men sufficient grace whereby to live virtuously, and merit happiness. Certain individuals freely co-operate with this grace; certain others resist it. God foresees both courses, and this foreknowledge is the foundation of one or the other decree. This exposition was at once assailed in the schools on two grounds—first as a revival of the Pelagian heresy, inasmuch as it appears to place the efficacy of grace in the consent of man's will; second, as setting aside altogether what the Scriptures represent as the special election of the predestined. Hence arose the celebrated dispute between the Molinists and the Thomists—both of whom, however, maintained that, in all circumstances, the will remains free, although they may fail to explain how this freedom is secured under the action of efficacious grace. It was first brought under the cognisance of the Inquisitor-general of Spain, by whom it was referred to Pope Clement VIII. This pontiff, in 1598, appointed the celebrated congregation De Auxiliis to consider the entire question; but, notwithstanding many lengthened discussions, no decision was arrived at during the lifetime of Clement; and although the congregation was continued under Paul V., the only result was a decree in 1607, permitting both opinions to be taught by their respective advocates, and prohibiting each party from accusing the adversaries of heresy. The dispute, in some of its leading features, was revived in the Jansenist (q.v.) controversy. Molinism has been commonly taught in the Jesuit schools. See AQUINAS, SUAREZ.

Molina, TIRSO DE. See TELLEZ.

Moline, a city of Illinois, on the Mississippi, 179 miles by rail W. by S. of Chicago, and separated from Rock Island only by a swift and narrow channel affording great water-power, which is utilised by means of a dam. There are many busy mills and factories here. Pop. (1890) 11,995.

Molinos, MIGUEL DE, was born of noble parentage at Patadina, near Saragossa, December 21, 1640. He received holy orders and was educated at Pampeluna, and afterwards at Coimbra. At Rome he soon acquired a high reputation as a director of conscience and a master of the spiritual life. An ascetical treatise which he published, under the title of *Guida Spirituale*, added largely to the popularity which he had acquired in his personal relations; but there were not wanting many who, in the specious but visionary principles of this work, discovered the seeds of a dangerous and seductive error. Among these the celebrated

Jesuit preacher Segneri was the first who ventured publicly to call them into question. By degrees reports unfavourable to the practical results of this teaching, and even to the personal conduct and character of Molinos, or of his followers, began to find circulation; and eventually, in the year 1685, he was cited before the Holy Office, and submitted to close imprisonment and examination. In addition to the opinions contained in his book, a prodigious mass of papers and letters, to the number, it is said, of 20,000, found in his house, were produced against him, and he was himself rigorously examined as to his opinions. The result of the trial was a solemn condemnation of sixty-eight propositions, partly extracted or inferred from his *Spiritual Guide*, partly, it would appear, drawn from his papers or his personal professions. These doctrines Molinos was required publicly to abjure, and he was himself sentenced to close imprisonment, in which he was detained until his death, 28th December 1697. The opinions imputed to Molinos may be described as an exaggeration of the principles of Quietism (q.v.)—the utter indifference of the soul, in a state of perfect contemplation, to all external things. See John Bigelow's *Molinos the Quietist* (New York, 1882); J. H. Shorthouse, *Golden Thoughts from the Spiritual Guide* (1884).

Mollise. See CAMPOBASSO.

Mollah, among the Turks, is the title of a superior judge. The mollah is an expounder of civil and criminal law, and of the religion of the state; he is therefore necessarily both a lawyer and an ecclesiastic. Under him is the *cadi* or judge, who administers the law.

Mollendo, a port of Peru, lying SW. from Lake Titicaca. It has railway connection with Puno (107 miles), and thence to Arequipa (218 miles), and enjoys considerable trade; but there is no other inducement to reside there, and the population is only 1500.

Mollusca, a large division of invertebrate animals, including three chief classes: bivalves or Lamellibranchs, 'snails' or Gasteropods, and cuttle-fish or Cephalopods. As these are separately discussed, it will be enough to state the general characters and classification of the series.

General Characters.—Though most cuttle-fish and not a few gasteropods are free swimmers, the average habit of molluscs tends markedly to sluggishness, and with this the calcareous shell of the great majority may be naturally associated. Most of the genera are marine, but there are many fresh-water forms (probably originating 'from the conversion of shallow continental seas into lakes'), while the species of terrestrial snails and slugs are legion. As to diet, the sluggish bivalves feed on microscopic animals and organic debris wafted to the mouth by the gills; the gasteropods are divided into carnivores and vegetarians, omnivorous gluttons and dainty epicures; and the cephalopods are voracious flesh-eaters. In this connection the absence of a rasping tongue in the bivalves, and its presence in all the others should be noticed.

One of the most conspicuous structural characters is the absence of the segmentation and the serial appendages which characterise the arthropods and higher 'worms.' The typical mollusc is bilaterally symmetrical, as may be seen in bivalves and in those gasteropods of which Chiton (q.v.) is a representative, but in the majority of gasteropods the body is markedly lop-sided. This condition is referred by Lankester to the exaggerated vertical growth of the viscera into a dorsal hump surmounted by a shell, which in creeping animals will tend to fall to one side, and thus produce torsion. With the skin, which is soft and

glandular, and often ciliated, two very characteristic structures are connected on the dorsal surface, the one a small pit constant in the embryo—the primitive shell-sac or shell-gland; the other a fold of skin overlapping the sides and forming the 'mantle.' From the latter a very varied permanent shell is usually formed as a cuticular product composed of carbonate of lime and an organic basis. Its thickness seems often to bear some relation to the external and internal activities of the mollusc, for it is thin in the active scallop (*Pecten*) and Lima, thick in the passive oyster and Tridacna, slight or absent in the pelagic Pteropods (sea-butterflies) and in the active Cephalopods, but heavy in most of the slowly creeping littoral forms. But that this is only one condition of shell-development is evident in many ways—for instance, when we compare land-snails with slugs; for the latter, though hardly less sluggish than the former, are practically shell-less. Another very distinctive structure is the molluscan 'foot,' a muscular protrusion of the ventral surface, usually locomotor in its function, but turned to various uses, and degenerate in the most sedentary bivalves, especially in the oyster.

As to the less obvious general characters, the nervous system consists typically of a pair of cerebral ganglia, connected to a pair of pedals and to a pair of pleurals, the latter associated with a visceral nerve-loop which may also be ganglionated. In the cephalopods, and in most gasteropods, the three chief pairs of nerve-centres are closely united in the head, but in the symmetrical chitons a much more primitive, and in the bivalves a much less concentrated arrangement obtains. The sense-organs vary greatly, but there may be tentacles like the snail's 'horns,' head-eyes like those so well developed in most cuttle-fish, while a pair of ear-sacs or otocysts in the front of the foot and a smelling-patch or osphradium at the base of the gills are all but constant. On the edge of the mantle of many bivalves, or penetrating the shell-plates in Chiton, there is quite a plethora of eyes, some of which are imperfectly visual and possibly light-absorbing in function. The food-canal includes in the mouth-region a toothed ribbon, absent in bivalves, and bears further back a digestive gland often of large size. The long coils of the gut are depressed ventrally into the foot of bivalves, and are protruded as if in a hernia on the dorsal surface of most gasteropods. The heart, absent only in Dentalium and related genera, lies dorsally in a special portion of the body-cavity known as the pericardium, and drives colourless blood through the body, thence into the gills and kidneys, whence it returns purified. The gills are vascular outgrowths of the body-wall, usually sheltered by the mantle, which in the terrestrial forms like the snail makes a lung-like chamber. A paired or single kidney connects the pericardium with the exterior. The reproductive organs—unisexual or hermaphrodite—vary extremely, from great simplicity in most bivalves to an extraordinary degree of complexity in many gasteropods, such as the snail.

In their *life-history* most molluscs pass through two larval stages. The first is a somewhat barrel-shaped form, with a ring of cilia in front of the mouth; it is known as a trochosphere, and is quite like the young stage of many 'worms.' This passes, however, into another more characteristic phase called the Veliger, which bears on its head a ciliated area or locomotor 'velum' often produced into lobes, has its body already characterised by a visceral hump and a ventral foot, and possesses on its dorsal surface the little shell-gland already mentioned. In the cephalopods, whose ova are rich in yolk, the trochosphere and veliger stages are skipped over, and there are also notable

modifications in the development of terrestrial and fresh-water molluscs.

Classification.—Branch A. Those with a well-developed head and a rasping tongue: Class I.—*Cephalopoda* (q.v.). See also CUTTLE-FISH, NAUTILUS. Class II.—*Gasteropoda*—(a) More or less unsymmetrical forms (see *GASTEROPODA*, also LIMPET, SNAIL, WHELK, &c.); (b) Symmetrical and primitive forms—e.g. *Chiton* (q.v.); (c) A distinct sub-class of pelagic forms, the *Pteropods* (q.v., sometimes called a class, or united with Class I.). Class III.—*Scaphopoda*—A few very distinct forms, of which *Dentalium* (q.v.) is the best-known representative. Branch B. Those in which the head-region is very slightly developed, and without a rasping tongue: Class IV.—*Lamellibranchiata* or *Bivalves* (q.v.). See also MUSSEL, OYSTER, &c.

History.—Provided as most molluscs are with substantial calcareous shells, their fossil remains have been to that extent very perfectly preserved, and long series have been traced out with remarkable success. Remains of the great types occur even in the Cambrian rocks, and more abundantly from the Lower Silurian onwards. The earliest *Nautilus* type of cephalopod has waned away through the ages, and only one genus (see *NAUTILUS*) now persists, while the cuttle-fish type which appeared much later is still represented by numerous species. As a whole, however, this class seems to have dwindled, for there are towards 4000 fossil species—distributed of course over many ages—as against less than 200 living forms. With the gasteropods, however, the case has been very different, for the number of genera steadily increases from the Cambrian and Silurian onwards, and of the total number of species, computed some years ago at 23,000, the extinct forms are estimated at 7000, the living forms at 16,000, which proves beyond doubt a notable increase in numbers. Nor can we deplore any modern diminution of lamellibranchs, for, although the extinct species are reckoned at about 9000 and the living at about 5000, the former were distributed over a much vaster period, while in some families the number of living species greatly exceeds that of the extinct. As one would expect, the lung-breathing gasteropods and the fresh-water lamellibranchs are both relatively late in appearing.

As to the *pedigree*, some of the characters of the chiton-like gasteropods and the general occurrence of a trochophore larva suggest the origin of molluscs from some worm-like type, but this is not saying much. Very helpful has been Professor Ray Lankester's attempted reconstruction of the ancestral or archi-mollusc, from which all the

early divided into two series, the sluggish bivalves, with many structures (e.g. the atrophied head) modified in relation to a sedentary life, and the active aggressive gasteropods and cephalopods, in which the general features of the archi-mollusc are more evidently retained.

As the economic importance of molluscs is recognised in special articles (such as those on Bivalves, Cuttle-fish, Gasteropoda, Mussel, Oyster, Snail, Whelk, &c.), we shall simply illustrate in conclusion their general zoological interest. For a long time the study of molluscs hardly penetrated beyond their shells; but, though this Conchology (q.v.) was often a collecting craze, and sometimes led to positively misleading conclusions, no one will dispute the charm of beauty and variety which these externalities possess, nor deny that their investigation rightly pursued (in relation to the tenanting animals and the surrounding conditions of life) may yield most important scientific results. It is very interesting also to consider how the limits of Mollusca have been gradually changed. As the original title, *Malakia*, means soft, it is necessary to explain that Aristotle applied it solely to the practically shell-less cuttle-fishes, while Linnæus used the Latinised term *Mollusca* also in primary reference to naked forms, along with which he included, however, hydroids, annelids, and echinoderms. The shelled molluscs which form the majority of the modern classes he separated

Fig. 2.—Earlier (A) and later (B) 'Veliger' of a Gasteropod (after Gegenbaur).
a, velum; b, foot; c, visceral dome.

off as *Testacea*. But strangely enough this last title was gradually replaced by *Mollusca*, under which Cuvier included not only cephalopods, gasteropods, pteropods, and the 'acephalous' or headless bivalves, but the lampshells or Brachiopoda, the Nuda or Ascidians, and the barnacles or Cirrhopoda. In modern times, as a reference to the articles on Brachiopoda, Ascidians, and Cirripedia will show, the researches of Vaughan Thompson, Kovalevsky, Milne-Edwards, and others have entirely freed the class of molluscs from Cuvier's last three divisions. The incomparably careful anatomical work of Lacaze-Duthiers, along with the researches of Kölliker and Gegenbaur, Huxley and Spengel, the embryological discoveries of Ray Lankester and others, and the generalisations which we owe to Huxley and Lankester are notable illustrations of recent progress in the study of molluscs. Moreover, on the problems of evolution no little light has been cast—e.g. by Würtenberger's comparison of the racial and individual development of the Ammonites, by Hyatt's monumental monograph on the evolution of fossil cephalopods, or even by the single chapter in which Hilgendorf worked out the variations of *Planorbis* in the Upper Miocene beds of Steinheim. In other directions, too, the inquiries of Dall and others into the deep-sea molluscs, the experiments by which Semper was able to impress changes upon various forms by altering their surroundings, Sollas's research on the origin of fresh-water fauna, Lang's study of the influence of sedentary life, Bateson's account of the variations of the cockle, and many other evolutionist investigations have yielded results not less valuable than those of the anatomists.

Fig. 1.—Section of Schematic Mollusc (from Lankester).

Mollwitz, a village of Prussian Silesia, 7 miles W. of Brieg. An obelisk (1878) marks the battlefield where Frederick the Great with 20,000 Prussians defeated an equal number of Austrians under Marshal Neipperg, April 10, 1741. The Austrians lost 5340 men, the Prussians 5500.

Molly. See FULMAR.

Molly Maguires, an Irish secret society which during the ten years preceding 1877 terrorised the coal regions of Pennsylvania. The name was imported from Ireland, where it had been adopted by a branch of the Ribbonmen whose outrages by night were perpetrated in female disguise (cf. Trench's *Realities of Irish Life*, p. 82). The object of the organisation in Pennsylvania appears to have been to secure for its members, as far as possible, the exclusive political power in the eastern part of the state. Murders were committed in the open day, though much more usually by night; and the terror of the society was on all the coal country until, in 1876-77, a number of the leaders were convicted and executed, mainly by the evidence of a detective named McParlan, who had acted for three years as secretary of the Shenandoah division. See works by Pinkerton (New York, 1877) and Lucy (Lond. n.d.).

Moloch, or more properly MOLECH, is mentioned in 1 Kings, xi. 7, as the 'abomination of the children of Ammon,' and occurs frequently elsewhere in the Old Testament as the name or title of a divinity occasionally worshipped in the kingdom of Judah with cruel rites. The Hebrew form of the word is invariably *Molech*, and it always (except perhaps in 1 Kings, xi. 7) has the article ('the Molech'); the occasional variant *Moloch* in the Authorised Version has come through the Septuagint and Vulgate. The word means 'king,' and is the same (*melech*) as that which appears in composite form in the names of the divinities Adrammelech and Anammelech (2 Kings, xvii. 31), in the title Melkarth (Malk-kart, Melicertes) applied to the Tyrian Baal, and in a large number of compound divine names in Semitic inscriptions; the change from *Molech* to *Moloch* is due to the later Jews, who gave the word in this connection the vowel-points of *Bosheth* ('shameful thing'; cf. Mephibaal, Mephibosheth). Of Moloch as a deity of the Ammonites nothing special is recorded, and it is not improbable that in 1 Kings, xi. 7, the only place where he is spoken of as such, the kindred word Milcom or Malcam ought to be read (see the LXX. and compare 1 Kings, xi. 5, 33; 2 Kings, xxiii. 13; Jer. xlix. 1, 3; Zeph. i. 5). In any case the worship of the Ammonite deity in the days of Solomon was essentially distinct from the Moloch worship which at a later date came to be practised in Judah, especially in times of great calamity. The first recorded instance of a worshipper of Jehovah 'making his son to pass through the fire to Moloch' is that of Ahaz (2 Kings, xvi. 3). The same story is told of Manasseh (2 Kings, xxi. 6), and that the practice had become a common one in the course of the 7th century is shown by frequent allusions in Jeremiah, Ezekiel, and the Book of Leviticus. The victims were slain at the sanctuary (Jer. xix. 4), and afterwards burned as holocausts on a 'tophet' or pyre in the valley of Hinnom (Ge-Hinnom, Gehenna) near Jerusalem (2 Kings, xxiii. 10; Jer. vii. 31, 32; xix. 6, 13, 14); the often quoted description by Rabbinical writers of a calf-headed brazen image of Moloch, in which

the children were burned alive, is mere invention. On the general question of the origin of human sacrifice, see SACRIFICE. It is probable that the ritual of Moloch worship was borrowed by the people of Judah from one or other of the surrounding nations; it was practised, we know, by the Moabites (2 Kings, iii. 27). At Jerusalem it has been held that it was intended to propitiate Jehovah, regarded as the national 'Moloch' or 'Baal' or 'King,' though the prophets speaking in Jehovah's name constantly denounced it as unsanctioned by Him (see Jer. vii. 31; xix. 5). See Baudissin's monograph, *Jahve et Moloch* (1874).

Moloch (*Moloch horridus*), an exceedingly spiny Australian lizard, covered all over with horny warts and sharp spines, which give it a quaint if

Moloch horridus.

repulsive appearance, concealing, however, an inoffensive character. It is sluggish in its movements, attains a length of 10 inches, and is found chiefly in South and West Australia.

Mologa, a town in the Russian government of Jaroslavl, near the confluence of the Mologa and Volga, 68 miles WNW. of Jaroslavl. Pop. 6361.—The river Mologa winds 337 miles south-eastward through the governments of Tver, Novgorod, and Jaroslavl, and is one of the links between the Volga and the Neva.

Molokai. See HAWAII.

Molossians, the most important people of ancient Epirus (q.v.).

Moltke, HELMUTH, COUNT VON, field-marshal of the German empire, who as chief of the general staff at Berlin planned the Prussian campaign of 1866 against Austria, and the German campaign of 1870-71 against France. He was born 26th October 1800, at Parchim in Mecklenburg-Schwerin, his father being a general in the Danish army, of a good old family and considerable wealth. In 1812 he was, with his only brother, sent to the military academy at Copenhagen, where he remained under the strictest discipline for six years, and distinguished himself in the scientific branches of military study. In 1819 he became lieutenant in a Danish regiment, but on the separation of Denmark from Norway he determined to retire from the Danish and enter the Prussian service. This change being effected, he passed the necessary examinations, and entered a Prussian regiment at Frankfurt. His parents having by this time lost the whole of their property from war and misfortune, he had to undergo many hardships in order to maintain himself on the slender pay of a Prussian officer, and at the same time obtain instruction in various foreign languages. In 1832 Moltke was appointed to the staff, and for three years he continued to develop by scientific and exact study his extraordinary powers of combination and organisation. He then obtained leave to travel, and, arriving in Turkey at a critical moment, he was

entrusted by the sultan with the task of remodeling the Turkish army, and remained with Mahmoud II. as military adviser till October 1839, when he returned to his old position at Berlin. From 1858 to 1888 he was chief of the general staff in Berlin, and he at once commenced the reorganisation of the Prussian army. He also elaborated plans for the defence of the German coasts, and the creation of a German navy. His wonderful strategical power was displayed in the wars with Denmark in 1863-64, with Austria in 1866, and with France in 1870-71, bringing them all to triumphant issues. He married in 1845 Mary Burt, the daughter of an English gentleman residing in Holstein, but had no family. His wife died in 1868. He was a man of great modesty and simplicity, and so reserved as to have gained the popular epithet of *The Silent*. His ninetieth birthday was the occasion of numerous honours at the hands of the emperor and the German people. Died 24th April 1891.

Moltke is the author of several important works, of which the first, *Letters from Turkey and the Campaign in Turkey*, were published in 1835, and the *Italian Campaign of 1859* in 1863. The *History of the German and French War of 1870-71*, published by the general staff in Berlin, was written entirely under his direction, and the greater part of it is actually from his pen. His *Letters from Russia*, written in 1856 to his wife, were published in 1877. An English version of these, by the present writer, was published in 1878 by Kegan Paul & Co., preceded by a sketch of his life. See also *Lives* by Wilhelm Müller (Eng. trans. Pinkerton, 1879), F. von Köppen (1888), and Müller-Bohn (1889).

Molucca Beans. See GULLANDINA.

Moluccas (also called **SPICE ISLANDS**), the easternmost division of the Malay Archipelago, comprising most of the islands between Celebes and New Guinea west and east, and between Timor and the Philippines south and north. Originally the term *Molucos* was applied by the Portuguese only to the small islands (Ternate, Tidore, &c.) west of Jilolo, which are now known as the *Little Moluccas*; but it was gradually extended to Jilolo itself, to Buru, Ceram, and all the spice-growing islands of the eastern seas, which, with parts of Celebes and New Guinea, now form politically the three Dutch residencies of *Ternate, Amboyna, and Banda*, and which physically fall into the two groups of the *Northern Moluccas*, disposed in the direction from north to south, and the *Southern Moluccas*, running mainly west and east. The northern group, which is surrounded on all sides by deep waters, ranging from 500 to 2000 fathoms, lies between the Molucca and Jilolo passages west and east, and comprises Morotai (Morty) and Rau (Riao) in the north, Jilolo, Ternate, Tidore, and other islets in the centre, Batchian (Batjan), Tawali, Mandioli, and Great and Little Obi (Oby) in the south, with a total area of nearly 10,000 sq. m., of which Jilolo has 7000, Morotai 1100, and Batchian 850. The population is vaguely estimated at 60,000, of which nearly half are concentrated in the small but politically important islands of Tidore and Ternate, with respective areas 35 and 25 sq. m.

The Southern Moluccas are connected by a submarine bed of less than 100 fathoms westwards with Sula and Celebes, but are separated from the northern group by an abyss of over 1500 fathoms, and are washed on the south side by the Banda Sea, which has a depth of 3000, and at one point (near the Banda volcano) of over 4000 fathoms. They comprise the two large islands of Buru (8500 sq. m.) and Ceram (7000), the small Amboyna, Uliasser, Banda, and Ceram Laut sub-groups, the outlying Ké (Kei) and Aru clusters, with some other islets scattered over the neighbouring waters, with a collective area of 16,500 sq. m., and an estimated

population of 350,000, of which 200,000 are in Ceram, 60,000 in Buru, 30,000 in Amboyna, 26,000 in Uliasser, and 6000 in Banda. Thus the Moluccas, taken in the widest sense, have a total area of over 26,000 sq. m., and a population of probably not much more than 400,000, chiefly Orang-Malayu, or civilised Malays, in the Little Moluccas, Banda, and Amboyna, elsewhere the so-called 'Alfuros'—i.e. uncivilised or non-Mohammedan natives, some Indonesians, some true Malays, some mixed Malayo-Papuans (see MALAYS).

The Moluccas lie partly on the line of the great volcanic fault, which sweeps round in a vast curve from Sumatra to the Philippines and Japan, and which in the Moluccas is indicated by the still active Gunong-Api (1870 feet) in Banda, Tidore (5730), Ternate (5650), Motir (2800), three cones in Jilolo, Tolo in Morotai. Api was the scene of a terrific eruption accompanied by earthquakes in 1825; Ternate is one of the most restless volcanoes in Malaysia; and several other cones appear to be of relatively recent date. For ages the whole region has evidently been subject to continuous convulsions, which have reduced it to its present fragmentary state. At a remote geological epoch it probably formed part of Celebes and the Philippines, a supposition by which are best explained the many features possessed in common by the natural history of these now scattered lands. The trachitic Morotai was certainly at one time connected with Jilolo, and were the connection restored the resemblance would be complete between the curiously shaped islands of Celebes and Jilolo, which have been compared to a mutilated starfish. Jilolo, also called Halmahera, or the 'Great Land,' largely consists, like Ceram and Buru, of crystalline or metamorphic and very old sedimentary (coral-line limestone) rocks, whereas Ternate, Tidore, Banda, and the smaller members of the group are partly of igneous, partly of coralline origin.

Despite their tropical position, being nearly bisected by the equator, the Moluccas enjoy a relatively healthy climate, and in some places the European race (Portuguese and Dutch) has even been acclimatised. The excessive heats are everywhere tempered by sea-breezes and by the mountainous character of the islands, which in Buru and Ceram rise to heights of 8000 and even 10,000 feet. In the Southern Moluccas the north-east trades prevail from May to October, and are accompanied by heavy rains and thunderstorms. They are followed by the west monsoon, which has already discharged most of its moisture before reaching this region. In the north the regular winds become intermingled, with the result that the seasons are here extremely variable, fine and wet weather alternating throughout the year. But the temperature oscillates everywhere within very narrow ranges, seldom rising above 85° or falling below 75° F. on the coast-lands. Rainfall, 150 inches at Amboyna.

Indigenous to most parts of this region are the clove, nutmeg, and other spices, although these plants are now cultivated only in Amboyna and the Banda group; elsewhere they were extirpated by the Dutch government with the view of increasing the value of the Banda plantations, and preserving the monopoly of the spice trade. Other valuable plants are the sago-palm, which supplies the staple food of the Moluccas; the pandanus, remarkable for its aerial roots, the kanary nut, dammar pine, and Cajeput (q.v.).

In its fauna the Molucca group is connected with Celebes by the babiroussa hog found in Buru, and with New Guinea by the bird of paradise (Batchian), the marsupial cuscus and flying opossum occurring in several islands. Here are also found the cassowary, the Australasian megapodius, or mound-building bird, the crimson lory, the racket-

tailed kingfisher, and numerous species of parrots and pigeons noted for their gorgeous plumage. Insects, such as the long-armed beetle of Amboyna and several butterflies, here attain their largest size and display their brightest colours. The shallow waters, especially of the southern group, are also noted for the vivid hues of the anemones, sponges, shells, and corals covering the bed of the sea, and for the immense number of their fishes.

Notwithstanding their small size, Ternate and Tidore have always been the chief centres of political power in the northern, and Amboyna in the southern Moluccas. These islands have long been occupied by civilised Malays, who easily asserted their supremacy over the surrounding lands, which are inhabited chiefly by rude wild tribes at a low stage of culture. Formerly the Mohammedan sultans of Tidore and Ternate were amongst the most powerful rulers in Malaysia, their dominions stretching westwards to Celebes and eastwards to New Guinea, and comprising all the intermediate islands. It was as heirs to these potentates that the Dutch claimed all the western part of New Guinea, as far as the 141st meridian. For the same reason the present Dutch residency of Ternate includes that part of East Celebes which is watered by the Gulf of Tomini, together with the adjacent islands. In Ternate is still centred most of the trade of the northern Moluccas, which export spices, tortoiseshell, trepang, beeswax, bark, and birds of paradise in considerable quantities. The residency of Amboyna, one of the oldest Dutch settlements in the East, comprises the whole of Buru, the western half of Ceram, and all the neighbouring islets. The town of Amboyna, capital of all the Dutch possessions in the Moluccas, carries on a flourishing export trade in cloves, of which half a million pounds have been raised in favourable years in the famous clove-gardens belonging to the government. Banda, the third Dutch residency, comprises, besides the Banda group (Great Banda, Api, Neira, and Pisang), a large part of Ceram, the Ké and Aru groups, Timor Lant, and the Serwati Archipelago. Banda is the true home of the nutmeg, which here grows naturally, and arrives at the greatest perfection on the slopes of all the volcanic islands, which are disposed round an inner basin like the fragments of some disrupted crater. Neira or Banda, called also Nassau, seat of the residency, occupies the southern extremity of Neira Island on the north side of the basin over against Gunung-Api. Besides the nutmeg and mace, Banda yields sago and cocoa-nuts for the export trade, which has long been monopolised by the so-called 'Perkeniers, descendants of Europeans settled in this group since the beginning of the 17th century, and now perfectly acclimatised.

Molybdenum (sym. Mo; atomic weight, 96; sp. gr. 8.62) is a rare metal, which, in a state of purity, is of a silvery white colour, has a strongly metallic lustre, is brittle, and very difficult of fusion. It never occurs native, and its principal ore is the bisulphide, which much resembles graphite. It is also occasionally found oxidised, in molybdate of lead. The metal may be obtained by roasting the bisulphide in a free current of air, when the sulphur goes off oxidised as sulphurous acid, and the molybdenum is also oxidised into molybdic Acid (MoO_3), and remains in the vessel. By the action of charcoal, the reduced metal is then obtained from the acid. Molybdenum forms three compounds with oxygen—the protoxide (MoO), the

binoxida (MoO_2), and molybdic acid (MoO_3). Of these three the last alone has any practical value. Molybdic acid is a white, glistening, crystalline powder, which is sparingly soluble in water, fuses at a red heat to a straw-coloured glass, and unites with bases to form well-marked salts, the molybdates, which are either colourless or yellow. A solution of molybdate of ammonia is one of the most delicate tests for phosphoric acid. Molybdenum forms various compounds with sulphur, chlorine, &c., none of which are of any practical importance, except the native bisulphide.

Mombasa, or MOMBAS, a seaport and the headquarters of the Imperial British East Africa Company's territories, stands on a small coralline island 3 miles long by $2\frac{1}{2}$ broad close to the coast, in $4^\circ 4'$ S. lat., about 150 miles N. of Zanzibar. The shores of the island are rocky and abrupt, and the greater part of its surface is covered with dense bush. The town has the usual Arab characteristics of ruin and neglect. The only object of interest is an extensive fort, built in 1594 by the Portuguese, and restored by them in 1635. Mombasa was visited by Vasco da Gama in 1497; it was then a large and prosperous town (as it was when Ibn-Batúta was there in 1331), with a colony of Christians of St Thomas and Banyans from India. It was held by the Portuguese during the greater part of the period from 1505 to 1698, though not without frequent captures. The native chief put it under British protection in 1823; but, they soon abandoning it, it was seized by the sultan of Zanzibar, who in 1888 ceded it provisionally to the British East Africa Company. They were made definitive masters of the place two years later, when they also were put in possession of a vast tract of country, extending 400 miles along the coast, from the river Juba to the river Umba, and inland up to Victoria Nyanza, and beyond it to the frontiers of the Congo Free State—an area of probably 700,000 sq. m., more than six times the size of Great Britain and Ireland together. Gold, copper, plumbago, and iron ore, as well as india-rubber, exist in this region in considerable abundance. The company have connected Mombasa with Zanzibar by telegraph, and in 1890 commenced a railway inland to Victoria Nyanza, a distance of 400 miles. The harbour, one of the largest, safest, and healthiest on the east coast of Africa, was in 1890 made a British naval coaling station, and the headquarters of the fleet in that part of the world. There is a pier; and other harbour-works were begun in 1890. Pop. about 20,000, mostly Africans, with some Arabs and Banyans. On the mainland opposite is Frere Town, the see of the Anglican bishop of East Equatorial Africa.

Moment of a dynamical quantity is the importance of that quantity in regard to its dynamical effect relatively to a given point or axis. The most familiar example is the Moment of a Force. For simplicity, take a body movable about a fixed axis—say, a door on its hinges. Everyday experience teaches us that such a door is most easily moved by a push or pull applied as far as possible from the hinge. In moving the door slowly through a certain angle, we must do so much work in, first, causing the necessary acceleration, and then in overcoming the friction of the hinges. If we apply the force at a greater distance from the hinge, it works through a proportionally greater arc, and is therefore proportionately less. Such considerations lead to the definition of the moment of a force about a point as the product of its amount into its perpendicular distance from the point. The

tendency of the action of such a force is to cause rotation about an axis perpendicular to the plane passing through the point and containing the force. Thus, in the case of a pendulum, the effectiveness of the force in causing rotation is measured by the moment Wl —where W is the weight of the pendulum, and l is the distance of the line of action of the force W from the centre of rotation C , or (what comes to the same thing) the distance of the centre of mass G from the vertical line through C .

The term moment enters into several other phrases, all of which relate either directly or indirectly to rotation. Thus, there is the moment of momentum, or angular momentum, whose rate of change is the measure of the moment of the force producing the change. To obtain it for any given body rotating with angular speed ω about an axis, we first imagine the body broken up into a great many small portions of masses m_1, m_2, m_3 , &c. at distances r_1, r_2, r_3 , &c. from the axis, multiply the momentum (mrv) of each mass by its distance, and then take the sum of all these products. The angular speed ω being the same in every expression, the moment of momentum takes the form $\omega(m_1r_1^2 + m_2r_2^2 + \text{&c.})$, which it is usual to write in the symbolic form $\omega \Sigma mr^2$. The quantity Σmr^2 , which is the sum of the products of each mass into the square of its distance from the axis, is called the Moment of Inertia about that axis. It is the factor in the moment of momentum, which depends upon the distribution of matter in the body. It enters into all questions of mechanics in which rotation is involved, from the spinning of a top or the action of an engine governor to the stability of a ship. By an obvious extension, the word moment is also used in such combinations as moment of a velocity and moment of an acceleration. Such phrases correspond to nothing truly dynamic, unless we regard velocity as meaning the momentum of unit mass, and acceleration as the rate of change of that momentum. See DYNAMICS, FORCE, INERTIA, ROTATION, &c.

MOMENTUM is our modern equivalent of Newton's quantity of motion (*quantitas motus*), which in Definition II. of the *Principia* is stated to be measured by the product of the velocity and the mass. Its dynamic importance is sufficiently discussed under FORCE.

Momien, a Chinese frontier-town in the extreme west of Yunnan, 135 miles N.E. of Bhamo. See Anderson's *Mandalay to Momien* (1876).

Mommsen, THEODOR, the most learned historian of Rome, was born the son of a pastor at Garding, in Sleswick, 30th November 1817. He studied at Kiel, next spent three years traversing France and Italy in the study of Roman inscriptions under commission of the Berlin Academy, edited awhile the *Schleswig-Holsteinische Zeitung*, and in the autumn of 1848 was appointed to a chair of Jurisprudence at Leipzig, of which two years later he was deprived for the part he took in politics. In 1852 he was appointed to the chair of Roman Law at Zurich, in 1854 at Breslau, and in 1858 to that of Ancient History at Berlin. Here he was engaged for many years in editing the monumental *Corpus Inscriptionum Latinarum*, projected by the Berlin Academy, and commenced in 1863; and in 1873 he was elected perpetual secretary of the Academy. In 1882 he was tried for slandering Bismarck in an election speech, but was cleared both in the lower court and in that of appeal. His fine library was burned in 1880, whereupon a number of English students presented him with a collection of books to make good at least part of his loss. Mommsen took a share in the work of editing the *Monumenta Germaniæ Historica*, and

has made his name illustrious by a series of works of vast range and profound erudition. His greatest work remains his *Römische Geschichte*, brought down to the battle of Thapsus (3 vols. 1854–56; 8th ed. 1889; Eng. trans. by W. P. Dickson, 4 vols. 1862–67). These three volumes form books i.–v. of Mommsen's plan; vol. v., forming book viii., was issued in 1885 (Eng. trans. by Dickson, *The Provinces of the Roman Empire from Cæsar to Diocletian*, 2 vols. 1886). Freeman characterises Mommsen as 'the greatest scholar of our times, well-nigh the greatest scholar of all times . . . language, law, mythology, customs, antiquities, coins, inscriptions, every source of knowledge of every kind—he is master of them all.' But, while admitting readily his wide and sure grasp of historical sequence, the reader finds Mommsen defective in political and moral insight, and prone to fall down in worship before mere force and success.

Other important works of Mommsen's are *Oskische Studien* (1845); *Die Unteritalischen Dialekte* (1850); *Corpus Inscriptionum Neapolitanarum* (1851); his monographs on *Roman Coins* (1850); the edict of Diocletian, *De Pretiis Rerum Venalium* (1851); *Die Rechtsfrage zwischen Cæsar und dem Senat* (1857); *Römische Forschungen* (1864–79); *Res Gestæ Divi Augusti* (1865); *Römisches Staatsrecht* (1871–76; 3d ed. 1887); and his *Digesta Justiniani Augusti* (1866–70).

Of his brothers, two have achieved distinction: TYCHO, born at Garding, 23d May 1819, studied at Kiel, traversed Italy and Greece, and held educational appointments at Eisenach, Oldenburg, and Frankfort-on-Main until his retirement in 1885. He devoted many years to studies upon Pindar, producing a great critical edition in 1864 (an edition of the text in 1866), *Scholia* (1861), a translation (1846), and *Parerga Pindarica* (1877).

AUGUST, born at Oldesloe, 25th July 1821, studied at Kiel, and taught in schools at Hamburg, Parchim, and Sleswick. Most of his works belong to the field of Greek and Roman chronology. Among them are *Römische Daten* (1855), *Beiträge zur Griechischen Zeitrechnung* (1856–59), *Griechische Jahreszeiten* (1873), *Delphika* (1878), and *Chronologie Untersuchungen über das Kalendervesen der Griechen* (1883).

Mompox, or MOMPOS, a town of Bolivar in Colombia, on the Magdalena, 110 miles S.E. of Cartagena. Founded in 1538, it contains a good secondary school and a distillery. Pop. 8000.

Monachism, or MONASTICISM (Gr. *monachos*, 'a monk,' from *monos*, 'alone'), may in general be described as a state of religious retirement, more or less complete, accompanied by contemplation, and by various devotional, ascetical, and penitential practices. It is, in truth, Asceticism (q.v.), with the element of religious solitude superadded. The institution of monachism has, under different forms, entered into several religious systems, ancient and modern. That it was known among the Jews before the coming of our Lord appears from the example of the prophet Elijah and from that of the Essenes; and it is probable that religious seclusion formed part of the practice of the Nazarites, at least in the later periods of Jewish history. In the Brahmanical religion it has had a prominent place; and even to the present day the *lamaseries* of Tibet may be said to rival in number and extent the former monasteries of Italy or Spain. The Christian advocates of monachism find in the exhortations to voluntary poverty (Matt. xix. 21) and to celibacy (1 Cor. vii. 37) at once the justification and the origin of the primitive institution. Its first form appears in the practice of asceticism, of which we find frequent mention in the early part of the 2d century.

The primitive ascetics, however, lived among the brethren, and it is only in the following century that the peculiar characteristic of monachism begins to appear. The earliest form of Christian monachism is also the most complete—that of the Anchorites or Hermits (q.v.)—and is commonly believed to have in part originated in the persecutions, from which Christians were forced to retire into deserts and solitary places. The hermits maintained from choice, after the cessation of the persecutions, the seclusion to which they had originally resorted as an expedient of security; and a later development of the same principle is found in the still more remarkable psychological phenomenon of the celebrated ‘Pillar-saints’ or Stylites (q.v.). After a time, however, the necessities of the religious life itself—as the attendance at public worship, the participation in the sacraments, the desire for mutual instruction and edification—led to modifications of the degree and of the nature of the solitude. First came the simplest form of common life, which sought to combine the personal seclusion of individuals with the common exercise of all the public duties; an aggregation of separate cells into the same district, called by the name *Laura*, with a common church, in which all assembled for prayer and public worship. From the union of the common life with personal solitude is derived the name *cœnobia* (Gr. *koinos bios*, common life), by which this class of monks is distinguished from the strict solitaries, as the hermits, and in which is involved, in addition to the obligations of poverty and chastity which were vowed by the hermits, a third obligation of obedience to a superior, which, in conjunction with the two former, has ever since been held to constitute the essence of the religious or monastic life. The first origin of the strictly cœnobitical or monastic life has been detailed under the name of St Antony (q.v.), who may be regarded as its founder in the East, either by himself or by his disciples. So rapid was its progress that his first disciple, Pachomius, lived to find himself the superior of 7000. In the single district of Nitria, the country of the Natron Lakes (q.v.) in the Egyptian delta, there were, according to Sozomen, no fewer than fifty monasteries, and before long the civil authorities judged it expedient to place restrictions on their excessive multiplication. It seems to be admitted that in the East, where asceticism has always been held in high estimation, the example of Christian monasticism had a powerful influence in forwarding the progress of Christianity; although it is also certain that the admiration which it excited occasionally led to its natural consequence among the members, by eliciting a spirit of pride and ostentation, and by provoking sometimes to fanatical excesses of austerity, sometimes to hypocritical simulations of rigour. The abuses which arose, even in the early stages of monachism, are deplored by the very Fathers who are most eloquent in their praises of the institution itself. These abuses prevailed chiefly in a class of monks called *Sarabaitæ*, who lived in small communities of three or four, and sometimes led a wandering and irregular life. On the other hand, a most extraordinary picture is drawn by Theodoret of the rigour and mortification practised in some of the greater monasteries. The monks were commonly zealous in religion; and much of the bitterness of the religious controversies of the East was due to that unrestrained zeal; and it may be added that the opinions which led to these controversies originated for the most part among the theologians of the cloisters. An order was called *Acemetæ* (Gr. ‘sleepless’), from their maintaining the public services of the church day and night without interruption (see GREEK CHURCH).

It was in the cœnobitic rather than the eremitic form that monachism was first introduced into the West, at Rome and in Northern Italy by Athanasius, in Africa by St Augustine, and afterwards in Gaul by St Martin of Tours. Here also the institution spread rapidly under the same general forms in which it is found in the Eastern Church; but considerable relaxations were gradually introduced, and it was not until the thorough reformation and, as it may be called, religious revival effected by the celebrated St Benedict (q.v.), in the beginning of the 6th century, that western monachism assumed its peculiar and permanent form. In some of the more isolated churches, as, for instance that of Britain, it would seem that the reformations of St Benedict were not introduced until a late period; and in that church, as well as in the church of Ireland, they were a subject of considerable controversy. One of the most important modifications of monachism in the West regarded the nature of the occupation in which the monks were to be engaged during the times not directly devoted to prayer, meditation, or other spiritual exercises. In the East manual labour formed the chief, if not the sole external occupation prescribed to the monks; it being held as a fundamental principle that for each individual the main business of life was the sanctification of his own soul. In the West, besides the labour of the hands, mental occupation was also prescribed—not, it is true, for all, but for those for whom it was especially calculated. From an early period, therefore, the monasteries of the West, and particularly those of Ireland or those founded by Irish monks (see COLUMBA, CULDEES), as Iona and Lindisfarne, became schools of learning, and training-houses for the clergy. At a later period most monasteries possessed a *scriptorium*, or writing-room, in which the monks were employed in the transcription of MSS.; and, although a great proportion of the work so done was, as might naturally be expected, in the department of sacred learning, yet it cannot be doubted that it is to the scholars of the cloister we owe the preservation of most of the masterpieces of classic literature which have reached our age.

In the remarkable religious movement which characterised the church of the 12th century (see FRANCISCANS) the principle of monachism underwent a further modification. The *spiritual egoism*, so to speak, of the early monachism, which in some sense limited the work of the cloister to the sanctification of the individual, gave place to the more comprehensive range of spiritual duty, that, in the institute of the various bodies of Friars (q.v.) which that age produced, made the spiritual and even the temporal necessities of one's neighbour, equally with, if not more than, one's own, the object of the work of the cloister. The progress of these various bodies, both in the 12th century and since that age, is detailed under their several titles. The monastic institutes of the West are almost all offshoots or modifications of the Benedictines (q.v.); of these the most remarkable are the Carthusians, Cistercians, Cluniacs, Premonstratensians, and, above all, Maurists. In more modern times other institutes have been founded for the service of the sick, for the education of the poor, and other similar works of mercy, whose members are also classed under the denomination of monks. The most important of these are described under their several heads.

The enclosure within which a community of monks reside is called a Monastery (q.v.), and sometimes convent. By the strict law of the church, called the law of cloister or enclosure, it is forbidden to all except members of the order to enter a monastery; and in almost all the orders this prohibition is rigidly enforced as regards the admission of

females to the monasteries of men. To such a length is this carried in the Greek Church that in the celebrated enclosure of Mount Athos not only women, but all animals of the female sex are rigorously excluded. The first condition of admission to a monastic order is the approval of the superior, after which the candidates remain for a short time as *postulants*. After this preliminary trial, they enter on what is called the *novitiate*, the length of which in different orders varies from one to three years; and at its close they are admitted to the profession, at which the solemn vows are taken. The age for profession has varied at different times and in different orders; the Council of Trent, however, has fixed sixteen as the minimum age. Originally all monks were laymen; but after a time the superiors, and by degrees other more meritorious members, were admitted to holy orders. Amongst the mendicants, those in priest's orders were called 'father,' the lay brothers 'brother' only. In either case, where the order is one of those solemnly approved by the church, the engagement taken at the final profession is life-long and irrevocable.

The name monastery, in its most strict acceptance, is confined to the residences of monks, properly so called, or of nuns of the cognate orders (as the Benedictine), and as such it comprises two great classes, the *Abbey* and the *Priory*. The former name was given only to establishments of the highest rank, governed by an abbot, who was commonly assisted by a prior, sub-prior, and other minor functionaries (see *ABBOT*). A Priory supposed a less extensive and less numerous community. It was governed by a prior, and was originally, although by no means uniformly (at least in later times), subject to the jurisdiction of an abbey. The distinction of abbey and priory is found equally among the Benedictine nuns. In the military orders the name of Commandery and Preceptory corresponded with those of abbey and priory in the monastic orders. The establishments of the mendicant and, in general, of the modern orders are sometimes, though less properly, called monasteries. Their more characteristic appellation is Friary or Convent, and they are commonly distinguished into Professed Houses (called also Residences), Novitiates, and Colleges or Scholastic Houses. The names of the superiors of such houses differ in the different orders. The common name is Rector, but in some orders the superior is called Guardian (as in the Franciscan), or Master, Major, Father Superior, &c. The houses of females—except in the Benedictine or Cistercian orders—are called indifferently *Convent* and *Nunnery*; their head is styled Mother Superior or Reverend Mother. The monastic institute, from the very earliest time, included women as well as men. The former were called in Greek by the name *nonis* or *nonna*, and in Latin *nonna* (from which the English *Nun*), as also *sanctimonialis*. The general characteristics of the monastic institute for females are substantially identical with those of the male orders.

It was to be expected that the monastic foundations in England would not long survive the national rejection of the papal power which was their main support. The monasteries had mostly outlived their days of usefulness, and very inadequately fulfilled the objects of their institution. A general, though not universal decay of religious fervour, and the revelation from time to time of grave scandals within their walls disposed many prudent men to regard them with little favour. But the immediate cause of their downfall was their accumulated wealth with which Cromwell tempted the covetousness of Henry VIII. The dissolution of monasteries was indeed no new idea, for Cardinal Wolsey several years before had obtained bulls from the pope

enabling him to suppress certain religious houses and appropriate their funds for other purposes. Henry's proceedings were, however, as unworthy as his motives. He appointed unprincipled agents to visit and report upon the state of all the religious houses in the kingdom. These men performed their work in indecent haste, and upon obviously insufficient evidence brought against the monks generally charges of gross immorality which were embodied in the so-called Black Book, now lost. The king at first acted with considerable craft. He appealed to the selfishness of the greater abbots who had seats in the House of Lords, and silenced their opposition by declaring that in the larger monasteries 'religion was right well kept,' and proposed the confiscation only of the smaller houses (376 in number) with a revenue of less than £200 a year. This ensured the passing of the Act of Suppression in February 1536. But the turn of the 645 greater monasteries soon came. Certain abbots implicated in the rising of the 'Pilgrimage of Grace' were convicted of treason and their houses seized. Then followed another general visitation, and, by bribes, intimidation, and violence, the remaining monastic communities were one by one induced in 1539 to 'surrender' their property to the king. The revenue accruing to the crown by the confiscation is estimated at over £130,000. With this fund six new episcopal sees and certain collegiate churches and grammar-schools were founded, and a few castles built for the defence of the coast. But the greater part of the property fell through purchase or gift into the hands of the nobility and gentry; and the policy which thus interested powerful laymen in maintaining the new order of things effectually barred the way to the restoration of monasticism in the reactionary reign of Mary. Fresh light has been thrown upon this whole subject by Canon Dixon in his recent *History of the Church of England*, and again more fully by Father Gasquet, O.S.B., in *Henry VIII. and the English Monasteries* (2 vols. 1889; 4th ed. 1890).

In some of the German states the temporalities of the suppressed monasteries were retained at the Reformation, and were granted at pleasure by the sovereign, to be enjoyed together with the titular dignity. Some of the German churches, however, in later times, have revived the institution, especially for women (see *DEACONESSSES*). In England there was the religious community of Little Gidding (1625-47), founded by Nicholas Ferrar (q.v.); and in 1865 a sort of Anglican mission order, the Cowley Fathers, was established at Oxford; but here, too, Sisterhoods (q.v.) are far more numerous. In all these Protestant revivals of monachism, the engagement is revocable at the will of the individual. At the French Revolution the monastic establishments of France were utterly suppressed; and in most of the other Catholic countries of Europe the example has been followed to a greater or less extent. After the Restoration a revival of many of the orders took place in France. In 1835 Spain suppressed 900 monasteries, and the rest soon thereafter; Portugal dissolved all its religious houses in 1834. In Belgium, Austria, and Switzerland, monasteries are numerous—in Belgium there are 200 communities, in Austria (without Hungary) 450, in Switzerland 88. In Italy, Sardinia put an end to the monasteries in 1866, and the same measure was extended to the whole kingdom after 1870, the orders being expropriated, and their houses made national property; in all upwards of 2200 houses were suppressed. In 1875 Prussia dissolved all orders save those devoted to sick-nursing (at that date there were in all Germany 2588 monks and 16,846 nuns), but in 1887 readmitted all those orders engaged in pastoral duty, Christian charity, or the contemplative life. The French decree of 1880,

breaking up 'unauthorised orders,' dealt with 384 houses with 7444 monks, and 602 houses with 14,003 nuns, there were in all at that date some 25,000 monks and nuns in France. In England and Ireland and America, on the contrary, and largely as a consequence, monastic institutions have made rapid progress of late years. Most of the orders introduced are active, not contemplative. In the United States some fifty orders are represented.

The following list gives the name and date of foundation of the chief orders; reference is made to the articles on them throughout this work, and to works cited there; as also to other articles quoted above, to ROMAN CATHOLIC CHURCH, CONGREGATION, &c.; and to Helyot, *Histoire des Ordres Religieux* (8 vols. 1714-21; new ed. 1860); Dugdale, *Monasticon Anglicanum* (new ed. 1817-30); Tanner, *Notitia Monastica* (1744); Möhler, *Geschichte des Mönchthums* (1836); Hill, *English Monasticism* (1867); Milman, *History of Latin Christianity* (1854); Montalembert, *Monks of the West* (Eng. trans. 1861-79); Harnack, *Das Mönchthum: seine Ideale und seine Geschichte* (1882); and *Handbook to the Convents and Religious Houses in the United Kingdom* (1885).

Monaco, a small principality on the Mediterranean, 149 miles ENE. of Marseilles, and 9 from Nice. Area, 8 sq. m.; pop. (1873) 5741; (1888) 13,304, of whom 3292 were in the town of Monaco,

Monaco.

6218 in Condamine, and 3794 in Monte Carlo. The territory, which is encircled by the French department of Alpes Maritimes and the sea, consists mainly of the rocky promontory on which the capital is built, and a small strip of coast. For more than nine hundred years it has belonged

to the family of Grimaldi. Originally of Genoese extraction, they first held lands in France, between Fréjus and Toulon, where the name of the bay of Grimaud still commemorates their sway. They acquired Monaco in 968, Mentone and Roquebrune and Castillon about 1230, and Antibes in 1237. In European politics they sided with the Guelph party. Honoré II. put his country under a French protectorate in 1644. In 1715 the heiress of the Grimaldi of Monaco married Matignon, Comte de Thorigny, and her descendants continued to reign over their small kingdom. It has, however, suffered at the hands of its great neighbours. In 1846 Mentone and Roquebrune were annexed by Sardinia, and after the war of 1859 the whole territory belonged for a short time to King Victor Emmanuel. The protests of its lawful owner were loud, but he was none the less ready for another arrangement, since in 1861 he sold Mentone and Roquebrune to Napoleon III. for 4,000,000 francs. His capital Monaco is now under French protection. Prince Albert (born in 1848, succeeded 1889), the present sovereign, has one son, Louis, by a marriage, dissolved in 1880, with Lady Mary Hamilton. About 1000 of the inhabitants are employed in the rooms and gardens of the celebrated Casino. These gambling-rooms, built at Monte Carlo on ground leased from the Prince of Monaco, belong to a joint-stock company, and have about 400,000 visitors. The climate of Monaco is milder than that of any other place in the Riviera; palms and aloes grow most luxuriantly, and rare wild-flowers are found on its rocky promontory. See Métyvier, *Monaco et ses Princes* (2d ed. 1865); and Boyer de Sainte-Suzanne, *La Principauté de Monaco* (1884).

Monad (Gr. *monas*, 'unity'), in Philosophy, is one of the simple elements of which, according to the system of Leibnitz (q.v.), the universe is built up. In Biology the name is applied to a large number of minute and relatively simple flagellate Infusorians (q.v.).

Monaghan, an inland county of Ulster, Ireland, situated between Tyrone on the N. and Meath (in Leinster) on the S. Its greatest length from north to south is 37 miles; the total area being 319,741 acres (496 sq. m.), of which about 140,000 are under tillage. The population, which in 1841 was 200,442, had fallen in 1891 to 86,089 (of whom 73 per cent. were Catholic). The general surface is undulatory; the highest point is 1254 feet above the sea. It is interspersed with lakes of small extent, and has many small streams. In its geological structure the level country belongs to the great central limestone district; see IRELAND (geology); limestone, freestone, and slates are worked. The flax crop has greatly increased of late years, and the linen manufacture is thriving. The principal towns of this county are Monaghan, Carrickmacross, Clones, and Castle-Blayney. It returns two members to parliament. Monaghan, granted by Henry II. to De Courcey, speedily fell back into the hands of the native chiefs of the sept MacMahon, by whom (with some alternations of re-conquest) it was held till the reign of Elizabeth, when it was erected into a shire. The county possesses two round towers, one, very complete, at Clones, the other at Inniskeen; and there are several raths and Danish forts. The name Monaghan is derived from

by whom (with some alternations of re-conquest) it was held till the reign of Elizabeth, when it was erected into a shire. The county possesses two round towers, one, very complete, at Clones, the other at Inniskeen; and there are several raths and Danish forts. The name Monaghan is derived from

the Irish *Muinechan*, 'Monkstown,' a monastery having stood here at a very early date.

MONAGHAN, the county town, is 76 miles NNW. of Dublin by rail. The town, which returned two members to the Irish parliament, is still the centre of some trade in agricultural produce, and can boast several public buildings of considerable pretensions, among which are the Catholic college and church, the infirmary, and national model school. Pop. (1861) 3910; (1881) 3369. See Evelyn P. Shirley's *History of the County of Monaghan* (1877-80).

Monaldeschi. See **CHRISTINA**.

Monarchy (Gr. *monarchia*, from *monos*, 'alone,' and *archō*, 'I govern'; literally, the government of a single individual) is that form of government in a community by which one person exercises the sovereign authority; see **GOVERNMENT**. For **Monarchianism**, see **UNITARIANISM**.

Monastery, a class of structures which arose in the middle ages to meet the requirements of the large number of monks that then existed. It is proved by documents that these buildings were at first constructed somewhat after the plan of a Roman house, or rather of a Roman villa or country-house. Records of abbeys as early as the 7th century show that the arrangements were similar then to those of the 12th century. The cloister,

plan cannot be obtained. The annexed plan is a model one made by Mr E. Sharpe, and contains the results of his careful investigation of the Cistercian monasteries throughout Europe (see *Trans. Roy. Inst. of British Architects*, 1871). In northern climates the cloister was usually situated on the south side of the church, for the sake of the sunshine and warmth. It was composed of an open courtyard, square or oblong in shape, surrounded by an open arcade, or covered way. The church formed the north side, and on the east side was situated the chapter-house, with the monks' dormitory over it. The latter was thus in immediate communication with the church, and conveniently placed for the monks' attendance at the services during the night. The chapter-house in the Cistercian monasteries was usually divided into three compartments by the pillars bearing the arches. The abbot's seat was opposite the entrance door, and a stone seat all round accommodated the monks. The doorway was not closed, and together with an open arch or window on each side of it allowed those in the cloister to hear the discussions in the interior. The sacristy is placed on the north side of the chapter-house, with a door from the church. A similar cell or 'parlour' occupies the south side; then comes a passage or 'slype' leading from the cloister to the gardens,

&c. Beyond this is the fratri or day-room of the monks, a long vaulted apartment running southwards, having a row of columns in the centre and open windows.

The south side of the cloisters generally gave access to the refectory, a large, rather ornamental chamber, usually with an open wooden roof. It was sometimes placed parallel and sometimes at right angles to the cloister. Opposite the door to the refectory and in a vaulted recess stood a fountain or basin where the monks might wash. Adjoining the refectory were the kitchen and offices. The former was frequently a detached building with a large number of hearths, each having a separate chimney in the roof.

Along the west side of the cloister, and sometimes extending much farther, lay the hospitium or guest-house, where all travellers were received, and the lay-room above, where they were lodged. A very important room in the monastery was the scriptorium or library, in which the MSS. were written and illuminated; this was situated on the second floor of the chapter-house. The abbot's lodge formed a separate edifice, as also did the infirmary. The whole establishment was surrounded by a wall, and provided with proper gates and defences. The outer gate gave access to the outer court, in which were situated the workshops of the various tradesmen connected with the abbey, and the buildings required in connection with the agricultural employments of the lay brethren.

Such were the arrangements of the Cistercian

Cistercian Abbey—Model Plan.

which formed the inner court appropriated to the monks, resembles the peristyle of the Roman mansion. The latter was the part of the dwelling communicating with the private apartments of the family, just as the cloister communicated with the refectory, dormitory, and other apartments used by the monks and not entered by the public. There was also in the monasteries, as in the Roman villas, an outer courtyard, in which were situated the various stores, granaries, workshops, and other places required in connection with both these edifices.

There was, however, one entirely new element in the monastery—viz. the church. This was the largest and most important building, and regulated the position of all the rest. The conventual buildings of every abbey in Britain, France, and Germany are so much destroyed that a complete

abbey in the 12th and 13th centuries. In later times the simplicity of the plan was broken in upon. The monks, desirous of more comfortable quarters, divided the dormitory and made it into cells. The open windows were glazed, and even the arches of the cloisters were sometimes enclosed. The early simplicity of the architectural style was also departed from, and the monastic buildings of the 15th century are as rich in decoration as the cathedrals and parish churches. The arrangements of the monasteries of the other orders were, generally speaking, similar to those of the Cistercian, except in the case of the Carthusians. In their convents, where absolute solitude and silence were required, each monk had a small house and garden to himself. These were arranged round the cloister, which, when the number of monks was large, were greatly extended in dimensions.

See Viollet le Duc, *Dictionnaire et Architecture Monastique*; De Caumont, *Abécédaire d'Archéologie*; Dugdale, *Monasticon*; and Mackenzie Walcott's works on the English and Scottish Churches. For Monasticism, see MONACHISM.

Monastir, called also BITOLIA, the second town in Turkish Macedonia, is situated in a broad mountain-valley, 90 miles NW. of Salonica. It manufactures carpets and silver filigree, and trades in corn and agricultural products. The Turks, recognising its strategic importance, have made it the headquarters of an army corps. Under its ancient name of Pelagonia it gives title to a Greek archbishop. Here the Albanian beys were massacred in 1833. Pop. 45,000.

Monboddó, JAMES BURNETT, LORD, Scottish lawyer and author, was born at Monboddó House, in Fordoun parish, Kincardineshire, in 1714, and was educated at Marischal College, Aberdeen, and Edinburgh University, afterwards studying law for three years at Groningen, in Holland. In 1737 he was called to the Scottish bar, and soon obtained considerable practice; but the first thing that brought him prominently into notice was his connection with the celebrated Douglas case, in which he acted as counsel for Mr Douglas. In 1764 he became sheriff of Kincardineshire, and in 1767 was raised to the bench by the title of Lord Monboddó. He died in Edinburgh, 26th May 1799. Monboddó's *Origin and Progress of Language* (6 vols. 1773-92) is a very learned, heretical, and eccentric production; yet in the midst of its grotesque crotchets there occasionally flashes out a wonderfully acute observation, that makes one regret the distorted and misapplied talent of the author. Its evolution theory—of monkeys that wore off their tails by constant sitting—seems less laughable now than it did to Monboddó's contemporaries; and in his study of man as one of the animals, and of civilisation by the light of savagery, he certainly anticipated the modern science of anthropology. Monboddó published, also anonymously, another work, *Ancient Metaphysics* (6 vols. 1779-99).

Monbuttu, a Negro stock in the basin of the Upper Nile and the Upper Welle. See AFRICA.

Moncalieri, a town of Italy, on the Po, 5 miles S. of Turin, with a royal palace (1470). Pop. 3463.

Moncontour, a village in the French department of Vienne, situated 48 miles SW. of Tours, was the scene of the defeat of the Huguenots under Coligny by the troops of the king of France, 3d October 1569.

Moncrieff Pits (named after the inventor, Sir Colin Scott Moncrieff) are excavations in which heavy guns are placed in coast batteries or other places where it is specially necessary to protect them from hostile artillery fire. The Moncrieff system of mounting utilises the force of recoil to

bring the gun down into the loading position at the bottom of the pit. It is returned into the firing position (shown in the figure) either, as in the early patterns, by means of a heavy counterweight in front of the breast of the gun-carriage, or, as in later designs, by hydro-pneumatic machinery. When the counterweight is used, the side brackets of the carriage on which the disappearing movement takes place are made on a specially designed curve, so that this movement may be regular and without any violent shock. The figure represents a diagrammatic section of this arrangement. A is the rotating side bracket

revolving on teeth; BC are two inclined planes keeping the gun horizontal as it descends into the position shown by dotted lines. The same result is obtained in the hydro-pneumatic system of mounting by means of recoil presses, which also store up the force of the recoil and enable it to be used to elevate the gun into the firing position. The invention belongs to the years 1868-72.

Moncton, a town and port of entry of New Brunswick, on the Petitcodiac River, 89 miles by rail NE. of St John. It has important railway-shops, a large sugar-refinery, a cotton-factory, &c. Pop. 7500.

Mon'dovi, a cathedral city of Italy, 58 miles S. of Turin by rail. Pop. 10,302. Here, on 22d April 1796, the Sardinians were totally defeated by Napoleon.

Monera, a class of Protozoa (q.v.) proposed by Haeckel to include the very lowest organisms supposed to be destitute of a nucleus. As this structure has been shown to exist in forms where it was formerly denied, the title is now being abandoned. See PROTOZOA.

Money. The term money is used, both in matters of business and in economic theories, in such very different ways that it is impossible to cover them all with a simple definition. Standard coins, bars of bullion which can at once be converted into standard coins, token coins, convertible bank-notes, inconvertible notes, are all included under 'money,' although they present essential differences. In modern societies one of the most important forms of money is 'bank money,' or the money of the money-market, which for the most part consists of neither coin nor notes. The whole of the banking system of the United Kingdom, for example, as well explained in Bagehot's *Lombard Street*, really rests upon the reserve kept by the Bank of England, and every bank receives deposits of 'money,' and makes advances of 'money,' with the use of a very small proportion of coins or bank-notes. A brief survey of the development of the complex monetary system of modern societies from its rudimentary forms will give the best explanation of this uncertainty in the meaning of this familiar word, and also bring out in the clearest way the principal functions of 'money.'

Exchanges first take place by means of barter, but the difficulties of simple barter are obviously very

great. A coincidence of mutual wants at the same time and place is the first condition of any exchange, and it is plain that a common *medium of exchange* will obviate one of the principal difficulties of direct barter. If there is some one thing which every one is willing to take, it follows that anything else can be bought or sold against this particular commodity. Accordingly the first function of 'money' is to provide (1) a *medium of exchange*, and its first forms consist of things which are generally desired in simple states of society. Skins, cattle, shells, corn, pieces of cloth, mats, salt, and many other commodities have at different times and places been used as 'money,' in the sense of a common medium of exchange. The commodity chosen, however, will be of little advantage unless it can be used both in large and small quantities. This consideration leads to another primary function of money—viz. (2) as a *measure of value*. Not only is it necessary that things can be exchanged against a common substance, but the rates of exchange must be measured. Finally, as society advances, a basis for (3) *deferred payments*, and also a method of (4) *storing 'values'* without deterioration, become of importance. In order that these four primary functions may be fulfilled, the substance chosen for money must have certain properties, of which the principal are portability or great value in small bulk, durability, sameness of quality, divisibility, stability of value, and cognisability. It was soon discovered that these qualities are possessed in the highest degree by gold and silver. Other metals have been used at different times even for standard money, but all of them fail in one or more of these particulars. Iron is liable to rust, lead is too soft, tin too brittle, and copper too heavy. It may be observed that the importance of the qualities varies according to circumstances. Thus, when, as in modern societies, the greater part of wholesale transactions are effected without the intervention of material money, portability is of comparatively small importance, whilst on the other hand stability of value is of the greatest importance in all kinds of deferred payments. It is not necessary that all the primary functions of money should be fulfilled by the same thing. In Saxon times, for example, and for long after in England the standard measure of value was the pound-weight of silver, but the actual medium of exchange consisted of silver pennies. At present the actual medium of exchange consists to a great extent of bits of paper—bank-notes, cheques, and various instruments of credit—whilst the standard measure of value is a piece of gold.

So long as the attention is directed to material money, the principal questions that arise are in connection with coinage. At first, after the introduction of the precious metals, it was left to the parties concerned to test their weight and fineness with *caveat emptor* for the rule, and the present unsatisfactory state of the English gold coinage is mainly due to the survival in law of the presumption that it is the duty of the receiver of money to see that it is of full value. But the essential object of coinage is that a responsible authority should affix its stamp to small ingots of metal, in such a way as to signify their weight and purity. Simple and important as this duty appears, history is full of examples of the debasement and deterioration of coins by governments with the view of making a petty gain. It is worth noting, however, that from the earliest times (with the exception of the reign of Henry VIII.) the English silver was kept of the same fineness. It is true that the weight of the coins became gradually less, but it was probably in most cases the recognition of an accomplished fact (through ordinary wear

and tear), and was not an attempt to defraud. The evils which arise from the natural or artificial debasement of coins have been well described by Macaulay in his account of the recoinage in the reign of William III. Since the primary object of coinage was simply to furnish a mark of weight and fineness, all metallic money was at first exactly what it professed to be. Thus, the old English silver pound was coined into 240 pennies; and this fact is preserved in the Troy table—20 penny-weights = 1 oz., 12 oz. = 1 pound. In process of time the actual weight of the penny became less than a pennyweight, but the same numbers were still supposed to go to the pound. Finally, a certain amount of gold of a certain fineness was declared to be equal in value to a 'pound of silver,' or rather to 240 pennies. This is historically the answer to Sir Robert Peel's famous question, 'What is a pound?' The technical answer to the question is now given by the Coinage Act of 1870 (in substance the same as that of 1816). The act declares the precise weight of the sovereign in grains, and the proportion of alloy in standard gold. Nominally, any one can take standard gold to the mint and get it coined into sovereigns or half-sovereigns free of charge; 20 pounds-weight Troy being coined into 934 sovereigns and one half-sovereign. Practically the time and trouble involved in going direct to the mint induced people to sell their gold in preference to the Bank of England, and at first (within certain narrow limits) the price varied. Now the bank is compelled to purchase all standard gold at £3, 17s. 9d. per oz., and, as it obtains from the mint £3, 17s. 10½d., there is a small profit by way of brokerage. Allowing for this small difference, it will be seen that the mint price of gold—viz. £3, 17s. 10½d.—simply refers to the number of standard coins made out of a certain amount of standard metal. It follows that this mint price is fixed and invariable so long as the law remains unchanged. Thus, if gold became as plentiful as blackberries, or as scarce as diamonds, the mint price would remain unaffected. At the same time, however, the value of gold in the sense of its purchasing power over commodities would change according to the variations in the quantity, though the precise nature and extent of the change would depend upon other elements. In some cases government makes a definite charge for coinage—that is to say, practically the weight of the coins returned is so much less than the weight of the bullion brought. This charge is called *seigniorage*. So long as this charge is paid, however, there is no restriction on the quantity of metal which may be converted into full standard coin.

It is necessary now to notice the distinction between standard money, in the proper usage of the term, and token money. The chief characteristics of the former are that, as just explained, it is coined to an unlimited extent, and further, that for any money contracts it is unlimited legal tender. In 'token' money these two characteristics are absent. The nature and uses of token money are also best explained historically. In the middle ages silver was very scarce, and prices were extremely low. The silver penny was originally about the size of the present threepenny-piece; consequently for the low range of prices then current it was inconveniently large and valuable. In a petition of the date of 1330 it was pointed out that 'beer is one penny for three gallons,' and that a penny is the smallest coin, and the petitioners pray that smaller coins may be struck to pay for their little purchases, and 'for works of charity.' The great practical difficulty, however, was to make very small coins of full standard value. So much was the need of small

change felt, however, that by the time of Elizabeth the people had resorted largely to 'tokens' of lead, tin, and even leather. These 'tokens' were at first private issues, and practically were like very small promissory-notes. It was soon found that they were forced into circulation by unfair means, and then the issuers refused to change them for goods or sterling money. The remedy adopted in 1613 was to give a monopoly of striking copper or brass farthings to certain persons for a consideration. This privilege, however, was so much abused, that in many parts of the country, including London, there was hardly any gold or silver left—the whole circulation being brass farthings. The patentees tried to force these farthings on the American colonies, but it is recorded of Massachusetts—'March 4, 1634, at the General Court at New Town, brass farthings were forbidden, and bullets were made to pass for farthings.' These 'royal' tokens were no sooner suppressed, owing to the abuses which they had caused, than they were again replaced by private tokens, and it is said that over 20,000 different kinds were in use between 1648 and 1672. Evelyn in his *Diary* speaks of the tokens issued by every tavern, 'passable through the neighbourhood, though seldom reaching farther than the next street or two.'

From this slight historical sketch the principles which should regulate the issues of 'token' money stand out clearly. The smallest coins cannot be made of the precious metals of full value—e.g. a silver farthing would be less than one-tenth of the present threepenny-piece—and, accordingly, baser material must be used. Here, however, the danger arises of going to the other extreme and making the coins too large. But this is only a minor difficulty compared with the necessary condition that the token coins must bear a fixed relation to the standard coins in value. Thus we arrive at the fundamental principles of 'token' coins; they should be issued in limited quantities, be legal tender to a limited extent, and their so-called intrinsic value should be less than the nominal value. Even those nations which use both gold and silver as standard money (see **BI-METALLISM**) are compelled to use token coins for small values, whilst nations which have a gold standard must make all their silver coins 'tokens.' With the progress of civilisation 'representative' money, as it has happily been styled by Jevons, became of more and more importance. The Romans, for example, had a highly-developed banking system, which, however, was broken up on the disruption of the empire. In the early mediæval period bills of exchange were used for foreign payments; and that they were considered as 'representative money' is shown by the fact that in England, up to the Tudor period, their value was regulated by the Royal Exchanger, a high official connected with the mint. The development of banking in the modern sense was very slow. The earliest banks in Italy were finance companies which provided governments with loans, but the great banks of the north of Europe were expressly designed to provide good money to meet the payment of bills of exchange (see Adam Smith's account of the origin of the Bank of Amsterdam, *Wealth of Nations*, book iv.). The money in the great trading centres was drawn from various countries, and was in general debased and worn. The banks took this bad money from the merchants and gave them good bank money in return. The merchants, however, allowed the money to remain in the bank, and handed one another transfers. It was soon discovered that a small amount of actual coin was sufficient to meet all liabilities, and, accordingly, the remainder was

lent. In this manner 'bank money' has in process of time come to consist of a large mass of representative money supported on a metallic basis. See **BANK**.

Compare, on the difficulty of defining 'money,' Sidgwick's *Principles of Political Economy*, book ii. chap. iv.; on the history of material money, Ruding's *Annals of the Coinage*, Dana Horton's *Silver Pound*, Kenyon's *Gold Coins of England*, Hawkins' *Silver Coins of England*; on tokens, Boyne's *Tokens in the Seventeenth Century*; on the 'money market,' Bagehot's *Lombard Street*; on the general principles, Jevons' *Money*, Professor F. A. Walker's *Money*, Professor Nicholson's *Money and Monetary Problems*. For the connection of money and prices, see **PRICE**. Money-lending. See **USURY**.

Money-wort, a name given to various plants—*Dioscorea*, *Lythraceæ*, *Thymus*, &c.

Monge, GASPARD, a French mathematician and physicist, was born of humble parentage at Beaune, in the department of Côte d'Or, 10th May 1746. When only fifteen, he went to study natural philosophy at the Oratorian College of Lyons, and afterwards obtained admission into the famous artillery school at Mézières, where he invented the method known as 'Descriptive Geometry.' In 1780 he was chosen a member of the French Academy, and was called to the Paris Lyceum as professor of Hydrodynamics. During the heat of the Revolution he became minister of Marine, but soon took charge of the great manufactories for supplying republican France with arms and gunpowder. After he had founded the *Ecole Polytechnique*, he was sent by the Directory to Italy. Here he formed a close friendship with Bonaparte, and, following him to Egypt, undertook the management of the newly-founded Egyptian Institute. On his return to France, he resumed his functions as professor in the *Ecole Polytechnique*, and, though his reverence for Napoleon continued unabated, he hotly opposed his aristocratic and dynastic views. The title of Count of Pelusium was conferred on him by Napoleon. He died 28th July 1818. His principal works were *Traité Élémentaire de Statique* (1788), *Leçons de Géométrie Descriptive* (1795), and *Application de l'Analyse à la Géométrie* (1795).

Monghyr, a picturesque city of Bengal in India, on the right bank of the Ganges, 80 miles E. by S. of Patna, consists of the fort, a rocky crag projecting into the river, and the native quarters. From the 12th century onwards it was a place of considerable strength; in the 18th century Mir Kasim made it his headquarters. He established an arsenal, and its armourers are still famed. Pop. 55,372.—The *district* has an area of 3921 sq. m., with a pop. (1881) of 1,969,774.

Mongols, an Asiatic people belonging to the Ural-Altaic branch of the human family, derive their name from a word *mong*, which means 'brave,' 'bold.' Their origin and early history are lost in a dim antiquity. Chinese annals first speak of them as dwelling, 6th to 9th century, in what is now Mongolia north of the desert of Gobi, and in the regions south of Lake Baikal. The origin of the royal house is enshrouded in myths, the maternal ancestor being by tradition a she-wolf; probably the house was descended from a ruling family of the Turks (Hiung-nu). The cradle of the Mongol people seems to have been on the plains between the river Onon, the Orkhon, and the Kerulon, the latter a tributary of the Argun. It was in that region that Genghis Khan was born, and in that region that he fixed his permanent camp or capital, at a place called Karakorum. An ancestor of the great conqueror ruled in the middle of the 12th

century over a confederation of Mongol tribes powerful enough to be a serious menace to the Kin empire of North China; and at the same time he was able to carry on a bitter contest against the Tartars. That the confederation was loose—probably the only tie was the compelling will of the energetic chieftain—is indicated by Temujin's (i.e. Genghis Khan's) early struggles. It was only by dint of hard fighting and tenacious persistence that he was able to maintain undiminished the power possessed by his father, and his father's father before him. But the conqueror's genius was in him, and he died supreme monarch of all central Asia (see GENGHIS KHAN). By his will his conquests and territories were divided amongst his sons; the third, Ogotai, succeeded him as khakan or chief khan of all the Mongol people. Batu and Orda, the sons of the eldest son (Juchi), were invested with Khwarezm, the region watered by the rivers Ural, Oxus, and Jaxartes; Jagatai, the second son, received the territories between Bokhara, the Irtysh, and the Gobi; the region between the Irtysh and Lake Baikal was assigned to Ogotai; and to the youngest son, Tuli, was given the home country south of the Baikal. The first care of Ogotai was to complete, in conjunction with his brother Tuli, the conquest of North China. The capital of the Kins was taken in 1234, and, the last emperor of the dynasty having hanged himself, the Mongol ruler became emperor in his stead. North China having been thus subdued, Ogotai proceeded to conquer China south of the Yellow River, then governed by the Sung dynasty, and to reduce Corea. Meanwhile another army, commanded by Batu, attacked and subdued the principalities of what is now Russia—Bulgaria on the Volga, Riazan, Moscow, Vladimir, Kieff. The force then divided: one division under Batu entered Hungary, crushed the Hungarians at Mohi near Tokay, and captured Pesth and Gran (1241); the other division overwhelmed the Poles near Liegnitz, and pushed on into Moravia. During the same period yet another Mongol army was assailing Khwarezm, which the son of the former ruler had recovered. This army drove Jelal ud-Din out of his kingdom, overran Azerbaijan, and in 1236 Armenia and Georgia, in all of which campaigns their path was marked by terrible cruelties and atrocities. Ogotai died in 1241. Kuyak, his son and successor, reigned seven years, and he was followed by his cousin Mangu, a son of Tuli. Both princes favoured Christianity. During Mangu's reign his brother Hulagu won great fame as the punisher of the Assassins (Ismaelites) in Persia, and as the destroyer of the califate of Bagdad. Moreover, he subjugated Syria, and captured Aleppo and Damascus, and threatened Jerusalem. Invested with these countries, he founded the kingdom of the Ilkhans in Persia (q.v.). Mangu's successor was his illustrious brother Kublai (q.v.) Khan, whose descendants ruled over China (q.v.) from 1294 to 1368. This eastern division of the Mongols was expelled from China, and its power finally crushed by the Chinese, in the end of the 14th century. The same people gradually absorbed in the following centuries the various small bodies of Mongols scattered over the centre of Asia, from the Great Wall to the Altai Mountains on the west and Tibet on the south-west. In the west of Asia and the east of Europe were formed the Kipchak (q.v.) states—in Russia, the Golden Horde, which subsequently broke up into the Tartar (q.v.) khanates of Kazan, Astrakhan, and the Crimea; in Turkestan, the Uzbek (q.v.) principality, out of which grew the khanates of Bokhara and Samarcand. Towards the end of the 14th century Toktamish made himself chief of the eastern Kipchaks, and united thereto the chieftainship

of the Golden Horde; but his power was crushed by the greater Tamerlane (q.v.). In 1519 Baber (q.v.), a descendant of Genghis' son Jagatai, founded the Mogul empire in India. The Kalmucks (q.v.) also belong to the western branch of the Mongols.

The total number of Mongols now under Chinese rule is estimated at two millions. They live for the most part in the immense plateau of central Asia called Mongolia (area, 1,238,000 sq. m.), which is girdled on all sides by lofty mountain-chains (Altai, Thian-Shan, Chingan, &c.). Its southern portion consists of the vast desert of Gobi. These people are still nomads, as their historic ancestors before them always were. Their wealth consists in flocks of sheep, herds of horses (small, but very enduring), cattle, camels, and goats. They are mostly Buddhists, though those in the west are in part followers of Shamanism, as all Mongols were before the days of the great conqueror. As a rule they are hospitable, though indifferent to personal comfort, addicted to cattle-stealing and to drink, but when sober good-hearted and friendly; on the whole, life being easy and their wants few and simple, they display a lack of foresight, and are lazy and dirty. They dwell in tents, which are their only protection against the violent sandstorms of summer and the still more terrible snow-hurricanes of winter. They are fond of making religious pilgrimages to Urga (q.v.), the religious capital of the country, and to various other shrines in China and Mongolia. Kalgan and Kiachta are the principal commercial centres. It is difficult to estimate the numbers of the western Mongols, as they have in many parts commingled with their Turkic neighbours; but see such articles as Kipchaks, Kirghiz, Russia, Siberia, Tartars, Turkestan, &c. The Buriats (q.v.), almost entirely subject to Russia, are a branch of the Mongol race.

The term Mongolic is used by ethnologists to describe the group of cognate languages which constitute one division of the Turanian (q.v.) family of speech. What Mongol literature there is consists for the most part of translations of religious works from Tibetan and Chinese, historical works (notably the chronicles of Ssanang Setsen in the middle of the 17th century), of folk and fairy tales, and a few poetic productions. Perhaps the best known of the folk-tales are the collection entitled *Siddhi-Kâr* (ed. Jülg, 1868). Others have been published by the same scholar (1866-69), by Bergmann (1804-5), I. J. Schmidt (1839), and Russian savants.

See Howorth, *History of the Mongols* (1876-88, where full bibliographical details will be found), and Gilmour, *Among the Mongols* (1888).

Monica. See AUGUSTINE.

Monier-Williams. See WILLIAMS.

Monism, a philosophical theory that all being may ultimately be referred to one category. Thus idealism, pantheism, materialism are monisms, as opposed to the Dualism (q.v.) of matter and spirit. See PHILOSOPHY.

Moniteur, Le, a French journal, started by the publisher Panckoucke, 5th May 1789, under the title of the *Gazette Nationale, ou le Moniteur Universel*. During the Revolution its reports, &c. were of very great importance, and its value was immensely increased when, in 1800, it was made the official organ of the government. It retained the privilege (without the first title, *Gazette Nationale*, which was dropped in 1811) down to 1869, when it was supplanted by the *Journal Officiel*. Afterwards it was issued as an Orleanist or private Conservative paper.

Monitor, a name given to a genus of Lizards somewhat isolated from other lizards in structural characters; in some respects they approach the Crocodilia, which are the highest of existing reptiles. They are the largest of existing lizards; a specimen acquired by the College of Surgeons in London measured 6 feet 10 inches. The tail of the greater number is laterally compressed, the better to adapt them to aquatic habits. They have received the name Monitor from a notion that they give warning by a hissing sound of the approach of a crocodile or alligator. There is only one genus, with many species.—The Monitor or Varan of the Nile

Monitor (*Varanus niloticus*).

(*Varanus niloticus*) is of a rather slender form, and has a long tail. It is olive-gray, mottled with black. It attains a length of five or six feet. Crocodiles' eggs or young crocodiles form the chief part of its food. It is a curious superstition in India, that the young of the monitor is more deadly than the most venomous serpent.

Monitor. See NAVY.

Monitorial System, or MUTUAL INSTRUCTION. It first occurred to Dr Andrew Bell (q.v.), when superintendent of the Orphan Hospital, Madras, in 1795, to make use of the more advanced boys in the school to instruct the younger pupils. These youthful teachers were called Monitors. The method was eagerly adopted by Joseph Lancaster, who in the first years of the 19th century did so much for the extension of popular education; and, from him and the originator, the system was called indifferently the Madras and the Lancastrian, as well as the Monitorial or Mutual System. See EDUCATION, Vol. IV. p. 210. The monitorial system is not, as is commonly supposed, a method of teaching; it is simply a method of organising schools, and of providing the necessary teaching power. At a time when the whole question of primary education was in its infancy, the state refusing to promote it on the ground that it was dangerous to society, and the public little disposed to contribute towards its extension, it was of great importance that a system should be adopted which recommended itself as at once effectual and economical. But the importance of the system as an educational agency was universally overrated, and in the end broke down.

Monk, GEORGE, Duke of Albemarle, soldier of fortune and restorer of the English monarchy, was the second son of Sir Thomas Monk of Potheridge, near Torrington, North Devon, and was born either there or at Lancross on 8th December 1608. He saw service first in the expeditions to Cadiz and Rochelle (1625-27), and then for nine years in Holland, returning to England in 1639, in time to take part in the two Bishops' Wars with the Scots. In 1642-43 he com-

manded a regiment against the Irish rebels, in 1644 was taken prisoner at Nantwich by Fairfax. He lay two years in the Tower, where he solaced himself with frill, ugly Nan Ratsford or Clarges (his future duchess), and whence he freed himself by taking the Covenant—Clarendon hints that he did so for money. As major-general in Ulster he so commended himself to Cromwell, still more by his brilliant conduct at Dunbar (1650), that next year he was left to complete the subjection of Scotland. In 1653 he was associated with Blake and Deane in naval operations against the Dutch, and won two great sea-fights over Tromp (q.v.); in 1654 Cromwell sent him back to Scotland as governor, in which difficult office he acquitted himself with vigour, moderation, and equity. Even the Highlands were reduced to order. His home for five years was Dalkeith, where he 'was ever engaged in business or in planting, which he loved as an amusement and occupation.' After Cromwell's death, seeing everything in confusion, and a splendid chance open to him who dared seize it, on New-year's Day 1660 he crossed the Border with 6000 men, and five weeks later entered London unopposed. So far he had kept his intentions profoundly secret. Still every one felt that the decision lay with 'Old George'; every party courted him; the Republicans even offered him the protectorate. But, while he offended nobody, he declined to connect himself with any of the sectaries, and waited patiently the course of events. From the first, his own wish, dictated by no high motive, had been to bring back the Stuarts; and before long he saw that the nation at large was with him. The freeing of the Rump parliament from the army, the re-admission of the excluded members, and the election of a new parliament—these were his wary steps towards the Restoration; on 23d May he welcomed Charles II. on the beach at Dover. Monk now was made Duke of Albemarle, and entrusted with the highest offices in the state. But he soon retired from political affairs. In 1665, when the plague ravaged London, and every one fled that could, as governor of the City he stuck bravely to his post, and did his best to allay the panic and confusion. Next year he was employed as second in command of the fleet sent under the Duke of York against the Dutch, and was defeated by De Ruyter in a sea-fight off Dunkirk, but soon after gained a bloody victory over him off the North Foreland. He died, sitting in his chair, at Newhall, his Essex seat, on 3d January 1670, and was buried in Westminster Abbey. 'A man,' says Guizot, 'capable of great things, though possessing no greatness of soul.'

See, besides works cited at CHARLES I., CROMWELL, and CHARLES II., the Lives of Monk by Gumble, his chaplain (1671), Skinner (1723), Guizot (Eng. trans. 1851), and Corbett (1889), the last a eulogy.

Monk, MARIA (c. 1817-50), a woman of bad character who pretended in 1835 to have escaped from the Hôtel Dieu nunnery at Montreal, and who, coming to New York, found a good many credulous adherents, and published *Awful Disclosures and Further Disclosures*, which had an enormous sale.

Monkey. This term may be conveniently restricted only to all the Primates exclusive of the Anthropoid Apes (q.v.). It has been sometimes applied to the tailed forms only, the rest being spoken of as Apes. This use of the words monkey and ape is ill-judged, inasmuch as it implies that the non-anthropoid Primates are divisible into tailed and tailless species. The real distinction is not to be found in this character. The quadrumana as a whole are divisible into three great groups—(1) Anthropoid Apes; (2) Platyrrhini, the New-World monkeys; (3) Catarrhini, the

Old-World monkeys. It is the two latter divisions that are dealt with in the present article.

In the Platyrrhini the nostrils are far apart; the tail is prehensile, and the number of premolar teeth is in excess of that of the Catarrhini, the dental formula being (for the molars and premolars) p.m. $\frac{3}{1}$, m. $\frac{3}{1}$. In the marmosets the formula is p.m. $\frac{3}{1}$, m. $\frac{1}{1}$; this, coupled with some other peculiarities in their anatomy, led to the institution of a distinct group—Arctopithecini, regarded as equivalent to either the Platyrrhini or Catarrhini. They are now, however, more usually referred to the Platyrrhini, though placed in a separate family.

a, Platyrrhine face (*Myocetes villosus*); b, Catarrhine face (*Macacus leoninus*).

In the Old-World monkeys, or Catarrhini, the nostrils are near together; the number of teeth 32, and these arranged as in the anthropoid apes and man; the molars and premolars being p.m. $\frac{3}{1}$, m. $\frac{3}{1}$ —the reverse of the condition seen in the Marmosets. The tail, when present, is never prehensile; and three are frequently ischial callosities developed, which structures are entirely unknown among the American monkeys.

The two divisions of the monkey tribe based upon those characters are absolutely distinct in their geographical distribution. The Platyrrhini are only found in America, the Catarrhini are limited to the Old World; further than this, the fossil species, which have not been found in strata earlier than of the Miocene period, show the same rigid correspondence between structure and distribution. No Platyrrhine has been met with in the Old World, and no Catarrhine in the New. Whether this indicates that the monkeys of the two hemispheres have had an independent origin or not, is a matter for further inquiry; it must indicate in any case the remoteness of the period during which there was a passable land connection between Asia and America.

In both the Old and New Worlds monkeys are almost confined to the more tropical districts; and yet this is not entirely due to an incapacity for bearing a rigorous climate, for monkeys occur high up on the sides of mountains in India. Monkeys do not occur in the tropical parts of Australia. During the Miocene and Pliocene periods these animals inhabited Europe and even England, for the remains of a *Macaque* have been described from the county of Essex. At present the only trace left in Europe of these inhabitants is the *Macacus inuus* or Barbary Ape, which occurs on the Rock of Gibraltar as well as on the opposite coast of Africa. But this animal is perhaps not truly indigenous; it may have been introduced.

In the New World monkeys are most abundant in South America. The forests of the Amazon and the Orinoco may be regarded as their headquarters. There are only ten species which occur north of the Isthmus of Panama, and only one of these extends its range into Mexico; this is a Spider Monkey.

The West Indian islands contain no indigenous monkeys. The American monkeys are all arboreal; and this of course limits their range to forest-clad districts. The prehensile tail has an obvious relation to their mode of life. But it is a most singular fact that the long-tailed monkeys of the Old World, which might often gain considerable advantage from being able to use their tail as a grasping organ, are totally unable to do so.

Some of the more remarkable kinds of monkeys are noticed in separate articles (BABOON, BARBARY APE, ENTELLUS, HOWLER, MARMOSET, &c.).

Monk-fish, another name for the Angel-fish (q.v.), was also applied in the 16th century to a large specimen of the Loligo or Squid family.

Monk's-hood. See ACONITE.

Monk's Rhubarb. See DOCK.

Monmouth, the county town of Monmouthshire, stands, girt by wooded hills, at the influx of the Monnow to the Wye, 16 miles N. of Chepstow, 18 S. of Hereford, and 26 WSW. of Gloucester. Its chief features are the ruined castle of John of Gaunt, in which Henry V. was born; the parish church, dating from the 14th century, and restored in 1882 by Street at a cost of £7000, with a graceful spire 200 feet high; the bridge over the Monnow (1272), with its 'Welsh gate,' and near it, a small Norman chapel; a fragment of a Benedictine priory, with 'Geoffrey of Monmouth's study'; the new town-hall, built in 1888 at a cost of £10,000; and a grammar-school (1614). In the neighbourhood are the temple-crowned Kymin (800 feet), commanding a glorious view; the Buckstone, a rocking-stone, displaced by tourists in 1885, but since re-poised; and, 7 miles SW., the superb ruins of Raglan Castle, defended for ten weeks in 1646 against Fairfax by the old Marquis of Worcester. First chartered by Edward VI., Monmouth unites with Newport and Usk to return a member. Pop. (1851) 5710; (1881) 6112; (1891) 5470. See *Charters of Monmouth* (1826), and works by Heath (1804) and Greene (1870).

Monmouth, capital of Warren county, Illinois, is 179 miles by rail WSW. of Chicago. It is the seat of Monmouth College (United Presbyterian, 1856), with about 400 students, and manufactures agricultural implements, sewer pipes, and cigars. Pop. (1890) 5837.

Monmouth, JAMES, DUKE OF, was born at Rotterdam, 9th April 1649, the son of 'browne, beautiful, bolde, but insipid' Lucy Walters (1630-83), by Charles II., she said, but more likely by Colonel Robert Sidney, to whom and to whose brother Algernon she had lately been mistress. When in 1656 she came with her son to London, she was treated as the king's wife, and by Cromwell was sent to the Tower, and then back to Paris. Charles sought out the boy and committed him to the care of Lord Crofts, who gave him his own name. In 1662, after the Restoration, 'Mr James Crofts' came to England with the queen-dowager, and was handsomely lodged at Hampton Court and Whitehall. In 1663 he was created Duke of Monmouth, and wedded to a rich heiress, Anne, Countess of Buccleuch (1651-1732); in 1670 he succeeded Monk as captain-general of the forces, and in 1673 received the additional title of Duke of Buccleuch. A poor, weak libertine, he yet became the idol of the populace, thanks to his beauty and his affability, to his humanity towards the Covenanters at Bothwell Bridge (1679), to the agitation of the Popish Plot and the Exclusion Bill, and to his two semi-royal progresses in the west and the north of England (1680-82). There were rumours of his legitimacy, the proofs in a certain 'black box'; and Shaftesbury knew well how to pit the 'Protes-

tant Duke' against the Popish heir-presumptive to the throne, how to enmesh him in the Rye-house Plot (1683), on whose discovery Monmouth fled, as four years before, to the Low Countries. There he remained until Charles's death, when, in concert with Argyll's Scotch expedition, with eighty-two followers he invaded England. On 11th June 1685 he landed at Lyme-Regis, and issued a manifesto branding James as a murderer and popish usurper, and asserting his own legitimacy and right to the crown. He was received with acclamations at Taunton, where he was himself proclaimed King James II.; and on the early morning of 6th June, after a roundabout march to near Bristol and Bath, he attempted with 2600 foot and 600 horse (peasants mostly and miners), to surprise the king's forces, 2700 strong, which under the Earl of Feversham were encamped on Sedgemoor, near Bridgwater. His men could not cross a broad drain, and were moved down by the royal artillery, 300 falling on the field, 1000 more in the pursuit. Monmouth himself had fled, but on the 8th was taken, disguised as a shepherd, in a ditch near Ringwood. His bearing before James was dastardly. He wept; he crawled to his feet; he even offered to turn Catholic. No: on 15th July he was bunglingly beheaded upon Tower Hill, and buried in the chapel of St Peter-ad-Vincula. His duchess had borne him six children; but his last thoughts were all with his mistress, Lady Henrietta Wentworth, who died of sorrow nine months after him. In the 'Bloody Assize' that followed the rebellion, Judge Jeffreys hanged 331 rebels, transported 849 to the plantations, and whipped or fined 33 others.

See G. Roberts, *Life of Monmouth* (2 vols. 1844), with works cited at CHARLES II. and JAMES II.

Monmouthshire, a county in the west of England, bounded N.E. by Hereford, E. by Gloucester, S. by the estuary of the Severn, and W. and N.W. by South Wales. With a maximum length and breadth of 32 and 28 miles, it contains 578 sq. m., or 370,350 acres, of which more than one-half is under permanent pasture, and about one-twelfth in woods. Pop. (1801) 45,582; (1841) 134,368; (1891) 252,260. Its surface is for the most part hilly, especially in the north and north-west (the Sugar Loaf is 1954 feet high), but the Caldicot and Wentloog Levels, which for a distance of 25 miles skirt the southern coast, are so low as to require in places the protection of sea-walls and earthworks. The Wye, with its tributary the Monnow, the Usk, Ebwy, and Rumney, all flowing south into the estuary of the Severn, are the principal rivers. In the rich valleys of the three former wheat is the principal crop raised, whilst on the poorer soils on the west side of the county oats and barley are chiefly grown. There are also extensive orchards. The great wealth, however, of Monmouthshire is derived from its minerals, coal and ironstone abounding in the region of Pontypool and Rhymney. In 1889 coal weighing 6,751,308 tons and of the value at the pit's mouth of £2,503,610 was raised; nearly 400,000 tons of pig-iron were made, and much limestone and other building stone, as also fireclay, produced. The county comprises six hundreds, the municipal boroughs of Monmouth and Newport, and 147 civil parishes. Three members are returned to parliament for the county, and one for the combined borough of Monmouth, Newport, and Usk; the County Council numbers 64. Towns other than the above are Abergavenny, Blaenavon, Caerleon, Chepstow, and Tredegar. Monmouthshire, which until 1535 formed part of Wales, is noted for its beautiful scenery and for the many remains of feudal castles, &c. scattered throughout it. Of these the finest examples are the castles of Raglan, Caldicot, and Chepstow, and the abbeys of Tintern and

Tintern. See the county histories by Williams (1796) and Coxe (1801).

Monochlamydeæ. See CALYX, FLOWER.

Monochord, an apparatus constructed to exhibit the mathematical proportions of musical intervals. It consists of a flat board of 4 or 8 feet long, or better 16 feet, where space can be spared. The breadth of the board is according to the number of the strings, which are from two to six. The board is covered with fine white paper. A straight line is drawn from end to end below each string, and each line is accurately divided into the different proportions into which the full length of the string, as a fundamental sound, harmonically divides itself (see HARMONICS). The string is fixed at one end, and rests on a bridge; while at the other end, where it also rests on a bridge, it is stretched by a tuning-peg, or by a weight. The sounds from the strings are produced by a violin-bow. The monochord is chiefly used in illustrating acoustical experiments in the proportion of intervals and temperament.

Monoclinical Strata. See GEOLOGY, MOUNTAINS, STRATIFICATION.

Monocotyledons. The higher phanerogams are distinguished from the Gymnosperms by their closed ovary as Angiosperms, and there fall into two main alliances, recognised by Ray and other predecessors of Linnaeus as monocotyledons and dicotyledons. The former are readily distinguished, as the name implies, by the single cotyledon of the embryonic plant, but also by a number of other important structural characters. Thus, the primary root (although it may develop strongly in germination, as in palms, lilies, maize, &c.) soon ceases to grow, and is replaced by lateral (adventitious) roots. The axis of the embryo also often dies away after producing lateral shoots, which may die in turn, and so on (e.g. sympodial rhizome of Solomon's Seal, tubers of orchids, &c.), but frequently also lengthens into the primary stem of full-grown plant (e.g. palms, aloe, maize, &c.); while young it grows (as in ferns) in the form of an inverted cone, each successive section being longer than the preceding until the adult size is reached, when the stem becomes cylindrical, tapering off only at the extreme point. There is thus usually no secondary growth in thickness (see, however, DRACÆNA). The leaves are seldom whorled, and the arrangement in two alternating rows is commonest. The leaf-bases are usually sheathing, and stipules are absent. The lamina is usually entire, the venation not ridged on the under side, and usually parallel. The fibro-vascular bundles of the stem do not anastomose nor form a ring, but are distributed throughout the whole stem, which thus does not exhibit the pith nor separable bark so familiar in many dicotyledons. The flower consists of alternating and isomerous whorls, outer and inner perianth, outer and inner stamens, and usually only one carpellary whorl; but from this type many characteristic specialisations arise. The endosperm is usually large and persistent, but some orders are exalbuminous.

The systematic study of the monocotyledons is most easily undertaken by clearly familiarising one's self with the Liliaceæ and their immediate allies, Amaryllidaceæ, Iridaceæ, &c.; and next by studying the progress of the floral specialisation, through Scitamineæ to its extreme in Orchidaceæ. Starting again from the lilies and their scarcely distinguishable allies, the rushes (Juncaceæ), we easily distinguish one series of degenerative (or more accurately vegetative) types, culminating in the sedges (Cyperaceæ) and grasses, commonly grouped as Glumifloræ. Another somewhat analogous line of change gives us the palms and Aroidæ,

grouped at Spadicifloræ. The Helobiæ (including Juncaginæ, Alismacæ, Hydrocharidacæ) are also of special interest, as representing in some respects more primeval forms, and pointing back to a common ancestry with dicotyledons. See VEGETABLE KINGDOM, and minor special articles; also Goebel's, Van Tieghem's, or other text-books of botany. For systematic details, see Engler's *Pflanzenfamilien* or the *Genera Plantarum*.

Monod, ADOLPHE, an active theologian of the Reformed Church, was born in 1802 at Copenhagen, the son of a preacher, himself a native of Geneva. He studied at Geneva, and laboured as a preacher at Naples and Lyons, as a professor at Montauban, and again as a preacher in Paris until his death, 8th April 1856. He published sermons and many religious works which were widely popular.—His brother, FRÉDÉRIC, born 17th May 1794 at Monnaz, in the canton of Vaud, was thirty years a prominent pastor in Paris, and founded in 1849, together with Count Gasparin, the Free Reformed Church of France. He edited until his death, 30th December 1863, the *Archives du Christianisme*. See Adolphe's *Life and Letters* (Eng. trans. 1885).

Monodon. See NARWHAL.

Monœcious (Gr. *monos*, 'one,' and *oikion*, 'a habitation'), a term introduced by Linnæus to describe those plants which have the stamens and pistil in different flowers, but upon the same plant—e.g. hop, box, birch, beech, alder, oak, hazel. Such plants formed one of the classes (*Monœcia*) of the Linnean system, but were obviously a specially artificial alliance, since that partial or complete separation of the sexes to which we apply the terms monœcious or diœcious respectively arises continually among the most unrelated plants or animals. See FLOWER, SEX.

Monogenists. See ETHNOLOGY.

Monogram (Gr.), a character composed of two or more letters of the alphabet, often interlaced with other lines, and used as a cipher or abbreviation of a name. A perfect monogram is one in which all the letters of the word are to be traced. They are found on early Greek coins, medals, and seals, and on the family coins of Rome, but not on the coins of the earlier Roman emperors. Constantine placed on his coins one of the earliest of Christian monograms, composed of the first and second letters of ΧΡΙΣΤΟΣ (Christos), a monogram which also appeared on the Labarum (see CROSS, Vol. III. p. 582; and CONSTANTINE); we often find it combined with the first and last letters of the Greek alphabet (Rev. i. 8). Another well-known monogram is that of the name of Jesus, IHS, from the first three letters of ΙΗΣΟΥΣ. Popes, emperors, and kings of France during the middle ages were in the practice of using a monogram

Fig. 1.

instead of signing their names. Fig. 1 represents that of Charlemagne, a perfect monogram, in which all the letters of *Karolus* can be traced. Painters and engravers in Germany and Italy have used monograms to a large extent as a means of distinguishing their works. Fig. 2 is the monogram of Albert Dürer. The first typographers made use of monograms or ciphers, a series of which, well known to the bibliographer, fixes the identity of the ancient editions, German, Italian, and English, from the invention of printing down to the middle or end of the 16th century. Those of William Caxton and Gaspard Philippe, an old Paris printer, will be found at BOOK, Vol. II. p.

Fig. 2.

303. See Brulliot, *Dictionnaire des Monogrammes* (1834); Duplessis, *Dictionnaire des Marques* (Paris, 1887). Potters' marks will be found at POTTERY.

Monograph (Gr.), a work in which a particular subject in any science is treated by itself, and forms the whole subject of the work—'an all-sided and exhaustive study of a special or limited subject,' as it has been called. Monographs have contributed much to our knowledge, especially in the department of the natural sciences. The term, however, is often loosely used for a small book on miscellaneous topics.

Monolith. See STANDING-STONES.

Monomania. See INSANITY.

Monongahela, a river which rises in West Virginia and flows north to Pittsburgh, where it unites with the Alleghany to form the Ohio.

Mono'physites, Christians who hold that Christ has only *one* nature (Gr. *monos*, 'one;' *physis*, 'nature'). See GREEK CHURCH, Vol. V. p. 398.

Monopoli, a town of Southern Italy, on the Adriatic, 43 miles by rail NW. of Brindisi, with a cathedral, ancient walls, and a castle built in 1552 by Charles V. Pop. 13,154.

Monopoly is properly definable as the sole or exclusive right of selling or trading enjoyed by an individual or group of individuals. In its strict sense monopoly belongs to an economic era which has passed away. During mediæval times and the period that followed, exclusive rights prevailed in almost all departments. There were manorial rights which circumscribed individual action. The city and the guild had their spheres of production and of trade more or less clearly defined, and more or less thoroughly recognised in practice. The central governments which arose on the ruins of the mediæval system continued to recognise such exclusive rights, sometimes conferring on favoured individuals the sole privilege of selling the most necessary articles of life, in other cases granting to great companies the monopoly of trade over immense regions of the world. It is with these instances that the name monopoly is most strictly associated in history. The last parliament of Elizabeth, held in 1601, pronounced an emphatic condemnation of the monopolies granted by that queen, and even she had to yield to the storm. Salt and coal were among the articles whose sale was thus subject to monopoly. One of the members made a sensation by asking: 'Is not bread among the number?' Curiously enough, the previous year saw the foundation by royal charter of the greatest of the companies which were based on the exclusive right of trade in an immense foreign market, the East India Company. The opposition to monopolies at home continued under the Stuarts, and their abolition may be regarded as one of the important results of the great parliamentary struggle of that time.

The spread of freedom has tended to the abolition of such monopolies, whether vested in individuals, in trade corporations, or in great companies engaged in foreign commerce. But, while the monopoly of law has so far passed away, new tendencies towards a monopoly of fact have been setting in. Under the prevalent system it is still the aim of the competitor to secure as far as possible the exclusive sale of the commodity in which he deals, either in the world-market or over a given portion of it; and when the single competitor is not strong enough to accomplish this, he seeks to attain his object by combination with a group of those engaged in the same business. The modern *trust* syndicate or union is the outcome of such efforts; and the great danger attendant on such gigantic combinations is the establishment of a monopoly

injurious to society. The trust considered in its social and economic aspects offers a wide problem for discussion; there can be no doubt that it establishes or seeks to establish a monopoly of fact. As regards the United States it may be maintained that such a monopoly is favoured by Protection; but in view of the fact that the same tendency is observable in England, where free competition with all the world exists, it should be considered whether such combinations are not a 'natural' outcome of the prevailing economic system. We have here merely to point out that in all such combinations, whether operating over the whole world-market or over a portion of it, the tendency towards a monopoly of fact is involved. In conclusion, reference should be made to monopolies, as in tobacco, retained by certain governments, but purely for revenue purposes. It was part of the later fiscal policy of Bismarck to establish such a state monopoly in spirits. See FARMERS-GENERAL.

Monothelism, the term usually employed to denote a belief in the unity of the Godhead, or belief in and worship of one God. It is thus the opposite of *Polytheism*. The doctrine of the Trinity is thought by some (e.g. the Unitarians) to be incompatible with the monotheism taught by Jesus Christ, and is therefore rejected as no part of His teaching. Mohammedans and Jews, of course, reject with vehemence the least approach to a Trinitarian conception of the Deity.

Monothelism (Gr. *monos*, 'single,' and *thelein*, 'to will'), the doctrine that Christ had only one will. It is a modification of Eutychianism. See EUTYCHES; GREEK CHURCH, Vol. V. p. 398.

Monotremata (Gr. *monos*, 'single;' *trēma*, 'an opening'), the lowest order of mammalia, in many of their characteristic points indicate an approximation to reptiles. The skull is smooth; the brain-case very small as compared to the face; the snout much prolonged, and the jaws unprovided with soft movable lips, and not furnished with teeth, except in the young Ornithorhynchus, where they have been discovered by Poulton and Thomas. The cranial bones coalesce, as do a bird's, at a very early period, and leave no signs of sutures. The external ear is altogether absent; while the eyes, though small, are perfectly developed.
